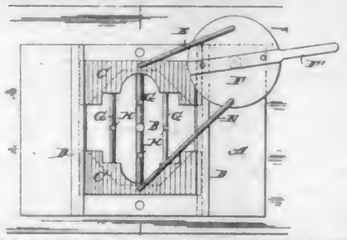
9. In a micrometer, a sliding bar, C, provided with a handle, *c*, a multiplying-needle, I, and spring L, acting directly upon the scale D, in combination with the arm E and screw H, constructed and operating together substantially as described, for the purposes specified.

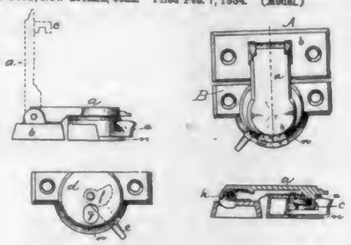


10. A micrometer consisting of the bar C, needle I, and spring L, inclosed in the body A, a scale, D, upon the body, and a screw, H, inclosed in the arm E, in combination with each other and operating together substantially as and for the purposes set forth.

297,603. APPARATUS FOR IMPROVING THE FIRE-TEST OF PETROLEUM AND FOR BLEACHING OTHER OILS. JOHN B. HUSTON, Cleveland, Ohio. Filed June 9, 1883. (No model.)

Claim.—The apparatus for improving the fire-test of oils and for bleaching animal and vegetable oils by a direct contact of live steam to petroleum or direct contact of bleaching material to animal or vegetable oils in a finely-divided condition, consisting of a vessel, A, divided by perforated floors *a* into two or more compartments, an air-pipe, B, connected to the upper part of said compartments by pipes *b b*, and inclosing a steam-pipe, C, connected to lower part of said compartments by pipes *c c*, and also inclosing oil-pipe D, connected to top chamber of vessel A, the vapor-escape pipes E, a box, G, for containing bleaching material, and a blower, H, connected through said box to air-pipe B and pipe I with top of vessel A, substantially as described.

297,604. DIE FOR PRESSING CLAY FENCE-POSTS. EPHRAIM IVEFF, North Ferrara, Ohio, assignor to himself and Frank Sheeran, same place. Filed July 23, 1883. (Model.)



Claim.—1. A die for pressing clay fence-posts made substantially as herein shown and described, and consisting of a plate provided with an opening and two adjustable sliding plates, by means of which the opening can be enlarged and decreased, as set forth.

2. In a die for pressing fence-posts, &c., the combination, with a plate having an opening, of the sliding plates C and the rods H, held on curved rods G, extending across the opening of the plate A, substantially as herein shown and described.

3. In a die for pressing fence posts, the combination, with the plate A, having an opening, B, of the sliding plates C, the connecting-rods E, and the disk F, provided with a handle, F', substantially as herein shown and described.

297,605. FASTENER FOR MEETING-RAILS OF SASHES. OLIVER S. JUDD, New Britain, Conn. Filed Feb. 7, 1884. (Model.)

Claim.—1. The herein-described sash-fastener, consisting of the spring-pressed latch having the slotted stud, the keeper having orifice *g* to receive said stud, and provided with a locking-lever and cam for engaging said slotted stud, substantially as described, and for the purpose specified.

2. In a sash-fastener of the class described, a chambered keeper having a flat upper surface containing a slotted orifice, and provided with a locking-lever mounted within the chamber, substantially as described, and for the purpose specified.

297,606. PREPARATORY COATING FOR WIRE-DRAWING. VIRGIL D. KENERSON and CHARLES N. HOWE, Worcester, Mass. Filed Sept. 14, 1883. (No specimens.)

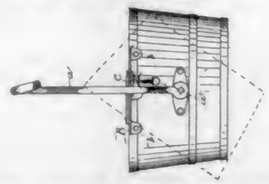
Claim.—1. As a coating for wire preparatory to drawing, a paste made of starch mixed with water and scalded and dried upon the surface of the wire, substantially as set forth.

2. A coating for wire preparatory to drawing, consisting of a paste made of starch mixed with water and scalded, and having combined therewith an alkaline substance—as sal-soda—substantially as hereinbefore set forth.

297,607. RAILROAD-TRACK CLEARER. GEORGE J. KINZEL, Knoxville, Tenn. Filed Oct. 24, 1883. (No model.)

Brief.—The under side of the scoop is flat, to allow it to move upon the faces of the rails, and is hung from a derrick mounted upon a truck and raised by ropes and a windlass.

Claim.—The combination, with a car or car-truck provided with a suitable derrick and windlass, of a scoop substantially of the form shown, and having its under side flat, and a slide-bar connected to its front edge, said scoop being suspended from the derrick by rope and pulley and connected to the car or car-truck by draw-bars, substantially as and for the purpose set forth.



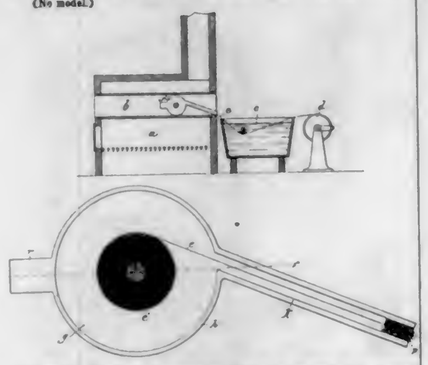
297,607.

297,608. PROCESS OF PRODUCING COLORED PICTURES ON POTTERY AND PORCELAIN. ADOLF KÜNTH, Leipsic, and ROBERT BEYERMANN, Gross Breitenbach, Germany. Filed Nov. 23, 1883. (No specimens.)

Claim.—The application and use of the chromo-lithographic process for the reproduction of colored pictures on pottery and porcelain, in the manner and for the purpose substantially as described.

297,609. SELF-DUMPING TUB. CHARLES P. LATTERCOR, Somerville, Mass. Filed Feb. 29, 1884. (No model.)

Claim.—1. The combination of the dumping-tub A, having the bail *a* pivoted thereto, as described, the locking-pawls C, the bolts D, for locking the pawls in place, and the latches F, for holding the bolts depressed, operated by the bail, all substantially as and for the purposes described.



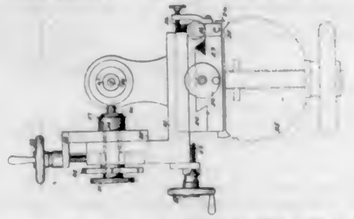
2. The combination of the dumping-tub A, having the bail *a* pivoted thereto, as described, the locking-pawl C, and pawl-locking bolt D, adapted to be moved to release the pawl C, all substantially as and for the purposes described.

3. The combination of the tub A, the bail *a* pivoted thereto, as described, the pawl C, pivoted, as described, the bolt D, for locking the pawl, and the arm E for depressing the bolt, all substantially as and for the purposes described.

4. The combination of the dumping-tub A, the bail *a*, and pawl C, bolt D, and latch F, all substantially as and for the purposes described.

5. The combination of the plate B, the pawl C, pivoted thereto, the spring-actuated rod d^3, carrying the bolt D, and secured to the side of the tub, as described, the bail *a*, unlatching-arm E, and the bolt-holding latch F, pivoted to the plate B, all substantially as and for the purposes described.

297,610. METHOD OF AND APPARATUS FOR HARDENING STEEL RIBBON. JOHN LOGAN, Waltham, Mass. Filed Dec. 13, 1883. (No model.)



Claim.—1. That improvement in the art or method of hardening steel ribbon for springs which consists in coiling the ribbon and inclosing the coiled ribbon in a case or body of metal, heating it therein, and uncoiling or unwinding the heated ribbon and cooling the same as it is unwound, substantially as described.

2. The furnace, combined with a case inclosing the coiled ribbon to be hardened, and protecting the said ribbon from the air or gases in the furnace, and means to cool the said ribbon as it is unwound from the case, substantially as described.

3. The case having a flanged main or body portion and cover, combined with a central pivot for the coil of ribbon, the said case having a nose for guiding and protecting the ribbon as it is unwound from the interior of the case.

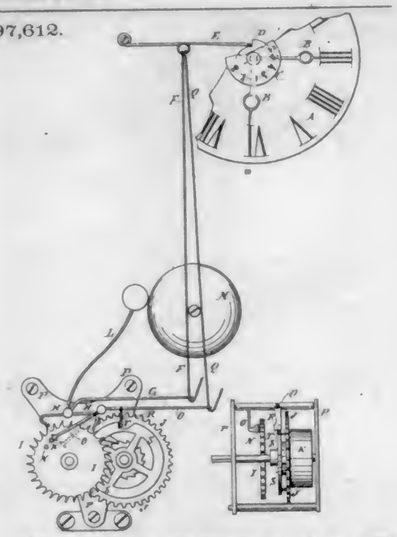
297,611. MACHINE FOR MAKING GEM-SETTINGS. CHARLES L. LOVERIN, Brooklyn, N. Y. Filed Sept. 25, 1883. (No model.)

Claim.—1. The combination, with suitable slides, as 20 21, of the hollow sleeve, as 27, and chuck 30, and means carried by the vertical portion of said slide 21 for supporting the same, substantially as described.

2. The combination, with suitable slides, as 20 21, of the hollow sleeve, as 27, chuck, as 30, gage-plate 28, and means carried by the vertical portion of said slide 21 for supporting the same, substantially as described.

3. The combination, with the slides 20 21, of the slide 22, provided with means for vertically adjusting it and for carrying a chuck, as 30, substantially as described.

4. The combination, with the slides 20 21 and the base-plate 23, of the slide 22, provided with means for vertically adjusting it and for carrying a chuck, as 30, substantially as described.

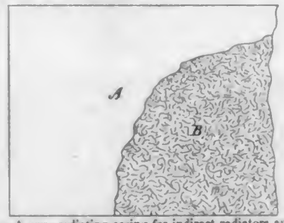


5. The combination, with the slides 20 21, of the slide 22, provided with a hollow sleeve, as 27, a chuck, as 30, and means for vertically adjusting said slide 22, substantially as described.

6. The combination, with the slides 20 21, of the slide 22, provided with a hollow sleeve, 27, a chuck 30, and a gage-plate 28, and means for vertically adjusting said slide 22, substantially as described.

7. The combination, with the slide, as 22, hollow sleeve 27, having short stud 32, and gage-plate, as 28, of a chuck, as 30, mounted in said hollow sleeve and held therein by a back nut, 31, substantially as described.

297,612. EIGHT-DAY CLOCK ALARM. C. FRED. LOCHER, Montgomery, N. Y. Filed Aug. 15, 1883. (No model.)

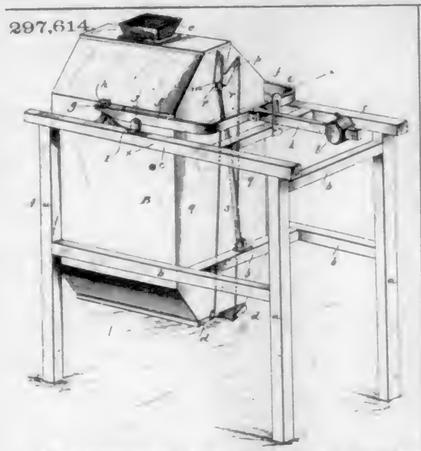


297,612.

Claim.—1. An eight-day alarm attachment for clocks, constructed substantially as herein shown and described, and consisting of the dial and cam C D, the lever E, the connecting-wire, pallet-arm, and pallet F G H, the connecting-wire Q, and the lever O, having follower R, the pallet-wheel I, having stop-pins N N, the main wheel J, having trip-wheel S, and the spring K, as set forth.

2. In an alarm attachment for clocks, the combination, with the drop-lever E, the pallet-wheel I, and the main wheel J, of the connecting-wire Q, the lever O, having follower R, the two pins N, and the trip-wheel S, having notch T, substantially as herein shown and described, whereby the alarm is made to sound successively each day for a week with one winding of the alarm-spring, as set forth.

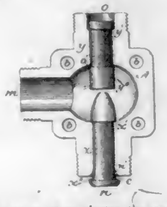
297,613. HEAT-RESISTING CASING. THOMAS A. MACDONALD, Boston, Mass. Filed June 13, 1883. (Model.)



Claim.—A non-radiating casing for indirect radiators and hot-air radiators, composed of card-board and asbestus united together by an adhesive substance and subjected to pressure, substantially as and for the purpose set forth.

297,614. AUTOMATIC GRAIN-METER. GEORGE MARSH and VINDEX ARNOLD, Marshall, Mich. Filed Feb. 15, 1884. (No model.)

Claim.—1. The combination, in a grain-meter, of a counterpoised receptacle divided into compartments, a gate arranged to alternately cover the inlet of one or the other of such compartments, a rock-lever connected with such gate, and a stationary spring-finger to engage such rock-lever to throw it first to one side and then the other, to move the gate from the empty to the full compartments, substantially as shown and described.



2. The combination, in a grain-meter, of the counterpoised receptacle divided into two compartments, a gate arranged to cover the inlets to said compartments alternately, a rock-lever connected with the gate, discharge-valves to said compartments, rods connecting said rock-lever and valves, and a stationary finger engaging said rock-lever, to throw its arms and the attached rods beyond the axis or dead-center of the lever as the receptacle descends, to positively lock the closed discharge-valve, substantially as described.

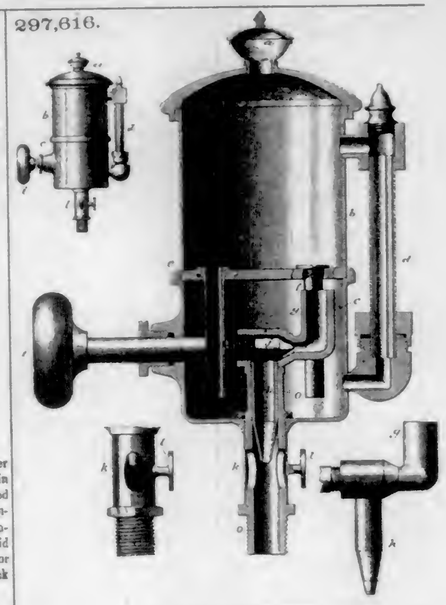
297,614.

3. The combination, in a grain-meter, of a frame, a forked lever fulcrumed thereon, a counterpoise on said lever, a receptacle hung in said forked lever and divided into two compartments, a gate arranged to cover the inlets to said compartments alternately, a rock-lever connected with the gate, discharge-valves to said compartments, rods connecting said rock-lever and valves, and a stationary finger engaging said rock-lever, to throw its arms and the attached rods beyond the axis or dead-center of the lever as the receptacle descends, to positively lock the closed discharge-valve, substantially as described.

297,615. EJECTOR. JOHN M. MARTT, Clarksville, Ark. Filed June 25, 1883. (Model.)

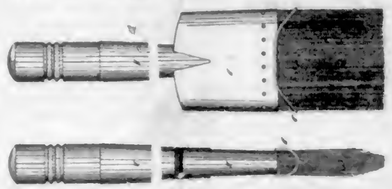
Claim.—1. In a steam jet or ejector, the casing made in two parts, A and B, exactly coinciding with each other, and held together by bolts and nuts *a* or screws passing through the holes *b*, each half having grooves so cut on its inner face that when joined together, as described, they will form suction-hole *m*, and cylinder-beds *n'* *o'*, having shoulders, substantially as shown and described, and for the purposes set forth.

2. In a steam jet or ejector, cylinders *x* and *y*, ground to fit loosely in their respective beds *n'* and *o'*, and having shoulders x' x^2 y' y^2, substantially as shown and described, and for the purposes set forth.



3. In a steam jet or ejector, the combination of half-casing A with tubes *x* and *y*, ground loosely in their respective beds *n'* *o'*, and having shoulders x' x^2 y' y^2, with half-casing B exactly coinciding with half-casing A, and all secured together by bolts and nuts *a*, substantially as shown and described, and for the purposes set forth.

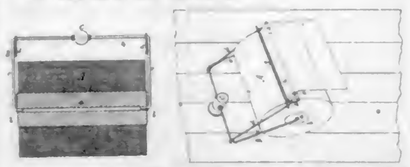
297,616. LUBRICATOR. MICHAEL MCMULLIN, Denver, Colo. Filed June 30, 1883. (No model.)



Claim.—1. The oil-reservoirs *b* and *c*, the former having an opening, *a*, said reservoirs communicating with each other by means of the flanged pipes *e* and *f*, and the pipe *g h*, provided with the conical-end regulating-screw *i j*, and the tube *o*, provided with the oval opening capable of being closed to exclude dust, and sleeve or cut-off *l*, and the glass tube *d*, whereby the flow of oil is observed and regulated through the pipe *g h*, as and for the purpose set forth.

2. The combination, with the reservoirs *b* and *c*, of the flanged pipes *e* and *f*, the pipe *g h*, the regulating-screw *i j*, the tube *o*, and the cut-off *l*, constructed, arranged, and operating substantially as herein described.

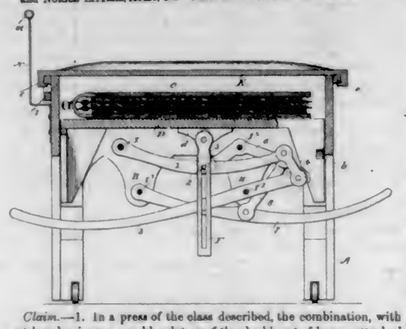
297,616.



297,617. BRUSH-BRIDLE. ALFRED S. MILES, Brooklyn, N. Y. Filed Apr. 18, 1883. (No model.)

Claim.—The herein-described bristle-supporter soldered to the brush-socket, extending up to support the bristles at the margin of the brush, and arranged to be detached, substantially in the manner and for the purposes set forth.

297,618. PAPER-HOLDER. ALBERT CANDY MOORE, Bellows Falls, Vt. Filed Dec. 26, 1883. (No model.)



Claim.—1. The knife connected to the bail and provided with a brake to extend from it, the said knife, against the roll of paper, and to be borne against it by the draft of the strip of paper on the knife while the latter may be in the act of separating the paper, all being substantially as set forth.

2. The bail provided with the guide and knife, arranged as set forth, and with a brake to extend from the knife against the roll of paper, all being substantially and to operate as represented.

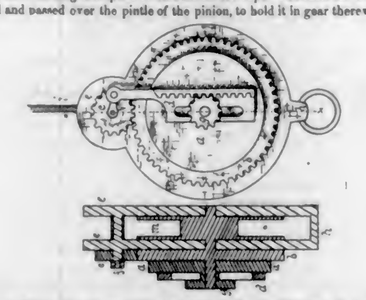
3. The combination of the bail provided with the supporting screw or device, with the knife and brake arranged and connected with each other as described, and connected with the bail by arms applied thereto, as set forth.

297,619. MACHINE FOR FORMING OIL-CAKES. JOHN L. MOSS and NORRIS LITTELL, Rome, Ga. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a press of the class described, the combination, with a mat-box having a movable platen, of the double set of levers attached to the under side of the platen, substantially as described.

2. In a press of the class described, the combination, with a platen working in a mat-box, of the connected set of levers and guide-bar, substantially as described.

3. In a press of the class described, the combination, with a vertically-movable platen, of a spring-catch engaging with a stop-support on the platen for holding the same in an elevated position, substantially as described.



4. In a press of the class described, the combination, with two or more mat-boxes arranged in the same horizontal plane, of a movable top or cover adapted to be adjusted over either mat-box and serve as a cover for the same while the mat is being subjected to pressure, substantially as described.

5. In a press of the class described, the combination, with a platen for supporting the mat, of a support for holding the leaves of the mat in opened condition while the mat-leaves are being filled with seed-meal, substantially as described.

6. An oil-cake former consisting of the following organized instrumentalities, to wit: two or more mat-boxes arranged in the same horizontal plane, a movable cover common to both, movable platens, means for actuating the platens, and means for locking the platen in the elevated positions, substantially as described.

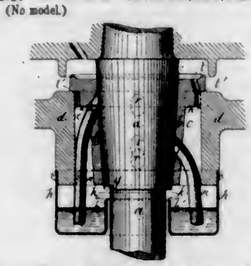
297,620. AUTOMATIC FIRE-ESCAPE. GEORGE W. MURPHEY and FRANK P. MURPHEY, Kenney, assignors of two-fifths to Park B. Murphey and Charles M. Murphey, both of Harristown, Ill. Filed June 14, 1883. (No model.)

Brief.—A fire-escape in which, as the rope is unwound, the motion of the rope-pulley is conveyed through gears to a racked bar, where it becomes oscillating motion, and is conveyed to the pinion and oscillating wheel, retarding the speed of descent on the rope. The rack-bar is slotted and passed over the pintle of the pinion, to hold it in gear therewith.

Claim.—In an automatic fire-escape, the combination of a cord-pulley, a gear-wheel, a crank-pinion, a rack and pinion, and an oscillating lever, as and for the purpose set forth.

297,621. BIRD-CAGE. JAMES S. MUSGRAVE, Bloomfield, N. J. Filed Aug. 10, 1883. (No model.)

Claim.—1. The safety-inclosure B, for bird-cages, having an open bottom and provided with side openings, a perch, and means for securing it in a cage above the bottom of the same, substantially as herein shown and described.



297,621.

2. The combination, with a bird-cage, of the open-bottom inclosure B, provided with perch *a*, bail *b*, openings *c*, and flanges *d*, substantially as herein shown and described.

3. The safety-inclosure B, for bird-cages, made open at the bottom and provided with a perch, and formed with the openings *c* and flanges *d*, substantially as and for the purposes set forth.

297,622. LUBRICATOR. THOMAS NEL, Paris, France. Filed Feb. 26, 1884. (No model.)

Claim.—1. The combination and arrangement of parts constituting the apparatus for lubrication by means of canes for the cylindrical or conical journals of vertical shafts, in connection with an oil-reservoir having an internal flange, whereby to assure the excess of oil returning to the reservoir, substantially as herein shown and described.

2. The chambered and bushed boss for loose pulleys, the same having channels *d* and apertures *e*, whereby to effect automatic lubrication by means of canes, substantially as herein described, and shown in Fig. 2, or equivalents shown in Figs. 3 and 4 of the drawings.

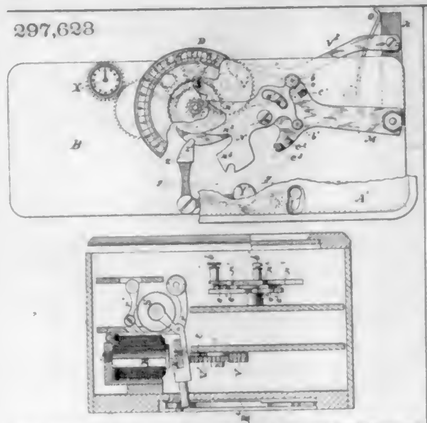
3. The combination, with the bosses of existing pulleys, of oil-chambers having internal flanges encircling the perforated boss, and of canes fitted therein, substantially as described, and shown in Fig. 5 of the drawings.

4. The combination, with the chambered bosses of loose pulleys and friction-pulleys on vertical axes, of loose reservoirs having internal flanges fitted to the boss, substantially as herein described, and shown in Fig. 6 of the drawings.

5. The combination of the oil-reservoir having internal flange with the bushing *b*, canes *r*, and shaft *a*, said shaft having an enlargement which overhangs the inner flange of the oil-reservoir, substantially as herein shown and described.

297,623. TIME-LOCK. HENRY F. NEWBURY, Brooklyn, N. Y. Filed Jan. 24, 1883. Renewed Mar. 27, 1884. (No model.)

Brief.—An electric motor is connected with a time-lock in such a way that in case the time mechanism is injured or stops the lock may be unlocked by said motor in about the same time that would be required by the time-lock.



Claim.—1. The combination, in a time-lock, of a lock bolt or dog, a time-movement or clock acting on the same through the medium of a revolving device, and an electromotor connected with said lock bolt or dog independently of such device, and capable of withdrawing the bolt from the locking position with a slow motion, substantially as and for the purpose set forth.

2. The combination, in a time-lock, of a lock bolt or dog, a time-movement or clock acting on the same through the medium of a revolving device, and an electromotor connected with said lock bolt or dog, both through the medium of such revolving device and independently thereof, substantially as and for the purpose set forth.

3. The combination, in a time-lock, of a lock bolt or dog, an electromotor for retracting the same from the locking position, and a cut-out for automatically short-circuiting such motor, and thus arresting its action when the bolt is fully retracted.

4. The combination, in a time-lock, of a lock bolt or dog, an electromotor for retracting the same from the locking position, and an indi-

297,623

cator arranged to be operated by such electromotor, substantially as and for the purpose set forth.

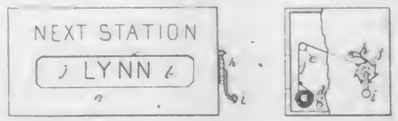
5. The combination, in a time-lock, of a revolving device actuated by the time-movement or clock thereof, and an adjustable forked lever arranged to be acted on by said revolving device, said lever being made heavier at one end than the other and loosely pivoted, so as to be brought into the operative position by the force of gravity, substantially as and for the purpose set forth.

6. The combination, in a time-lock, of an adjustable forked lever interposed between the dial and the lock-bolt, and two adjusting devices, one of which operates in connection with a fixed stop for regulating the position of such lever when setting the lever for a single day, substantially as and for the purpose set forth.

7. The combination, in a time-lock, of an adjustable forked lever interposed between the dial and the lock-bolt, one or more adjusting devices for regulating the position of such lever, and positive stops to prevent the accidental displacement of the lever, substantially as set forth.

8. The combination, in a time-lock, of the bolt-operating lever, an adjustable forked lever pivoted thereto in position to be acted on by the dial, one or more adjusting devices for regulating the position of such forked lever, and inclined stops on the bolt-operating lever for such adjusting devices to operate against, substantially as and for the purpose set forth.

9. The combination, in a time-lock, of an unlocking-lever, a detent for holding said lever in the retracted position, and an operating-connection passing through the lock-case for tripping such detent from the exterior of the lock-case.

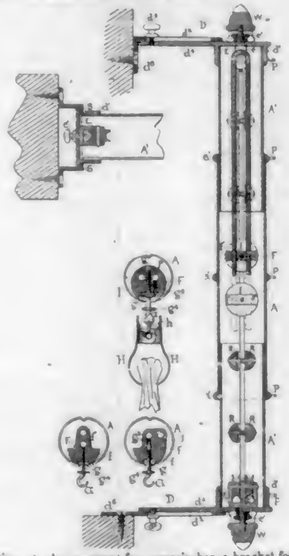


297,624. PULLEY. OLAF R. OLSEN, Indianapolis, Ind., assignor to the Indianapolis Machine and Bolt Works, same place. Filed Mar. 1, 1884. (No model.)

Claim.—1. The outer rim, *r*, in combination with the secondary rim *r'*, hub *h*, and spokes *s*, substantially as described.

2. A pulley composed of a jointed outer metal rim to which the hub and spokes are connected by means of a secondary inner rim, substantially as described.

297,625. STATION-INDICATOR. IRVING OSGOOD, Ellsworth, Me. Filed Nov. 8, 1883. (No model.)



Claim.—1. The within-described station-indicator, consisting of a casing, a spring-roll, *d*, secured near the front of said casing, loose roll *e*, situated in substantially the same vertical plane as said roll *d*, and serving to guide the web *j* and keep it extended in a vertical plane, roll *f*, revolved by means of crank *i*, and held in any desired position by the ratchet and pawl *h*, and flexible web *j*, attached to said rollers *d* and *f*, and having the names of the stations affixed thereto, all combined and operating substantially as and for the purposes set forth.

297,626. INDESTRUCTIBLE COMPOUND FOR COATING WIRES FOR ELECTRICAL PURPOSES. JOEL H. PAGE, Philadelphia, Pa., assignor of one-half to Blanch Carrie King, same place. Filed Dec. 28, 1883. (No specimens.)

Claim.—1. A compound of litharge and glycerine, formed into a thick paste, for coating wires to be used for electric purposes, substantially as hereinbefore described.

2. Electric wires coated with a compound of litharge and glycerine, substantially as set forth and described.

297,627. CURTAIN-FIXTURE. LOUIS PAGE and LOUIS WIESER, Brooklyn, N. Y. Filed Jan. 18, 1884. (No model.)

Claim.—1. As a support for a curtain-bar, a bracket formed of two or more flat pieces placed edgewise up and down, one or more of the pieces with edges raised laterally, and one or more of the pieces slotted, so as to admit of their sliding upon and stiffening each other and of being clamped together laterally, substantially as set forth.

2. As a support for a curtain-bar, an extension-bracket formed of two or more pieces arranged to slide upon each other endwise, one of such pieces forming the end cap of the curtain-bar, as set forth.

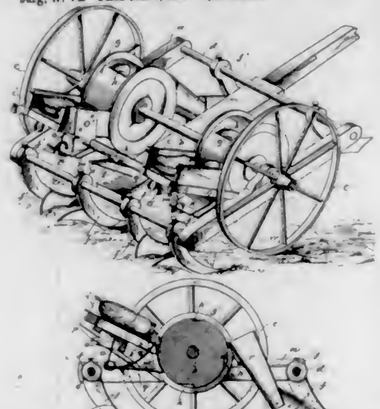
3. The combination, with a curtain operated endwise along its support, of sockets which support and confine the ends of the curtain-bar, each socket being divided circumferentially into two parts, and provided with a flange which retains endwise the end cap of the bar, substantially as set forth.

4. The combination, with a curtain arranged to slide endwise along its supporting-bar by means of cords, of master-balls F F, attached to such cords, each ball provided with an eyelet for each cord, with a central screw-tapped hole at right angles to and between such eyelets, a smooth hole opening into one of said eyelets, in which hole a pin, g^3, slides freely, together with a curtain-supporting hook, G, the threaded shank of which is screwed into said central tapped hole, and is made to control the position of said pin g^3 and its impingement upon the cord by means of a flange, g', upon said hook, which hook G is operated from the outside of the bar, substantially as set forth.

5. The combination, with a curtain arranged to travel endwise along its supporting-bar by means of cords, of master-balls, each ball provided with an eyelet and a curtain-supporting hook, the shank of which hook screws into such ball, and by its entry into the ball causes the cord in such eyelet to be clamped, substantially as set forth.

6. The combination, with an adjustable extension curtain-bar formed of two or more cylindrical pieces telescoping into each other, of longitudinal grooves or other indentations which match so as to prevent the telescoping sections from turning upon each other, substantially as set forth.

7. The combination, with an extension curtain-bar composed of two or more pieces sliding along each other, of a leg or pin, K', and corresponding openings, K^2 and e^2, operating substantially as set forth, in guarding against excessive extension of the bar-sections.



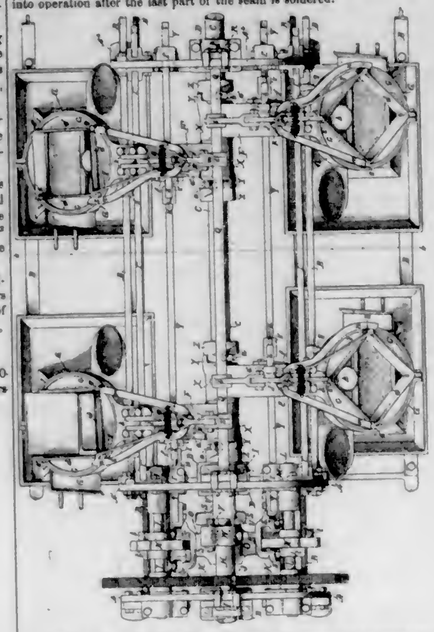
8. The combination, with a curtain arranged to move endwise along its supporting-bar, of a curtain-clasping clamp, H, suspended from the bar by a hook or eyelet, G, attached to the clamp by a bail, A, the ends of which are fastened to the spindle pivoting the two parts of the clamp, substantially as set forth.

9. The combination, with a curtain operated endwise along its supporting-bar, of hooks or eyelets P, attached to the under and front side of such bar for the support of a supplemental lambrequin or other ornamental drapery, substantially as set forth.

10. The combination, with a curtain operated endwise along its supporting-bar, of curtain-supporting hooks and rollers arranged to travel along such bar, each set being formed of two rollers, R R, their spindle r^3, and the hook G, with its shank looped centrally around spindle r^3 and piercing at its upper end the bail *r*, which bail is looped around the ends of spindle r^3, the whole operating substantially as set forth.

11. The combination, with a curtain arranged to be operated endwise along its supporting-bar by means of cords, of cord-guiding rollers attached by their frames to the bottom of the caps covering the ends of the bar, substantially as set forth.

297,628. COMBINED CORN-PLANTER, POTATO-PLANTER, POTATO-DIGGER, AND CULTIVATOR. GEO. WESLEY PERSOL, Parkersburg, W. Va. Filed Jan. 9, 1884. (No model.)



Claim.—1. In an organized machine, the combination, with the adjustable dropping-wheels having seed-pockets in their peripheries, and the hinged seed-tubes connected to the opening-plows, of the inclined adjustable hoppers, the adjustable shields, the adjustable feed-checks, the operating-lever, and the adjustable covering-plows, substantially as specified.

2. In an organized machine, the combination, with the drop-wheels, inclined hoppers, and adjustable shields, of the feed-checks *n n*, secured to the crank-arms *o*, connected by the coupling-lever *p*, and the foot-lever *q*, connected to the coupling-lever *p*, and fulcrumed on the frame of the machine, substantially as specified.

3. In a seeding-machine, the combination, with the driving mechanism, feed-wheels, and seed-tubes, of the laterally-adjustable inclined hoppers, substantially as specified.

297,629. SOLDERING-MACHINE. GEORGE H. PERKINS, Philadelphia, Pa. Filed Mar. 23, 1883. (No model.)

Brief.—This machine solders the seam which unites the head to the body of a rectangular or other angular bodied can. The cans are placed in holders mounted upon arms carried by a rock-shaft. Each holder descends and dips that portion of the seam which is at one side of the head into the solder bath. This is done successively until the entire seam is soldered. The can rises from the bath in an angular position, so that the freshly-soldered portion of the seam drains toward the next unsoldered portion. After the last portion of the seam is soldered, the can rises in a position to drain this part of the seam toward the part last before soldered, and then the corner of the can between those two parts of the seam is dipped to remove the surplus drop of solder. The holder is turned to present an unsoldered portion of the seam to the bath by a pulling and a pushing pawl, which operate as the holder is rising and descending. The holder is given a partial turn backward to present the corner of the can to the bath by a tripping-pawl, which is brought into operation after the last part of the seam is soldered.

Claim.—1. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, a series of stationary rotatable can-holders each adapted to receive a can; second, a series of rock-shaft arms to which said can-holders are connected so as to rock therewith; third, mechanism common to all of the rock-shaft arms whereby said rock-shaft arms are at predetermined intervals caused to rock; fourth, mechanism whereby the can-holders are at predetermined intervals caused to turn or rotate; and, fifth, pans or suitable devices adapted to contain solder.

2. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, a double series of rotatable can-holders each adapted to receive a can; second, a double series of rock-shaft arms to which said can-holders are respectively connected so as to rock therewith; third, mechanism common to both series of rock-shaft arms whereby first one series of said arms and then the other series is at predetermined intervals caused to rock; fourth, mechanism whereby first one series of can-holders and then the other series is at predetermined intervals caused to turn or rotate; and, fifth, pans or suitable devices to contain solder.

3. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, a series of stationary rotatable can-holders each adapted to receive a can; second, a series of rock-shaft arms to which said can-holders are connected so as to rise and fall therewith; third, mechanism whereby the rock-shaft arms are at predetermined intervals caused to rock; fourth, mechanism whereby the can-holders during their rise are caused to make a part of a quarter-turn, and during their fall to complete said quarter-turn; and, fifth, pans or suitable devices adapted to contain solder.

4. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, a series of rotatable can-holders adapted each to receive a can; second, a series of rock-shaft arms to which said can-holders are connected so as to rise and fall therewith; third, mechanism whereby

the rock-shaft arms are at predetermined intervals caused to rock to their full throw up and down; fourth, mechanism whereby the rock-shaft arms are at predetermined intervals arrested in descending before they have completed their full descent, and retained in such position until they again rise; and, fifth, pans or suitable devices to contain solder.

5. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, a series of rotatable can-holders adapted each to receive a can; second, a series of rock-shaft arms to which said can-holders are connected so as to rise and fall therewith; third, mechanism whereby the rock shaft arms are at predetermined intervals caused to ascend to the full height and descend to the full extent of the movement of the rock-shaft arms; fourth, mechanism whereby the rock-shaft arms are at predetermined intervals arrested in their full descent, and retained in their arrested position until their next ascent; fifth, mechanism whereby the can-holders are caused to intermittently rotate, so as to present the four sides of one of the head-seams of the cans contained in them and one of the corners to a bath of solder; and, sixth, pans or suitable devices adapted to contain solder.

6. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: first, pans or suitable receptacles or devices adapted to contain molten solder; second, a double series of rotatable can-holders adapted to receive each a can; third, a double series of rock-shaft arms to which said can-holders are connected so that they rise and fall therewith; fourth, mechanism whereby the rock-shaft arms are at predetermined intervals caused to ascend and descend; and, fifth, suitable devices whereby given rock-shaft arms are at predetermined intervals raised to a height greater than is correspondent with the descent of the remaining arms.

7. In a machine for soldering the seams which secure the heads to the bodies of quadrangular, square, hexagonal, or other shaped sheet-metal cans not circular or oval, the following instrumentalities in combination: a series of can-holders, a series of holder-supports, a series of rock-shaft arms, a series of pawls, a pawl-shaft and pawl-carrying attachments, a rock-shaft, and suitable mechanism for actuating the rock-shaft and the pawl-shaft, substantially as hereinbefore set forth.

8. In a machine of the class above recited, in combination with a series of revolable can-holders provided with pawl-pins, a series of pushing and pulling pawls, and means for actuating said pawls so as to occasion quarter-turns of the can-holders, substantially as set forth.

9. In a machine of the class above recited, in combination with a series of revolable can-holders provided with pawl-pins, a series of trip-pawls and means for occasioning the intermittent actuation of said trip-pawls, for the purpose of giving an eighth-turn to the can-holders, substantially as and for the purpose set forth.

10. In a machine of the class above recited, as a composite device for occasioning the rotation of a can-holder, a pushing-pawl, a pulling-pawl, a trip-pawl, and means for actuating said pawls, substantially as hereinbefore set forth.

11. In a machine of the class above recited, in combination with a revolable can-holder provided with pawl-pins and connected with a rock-shaft arm so as to rise and fall therewith, a pushing and a pulling pawl connected together by a spring, and ordinarily in range of contact with the pawl-pins, and a trip-pawl pivoted to said pulling-pawl, suitably actuated to rise and fall oppositely to the rock-shaft, and ordinarily retained out of contact with the pawl-pins on the can-holder, and means for tripping said trip-pawl into action with said pins, so as to raise the pushing and pulling pawls out of range of contact therewith, substantially as set forth

12. As a device for actuating the pushing and pulling pawls and the trip-pawl, the pawl-carrier, the pawl-rocker, the shifter-standard, means for actuating said shifter-standard, and means for oscillating the pawl-shaft, substantially as set forth.

13. As a device for tripping the trip-pawl, the shifter-standard provided with a cam-surface, and means for actuating said shifter-standard, so that its cam-surface operates upon said trip-pawl, substantially as set forth.

14. In a machine of the class above recited, in combination with a pulling-pawl, a trip-pawl provided with a counter-balance, substantially as set forth.

15. In a machine of the class above recited, as a device for intermittently arresting the descent of the rock-shaft arms, the shifter-standards provided with the base-bands and erected from the shifter-rod, the shifter-rod, and means for imparting to the shifter-rod a predetermined intermittent longitudinal reciprocation, substantially as set forth.

16. In a machine of the class above recited, as a means for connecting the rock-shaft arms with the rock-shaft in such manner as to permit for a given arm a lift greater than the descent of a given arrested arm, the laterally-projecting lugs on the rock-shaft arm, and the collars on the rock-shaft, substantially as set forth.

17. In a machine of the class above recited, in combination with the trip-pawls and with the rock-shaft arms, the shifter-standards, formed each with a base-band or laterally-projecting stop, and provided with a boss having an upper surface, a lower surface, and an intermediate incline, the shifter-rod, and means for actuating said shifter-rod longitudinally, so as at predetermined intervals to place the base-bands in the path of the descending rock-shaft arms, and to force the trip-pawls to travel up the inclined surface on the bosses, substantially as and for the purposes hereinbefore recited.

18. In a machine of the class above recited, in combination with and as a device for occasioning the oscillation of the rock-shaft, rock-shaft arms, and can-holder, the rocking yoke on the rock-shaft, the cams on the cam-shafts, and means for actuating said cams, substantially as hereinbefore set forth.

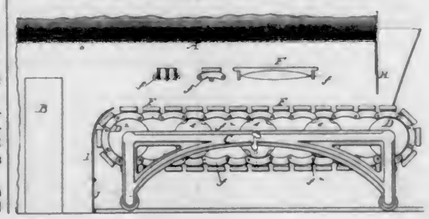
19. In a machine of the class above recited, in combination with the can-holders, the pawls, and the pawl-shaft, the depending yoke on said pawl-shaft, the crank on the driving-shaft, the driving-shaft, and means for actuating said shaft, substantially as and for the purposes set forth.

20. In a machine of the class above recited, in combination with the can-holders and the set of pawls which actuate said holders, the shifter-rods and their shifter-standards, the roller-yoke, the cams, and suitable mechanism for actuating said cams, substantially as and for the purposes set forth.

21. In a machine of the class above recited, a series of rotatable can-holders, a series of rock-shaft arms supporting the same, a rock-shaft for actuating said rock-shaft arms, a set of pawls for occasioning the rotations of said holders, pawl-rockers, and pawl-carrying devices for actuating said pawls, a pawl-shaft, and suitable mechanism for occasioning the opposite oscillations of the rock-shaft and of the pawl-shaft, substantially as hereinbefore set forth.

22. In a machine of the class above recited, in combination with the rock-shaft, rock-shaft arms, and can-holder, and with the pawl-shaft, pawl-rockers, and pawls, the driving-shaft, driving-pinion, driving toothed wheels, cam-shafts, cams, rocking yoke, depending yoke, and crank, the whole assembled, related, and operating substantially as and for the purposes specified.

23. In a machine of the class above recited, in combination with a can-holder, a pawl-carrier, a pushing and a pulling pawl, a spiral spring connecting said pawls, heels on the rearwardly-extending extremities of said pawls, and a counterbalanced trip-pawl pivoted to the pushing-pawl, substantially as and for the purposes set forth.



24. In a machine of the class above recited, in combination with a rock-shaft arm, a can-holder connected with and carried by said arm, a pawl-carrier provided with pawls to actuate said can-holder, and a guide for said pawl-carrier, substantially as and for the purposes set forth.

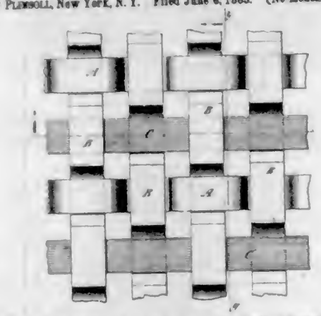
25. In a machine of the class above recited, in combination with cams having crests and hollows upon their peripheral faces and cam-surfaces upon their sides, roller-yokes operating in connection with the cam-surfaces on their sides, and a rocking yoke operating in connection with the crests and hollows upon their faces, a rock-shaft equipped with can-holders and adapted to be actuated by said rocking yoke, devices for actuating the can-holders, and shifter-standards for controlling the can-holder-actuating devices adapted to be actuated by said roller-yokes, substantially as and for the purposes set forth.

26. In a machine of the class above recited, in combination with a can-holder, being a rotatable disk or plate of metal provided with a central opening, pawl-pins, substantially as and for the purposes specified.

27. In a machine of the class above recited, in combination with a solder-pan provided with a central stop adapted to receive the corner of an angular can, a correspondingly angular can-holder adapted to receive a can, means for rocking said can-holder up and down with respect to said solder-pan, and means for presenting said can-holder angularly with respect to the plane of the surface of solder in said pan, so that upon a descent of the can-holder in its angular position a corner of the can will encounter and rest upon the stop, substantially as and for the purposes set forth.

297,630. SMOKE-PREVENTING FURNACE. GEORGE PLAYFORD and GEORGE RICHARD SWAINE, Cleveland, Ohio; said Swaine assignor to Charles F. Alexander, same place. Filed June 29, 1883. (No model.)

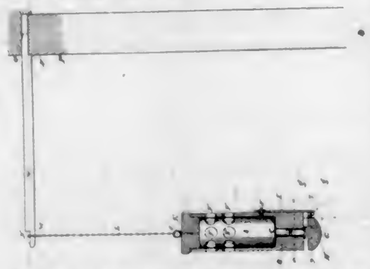
Claim.—1. The herein-described traveling grate, consisting of the combination of two or more series of transverse bars, the bars of each series being pivotally connected to form an endless carrier, and the different series connected by means, substantially as described, whereby the unity of the grate is insured and the removal of the individual bars permitted, substantially as set forth.



2. The herein-described traveling grate, consisting of the combination of two or more series of transverse bars, said bars being joined to one another by continuous pivots, which also connect the different series with one another, substantially as set forth.

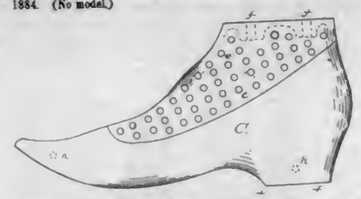
3. The herein-described traveling grate, consisting of the combination, with the transverse bars pivoted together to form an endless carrier, and having the downwardly-projecting links *f*, of intermediate supporting-rollers recessed to fit said projections, substantially as set forth.

4. The herein-described traveling grate, consisting of the combination of two or more endless carriers formed of grate-bars, said carriers being arranged side by side, and connected by means, substantially as described, with one another, and intermediate supporting-rollers arranged on the line or lines of junction of said carriers, substantially as set forth.



5. The herein-described traveling grate, consisting of the combination of two or more series of transverse bars, said bars being joined to one another by continuous pivots, which also connect the different series with one another, and an intermediate supporting roller or rollers arranged on the line of juncture of the different series, substantially as set forth.

297,631. MODE OF WEAVING METALLIC BARS. HENRY DAVIDSON PLEWSOLL, New York, N. Y. Filed June 6, 1883. (No model.)



Claim.—The mode of forming a woven fabric from bars or tubes of metal, which consists in rolling, forging, casting, or pressing a series of bars or tubes, B, into wavy or undulating form, and similarly preparing another series of bars or tubes, A, of a different thickness and curve, as shown, and arranging them as described, and then inserting in the openings or loops formed by the bars or tubes B a series of straight bars, C, to lock together said bars or tubes A and B, in the manner shown and described.

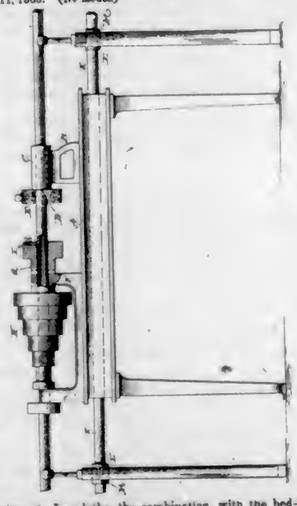
297,632. BURGLAR-ALARM. WILLIAM H. KEIFF, Philadelphia, Pa. Filed Feb. 11, 1884. (No model.)

Claim.—In a burglar-alarm, the cylinder A, having solid part B, with a hole, C, lugs *b b*, and groove K at the bottom, and with apertures F at the top, in combination with cap E, hinged hammer G, having pin H, and faces *g g'* at right angles to each other and on the hinge, and a spring, I, the end of which presses on the faces *g g'*, to hold the hammer open or closed, and kept from displacement by lugs *b b* and groove K, between which it works, substantially as and for the purpose specified.

297,633. LAST. GEORGE A. REYNOLDS, Utica, N. Y. Filed Jan. 25 1884. (No model.)

Claim.—1. A metallic shell-last provided with an upper perforated shank portion, substantially as and for the purposes stated.

2. A metallic shell-last provided with a perforated shank portion, as shown, composed of sections which are jointed and cemented, all substantially as set forth.

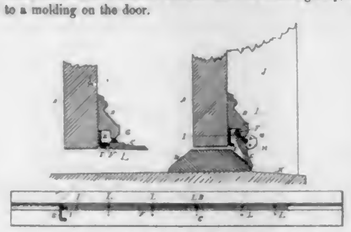


297,634. HAME-TUG. THOS. L. RIVERS, Mount Vernon, Ill., assignor to Charles B. Lindsey, same place. Filed Dec. 28, 1883. (No model.)

Claim.—1. The combination of a series of hame-tugs having rectangular slots, hooks, or catches formed upon their inner sides, and with re-enforcing strips, said tugs being connected by links engaging with the hooks upon the under sides of said tugs, with a trace-plate having an inwardly-projecting lug formed upon its inner side, substantially as set forth.

2. As an improved article of manufacture, a hame-tug having the slots or openings *b b'*, communicating with each other by means of the slot *b'*, said tugs being formed upon their inner sides with hooks, and provided upon their outer sides with re-enforcing strips, in combination with a plate, C, formed with the lug D, substantially as described.

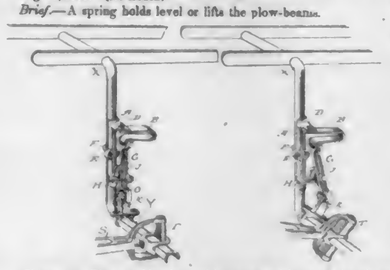
297,635. TURNING-LATHE. JOHN B. ROMANS, Nashville, Tenn. Filed Sept. 11, 1883. (No model.)



Claim.—1. In a lathe, the combination, with the bed-frame A, of the laterally-extending rods K, arranged to slide in the bed-frame, and the adjustable supports L, having the collars M and the upwardly-projecting crutches, substantially as specified.

2. In a lathe, the combination, with the bed-frame, of the head-block and tail-block having hollow spindles, the rods K, extended from the ends of the bed-frame, and adapted to slide in the latter, and the supports L, adjustable upon the rods K, and provided with upwardly-projecting crutches, substantially as specified.

297,636. WEATHER-STRIP. JOSEPH F. ROWLETT, Richmond, Ind., assignor, by direct and mesne assignments, to Frank Dennis and Carrie N. Rowlett, both of same place. Filed Jan. 30, 1884. (No model.)



Brief.—A thin wooden strip provided with a longitudinal metallic bar, which acts both as a counter-balance and a re-enforcing strip, is pivoted to a molding on the door.

Claim.—In combination with mold B, the hinged strip C, the longitudinal metallic bar F, fastenings L, stop E, and projection or button H, all constructed for the purpose as herein described.

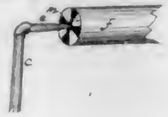
297,637. CULTIVATOR. HANS H. SATER, Dubuque, Iowa. Filed Aug. 31, 1883. (No model.)

Brief.—A spring holds level or lifts the plow-beams.

Claim.—1. The combination, with the shovel-bars, of the pivoted standards K, the lever G', the spring secured to the said lever and connected to the frame of the cultivator, and the roller J and its curved track.

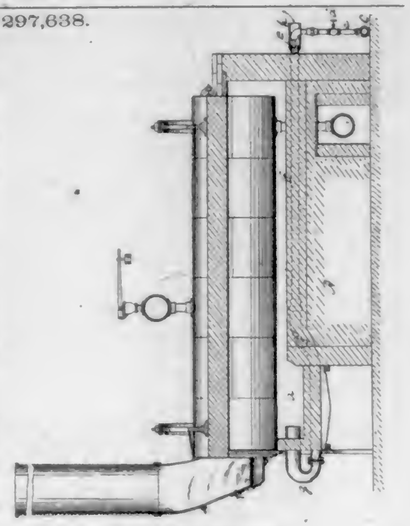
2. Combined with the arch of the cultivator, axles, semi-tubular sleeve A, curved track H', in combination with the spring B, secured to said sleeve, the bar G, having a roller, and a pivoted standard, K, connected to the shovel-bars.

3. The combination, with the coupling T and the bars attached thereto, of the standard K, locked to such coupling, the bar G, having forked ends, and the spring B, connected to the semi-tubular sleeve A.



297,638. METHOD OF USING NATURAL GAS AS A FUEL. ADAM SCHAEFER, Sharpsburg, Pa. Filed Nov. 21, 1883. (No model.)

Claim.—1. The method herein described for burning natural gas, which consists in mixing air with the natural gas as it comes from the well and heating the admixture prior to ignition, substantially as and for the purposes specified.

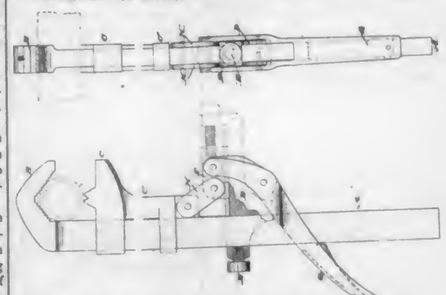


2. In devices for admixing and burning natural gas, the combination, with a gas-supply pipe, of a gas and air admixing conduit the diameter of which is greater at the delivery end than at the receiving end, substantially as and for the purposes specified.

3. In devices for admixing air and natural gas and burning the same, the combination of an admixing-conduit whose diameters increase from the receiving to the delivery end, and a burner or delivery-nozzle which increases in diameter from its receiving end to its mouth, substantially as and for the purposes specified.

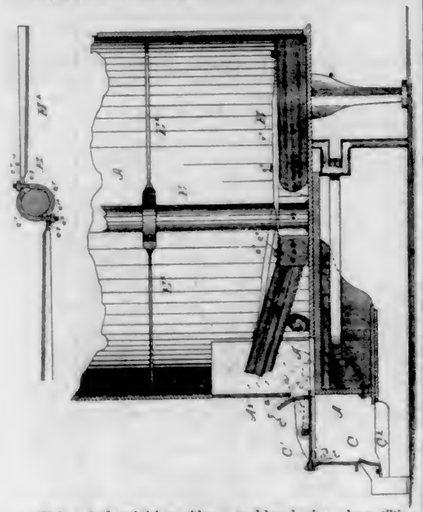
4. In a device for admixing air with natural gas and burning the admixture, the combination, with the open-ended conduit, which gradually increases in diameter, of a gas-supply pipe projecting into its open end, where the diameter of the conduit is the least, and an expanding nozzle or burner secured to its opposite end, or where the diameter of the conduit is the greatest, substantially as and for the purposes specified.

297,638.



297,639. PROCESS OF MANUFACTURING CHAIR-SEATS OF VEGETABLE FIBER AND CHROMIC ACID. RUDOLF SCHEMMEL, Annaberg, Germany. Filed May 25, 1883. (Model.)

Claim.—The process of manufacturing chair-seats, consisting of the following steps: first, mixing together ground rags and vegetable fiber (in equal parts) and chromic acid to make a paste; then forming this paste into sheets; then strengthening these sheets by the addition of textile fabric; then molding and pressing each sheet to give the proper texture and superficial configuration; then varnishing and drying each sheet and cutting the chair-seats out of the same.



297,640. WRENCH. FRIEDRICH SCHEMANN, Philadelphia, Pa. Filed Nov. 3, 1883. (No model.)

Claim.—1. A wrench having a movable jaw and an adjustable slide, both fitted on the bar, a screw for holding said slide, a movable block supported on said slide, a pivoted link connecting said block and the movable jaw, and means for operating said block, substantially as and for the purpose set forth.

2. In a wrench, a bar, fixed jaw, and movable jaw, in combination with an adjustable slide fitted on said bar and having a holding-screw, a movable block, means for operating said block mounted on said slide, and a link connecting said block and the movable jaw, substantially as and for the purpose set forth.

297,641. BRICK-MACHINE. FRANK W. SHELLEY, Anderson, Ind. Filed Feb. 21, 1884. (No model.)

Claim.—1. In a brick-machine, a mud-box having a loose tilting plate forming the cover thereof, substantially as described.

2. In a brick-machine, the combination of a mud-box having a loose tilting plate forming the cover thereof, and a reciprocating plunger working horizontally in said box, substantially as described.

3. In a brick-machine, the combination of a mud-drum, a mud-box connected with said drum, and having a loose tilting plate forming the cover thereof, and a reciprocating plunger working horizontally in said box, substantially as described.

4. In a brick-machine, the combination of a mud-drum having an opening or slot, a', a mud-box connected with said drum, and having a tilting plate provided with a curved lip, and a horizontally-reciprocating plunger in said box, substantially as described.

5. In a brick-machine, the combination of a mud-drum having an opening or slot, a', a mud-box connected to said drum, and having a tilting plate provided with a curved lip and a strip, and a horizontally-reciprocating plunger, substantially as described.

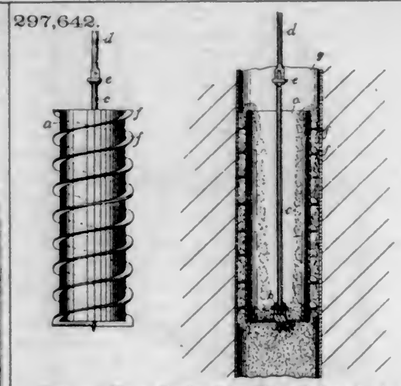
6. In a brick-machine, a mud-box having a pivoted plate provided at its forward or front end with a strip of leather or equivalent substance, substantially as described.

7. In a brick-machine, a mud-box having a tilting plate provided with a curved lip, substantially as described.

8. In a brick-machine, a mud-box having a tilting plate provided with a curved lip and a longitudinal strip, substantially as described.

9. In a brick-machine, the combination of a mud-box having a loose tilting cover, and means for automatically returning said cover to its place when tilted, substantially as described.

10. In a brick-machine, a wiper consisting of a hub and extensions forming the wiper-blades, which are pivoted at their inner ends to the hub and adapted to ride over obstructions on any part of the bottom, substantially as described.



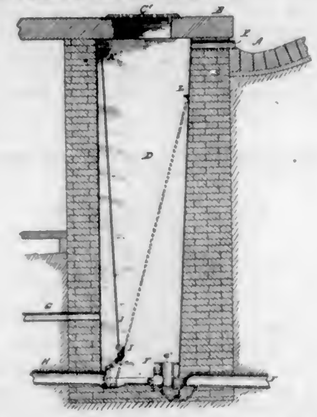
11. In a brick-machine, a wiper-blade pivoted to the hub, and having a spring for holding said blades against the bottom of the drum, substantially as described.

12. In a brick-machine, the combination of a shaft and knives, which are provided with a curved part, a', screw-threaded end a^2, openings a^3, and nuts a^{10}, for clamping the blades onto the shaft, substantially as described.

297,642. SAND-AUGER. JACOB SICKLER, Otterbein, Ind. Filed Feb. 12, 1884. (No model.)

Brief.—A cylindrical vessel exteriorly traversed by two spiral flanges delivering thereinto and terminating below in cutting-points has a socket in its closed bottom for receiving a shaft-section pivoted to the main shaft and prevented from playing on the pivot by an embracing-ring.

297,642.

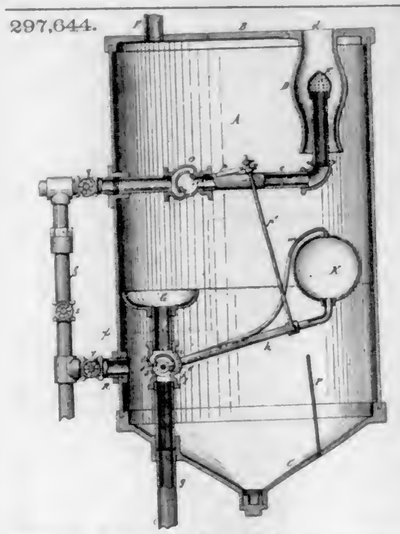


Claim.—1. The combination of the hollow cylinder a, closed at the bottom, flanges $f\,f$, socket b, shaft c, shaft d, and band e, adapted to holding c and d rigid, all substantially as shown and described.

2. A sand-auger consisting of a hollow cylinder, a, closed at the bottom, having two sharpened lips on the bottom, and having two spiral flanges wound upon it externally from the top to the center of the bottom, and forming a hollow auger adapted to being moved freely inside of a well-tube, and to being attached to a common well-boring auger-shaft, substantially as shown and described, and for the purpose set forth.

297,643. SEWER. THOMAS L. STARK, Chicago, Ill. Filed Dec. 26, 1883. (No model.)

Brief.—A basin or well, into which empties the house-drain and gutter pipes, has a man-hole and cover, and overflow-pipe connecting with the street-gutter, and a discharge-pipe emptying into the main sewer. A valve applied to the mouth of the house-drain pipe is operated by a rod secured in raised or lowered position.



Claim.—1. The combination of the well, hole, or basin, the house-pipe H, entering the said basin, the pipe F, entering the said basin and communicating with the main sewer, a valve or door applied to the discharging end of the pipe H, and means for opening and closing the said valve, substantially as and for the purposes specified.

2. The combination of the basin D, the pipes H and F, the valve I, the rod J, and means for retaining it in its raised and lowered positions, the pipe or duct E, the hole or opening C and its cover, and the roof-gutter pipe, all arranged, substantially as shown and described, with relation to each other, for the purposes set forth.

297,644. FEED-WATER HEATER. DAVID P. STEWART, Buffalo, N. Y. Filed Aug. 30, 1883. (No model.)

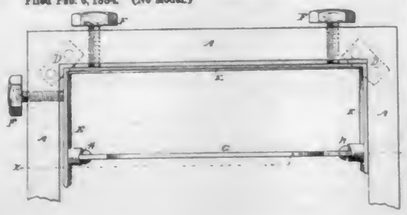
Claim.—1. The combination, in a feed-water heater, of a water-inlet pipe and an overflow-pipe, each having a regulating cock or valve, and a float, whereby the positions of both of said cocks or valves are

297,644.

automatically adjusted, substantially as set forth.

2. The combination, with the overflow-pipe, of a regulating cock or valve having its hollow plug at all times in communication with the lower portion of the overflow-pipe, a float, and a hollow stem extending from the lower portion of the float to the hollow plug of the regulating-valve, substantially as set forth.

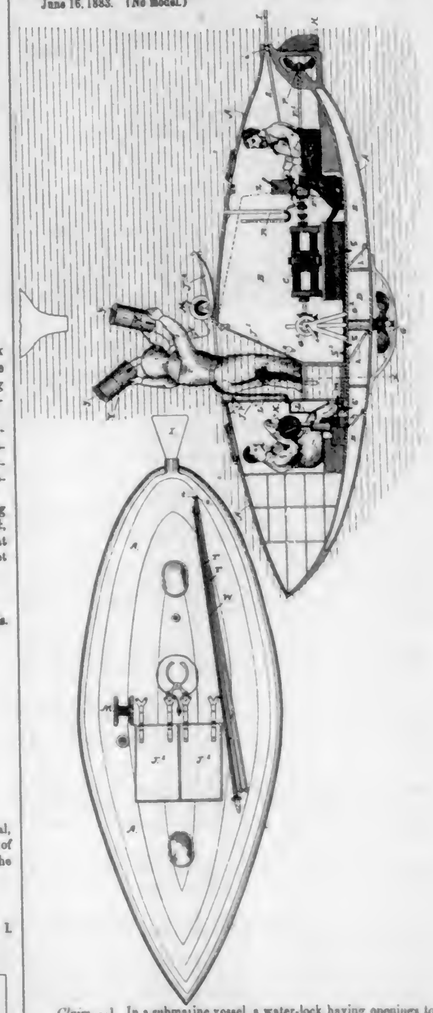
3. The combination, with an escape-pipe, of a cock or valve having its hollow plug in communication with the lower portion of the escape-pipe, a float and a drain-pipe, and a vent-pipe extending from opposite ends of the float to the hollow plug of said cock or valve, substantially as set forth.



4. The combination, with the overflow-pipe *g*, of a cock, I, having a hollow plug, J, and hollow shank *l*, a float having a hollow stem, *k*, opening into the shank *l*, and a vent-pipe, *m*, extending from the float through the hollow shank *l* into the hollow plug J, substantially as set forth.

297,645. JOURNAL-BOX. FRANK W. THAYER, Milwaukee, Wis. Filed Mar. 11, 1884. (No model.)

Claim.—In shell journal-boxes composed of hard and soft metal, the shell A, cast solid with the notched end flanges, I I, the two sets of diagonal ribs B B B B, and the ribs D D, extending inward from the flanges I I.



297,646. MOLDER'S FLASK. ELEAZER THOMAS, Pawtucket, R. I. Filed Feb. 6, 1884. (No model.)

Claim.—1. In combination with a molder's flask provided with supports D, or their equivalents, a marginal sand frame or band and one or more clamping-screws adapted to confine said frame or band within the flask or release it therefrom, substantially as and for the purpose set forth.

2. In combination with a molder's flask, a marginal sand frame or band provided with removable and adjustable cross-bars, substantially as and for the purpose set forth.

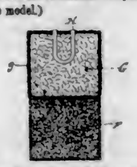
297,647. SUBMARINE VESSEL. JOSIAH H. L. TUCK, San Francisco, Cal., assignor to the Submarine Monitor Company, New York, N. Y. Filed June 16, 1883. (No model.)

Claim.—1. In a submarine vessel, a water-lock having openings to the interior and exterior of the vessel, and means for closing the same, in combination with a water-ballast compartment and connections thereto, whereby the lock may be emptied of water after being used, as set forth.

2. In a submarine vessel or boat, a water-lock, J, located in the upper part of the vessel, and having hatches or coverings opening out upon the top thereof, whereby a person in the lock, when it is open, can stand upright above the top of the vessel.

3. In a submarine vessel or boat, a double water-lock the compartments of which are separate from each other, and which can be used separately or together, substantially as set forth.

4. In a submarine vessel, a water-lock located at or near its upper surface, and provided with hatches opening upon said upper surface, but which are air and water tight when closed, the said lock having an air-vent connected with the air-chamber of the vessel, and means for controlling the same, and a water-passage leading to the water-ballast chamber or compartment underneath the vessel, substantially as set forth.

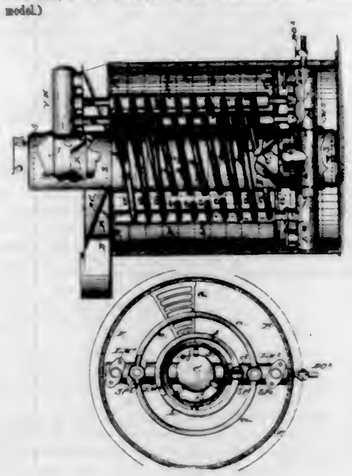


5. In a submarine vessel, the combination, with the water-lock located at or near its upper surface, and means for entering, opening, closing, and emptying the same, of an air-supply pipe, as L', connected to the interior of the vessel at one end and to the armor of the operator at the other, as set forth.

6. In a submarine boat or vessel, a water-lock compartment, J, located in the upper portion of the vessel's body, having openings upward upon the top of the vessel controlled by removable covers, doors, or hatches J' J², a water-discharge pipe, *m*, connecting it with a water-receiving compartment in the vessel, an air-vent, *p*, and a coupling, K, for connecting an air-tube within the compartment with an air-supply apparatus in the vessel, as set forth.

7. The combination, with the body or vessel A, of the air-conducting tubes T T, capable of being raised and lowered, having their open ends controlled by valves to keep out water and admit air, and the hinged mast W, to which the tubes are attached, and with which they are raised and lowered, substantially as described.

8. The herein-described submarine vessel, consisting of the hull A, having water-lock compartments J, water-ballast compartments D E E, inlet and discharge tubes *g g k*, propelling-engine C, propellers F G, and suitable motors for driving them, the indicator R, the air-conducting tubes T T on the outside, and means for raising and holding their ends above the water, and an air-pump, substantially as described.



297,648. MARINE TORPEDO. JOSIAH H. L. TUCK, San Francisco, Cal., assignor to the Submarine Monitor Company, New York, N. Y. Filed Mar. 18, 1884. (No model.)

Claim.—1. A torpedo having a float portion coated with adhesive material and provided with a magnet, substantially as set forth.

2. In a buoyant torpedo, the combination, with the magazine, of a superposed buoyant chamber or float and a coating of some adhesive material applied thereto, whereby the torpedo will adhere to any object with which it may come in contact, substantially as described.

297,649. WATER-TUBE STEAM-GENERATOR. CHARLES WARD, Charleston, W. Va. Filed Mar. 4, 1880. Renewed Nov. 2, 1883. (No model.)

Claim.—1. The combination, with a series of semicircular or circular tubes and upper and lower manifolds, of a pipe having a lengthwise division-plate or diaphragm, as specified, whereby said pipe serves both for supply and discharge, as specified.

2. In combination with the cylindrical boiler or separator and manifold, a series of encircling-tubes which take their supply from above the mud-space through transverse supply-pipes, (from separator,) and deliver the water and steam into the cylindrical boiler by manifold for the purpose of separating steam, water, and mud, substantially as described.

3. The combination, with the cylindrical boiler or separator having a mud-collector in its lower part, of vertical pipes c, a series of encircling-tubes which receive their supply at a point above the mud-collector or mud-space, and discharge into pipes that lead into the upper end of the separator, as specified.

4. The combination, with the vertical separator, of the deflector D, placed in its upper portion, and the series of tubes and stand-pipes connected with the separator at a point located above the deflector, as and for the purpose specified.

5. The combination, with the separator, of the annular mud-collector located in its lower portion, and the manifolds connected at a point below said collector, as specified.

6. The combination, with the annular mud-collector and the separator, of the cone which changes the course of the water and facilitates the deposition of mud, as specified.

7. The combination, with the separator and the system of tubes and stand-pipes, and the lower manifold having a partition, *p*, of the blow-off cocks attached, respectively, to the separator and manifold, as shown and described, to allow, first, blowing out the mud, and then the water, through all the circulating system.

297,650. ELEVATOR-CHAIN. CARLOS SHERMAN WARNER, Brooklyn, N. Y., assignor to Lucius Curtiss Warner, Crown Point, Ind. Filed Jan. 10, 1883. (No model.)

Claim.—In an elevator-chain, the combination of the flat links A, having their ends bent to form loops C D, the latter of which is provided with a slot, E, and the wire links B, having their solid ends fitted into the loop C of the link A and their open ends into the loops D of the links A, the ends of said links B being bent out through the slot E, substantially as shown and described.

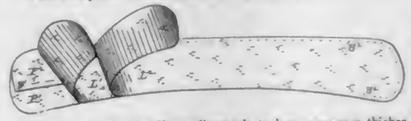
297,651. PEN-HOLDER. OLIVER S. WARNER, Akron, Ohio, assignor of one-half to David E. Warner, Jamesport, N. Y. Filed Jan. 25, 1884. (No model.)

Claim.—1. A pen-holder having a grip of the triangular type and integral with the penstock, one of the sides of said triangle being convexly curved and one concavely curved, substantially as and for the purposes specified.

2. A pen-holder having a grip of the triangular type, one of the sides of said triangle being convexly curved, one concavely curved, while the third is a plane surface, substantially as and for the purposes specified.

3. The combination, substantially as before set forth, of a pen-holder having at one end a tubular socket and triangular-shaped grip, one of the sides of which is convex, and an elastic plug or pen-seat secured within the tubular socket, substantially as and for the purposes specified.

297,652. SHAFT-COUPLING. JEREMIAH MEARS WATSON, Sharon, Mass. Filed Nov. 1, 1883. (No model.)

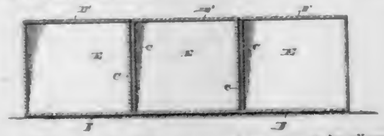


Claim.—1. The combination of the shaft-coupling sleeve, having within it and arranged, as described, with its bore, a cylindrical chamber eccentric therewith, substantially as explained, with a curved wedge placed in such chamber, and to operate with a shaft when in the bore, essentially and for the purpose as set forth.

2. The shaft-coupling sleeve having within it and arranged with its bore a cylindrical chamber, essentially in manner as described, and also having two screw-threaded openings arranged to lead into such chamber in manner as set forth, in combination with a curved wedge arranged in such chamber, and with a screw screwed into one of such openings and to operate against the head of the said wedge, substantially as represented.

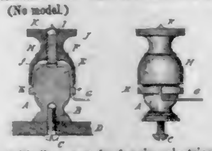
3. The combination of the shaft, grooved or recessed in its periphery at or near one end of it, with a curved wedge lapping about such shaft, and having a spline or feather extending from it into the groove or recess of the shaft, and with a sleeve having within it a chamber eccentric with the bore of such shaft, and applied to the shaft and wedge, substantially as set forth.

4. The combination of a sleeve having within it two cylindrical chambers eccentric with its bore, and in each chamber a curved wedge having a spline or feather, as described, with two shafts grooved or recessed in their peripheries to receive the splines or feathers of the said wedges, and extended in opposite directions into the bore of such sleeve and into or through the two eccentric chambers, and arranged with the wedges, as set forth.



297,653. COLLAR. ALVIDER WHITED, Troy, N. Y., assignor to Holmes & Ide, same place. Filed Nov. 23, 1883. (No model.)

Claim.—1. In a bandless collar made to have an upper thicker part and a lower thinner part, and, in combination therewith, an interior longitudinally-arranged lapping seam between the said thinner and thicker parts of the collar, and produced by inverting a thickness of the ply that is cut to be narrower than the full-width blanks of the collar, uniting said narrower blank as inverted on its inner edge longitudinally to a full-width thickness of the ply at or below the transverse center of the latter, and then turning up said narrow ply-blank over its lapping union, so as to bring its outer edge in folded coincidence with the other blanks before superimposing the facings, sewing, and turning the collar, as shown and described.



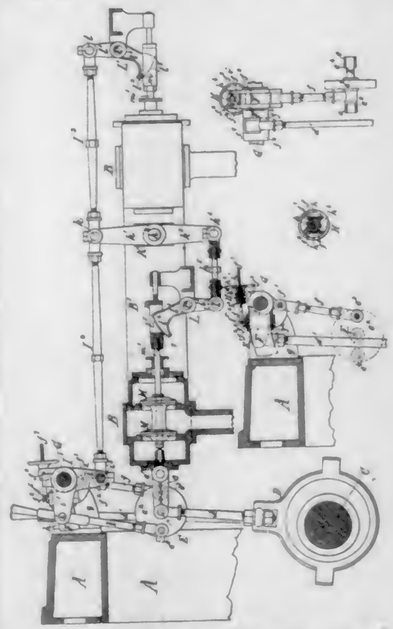
2. A bandless collar made with an upper thicker and lower thinner part, in combination with an interior stiffening-seam arranged longitudinally within the ply free from the facings of the collar, and between said thicker and thinner parts, as herein shown and described.

297,654. WOODEN BOX. HENRY WOOD, Wellington, Ohio. Filed Dec. 28, 1883. (No model.)

Claim.—A box divided into a series of compartments by adjacent partitions, which latter constitute ends of the adjacent compartments, each compartment of said box having one or more of its four sides entirely independent of the adjacent compartment, substantially as set forth.

297,655. BINDING-POST. THOS. R. ABERNETHY, Chicago, Ill. Filed Nov. 21, 1883. (No model.)

Claim.—1. A binding-post for forming electrical connection between a conducting-wire and other conductors, consisting of a conical or sugar-loaf-shaped base provided with means for securing to a support, and having a projection at its apex perforated for the passage of the conducting-wire, a cap the interior whereof conforms in shape to the base engaging therewith, substantially as and for the uses and purposes shown and described.



2. In a device of the character herein specified, a conical post provided with a screw-threaded perforation at bottom for engaging with a securing-screw, as set forth, and having a perforated projection at top adapted and arranged to receive a conducting-wire, substantially as shown and described.

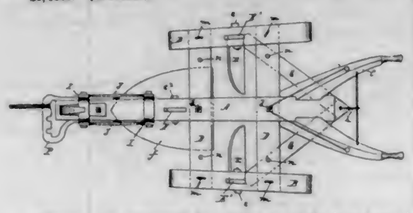
3. A binding-post wherein the upper portion of the base is conical or sugar-loaf in shape, a screw-thread being formed at the base of the cone, and arranged to engage with a corresponding thread near the rim of a cap passing down thereover, substantially as shown and described.

4. The combination, with the base A, having a conical upper portion, E', of a screw-threaded projection, F, perforated at *f*, substantially as and for the uses and purposes shown and described.

5. In a binding-post of the character herein specified, base A, screw-threaded perforation B, screw C, cone E', projection F, perforated at *f*, and cap or cap-piece H, the whole combined and arranged to operate substantially as shown and described.

297,656. VALVE-GEAR. HERMAN F. AMBOS, Columbus, Ohio, assignor to the Columbus Machine Company, same place. Filed Jan. 7, 1884. (No model.)

Claim.—1. In a valve-motion for steam-engines, the combination of a stroke-varying mechanism, comprising the adjustable slide and its connections, and a stroke-increasing mechanism, comprising the disk c^3 and its connections, whereby a very quick and variable or adjustable valve-stroke is obtained, substantially as and for the purpose described.

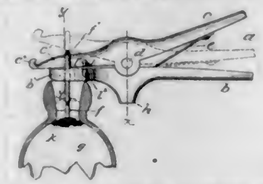


2. The combination of the eccentric-rod *d*, operating the center shaft, E, of the disk c^3, the wrist-pins c^3 c^4, connecting-rods *f* I, lever-arm I', having a wrist-pin, *i*, and swinging arm F, having pin *f''*, whereby a rapid motion for the valve is obtained, substantially as and for the purpose described.

3. The combination of the slide *f'*, the swinging arm F, having the adjusting device of the said slide attached to it, and the connecting-rods *f* and I, substantially as and for the purpose described.

4. The combination of the valves M, having frames *m* and valve-rods *m'*, and the operating-levers L L', having tappet-heads *l*^{3} of the construction shown, whereby only the greatest speed of the valve-motion is utilized, substantially as and for the purpose described.

5. The combination of the valve-rods *m'*, having oblong frames *m*, and the tappet-levers L L', having concentric surfaces *l*^{3}, whereby the valves M are kept in their closed position, substantially as and for the purpose described.



297,657. CULTIVATOR. DANIEL ARCHER, Madison, Cal. Filed Oct. 29, 1883. (No model.)

Claim.—1. In a cultivator, the combination of the draw-beam A and cross-pieces D D, movable side bars, B, and means for adjusting them to and from the draw-beam, shares E, secured to the side bars, with a central share, *f*, secured in front of the shares E to the draw-beam, substantially as herein set forth.

2. In a cultivator, the combination, with the draw-beam and frame, of the upright standards E, bearing the shares, and the horizontal bars G, having the harrow-teeth *g g*, said supports being secured to the standards E at one end, and supported by a rod, A, secured to the frame at the other, substantially as set forth.

297,658. STOPPER-PULLING PLIERS. BELLAMY A. BACON and JAMES W. BOARDMAN, Hartford, Conn. Filed Mar. 5, 1884. (No model.)

Claim.—1. As an improved article of manufacture, stopper-drawing pliers consisting of a lever-handle having a forked jaw and a lever-handle having a hook-bearing jaw pivotally connected, and operating substantially as described, and for the purpose set forth.

2. In combination, pivoted levers with jaws opening under pressure upon the handles, and one jaw bearing a hook, substantially as described, and for the purpose set forth.

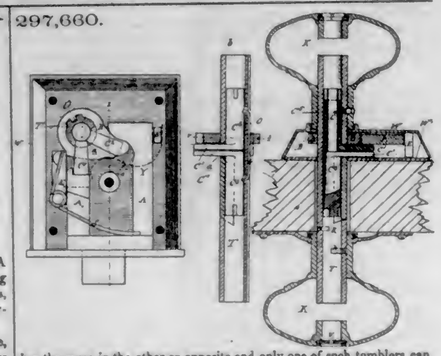
3. In combination, lever *b*, with a forked jaw, *b'*, lever *c*, with the jaw *c'*, bearing the hook c^3, and the pivot *d*, all substantially as described.

4. In combination, the pivotally-connected lever-handles *b* and *c*, with jaws bearing the laterally-projecting valve-stretching device *l*, all substantially as described.

5. In combination, the fulcrum-lever *b*, having the forked jaw *b'*, and hammer-head *h*, the lever *c*, with elongated jaw *c'*, bearing the hook c^3, and the pivot *d*, all substantially as described.

6. In combination, a fulcrum-lever, *b*, having a forked jaw, *b'*, with a lateral prong, l^2, a lever, *c*, having a jaw, *c'*, with a hook, c^3, and lateral prong, *l'*, and a pivot, *d*, all substantially as described.

297,659. FORGE-HAMMER. JAS. H. BAKER, Westville, Ohio. Filed Oct. 24, 1883. (No model.)



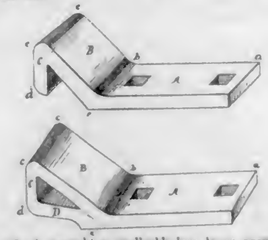
Claim.—1. The combination, with the movable die-block B, of the rack F, secured on the same, the shaft G, the pinion J, mounted on the same, and engaging with the rack F, and of the hand-wheel K on the outer end of the shaft, substantially as herein shown and described.

2. The combination, with the anvil I and the movable die-block B, of the rack F, secured on the die-block, the arm H on the anvil, the shaft G, held to turn in the arm H, the pinion J, mounted on the shaft G and engaging with the rack, and of the hand-wheel K, mounted on the outer end of the shaft G, substantially as herein shown and described.

297,660. LOCK. FREDERICK BALLIN, Detroit, Mich. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a lock provided with a hollow spindle, two tumblers, the pintles of which are inclosed within said spindle, and constructed and arranged substantially as specified, whereby the insertion of a key into one end of said spindle actuates both of said tumblers, while by inserting the same in the other or opposite end only one of such tumblers can be operated, substantially as and for the purpose set forth.

297,660.



2. In a lock, and in combination with the hollow spindle thereof, the tumblers C' C'', the latter being provided with a solid pintle upon one side and a pin upon the other, said pin passing through the hollow pintle of the tumbler C', substantially as set forth.

3. In combination with the two tumblers C' C'', provided with pintles having depressions or indentations, and hollow spindle T, having openings coincident with said depressions in said pintles, and provided with a longitudinal groove on its outer face, the spring O, seated in said groove, with its ends projecting through said openings in the spindle and engaging with said pintles to prevent their displacement, as set forth.

4. In combination with the hollow spindle T, having a longitudinal groove and openings, as described, and tumblers C' C'', provided with pintles having depressions coincident with said openings, the spring O, seated in the said groove and held therein by the tumbler sleeved on said spindle, the ends of said spring being in engagement with the said pintles, substantially as and for the purpose specified.

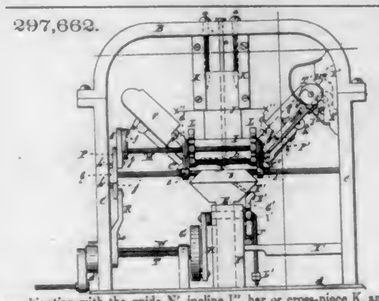
297,661. RAIL-BRACE. PINCKNEY F. BARR, Denver, Colo. Filed July 28, 1883. (No model.)

Brief.—A wrought or malleable iron brace formed with a foot, a diagonal stay, a vertical side or back, and a foot-connection which may be welded to the foot.

Claim.—1. A wrought or malleable iron brace provided with a foot, A, a diagonal stay, B, and vertical side C, substantially as described.

2. A wrought or malleable iron brace provided with a foot, A, a diagonal stay, B, vertical side C, and foot-connection D, substantially as described.

3. A wrought or malleable iron brace provided with a foot, A, a diagonal stay, B, vertical side C, and foot-connection D, and having the foot-connection welded to the foot, substantially as described.



297,662. TRAY-MACHINE. MYRON E. BENJAMIN, Cleveland, Ohio. Filed Oct. 5, 1883. (No model.)

Claim.—1. The bifurcated lever G', pin E', adjustable screw-rod J', and trip M', in combination with the cog-wheel A', for the purpose set forth, and substantially as described.

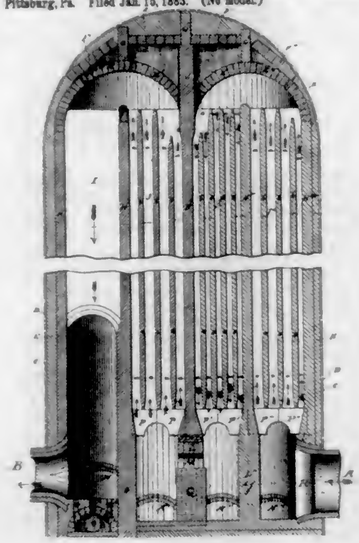
2. In a machine for making trays, guide-arm N', the staple-bending slide O', provided with projecting arms *f'' f'''*, for bending the staple-blanks and for cutting the same from the wire for said blanks, and the rollers T', in combination with the jaw P', provided with a transverse groove in the end thereof, spring for closing said jaw, and inclines H''' and J'', substantially as described, and for the purposes specified.

3. In a machine for making trays, the staple-driver provided with a shoulder, *s'*, and roller A'', arranged to operate in relation to and in

297,662.

combination with the guide N', incline I'', bar or cross-piece K, and jaw P', provided with spring Q', having a shoulder, r', the co-operation of which shoulders s' and r' open said jaw for the removal of the staple from the groove in the end of the jaw P', that the staple may be driven therefrom into the folds of the tray and clinched, substantially as set forth.

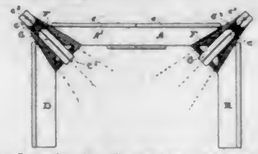
4. In combination with the guide N' and staple-driver, the jaw P', provided with a groove, n', adapted to receive the staple-blank below the upper surface of the end of the said jaw, so that the prongs of the staple may be bent against the blank sides of the end of the jaw below its line of contact with the guide, substantially as described.



5. In combination with the jaw P' and staple-driver, the finger R', arranged in relation to the groove in said jaw, substantially as set forth, and for the purpose specified.

6. In a machine for making trays, the guiding-jaws n', each of which is provided with a notch, which, when the jaws are closed, forms a hole for guiding the stapling-wire from the conducting-tube to the bending-slide, in combination with the slide U', pin, and bending-slide O', as described.

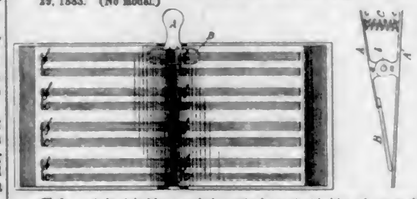
7. In combination with the forming-dies of a machine for making trays, a slide consisting of the bar or cross-piece V, with projecting arms extending therefrom to and between the said forming-dies for conveying thereto the tray-blanks, and having a reciprocating movement imparted thereto on the frame U by the mechanism described, substantially as set forth.



8. In a machine for making trays, the rotative segmental clinchers arranged in relation to each other and to the cog-wheel A' and B', as set forth, and provided with a segment-rib adapted to fit and move in a corresponding groove, by which is obtained to said clinchers an annular movement, substantially as described, for operating the same, in combination with the means for holding and driving a staple, for the purpose specified, and substantially as set forth.

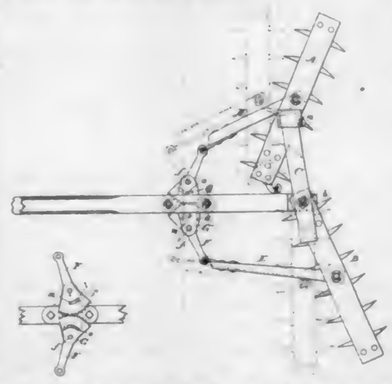
297,663. BLAST-FURNACE APPARATUS. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Jan. 15, 1883. (No model.)

Claim.—In apparatus for raising the temperature of the air to be fed to a blast-furnace, a stove, C, having cold-air inlet A, sloping wall R, dividing the current, partition-walls H H' H'' H''' H'''', forming chambers I J J' J'', tubes *b b b*, forming flues *a a a*, passage M, and heated-air outlet B, substantially as described.



297,664. MITER-BOX. WM. I. BOYER, San Francisco, Cal. Filed Sept. 21, 1883. (No model.)

Claim.—1. In a miter-box, the combination of two sides joined at a right angle with a triangular plate, as F, placed at the juncture thereof, having its base set to face the inside of the box, and a saw-guide pivoted and adjusted on said plate, substantially as set forth.



2. A miter-box consisting of the sides A B D, joined together to form three sides of a square, with their junctures secured by triangular plates F, having the saw-guides C pivoted to the outer ends thereof and adjusted upon the inner broader ends, substantially as set forth.

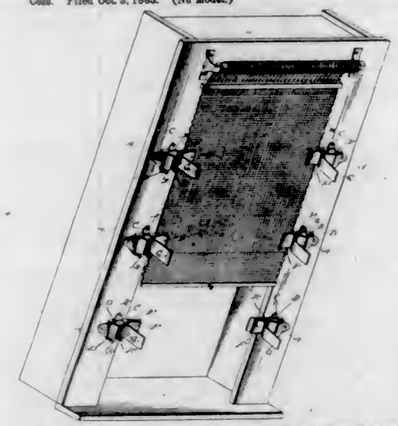
297,665. LEAF-HOLDER. JACOB W. BRAAM, Crapo, Mich. Filed Dec. 29, 1883. (No model.)

Claim.—A leaf-holder consisting of plates A A', hinged to each other, as set forth, wire extension B, and spring C, the whole combined and arranged to operate substantially as shown and described.

297,666. DISK-HARROW. FRANK BRAMER, Little Falls, N. Y. Walter W. Whitman and Lewis H. Crandall Executors of said Bramer, deceased. Filed June 23, 1883. (No model.)

Claim.—1. The combination, substantially as set forth, of the gang-frames, the draft-bars, the pivoted geared slotted adjusting-plates, the projecting wings or plates in which they are pivoted, and a pin or stop for limiting the swing of the gangs.

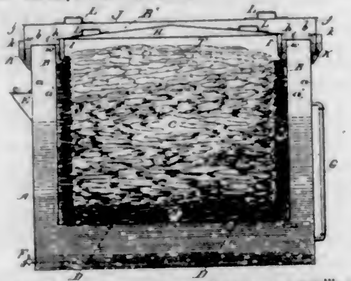
2. The combination, substantially as set forth, of the pole, the disk-gang frames hinged thereto, the draft-bars, the pivoted adjusting-plates to which the draft-bars are hinged, and mechanism for controlling the movement of the plates so as to permit the disks to automatically assume a position parallel with the line of draft when the machine is backed,



and to hold the gangs at the desired angle when the machine is drawn forward.

3. The combination, substantially as set forth, of the draft-pole, the disk-gang frames hinged thereto at their inner ends, the draft-bars, the pivoted adjusting-plates, which permit the disks automatically to assume a position parallel with the line of draft when the machine is backed, and hold the gangs at the desired angle when the machine moves forward, mechanism for limiting the movements of the adjusting-plates, and the hinge-connections between the draft-bars and adjusting-plates, placed on a lower plane than the hinge-connections between the gang-frames and draft-pole.

4. The combination, substantially as set forth, of the pivoted geared adjusting-plates, the gang-frames, connections between the gang-frames and the plates, and mechanism for controlling the movement of the adjusting-plates so as to vary the angle of the gangs.



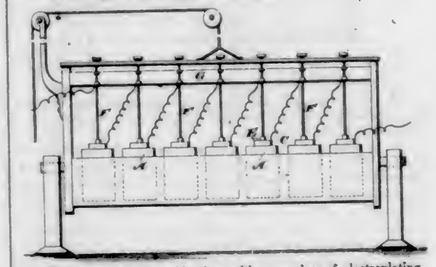
5. The combination, substantially as set forth, of the draft-pole, the plate bolted thereon and having the laterally-projecting wings, the geared slotted adjusting-plates with which the gang-frames are connected, pivoted in said wings, stop-pin apertures in the wings, and a pin or detent for limiting the movement of the gangs.

297,667. WINDOW-SCREEN. AINSWORTH BROWN, Colorado Springs, Colo. Filed Oct. 3, 1883. (No model.)

Claim.—The combination of a base-plate, A, having forwardly-bent arms D D and E E, the laterally-projecting flat spring F, secured between the arms D D, and forced outward from the body-plate A by its own tension, and the cam-lever G, pivoted between the arms E E, and adapted to force the end of the spring F into contact with the base-plate, as and for the purpose herein set forth.

297,668. TOBACCO-SWEATER. GEORGE BROWNSTEIN, San Francisco, Cal. Filed Sept. 7, 1883. (No model.)

Claim.—1. In a machine for sweating tobacco, a metallic vessel having an outer water-jacket with perforated top *b*, in combination with the removable metallic covers having a space between them, forming a steam-jacket over the top of the interior compartment, and communicating with the water-jacket of the main vessel through the perforated top of the latter, substantially as described.



2. In a machine for sweating tobacco, the metallic vessel A, having an interior tobacco-containing compartment, and a surrounding water-jacket having an inlet and a drain, and the inner and outer circumscribing flanges, I K, at the top of the vessel, forming troughs *i k* for a water-seal, in combination with the removable inner and outer covers, H J, having flanges *h j*, fitting in the water-troughs, and having a steam-jacket, B', between them, communicating with the water-jacket of vessel A, substantially as herein described.

3. In a machine for sweating tobacco, the metallic vessel A, having an interior tobacco-containing compartment, and a surrounding water-jacket having an inlet and a drain, and the inner circumscribing flange, I, at the top of the vessel, forming a trough, *i*, for a water-seal, in combination with the inner cover, H, having its upper surface sloping from center to edge, and a flange, *h*, fitting the inner water-trough, and the raised outer cover, J, forming between itself and the inner cover a steam-jacket communicating with the water-jacket of vessel A, substantially as herein described.

4. In a machine for sweating tobacco, the metallic vessel A, having an interior tobacco-compartment and a surrounding water-jacket, and the inner and outer circumscribing flanges, I K, at the top of the vessel, and higher than its upper edge, said flanges forming troughs *i k* for a water-seal, in combination with the removable inner and outer covers, H J, having flanges *h j*, fitting in the water-troughs, and having a steam-jacket between them, communicating with the water-jacket of vessel A, substantially as herein described.

297,669. APPARATUS FOR ELECTROPLATING. CHAS. F. BRUSH, Cleveland, Ohio. Filed May 27, 1881. (No model.)

Brief.—Agitates solution by current of air.

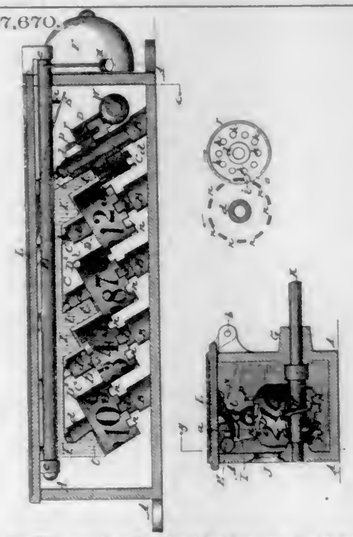
Claim.—1. The combination, with a number of electroplating-baths, each provided with an anode adapted to surround an electric-light carbon, of devices for supporting an electric-light carbon centrally (or approximately so) within each anode, and electric conductors for connecting the electroplating-baths in series, so as to be traversed by the same current, substantially as set forth.

2. The combination, with a number of electroplating-baths, each provided with an anode adapted to surround an electric-light carbon, and electric conductors for connecting the baths in series, of devices for supporting an electric-light carbon centrally (or approximately so) within each anode, and for raising and lowering said carbons, substantially as set forth.

3. The combination, with a number of electroplating baths, each containing an anode adapted to surround an electric-light carbon, of a series of clamps, each adapted to support an electric-light carbon centrally (or approximately so) within each anode, and means for raising and lowering the clamps simultaneously, substantially as set forth.

4. The combination, with a tilting frame having a series of jars or receptacles supported therein, each jar or receptacle being provided with an anode and suitable bath, of devices for supporting an electric-light carbon in each bath, electric conductors for connecting the baths in series, and devices for raising and lowering the carbons simultaneously, substantially as set forth.

297,670. ENGINE-REGISTER. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Apr. 13, 1881. (No model.)



Claim.—1. In an engine-register, a revoluble shaft provided with tappets and a bell-hammer arm, said shaft and arm being spring actuated, as specified, in combination with a series of count or dial wheels, each having a row of ten holes, and a pin adapted to be inserted into any one of said holes, substantially as described, and for the purposes set forth.

2. In combination with the dial-wheels D D', &c., the pin *p*, tappets *t*, plate I, shaft E, hammer H, and bell F, all constructed, arranged, and operating substantially as described.

3. In combination with the case A, the lugs B, inclined studs C, lugs *l*, and wheels D D', &c., constructed and operating in the manner and for the purpose specified.

4. The combination of the alarm mechanism and the lugs *l* with the lid L of the case, in order that when the lid is opened the wheels

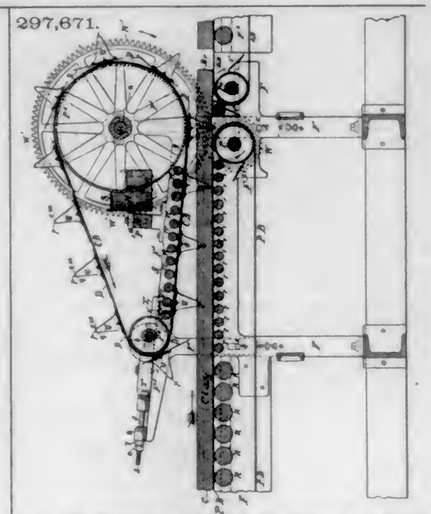
297,670.

can be readily removed or adjusted and the alarm-pin set, as desired.

5. The combination of the lid L, provided with the lugs *l* and the dial-wheels, to prevent the removal or displacement of the wheels when the lid is closed, as set forth.

6. In an engine-register, a series of count or dial wheels loosely mounted on diagonal or inclined studs, so that the upper face edge of the first or driving wheel of said series shall lie immediately under the lower edge of the adjoining wheel, said upper face edge of the driving-wheel being provided with a tooth, the said under lower edge of the adjoining or driven wheel being provided with ten notches, whereby at each revolution of the driving-wheel the driven wheel is turned one-tenth of a revolution, as set forth, and at the same time permitting the wheels to be raised and lowered on their respective studs, to effect the disengagement of the teeth and notches aforesaid, for the purpose of adjustment, substantially as described and set forth.

7. In an engine-register, a series of count or dial wheels loosely mounted and inclined, so that the upper face edge of the first or driving wheel of said series shall be immediately under the lower edge of the adjoining wheel, said upper face of the driving-wheel being provided with a tooth, the said under lower edge of the adjoining or driven wheel being provided with ten notches, whereby at each revolution of the driving-wheel the driven wheel is turned one-tenth of a revolution, as set forth, in combination with a drive-shaft and worm, said worm engaging with the notches on the under side of one of the dial-wheels, substantially as specified.



297,671. BRICK-MACHINE. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Feb. 8, 1883. (No model.)

Claim.—1. The improvement in the art of making bricks of clay or other plastic substance, which consists in forcing the same through a die in a bar and cutting the latter into bricks by means of a wire or wires mounted on an endless belt propelled automatically by the pushing force of the said bar, through suitable intermediate mechanism, to move in the same direction as the bar and diagonally across its path, the movement given to the wire or wires with relation to that of the bar being as described, whereby the latter is intersected transversely at right angles, and is cut off into brick-lengths, substantially as set forth.

2. The improvement in the art of making bricks of clay or other plastic material, consisting in forcing such material through a suitable die in a continuously-moving bar or column, and simultaneously dividing the same into bricks by means of a wire or series of wires caused to move with the continuous bar, and at the same time across its path, substantially as set forth.

3. In a machine for making bricks of clay or other plastic material, the following elements, combined and operating substantially as hereinbefore described, viz: mechanism for expressing a body of such material through a die in a bar or column, means for sustaining the latter, and mechanism for severing it into bricks, consisting of one or a series of wires mounted on an endless belt, substantially in the manner described, caused to move with and to carry said wire or wires across the path of the said bar of clay, whereby the latter is divided into bricks.

297,671.

4. The combination, in a brick-making machine, with mechanism for forcing the clay through a die in a continuously-moving bar, of means for sustaining and preserving the same in line with the die, and a device for severing the bar into bricks, consisting of a wire or a series of wires suitably mounted on an endless flexible belt arranged and caused to move with and simultaneously across the path of the continuous bar, whereby the same is cut off into bricks, all constructed, combined, and operating substantially as described.

5. In a brick-making machine, the combination, with means for forcing a continuous bar of clay through a die, of an endless belt running over pulleys and supported in a suitable frame, which belt is located and adapted to receive said bar of clay thereon and be by the latter propelled, and mechanism for cutting off the advancing end of the bar into bricks, consisting of one or a series of wires suitably mounted over and near the end of the bar on a flexible endless belt inclined toward the bar of clay and propelled, through intermediate connections, by the push or force of the bar impinging upon the first-mentioned belt, all combined, constructed, and adapted to operate substantially in the manner and for the purposes shown and described.

6. The combination, with the propulsion-belt PB, adapted to receive and sustain the ejected continuous bar of clay, of the pulley P^v, gears W W', pulleys P^s and P^u, and the endless carrier running upon the last-mentioned pulleys, and having mounted thereon the cut-off wires, whereby the wires are successively carried athwart the moving bar of clay, and whereby the latter is severed into bricks, substantially as shown and set forth.

7. In that class of brick-machines wherein the clay is expressed through a die in the form of a bar, the combination of a movable carrier, a series of cut-off wires secured thereto and held taut by spring-controlled devices, whereby said wires are adapted to yield to hard bodies in the clay and then resume their normal position, together with suitable mechanism for propelling said carrier and causing the cut-off wires to advance through and sever the bar of clay into bricks, substantially as and for the purpose set forth.

8. In combination with the endless belt CB, the U-shaped bows secured thereto, and adapted to hold the cut-off wires, substantially as shown and described.

9. The combination, with the endless belt or carrier CB, of the elastic U-shaped bows secured thereto, the said bows being adapted to hold and by their elasticity keep taut the cut-off wires, yet allow them to yield temporarily to obstructions, substantially as specified.

10. In combination with the belt CB, the U-shaped bows having means, substantially as shown, for the ready attachment thereto of the cut-off wires, and for determining and limiting the position of the latter, substantially as and for the purposes set forth.

11. In combination with the endless cut-off belt and the described wire-holding bows, the rigid plates D, substantially as shown, and for the purposes specified.

12. In combination with the bows U, the cut-off belt and its pulleys, the plates D, when secured to said belt at a single point or transverse line, whereby the belt is at all times permitted to hug closely the said pulleys, substantially as specified.

13. The combination, with the cut-off belt and its convex-faced pulleys P^u P^s, and the U-shaped bows, and the series of convex-faced rollers *rr*, of the plates D, having concaved bases to conform to the shape of said pulleys, substantially as and for the purpose specified.

14. In combination with the flexible endless carrier CB, wire-holders U, and pulleys P^u P^s, of the plates D, when secured to said belt at a single point or transverse line to the rear of the minor axis of the plates, substantially as and for the purposes specified.

15. The combination, with the endless cut-off carrier-belt and its pulleys, and the cut-off wires mounted on said belt in bows or frames, having elongated bases, of the series of resistance-rollers *rr*, the arrangement, construction, and operation being substantially as and for the purposes set forth.

16. The combination, with the belt CB, pulley P^s, driving-pulley P^u, the series of wires mounted on said belt in a suitable frame, and the line of resistance-rollers *rr*, of the opposed series of rollers *r* beneath the propulsion-belt, all constructed, arranged, and adapted to operate substantially in the manner and for the purposes described.

17. The combination, with the cut-off belt carrying the transverse wires, the pulley P^v, and mechanism for driving the same, of the pulley P^s, journaled in the tightener-frame T, whereby said pulley P^s may be adjusted longitudinally, substantially as and for the purposes stated.

18. In combination with the propulsion-belt, its pulley P^v, and the endless belt bearing the cut-off wires, the pulleys P^u and P^s, journaled in the vertically-adjustable frame F', substantially as and for the purposes specified.

19. The combination, with the cut-off belt having the cut-off wires suitably mounted thereon, as described, of the pulley P^s, and the tightener-frame T, having pulley P^s, journaled in said frame, together with one or more resistance-rollers, *rr*, whereby the relative positions of the pulley P^s and said rollers will remain unaltered, substantially as and for the purpose specified.

20. The combination, with the wire cut-off belt and its pulleys, arranged as shown with relation to the propulsion-belt PB and to the continuous clay bar C, of the gears W W', proportioned as described, whereby the said cut-off belt is caused to advance at a speed having a relation to that of the propulsion-belt—that is, in effect the bar of clay—as set forth, whereby the cut-off wires are caused to be carried squarely through the moving clay bar.

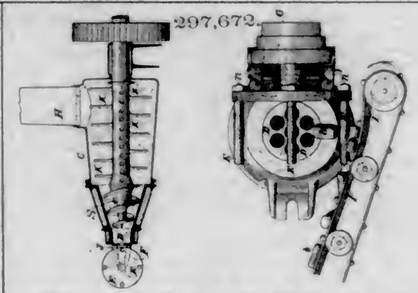
21. The combination, with the cut-off belt and mechanism for driving the same, and rollers *r*, and pulley P^v, of the U-shaped wire-holders having the distance between their opposite limbs greater than the width of said rollers and pulley, so as to admit of the cut-off wires being carried below the bar of clay, as specified.

22. In a brick-machine of the class recited, the following elements in combination, viz: an endless belt or its equivalent for receiving and sustaining the moving bar of clay issuing from the die of the machine, an endless carrier having cut-off wires suitably mounted thereon and propelled by mechanism, substantially as described, and an off-bearing belt caused to travel at a greater surface speed than that of the carrier and the bar of clay expressed from the die of the machine, whereby the severed bricks are successively carried away by said off-bearing belt in time to escape the wire that has just severed the brick from said moving clay bar, the combination and arrangement being substantially as and for the purpose described.

23. The combination, with the propulsion-belt, and the wires mounted upon the endless cut-off belt running over pulleys above the path of the bar of clay and propelled by suitable mechanism, substantially as shown, of the off-bearing belt caused to run faster than said propulsion-belt, whereby the severed brick is carried away in time to escape the wire which has just cut it from the said bar, substantially as shown and described.

24. In combination with the propulsion-belt and the off-bearing belt running over pulleys, respectively, in suitable frames, the independent transfer-roller I, located with relation to said belts, substantially as and for the purpose described.

25. The improvement in scrapers for freeing belt-pulleys of clay or other substances, consisting in the combination, with said scrapers, of deflecting-wings for directing the material scraped from the peripheries of the pulleys, so that the same will fall beyond the belts, substantially as described.



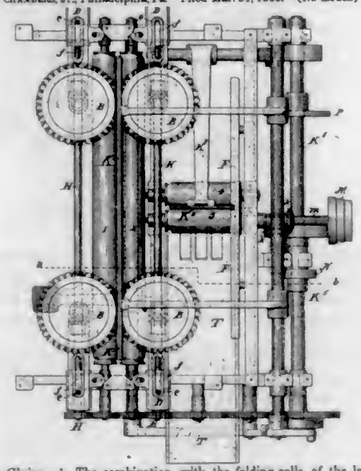
26. In combination with the cut-off belt and its pulleys, the scrapers having the deflecting-wings H, as and for the purpose stated.

27. In the class of brick-machines in which the bar of clay expressed through a die is severed into bricks by means of a series of wires on an endless moving carrier, the method of adapting the cut-off mechanism for making either bricks or tiles, (in connection with suitable dies,) consisting in mounting upon said carrier an even number of said cut-off wires whose distance apart is substantially equal to the length of ordinary bricks, and removing alternate wires for adapting the cut-off to make tiles, and reinserting such alternate wires for making bricks, substantially as set forth.

297,672. APPARATUS FOR MAKING CLAY RAILROAD-BALLAST. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Mar. 31 1883. (No model.)

Brief.—Forces tempered clay through die and breaks it off in chunks as it issues preparatory to drying and burning.

297,672.



Claim.—1. In combination with devices for expressing a column of clay from a die, a breaker-bar or series of such bars projecting across the path of the column of clay issuing from said die, and arranged with relation to said column as shown—that is to say, so that the latter is free to advance until broken off by the breaker-bar—together with means for moving said breaker-bar across the path of the column of clay, substantially as and for the purpose set forth.

2. In combination with one or more dies and mechanism for forcing clay in plastic condition through the same, the rotatable disk bearing a series of breaker-bars projecting therefrom laterally across the path of the bodies of clay expressed from said dies, said bars being arranged on said disk, as shown, whereby the advance of the bodies of columns of clay is unobstructed until broken off by the said breaker-bars coming into contact therewith when the disk is rotated, substantially as and for the purpose described.

3. In combination with the die or dies and devices for forcing clay out of the same, the breaker-bars secured to a disk which is pivoted to a swinging bracket, whereby the said bars may be brought in the path of or out of the path of the body of clay issuing from the die or dies, substantially as and for the purpose recited.

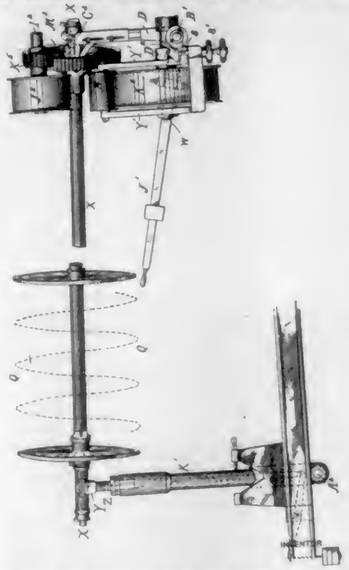
4. The combination, with the die or dies D, breakers E, disk F, and bracket J, hinged as shown and described, of the lug *m*, substantially as and for the purpose specified.

297,673. MACHINE FOR FOLDING TOWELS, NAPKINS, &c. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Mar. 31, 1883. (No model.)

Claim.—1. The combination, with the folding-rolls, of the lateral smoothing-brushes and the vibrating knife for tucking the article to be folded into the bite of said rolls, substantially as and for the purpose stated.

2. The combination of the slotted feed-table, the first pair of folding-rolls, the folding-knife, and the lateral rotary smoothing-brushes, all combined, constructed, and operating substantially as described, and for the purposes specified.

3. The combination, with the slotted feed-table, of the trio of rolls 1 2 3, means, substantially as described, to rotate the same, the first of two said rolls being in a horizontal plane, and the third in a vertical plane with the second of the trio, together with the respective folding-



blades for operating the same, and mechanism, substantially as described, to tuck the articles to be folded into the bites of the first and second and of the second and third of the trio of rolls, respectively, substantially as and for the purposes stated.

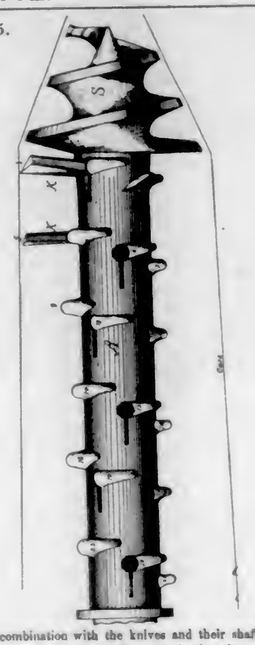
4. In combination with the slotted feed-table and the folding-rolls and folding-blades, the lateral rotary brushes, and means, substantially as described, for adjusting the same longitudinally, substantially as set forth.

5. The combination, with the first pair of folding-rolls, of the vibrating knife K, the rotary smoothing-brushes having the bevel-gear C, the feathered shafts H, with a bevel-gear, and the adjustable bracket provided with bearings for said gears and brushes, together with mechanism, substantially as shown, for operating said brushes, rolls, and folding-knife, the construction and operation being substantially as and for the purposes set forth.

6. The combination of the slotted feed-table, the lateral brush-wheels, the rolls 1 2 3, and rolls 4 5 6, at right angles to the first-mentioned rolls, together with the respective folding-blades, and the mechanism for operating the same, all combined, constructed, and operating substantially as and for the purposes set forth.

297,674. CUT-OFF-REGULATING DEVICE FOR BRICK-MACHINES. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Dec. 26, 1883. (No model.)

Claim.—1. The combination of the cut-off-blade shaft having gear M^3, the gear K^3, pulleys K^3 and J^3, the pivoted yoke having the idler B, and set-screws *s*, (or their equivalent,) the arm D^2 on rock-shaft B', and the lever D', connecting said cut-off-blade shaft and rock-shaft, all constructed and adapted to operate substantially as and for the purpose recited.

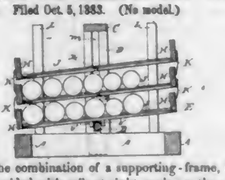


2. In a brick-machine of the recited class, the combination, with the cut-off mechanism, of an adjustable friction-belt device, substantially as shown and described, whereby, through suitable intermediate mechanism, the movement of the bar of clay issuing from the die of the machine is caused to operate said friction-belt device, and thereby causes the same to convey power to and to speed the cut-off mechanism correspondingly to the speed of the bar of clay, substantially as set forth.

297,675. CLAY TEMPERING AND EXPRESSING DEVICE FOR BRICK-MACHINES. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Dec. 26, 1883. (No model.)

Claim.—1. In combination with the shaft and screw, the knives arranged upon said shaft in a spiral running reversely to the spiral of the screw and staggered longitudinally, in the manner and for the purpose specified.

2. In combination with the screw and the knives arranged on the shaft in the manner shown, the first two knives located with relation to each other and the screw, as and for the purpose specified.



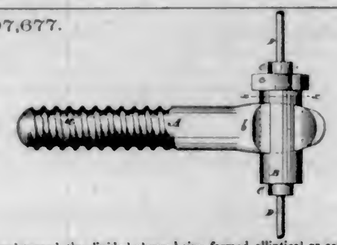
297,675.

3. In combination with the knives and their shaft provided with the unequidistant end grooves, the screw having the socket, with lugs corresponding to said grooves, substantially as and for the purpose specified.

4. In combination with the pugging-shaft, the tempering-knives arranged thereon in a spiral, and staggered, as and for the purpose specified.

297,676. DEVICE FOR PRESERVING EGGS. GEORGE COWAN, Marshfield, Mass. Filed Oct. 5, 1883. (No model.)

Claim.—1. The combination of a supporting-frame, a tilting rack pivoted thereto, provided with rails at right angles to the axis on which the rack oscillates, said rails being a proper distance apart for the support of hens' eggs placed side by side between them, and means for arresting the rack at a slight incline to the horizontal in either direction to which it may be tilted, substantially as described.



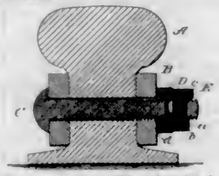
2. The combination of the standards provided with vertical grooves and supporting-pins crossing the grooves at different heights, and oscillatory racks provided with pivot-pins adapted to rest within said grooves on said supporting-pins, said racks having rails at right angles to their axes of oscillation a proper distance apart for the support of eggs placed side by side between them, substantially as described.

3. The improved egg-preserver herein described, the same consisting of the base A, bar D, standards B, provided with the grooves *m*, and pins *d*, rack E, provided with the pins *v*, racks F G, provided with the pins *x*, and the wire K, constructed, combined, and arranged to operate substantially as set forth.

297,677. DEVICE FOR ATTACHING TELEGRAPH-WIRES TO POSTS AND INSULATING THEM THEREFROM. HERBERT COTTRELL, Newark, N. J. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination of the hook constructed to be attached to a telegraph-pole, and the divided clamp B B, lined with insulating material C C, the sections of said clamp being adapted to be placed together with the wire between them, and then slipped laterally through the hook, and

297,677.



afterward turned, the divided clamp being formed elliptical or cam-like in cross-section, whereby when it is inserted in the hook and turned it will bind both against the hook and the wire, substantially as described.

2. The combination of the hook having the throat *g*, and constructed to be attached to a telegraph-pole, and the divided clamp B B, lined with insulating material C C, the sections of said clamp being adapted to be placed together with the wire between them while the wire is in the hook, and then slipped laterally through the hook, and afterward turned, and said clamp having its circumference constructed with a projection which binds against the hooks when the clamp is turned and locks the latter in contact with both the hook and the wire, substantially as described.

3. The combination of a hook and a divided clamp elliptical or cam-like in cross-section and lined with insulating material, substantially as described.

4. The combination of a hook and a divided clamp elliptical or cam-like in cross-section and lined with insulating material, said clamp having an angular head, *c*, for receiving a wrench, the sections composing the clamp being adapted to be placed together upon the wire while the latter is in the hook, and then slipped laterally through the hook and turned, substantially as described.

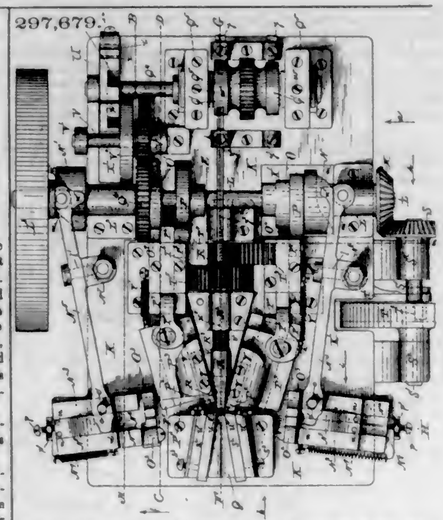
297,678. NUT-LOCK. CHAUNCEY B. CRAGIN, Ada, Minn. Filed Jan. 19, 1884. (No model.)

Claim.—1. The combination, with a slotted bolt and its nut, of a transverse key having a projection at right angles at each end, substantially as and for the purposes set forth.

2. The combination, with the slotted bolt and the fish-plate, or other structure through which such bolt passes, of the key having outwardly-extending projections arranged to overlap the edges of the slot, and the spring interposed between the fish-plate and the nut, substantially as described.

297,679. BARB-FENCE MACHINE. JOHN D. CURTIS, Worcester, Mass., assignor to Washburn & Moen Manufacturing Company, same place. Filed Aug. 1, 1883. (No model.)

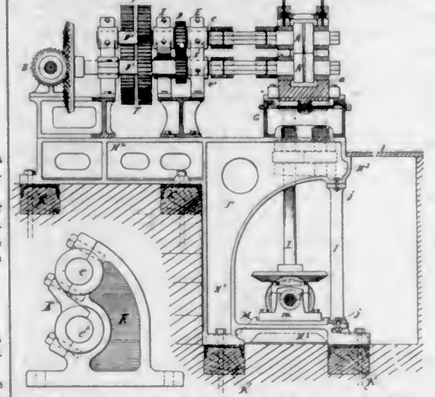
Brief.—Two sets of barb feeding and cutting devices, placed one set on each side of the coiling-spindle, are operated alternately. The coiling-spindle coils a barb while revolving in one direction and another barb during its revolution in the opposite direction. The barbs are cut off after their free ends are coiled about the main wire.



Claim.—1. In a machine for manufacturing barbed fence-wire, means for supporting and feeding the main wire and means for supporting and feeding the barb-wires, in combination with the coiling-spindle and means for operating the same, all arranged and operating substantially as described, whereby the barb-wire is coiled upon the main wire by the rotary movement of the coiling-spindle in each direction, substantially as shown and described.

2. In a barb-fence machine, the combination, with the coiling-spindle, of alternately-acting barb-wire-feeding devices placed on opposite sides of the coiling-spindle, substantially as shown and described.

3. In a machine for barbing fence-wire, the combination, with the coiling-spindle, of movable and stationary cutters, placed on opposite sides of the coiling-spindle, for cutting off the barb-wires, working alternately, substantially as shown and described.



4. In a machine for barbing fence-wire, the combination, with coiling-spindle, of alternately-acting barb-wire-feeding devices, placed on opposite sides of the coiling-spindle, and alternately-working movable

297,679.

and stationary cutters placed on opposite sides of the coiling-spindle, substantially as shown and described.

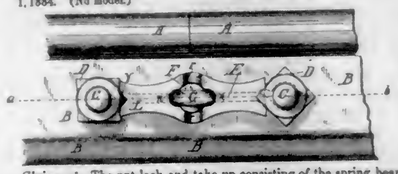
297,680. CONSTRUCTION OF CONTINUOUS ROLLING-MILLS. FRED H. DANIELS, Worcester, Mass. Filed June 21, 1883. (No model.)

Claim.—1. A continuous rolling-mill in which the several pairs of rolls are arranged in the peculiar manner shown—viz., the first ten pairs being arranged with their axles alternately in horizontal and vertical positions, and the following six pairs with their axles all in horizontal position—in combination with driving-shafts and gearing for operating the same, disposed in the manner described.

2. The transverse under frame, H, having the foot portion, central upright, and extended top, integrally constructed and disposed in the peculiar manner shown and described, for the purpose set forth.

3. The combination, with the transverse frame H in a continuous rolling-mill, of a removable support or column, I, arranged between the upper and lower forward-projecting parts of said frame, substantially as and for the purpose set forth.

4. In a continuous rolling-mill, the combination of the transverse frame H, having overhanging end H^3, and the removable support or column I, said parts being respectively provided with interlocking flanges and grooves *i*, and corresponding side slots, with the holding-bolts *j* arranged therein, substantially as and for the purpose set forth.



5. The combination, with a continuous rolling-mill, of an auxiliary feed mechanism located between the furnace and first pair of reducing-rolls, as described, for receiving and drawing the hot billets from the

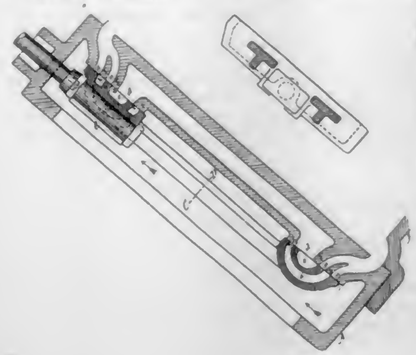
heating-furnace and delivering them squarely to the grooves of the reducing-rolls of the mill, substantially as set forth.

6. The combination, with a continuous rolling-mill and a heating-furnace, of an auxiliary set of feeding-rolls, *n n*, operated independently of the mill-rolls, and adapted for receiving and withdrawing the heated billets from the furnace, and guiding devices for conducting them into the mill.

7 The combination, with a continuous rolling-mill and the auxiliary feeding apparatus, of the hinged guide P, adapted to be swung out of position, to permit passage of the attendant from one side of the machine to the other, as set forth.

297,681. NUT-LOCK. LEVIS H. DAVIS, West Chester, Pa., assignor to the Wilmington Malleable Iron Company, Wilmington, Del. Filed Feb. 1, 1884. (No model.)

Claim.—1. The nut-lock and take-up consisting of the spring bearing-plate, the T-head button, and the locking-plate, when constructed, combined, arranged, and adapted to operate substantially as and for the purposes specified.



2. The combination of the arched spring bearing-plate, the rotatable button having a slot therein to receive the arched portion of said plate, and the projecting cross-bar, together with the locking-plate recessed on its under side to receive and allow play of the bearing-plate, and having an opening therein with side extensions thereof adapted for the reception of the said button and its cross-bar, and having also inclinations extending up from the extremities of said side extensions of the opening in the plate, all constructed and adapted to operate together substantially as and for the purposes set forth.

3. In combination with the bearing-plate and the cam-locking plate having the described opening therein, the T-head button provided with means, substantially as shown, for limiting the rotation of said button, substantially as and for the purpose stated.

4. The combination of the slotted button and the arched spring bearing-plate passed through the slot in said button, and having its ends bent around to form bolt-holes, substantially as and for the purpose specified.

5. In combination with the rails and fish-plates or other structures bolted together, the bolts, their nuts, the arched elastic bearing-plate having openings for the passage of the bolts, and the rotatable button connected to the bearing-plate substantially in the manner shown, and provided with the projecting cross-bar, together with the correspondingly recessed and perforated locking-plate having its ends adapted to abut against or in close proximity to the nuts, said locking-plate being also provided with upwardly-inclined faces communicating with a transverse groove, upon which faces the under sides of the projecting parts of the cross-bar of the button bear against the stress of the spring bearing-plate when the said button is turned, all constructed, arranged, and operating substantially as and for the purposes described.

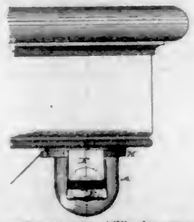
297,682. SLIDE-VALVE. ISAAC DE GRAFF, Detroit, Mich. Filed Oct. 1, 1883. (No model.)

Claim.—1. A Ω-valve provided with a passage, *a'*, and a passage, *e*, with the bridge *c* between them, serving to close the exhaust-port when the live steam is passing through the passage *a'*, and both passages being contained wholly within said valve, and terminating in exhaust-passages when steam is passing from the cylinder to the exhaust-port, substantially as described.

2. The combination, *m* a valve-case, of the valve C, provided with the auxiliary passages *a'* and *e*, and the ports *a* and *d* of the cylinder, and the latter having the bridge *b*, and all relatively proportioned to the lap, travel, and bridges, substantially as set forth.

297,683. TELEPHONE-LINE. THOMAS B. DOOLITTLE, Bridgeport, Conn. Filed Feb. 21, 1883. (No model.)

Claim.—1. A telephone-line having a series of earth-connections of a material of low conductivity—such as wood—said material having its surface coated with water-proof material, substantially as described.



2. A telephone-line upheld by a series of supports, of wood or similar material, of low conductivity, having their surface coated with water-proof material, substantially as described.

3. A support for telephone-wires, consisting of a wooden pin inserted in a pole or cross-arm, and made water-proof at all parts of its surface, except at the point on which the conducting-wire absolutely rests, substantially as described.

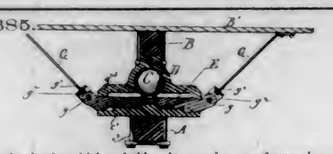
4. A support for telephone-lines, consisting of a wooden pin and a grooved wire-holder at its upper part, the surface of the said pin being painted or varnished, as described, to prevent the substance of the pin from acquiring moisture, and the groove thereof being left unpainted, whereby the normal escape is maintained constant, substantially as described.

5. A support for telephone-lines, having its surface coated or covered with a waterproofing and insulating material, except where the wire rests, substantially as described.

297,684. CHALK-HOLDER FOR BILLIARD AND OTHER GAME TABLES. TIBERIAS DOUGHERTY, Philadelphia, Pa. Filed Nov. 6, 1883. (No model.)

Claim.—1. A chalk-holder for a billiard or other game table, consisting of a chalk clamp or holding device, a cord, a reel, a spring, and a rotatable supporting frame or casing, the clamp or holding device automatically returning to its normal position by the action of said spring, and the frame or casing moving relatively to the position of the player, substantially as and for the purpose set forth.

2. A chalk-holder for a game-table, having a cord for connection with the chalk, a winding device for said cord operating automatically, and a frame or casing rotatably movable relatively to the position of the player, substantially as and for the purpose set forth.



3. In a chalk-holder for a game-table, a clamp formed of rubber, and a strengthening-plate connected therewith at the base, having the cord attached to it, substantially as and for the purpose set forth.

4. A chalk-holder for a game-table, consisting of a clamp or holding device, a cord, a reel, spring, and rotatable frame or casing, substantially as and for the purpose set forth.

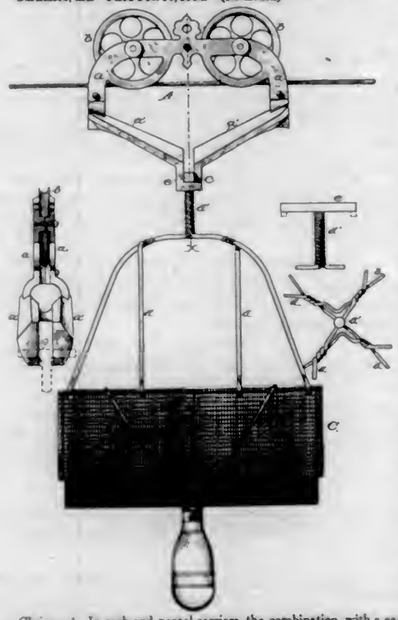
297,685. FIFTH-WHEEL FOR WAGONS. JAMES T. DOOLEY, Chicago, Ill. Filed Feb. 25, 1884. (No model.)

Claim.—1. The combination of the ball and its plate with a socket and its plate, the one secured to the axle and the other to the bolster, an

297,685.

interposed ring having thick and thin edges, and means for turning said ring with the bolster or with the plate secured thereto, substantially as specified.

2. The combination, with the axle and its bolster, of a ball and its socket secured the one to the axle and the other to the bolster, and an interposed ring or device for limiting the movement of said socket on its ball, substantially as specified.



3. The combination of the ball and its plate with the socket and its plate, and the ring interposed between said plates, and made with thick and thin edges, to permit the socket to rock from side to side, but not backward and forward, substantially as specified.

4. The combination of the ball and its plate secured to the axle, with the socket and its plate secured to the bolster, and the interposed ring having thick and thin edges, and provided with a brace for turning said ring with the bolster, substantially as specified.

5. The combination of the ball and its plate secured to the axle, with the socket and its plate secured to the bolster, said socket being made in two parts embracing said ball, a two-part interposed ring mounted on the neck of said ball, and braces extending from said ring to the body of the vehicle, and having a swivel-connection with said ring, substantially as specified.

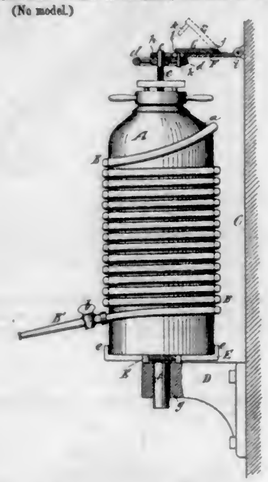
6. The combination of the ball and its plate secured to the axle, with a socket and its plate secured to the bolster, a neutral ring, and a brace extending from said ring to the vehicle, to prevent the bolster rocking backward and forward, substantially as specified.

297,686. CASH AND PARCEL CARRIER. GILBERT R. ELLIOTT, Boston, Mass., assignor to the Continental Cash Car Company of Baltimore, Baltimore, Md. Filed Feb. 16, 1884. (No model.)

Claim.—1. In cash and parcel carriers, the combination, with a car permanent upon the track, of a carrier detachably connected thereto substantially in line with the center of gravity of such car, and whose supports center at a point in line with its center, as described.

2. In cash and parcel carriers, the car having sides separated for the admission of the supports of a carrier.

3. In cash and parcel carriers, the car having straight sides and separated for the admission of the supports of a carrier.



4. In cash and parcel carriers, the car having sides inclining toward its center and separated for the admission of the supports of a carrier.

5. In cash and parcel carriers, the car having sides inclining toward its center, and forming thereat the channel *c*, and separated for the admission of the supports of a carrier.

6. In cash and parcel carriers, the combination, with a car of the kinds described, of a carrier having supports uniting at a point above it, and provided with a cross-piece which is at right angles to the length of said carrier.

7. In cash and parcel carriers, the combination, with a car of the kinds described, of a carrier having supports uniting at a point above it, and provided with a cross-piece having hooked ends, as described.

297,687. SUPPORTING AND OPERATING CHEMICAL FIRE-EXTINGUISHERS. JAMES E. GILLESPIE, Warwick, N. Y. Filed Nov. 16, 1883. (No model.)

Claim.—1. The combination, with a chemical fire-extinguisher consisting of a closed cylindric vessel and a hose connected therewith and communicating with the interior thereof, of a support or bearing on which the extinguisher may rotate to enable the hose to be reeled upon it or extended for use, whereby the closed cylindric vessel which constitutes the chemical fire-extinguisher may be made to serve as a barrel for the hose, substantially as herein described.

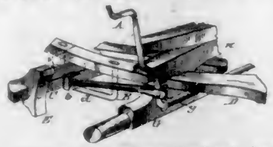
2. The combination, with a chemical fire-extinguisher consisting of a closed cylindric vessel and a hose connected therewith and communicating with the interior thereof, of a base-piece whereon the extinguisher may stand, and a support or bearing to which the base-piece is fitted, and whereon the extinguisher and base-piece may rotate to enable the hose to be reeled upon the extinguisher or extended for use, whereby the closed cylindric vessel which constitutes the chemical fire-extinguisher is made to serve as a barrel for the hose, substantially as herein described.

3. The combination, with a chemical fire-extinguisher and a hose connected therewith, of a bearing or support whereon the extinguisher may rotate to enable the hose to be reeled upon it or extended for use, and means for automatically liberating the chemical in the extinguisher by the rotating of the extinguisher, substantially as and for the purpose herein described.

4. The combination, with a chemical fire-extinguisher provided with a projecting stem, whereby the chemical is liberated, and a hose connected with the extinguisher, of a bearing or support whereon the extinguisher may rotate to enable the hose to be reeled upon it or extended for use, and a detent for precluding the turning of said stem, substantially as and for the purpose herein described.

5. The combination, with a chemical fire-extinguisher provided with a projecting stem, whereby the chemical is liberated, and a hose connected with said extinguisher, of a base support or bearing whereon the extinguisher may rotate, a top bearing for said stem, and a detent for holding the stem against turning and removable independently of said top bearing, substantially as and for the purpose herein described.

6. The combination, with the extinguisher A, provided with the stem *c*, and handle or wheel *d*, of the hose B, the base-piece E, the bearing *g* for said base-piece, the hinged arm F, comprising a bearing for said stem, and the secondary arm G, carrying the detent *k*, all substantially as herein described.



297,688. TELEPHONE-CABLE. FRANZ C. GUILLEAUME, Cologne, Prussia, Germany. Filed Nov. 3, 1883. (No model.)

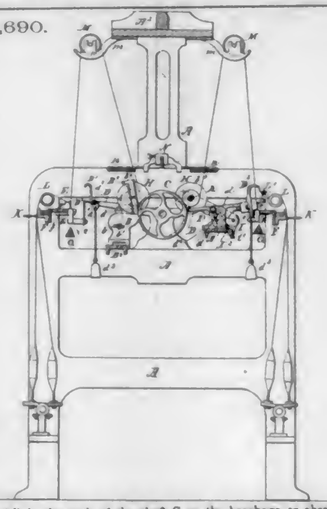
Claim.—1. A cable composed of strands wrapped spirally around a core-strand, *d*, of non-insulated wire, the said wrapping-strands being composed of a series of insulated wires, *a*, wrapped spirally around a single non-insulated wire, *b*, as set forth.

2. The cable described, composed of the strands of insulated wires *a* and non-insulated wire *b*, wrapped spirally around a core, *d*, of non-insulated wires, the said strands and core being wrapped with tin-foil tape, as set forth.

297,689. WAGON-BRAKE. JAMES H. HENCOCK, Bradford, Penn. Filed Feb. 16, 1884. (No model.)

Claim.—In a vehicle-brake, the combination of a lever, A, secured to the front of the axle, with the end bolts, B, adjustably secured to the brake-beam, and slotted in front, so as to embrace the lever, and the supporting-guides *d*, whereby the brake-beam is held in place and prevented from moving laterally, substantially as and for the purpose set forth.

297,690. MACHINE FOR DOUBLING AND WINDING YARN OR THREAD UPON BOBBINS. JOHN HORROCKS and JAMES HORROCKS, Manchester, County of Lancaster, England. Filed Oct. 19, 1882. (No model.) Patented in England Oct. 22, 1879, No. 4,273; in France Apr. 20, 1880, No. 136,230, and in Belgium Apr. 22, 1880, No. 51,234.



Brief.—The detector-wires fall into the path of a revolving shaft upon the breakage or absence of a thread or threads, and cause the pivoted detector-plate to be tilted, thereby releasing suitable mechanism which operates to lift the bobbin clear of the driving drum and carry the detector-wires out of the path of the said revolving shaft.

Claim.—1. The combination, with a pivoted detector-plate, the detector-wires thereof, a driving-drum, C, and a rotating shaft, G, of mechanism, substantially such as described, to lift the bobbin clear of the drum when one or more detector-wires fall in the path of shaft G on the breakage or absence of a thread or threads, and automatically carry said wires out of the path of said shaft, as described, for the purpose specified.

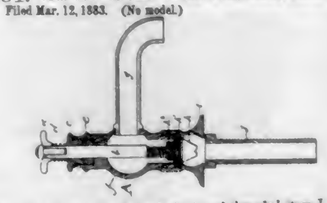
2. The combination, with a pivoted detector-plate, its detector-wires, a driving-drum, C, and a rotating shaft, G, of a lever operating to lift and support the bobbin out of contact with the driving-drum when one or more detector-wires fall in the path of the shaft G on the breakage or absence of a thread or threads, and means whereby said wires are automatically moved out of the path of said shaft, as described, for the purpose specified.

3. The combination, with the driving-drum C, the detector-plate E, and detector-wires E′, of the rotating shaft G, prism-shaped in cross-section, and mechanism, substantially such as described, for positively lifting the bobbin clear of the driving-drum when one or more of the detector-

297,690.

wires fall in the path of the shaft G on the breakage or absence of a thread or threads, and devices for automatically moving said wire or wires out of the path of said shaft, as described, for the purpose specified.

4. The combination, with the driving-drum, the detector-wires and detector-plate, and a rotating shaft to tilt said plate when one or more of said wires fall by reason of the breakage or absence of a thread or threads, of a lever operated by the movement of said detector-plate to lift the bobbin out of contact with the driving-drum, appliances, substantially such as shown and described, to hold said bobbin in the latter position independently of the lever, and a tripping device operated from said lever to return the bobbin into contact with the driving-drum, as set forth.



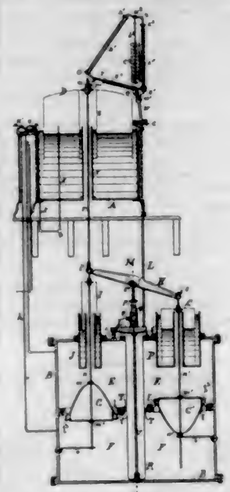
5. The combination, with the driving-drum, the bobbin-support, the detector-wires E′, detector-plate E, wire *s*, and shaft or bar G, of the adjustable lever D and the adjustable bent wire D^2, all arranged for co-operation, substantially as and for the purpose specified.

6. The combination, with the driving-drum, the bobbin-frame I, and the prop I^2, of the lever D, and the tripping-arm d^6, substantially as and for the purpose specified.

7. A detector-wire, bent as at e^2, in combination with the detector-plate E, constructed with longitudinal ribs *e′*, channeled as at e^3, the retaining-plate E^2, and means, substantially such as described, for rigidly securing plate E′ to plate E, substantially as shown, and for the purpose specified.

8. The combination, with a driving-drum, a pivoted bobbin-frame, a lever, a stop to hold said lever out of contact with the bobbin-frame or its bobbin, and tripping devices to trip the stop on the breakage or absence of a thread, of a weight connected with the lever, substantially as and for the purpose specified.

297,691. SELF-CLOSING TAP. FRANCIS HYDE, Toronto, Ontario, Canada. Filed Mar. 12, 1883. (No model.)



Claim.—In a faucet, the valve-body A and threaded stem J, combined with the valve-stem *b*, triangular in cross-section and carrying the upwardly-seating valve *h*, valve-seat *h′*, and metallic flanged washer h^3, the whole arranged substantially as set forth.

297,692. GAS-PRESSURE REGULATOR. GUSTAVUS A. HYDE, Sr., Cleveland, Ohio, and GUSTAVUS A. HYDE, Jr., East Saginaw, Mich. Filed Jan. 2, 1884. (No model.)

Claim.—1. In a gas-pressure governor or regulator, the adjustable weight e^3, together with the vibrating pendent rod h^3, suspended from the triangular adjustable frame O O′ *z z′*, having V-shaped or sharp-

297,692.

pointed supports *a a′ a″*, secured in V-shaped bearings *r w w* by stops *v v v′*, in combination with the float D, rods *r*, *n*, and *n′*, and valves G and G′, substantially as shown, and for the purpose set forth.

2. The two valves G and G′, having projecting rings l^2 l^2, sharp-edged gage-rings *l l*, and sharp-edged seats *l′ l′*, in combination with rods *n*, *n′*, and *r*, tubings I and C, balancing-bar H, float D, triangular adjustable frame O O′ *z z′*, vibrating pendent rod h^3, and adjustable weight e^3, substantially as shown, and for the purpose set forth.

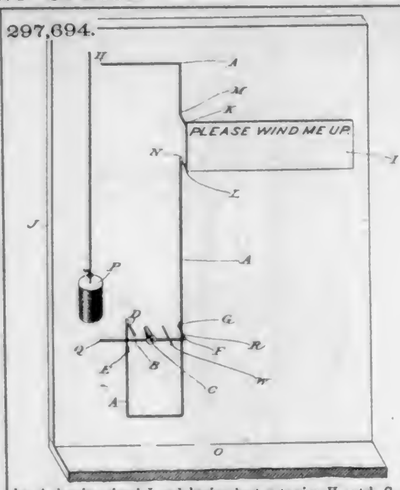
3. The tubing C and its annular tubing P, having greater diameter than the tubing I and its annular tubing J, in combination with the rods *n*, *n′*, and *r*, balancing-bar H, valves G and G′, with float D, triangular adjustable frame O O′ *z z′*, and vibrating pendent rod h^3, and adjustable weight e^3, substantially as shown, and for the purpose set forth.

4. The balancing-bar H, fulcrumed at its center and connected with rods *n*, *n′*, and *r*, with sharp-edged bearings i^7 i^8 i^9, and having an adjustable fulcrum-pillar, *p*, in combination with tubings I and C, valves G and G′, float D, and triangular adjustable frame O O′ *z z′*, substantially as shown and described.

5. A varying-temperature regulator composed of alternate wood and iron rods c^4 d c^5 f c^6 d c^7, inclosed in casing R, and connected to lever L′ and rod L, in combination with triangular adjustable frame O O′ *z z′*, float D, rods *r*, *n*, and *n′*, valves G and G′, tubings I and C, and balance-bar H, substantially as shown, and for the purpose set forth.

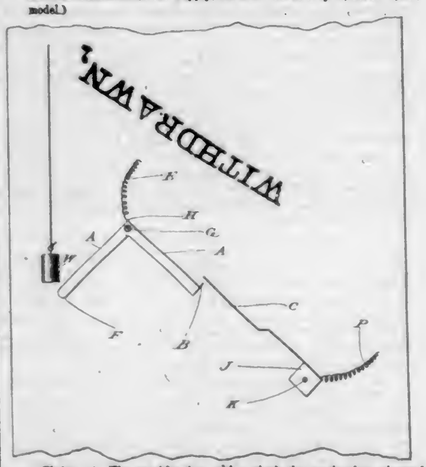
297,693. EJECTOR FOR INSECT-POWDERS. ADOLPH ISAACSEN, New York, N. Y. Filed Nov. 8, 1883. (No model.)

Claim.—In combination with a readily-detachable current-inducing means, as F D, and a powder-receptacle having a thread, a^2, the cap B, having tube C, provided with perforations *c*, and bayonet-joint *c′*, as and for the purposes set forth.



297,694. AUTOMATIC WINDING-REMINDER FOR CLOCKS. EDWARD JUNGERMAN, Fort Supply, Ind. Ter. Filed May 7, 1883. (No model.)

Claim.—1. In a clock the mechanism whereof is operated by the descent of a weight, the combination of a movable sign bearing the inscription "Please wind me up," or its equivalent, with a suitable opening in the dial or case of the clock, and with supporting devices for the sign so arranged relatively to the weight that the latter causes the sign to be moved so as to expose the inscription when it is run down, and to move the inscription out of sight when it is run up, substantially as shown and described, and for the purpose specified.

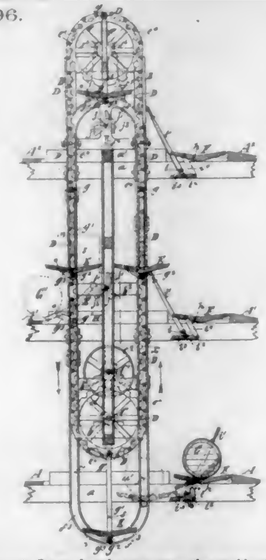


2. In a clock the mechanism whereof is actuated by a weight, the combination, with the weight P, of the pivoted bar B, the vertically-sliding rod A, and the movable sign I, the whole arranged to operate substantially as shown and described.

3. In a clock the mechanism whereof is actuated by a weight, the bar A, bearing signal I, and having bent extension H, catch G, and points D E, and the bar B, the whole arranged to operate substantially as shown and described.

297,694.

297,695. ELECTRIC WINDING-REMINDER FOR WEIGHT-CLOCKS. EDWARD JUNGERMAN, Fort Supply, Ind. Ter. Filed May 7, 1883. (No model.)



Claim.—1. The combination, with a clock the mechanism whereof is actuated by the descent of a weight, of an electrical circuit including an electric bell or other electrical warning device, said electrical circuit being disposed and arranged relatively to the weight in such a manner that the circuit is closed by the weight when the latter is run down, substantially as described, and for the purpose specified.

2. The combination, with a clock the mechanism whereof is actuated by the descent of a weight, of devices whereby the descent of said weight may be made at a certain point to close an electrical circuit including an electric bell or other electrical warning device, substantially as shown and described, and for the purpose specified.

3. The combination, with a clock the mechanism whereof is actuated by a weight, W, of the piece A A, pivoted at G, as set forth, one arm of said piece bearing the point B, and the electrical circuit leading to an alarm-bell, substantially as and for the uses and purposes shown and described.

297,696. ELEVATING APPARATUS. THOMAS KEITH, New York, N. Y. Filed Feb. 16, 1884. (No model.)

297,696.

Claim.—1. In an elevating apparatus, the combination, with two endless chains or carriers and wheels therefor, arranged at the top and bottom of the apparatus, of a rod extending between and connected with said chains or carriers, hangers depending from said rod between the chains or carriers, a moving platform pivoted to and carried by said hangers, and a tripping mechanism against which the inner edge of said platform is brought in its descent to tilt said platform and cause it to deliver its load outward, substantially as herein described.

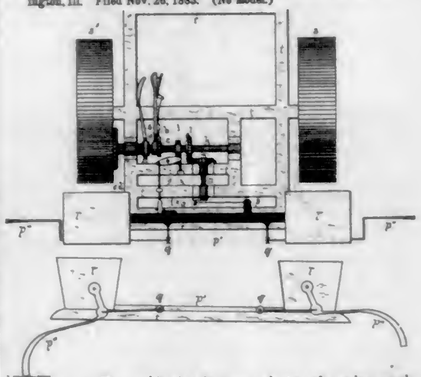
2. In an elevating apparatus, the combination, with two endless chains or carriers and wheels therefor, arranged at the top and bottom of the apparatus, of a moving platform depending by means of hangers from and between the chains or carriers, guides for the chains or carriers, and independent guides for the lower portions of said hangers, whereby the vertical position of said hangers is continuously maintained, substantially as herein described.

3. In an elevating apparatus, the combination, with two endless chains or carriers and wheels therefor, arranged at top and bottom of the apparatus, of a rod extending between and connected with said chains or carriers, hangers depending from said rod, a moving platform pivoted to and suspended by said hangers, pivoted loading-platforms capable of being tilted by the moving platform in its ascent to deliver their load upon the moving platform, and a trip mechanism for tilting said pivoted moving platform independently of its hangers in its descent in order to deliver the load, substantially as herein described.

4. In an elevating apparatus, the combination, with endless chains or carriers and a cross-rod connecting them, of hangers depending from said rod, a moving platform pivoted to said hangers, and pivoted loading-platforms capable of being tilted by the moving platform in its ascent to depress the inner edges of said loading-platforms and cause their load to pass onto the said moving platform, substantially as herein described.

5. In an elevating apparatus, the combination, with two endless chains or carriers and a cross-rod extending between and connecting them, of hangers depending from said rod between the chains or carriers and provided with outwardly-extending arms, and a moving platform slanting from opposite edges toward its center, pivoted to said outwardly-extending arms of the hangers at a distance from its center, and supported by said hangers at its center, substantially as herein described.

6. The combination, with endless chains and wheels therefor, of a rod, g, extending between said chains, hangers g', a rod, g^2, connecting the lower ends of said hangers, arms g^3, extending outward and upward from the rod g^2, and a moving platform having its lowest point at the center, pivoted to said arms, and resting upon the rod g^2, substantially as herein described.

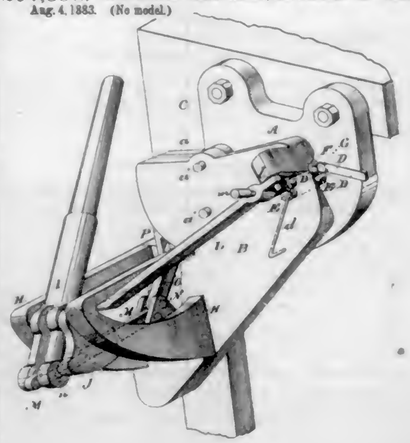


7. The combination of the wheels d e, endless chains D D, the rods g g^2, the hangers g', and arms g^3, separate guides for the ends of said rods g g^2, and the moving platform E, pivoted to the arms g^3 and resting on the rod g^2, substantially as herein described.

8. The combination, with two endless chains or carriers and wheels therefor, of moving platforms depending by means of hangers from and between said chains or carriers, a pivoted loading-platform, a tripper pivoted below said loading-platform and within range of said moving platform in its ascent, and a rod or connection between the rear end of said tripper and the front end of said loading-platform, whereby the moving platform, in rising, will act upon said tripper, and by raising its front end will depress the front end of said loading-platform and cause it to deliver its load upon the moving platform, substantially as herein described.

9. The combination, with endless chains or carriers and a moving platform suspended between them, of a pivoted loading-platform, F, the shaft i, the lever i', whereby said shaft may be turned, the arms i^2, the tripper i^3, pivoted to said arms, and the rod i^4, connecting the tripper in rear of its pivot with the platform F forward of its pivot, substantially as herein described.

10. In an elevating apparatus, the combination, with two endless chains or carriers and cross-rods connecting them, of hangers depending from said cross-rods between said chains or carriers, movable platforms suspended by said hangers and capable of making the complete circuit of the chains or carriers without being inverted, guides for said chains or carriers, and stops applied to the chains or carriers, capable of yielding to the forward movement thereof, but serving to prevent a reverse movement, substantially as herein described.



297,697. CHECK-ROW CORN-PLANTER. WARNER L. KELLAR, Lovington, Ill. Filed Nov. 26, 1883. (No model.)

Claim.—1. The combination, in a corn-planter, of a spring-crank adapted to convert continuous rotary motion from the planter-wheel into reciprocating motion in the seed-slide, and a catch adapted to hold the seed-slide rigid during a partial revolution of said crank, and to release the same by motion from the planter-wheel at the proper time for operating the drop, as set forth.

2. The combination, in a check-row corn-planter, of wheel a', gearing e d k l m, spring-crank o, and seed-slide p', as and for the purpose set forth.

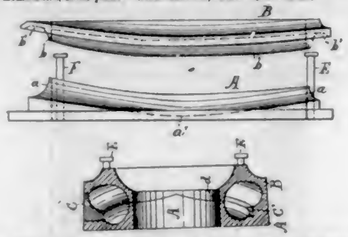
297,698. SAW-SWAGE. SIMON KINNEY, San Francisco, Cal. Filed Aug. 4, 1883. (No model.)

Claim.—1. In a saw-swaging machine, the clamp or shoe D and sliding clamp D', by means of which the sides of the tooth are held, the anvil-bar E, and pivoted lever F, in combination with the stop G on said anvil and die-lever, and secured to said die-lever by a spring, g, substantially as shown, and for the purpose described.

2. In a saw-swaging machine, the plates A B, spaced by the blocks a, the stationary clamp or shoe D, and sliding clamp D', in combination with the lever I, having a cam, J, and the swinging or pivoted bar L, having a roller, K, substantially as shown and described.

3. In a saw-swaging machine, the plates A B, spaced by the blocks a, the former having the stationary clamp or shoe D, and the anvil-bar E, having a flattened upper surface, in combination with the sliding clamp D', the pivoted die-lever F, the clamp D' being adapted to be operated by the lever I, having cam J, the pivoted bar L, having roller K, and means for operating the die-lever after the operation of the clamp, consisting of the arm M, lever I, arms N O, and block P, all arranged and operated substantially as herein described.

4. In a saw-swaging machine, the spaced plates A B, anvil-bar E, the die-lever F, pivoted to said plates, and adapted to swage the tooth by means of the fulcrumed lever I, arm M, swinging arm N, arm O, and block P, all arranged and operated substantially as described.



297,699. PIN FOR ELECTRIC INSULATORS. JOHN M. KLEIN, San Francisco, Cal. Filed Sept. 13, 1881. (No model.)

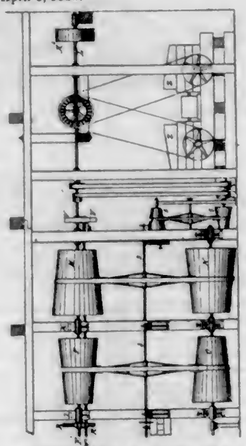
Claim.—1. The wrought-metal pin B, provided with a soft-metal head, b, which is grooved or threaded to fit into and engage with the socket in an insulator for supporting electric wires, substantially as set forth.

2. An insulator pin or support for electric insulators, having a wrought-metal body and a screw-threaded head of larger diameter than the body of the pin, of cast metal, substantially as set forth.

297,700. MOLD FOR HORSE-COLLARS. THEODORE F. LEMASSENA and JAMES STANLEY, Newark, N. J.; said Lemassena assignor to Lillian Lemassena, same place. Filed Nov. 19, 1883. (No model.)

Claim.—1. The combination, in a horse-collar mold, of the top and bottom sections, B A, each made in one piece to fit the front and back of the collar, as described, and the side sections, formed in two pieces and fitted to the hame-crease, substantially as and for the purpose set forth.

2. In a horse-collar mold, the top and bottom sections, fitted to one another upon the inner side of the collar, and provided with an open space at the outer side along the line of the hame-crease, in combination with the loose sections C, fitted to such open space for shaping the hame-crease, and held in place by the pins E, the whole arranged and operated as and for the purpose set forth.



297,701. CAR-COUPLING. DAVID T. LINDSAY, Cairo, Ill. Filed Mar. 21, 1884. (No model.)

Claim.—The combination, with the draw-head, of the pin-rest and link-supporting head A, tube B, attached to head, tube C, attached to filling-piece E, and the spiral spring D, as shown and described.

297,702. MACHINERY FOR MAKING PAPER. GEO. E. MARSHALL, Turner's Falls, Mass. Filed Mar. 25, 1884. (No model.)

Brief.—Improvement on the invention in Letters Patent No. 275,056, dated April 3, 1883.

Claim.—1. The combination of the four cone-pulleys M N O P, for the purpose of changing and regulating the speed of a paper-machine, constructed substantially as described

2. The combination of the cone pulleys M N O P with the shaft F, by which are driven the couch-roll, the press-roll, the driers, and the calender, or any one of them, constructed substantially as described.

3. The combination of the friction-wheels V V with the screw X and the shafts L and W, for driving the felt washers 2 2, constructed substantially as described.

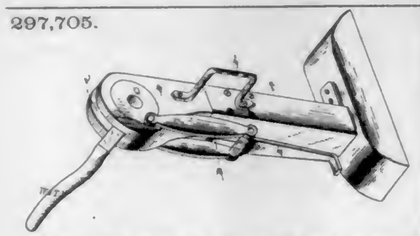
4. The combination of the main shaft and the cone-pulleys M, N, O, and P with the shaft F, to drive the different parts of paper machinery, giving to each the requisite degree of speed without the necessity of stopping the machine or changing the gear-wheels.

297,703. APPARATUS FOR CONSTRUCTING ARTIFICIAL TOOTH-CROWNS. ARTHUR E. MATTESON, Chicago, Ill. Filed Oct. 12, 1883. (No model.)

Claim.—1. A die for swaging artificial-tooth-crown blanks, having a face shaped to give form to the metal crown-blank, and also having an anvil-surface opposite the face of the die, around which a portion of the blank is bent or formed, substantially as described.

2. The combination of a male die for swaging artificial-tooth-crown blanks, having an anvil-surface opposite the swaging-face of said die, with a female die shaped to receive the swaging-face of said male die, substantially as described.

3. A pair of pivoted jaws forming part of a swaging device, fitted with detachable swaging or forming dies, for forming artificial tooth-crowns, substantially as described.

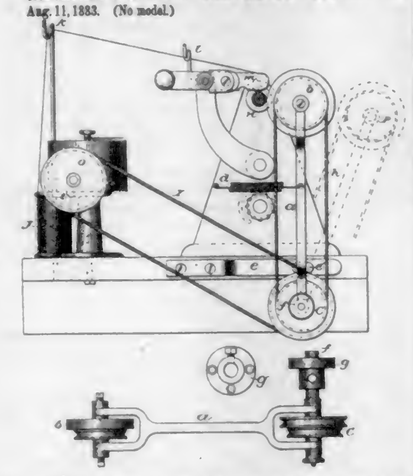


297,704. ARTIFICIAL TOOTH-CROWN. ARTHUR E. MATTESON, Chicago, Ill. Filed Sept. 17, 1883. (No model.)

Claim.—An artificial tooth crown or shell, or portion thereof, constructed of a compound plate of gold and platina, substantially as described.

297,705. LIFTING-JACK. HENRY WILLAM MOHANY, Mount Horeb, Wis., assignor of two-thirds to Halvar Nelson and Henry J. Eggers, both of same place. Filed Mar. 4, 1884. (No model.)

297,705.



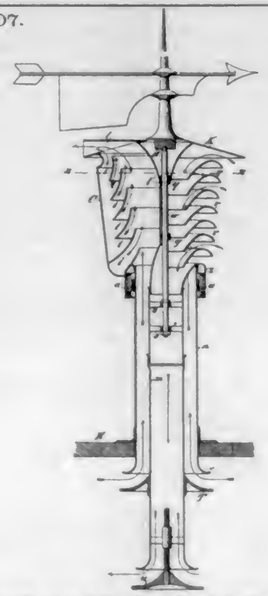
Claim.—1. The combination, with a suitable upright or standard, of a jack-head secured to the upper end thereof, said jack-head being provided with a slot extending around a portion of its circumference and provided with an enlarged opening, substantially as set forth.

2. The combination, with a suitable upright or standard provided at its upper end with a jack-head or bracket having a slot and opening, as shown, of a roller having bearing in said opening, substantially as set forth.

3. The combination, with a jack-head or bracket supported upon a suitable standard, and provided with a slot and opening, as shown, of a roller having bearing in said opening, and provided with a recess or slot for the reception of a bar or lever, substantially as set forth.

4. The combination, with a jack-head or bracket supported upon a suitable standard, and provided with a slot and enlarged opening, as shown, of a roller bearing in said opening, and provided with a recess or slot for the reception of a bar or lever, and arms connected to the sides of said roller, said arms being provided at their ends with a pivoted portion having an angular end, substantially as set forth.

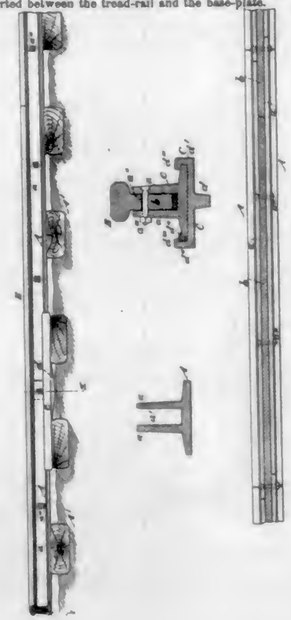
297,706. MACHINERY FOR MEASURING SILK THREAD DURING THE PROCESS OF SPOOLING. ROBERT MORRISON, Canton, MASS. Filed Aug. 11, 1883. (No model.)



Claim.—The combination of the pivoted arm *a*, the wheel *b*, having an elastic and a grooved face, the wheel *c*, the bands *h* and *i*, and the tension-spring *d*.

297,707. VENTILATOR. CONRAD MÜLLER, Hamburg, Germany. Filed May 28, 1883. (No model.) Patented in Germany Sept. 23, 1882, No. 22,015.

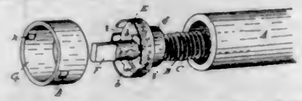
Claim.—1. The combination, with stationary inlet and outlet tubes *m n*—one within the other—of a cowl having a central partition, *t*, and a cap or crown, K, with which said partition is connected, and having on one side of said partition a series of funnels, *r r*, communicating with the inlet-tube *m*, and on the other side a series of inverted funnels, *i i*, communicating with the outlet-tube *n*, substantially as herein described.



2. The combination, with stationary inlet and outlet tubes *m n*—one within the other—of a cowl having a central partition, *t*, and a cap or crown, K, with which said partition is connected, and having on one side of said partition a series of funnels, *r r*, communicating with the inlet-tube *m*, and on the other side a series of inverted funnels, *i i*, communicating with the outlet-tube *n*, and a mantle, C, inclosing said funnels, open at the edges of the partition *t*, and communicating with an opening, *l*, provided in the cap or crown K on the same side of the partition *t*, substantially as herein described.

297,707.

297,708. RAILROAD-RAIL AND RAIL-JOINT. JOHN S. MCLEOD, Boston, MASS. Filed Apr. 23, 1883. (No model.)



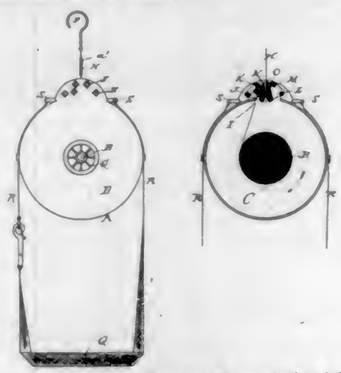
Brief.—A compound railroad-rail set in a base-plate having vertical ribs. One of the ribs is projected beyond and one set back of the ends of the plate. The tread-rail is inserted between the ribs of the base-plate, and has vertically-elongated bolt-holes in its web. A cushion is inserted between the tread-rail and the base-plate.

Claim.—1. A base-plate for a compound railroad-rail, having vertical ribs or flanges on its upper face, one of said ribs or flanges being projected beyond and one set back from each of the respective ends of the plate, substantially as and for the purposes set forth.

2. In a compound railroad-rail, a base-plate having vertical ribs or flanges on its upper face, one of said ribs or flanges being projected beyond and one set back from each of the respective ends of the plate, combined with a tread-rail inserted between the ribs or flanges of the base-plate, and having vertically-elongated bolt-holes in its web, and a cushion inserted between the bottom of the tread-rail and the base-plate, substantially as and for the purposes set forth.

297,709. CURTAIN-FIXTURE. WALTER B. NOYES, Saginaw, Mich. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a spring curtain-fixture, the spindle B, constructed in two sections, between the engaging ends of which the box and pawl-disk are secured, substantially as described.



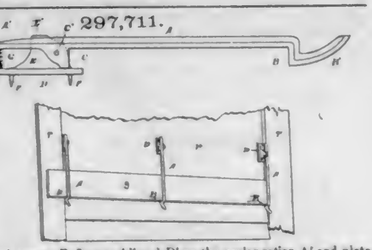
2. In a spring curtain-fixture, the combination of the spring-spindle B, cap H, and flattened spindle-section F with the box D and pawl-disk E, substantially as set forth.

3. In a spring curtain-fixture, the combination of the spring-spindle B and means, substantially as described, for securing thereto the flattened end section, F, with the disk and box D, provided with the hollow boss *d*, substantially as described.

4. The combination, in a spring curtain-fixture, of the roller A, spring-spindle B, spring C, spindle F H, box D, pawl-disk E, and ferrule G, when constructed, arranged, and operating substantially in the manner and for the purposes set forth.

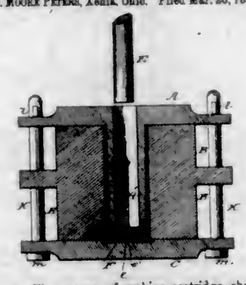
297,710. FIRE-ESCAPE. MATTHEW C. O'CONNOR, New Haven, CONN. Filed May 23, 1883. (No model.)

Brief.—The rope or band is passed from the reel over bearing-pins and friction-blocks near the opening of the case.



Claim.—1. In a portable fire-escape, the combination of the case A, having rounded bearing-pins I J K L M projecting from the inner face of the back plate, C, and friction-blocks N O, arranged between said bearing-pins, webbing or other suitable material, H, means, substantially as described, for coiling and uncoiling the same, and the sling Q, substantially as and for the purpose set forth.

2. The fire-escape herein described, consisting of case A, having rounded bearing-pins I J K L M, and friction-blocks N O, having rounded lower ends, webbing or other suitable material, H, adapted to travel across the faces of said pins, and across the rounded lower ends of both of and around one and between both of said friction-blocks, central shaft, B, hand-wheel G, and sling Q, substantially as and for the purpose set forth.

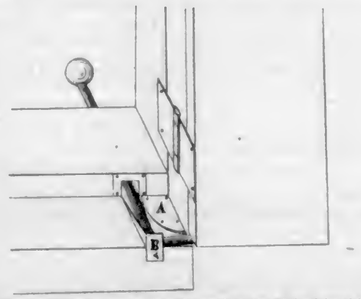


297,711. SIDING-HOOK. JOHN D. OTIS and DWIGHT M. MAXWELL, Peoria, Ill. Filed Oct. 17, 1883. (No model.)

Claim.—The hook B, having straight shank A and lug C, in combination with the plate D, having lug E, to which said shank A is pivoted, and prongs F, fingers A″ and D′ on the prolongation A′ and plate D, respectively, and the coiled spring G, abutting between said fingers, substantially as and for the purpose set forth.

297,711.

297,712. MANUFACTURE OF CARTRIDGE-SHELLS FROM PAPER-PULP. G. MOORE PETERS, Xenia, Ohio. Filed Mar. 20, 1884. (No model.)



Claim.—1. The process of making cartridge-shells from paper-pulp, which consists in pouring said pulp into a mold enlarged vertically and circumferentially at the bottom to form the base of the shell, and having an internal tube slightly tapered on its outer surface and rounded at the bottom, and a piston for forcing the pulp into the mold, whereby the body of the shell is formed in said mold, substantially as and for the purpose set forth.

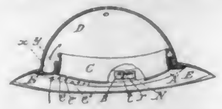
2. A mold for making cartridge-shells from paper-pulp, consisting of the internal cylinder, and sides having a tapered opening between them, and a base provided with means for forming a seat for the primer, and an opening through the base into the charge, substantially as set forth.

3. A cartridge-shell made of paper-pulp compressed or molded, and provided with a thickened base and a flange, and a seat for the primer, substantially as set forth.

297,713. SHUTTER-WORKER. JOHN POOL, Elizabeth City, N. C. Filed July 3, 1880. Renewed Oct. 5, 1883. (Model.)

Brief.—The invention consists in providing a curved fulcrum-plate for the jointed lever, whereby a continuous fulcrum-bearing surface is obtained.

Claim.—In a shutter-worker, the combination of the jointed lever *a b c* with the fixed curved fulcrum-plate A in the form of a section of an ellipse, and filling the angle between the window-frame and said jointed lever, whereby said jointed lever is afforded a continuous fulcrum-surface during the opening or closing of the shutter, substantially as described.



297,714. VEHICLE. JACOB PEREK, San Leandro, Cal. Filed Oct. 6, 1883. (No model.)

Claim.—1. In a vehicle, the side bars shaped to the form of the body, with vertical and horizontal ribs, and supplemental lugs or seat-supporting flanges, substantially as herein described.

2. In a vehicle, the side bars shaped to the form of the body, with vertical and horizontal ribs, and the deep vertical webs *a a* at the bends or angles, and the supplemental lugs, substantially as herein described.

297,715. ADJUSTABLE VENTILATOR FOR HATS. WILLIAM M. PROTHEROE, New York, N. Y. Filed Apr. 16, 1883. (Model.)

Claim.—1. An entire horizontally sliding, swinging, or movable hat-sweat, substantially as and for the purposes described.

2. A hat-sweat made smaller in circumference than the interior circumference of the hat, and secured thereto by slides or other fastenings, whereby the sweat is capable of horizontal movement relatively to the hat, substantially as and for the purposes described.

3. The combination of the hat D E, the hat-sweat C, and the slides or fastenings *g*, whereby the sweat is capable of horizontal movement relatively to the hat, substantially as and for the purposes described.

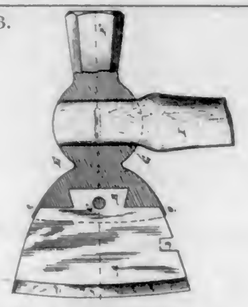
4. As a new article of manufacture, a hat-sweat strengthened or braced, and provided with slides or other fastenings for the purpose of securing the sweat within the hat, and of allowing a horizontal movement of the same relatively to the hat, substantially as and for the purposes described.

5. As a new article of manufacture, a continuous ring of stiffened felt, provided with slides or other fastenings for the purpose of securing said ring within a hat, and of allowing a horizontal movement of said ring relatively to the hat, substantially as and for the purposes described.

6. In a ventilating-hat, the sweat-band C, the flange A, perforated at *a a' a''*, &c., and the flange A', in combination with the slides or other fastenings, *g*, whereby said sweat-band and flanges are capable of horizontal movement relatively to the hat, substantially as and for the purposes described.

7. In a ventilating-hat, the continuous ring of felt A B A', with perforations *a a' a''*, &c., and the sweat-leather C, in combination with the slides or other fastenings, *g*, whereby said ring of felt and sweat are capable of horizontal movement relatively to the hat, substantially as and for the purposes described.

8. In a ventilating-hat, the sweat-brace B, with flanges A A', perforated at *a a' a''*, &c., in combination with slides or other fastenings, *g*, whereby said sweat-brace is capable of horizontal movement relatively to the hat, substantially as and for the purposes described.



9. A ventilating device for hats, consisting of the sweat-band C, made smaller in circumference than the interior circumference of the side crown, D, at its intersection with the brim E, to admit air between it and the side crown, braced or strengthened by a ring of metal, felt, or other material, provided with the flange A, perforated at *a a' a''*, &c., and the flange A', all secured to the hat by the slides or other fastenings, *g*, in such manner that by horizontal movement of the sweat relatively to the hat the ventilation may be opened or closed or changed, substantially as described.

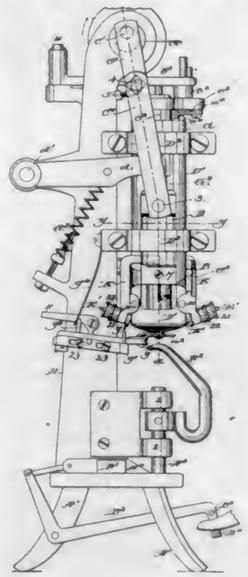
10. In combination with the horizontally sliding, swinging, or movable hat-sweat C, the flange A, constructed sufficiently broad so as to enable the wearer to support it firmly up against the under side of the hat-brim E between the thumb and fingers in the operation of putting on and removing the hat, substantially as and for the purposes described.

297,716. HATCHET. ALFRED C. REX, Philadelphia, Pa. Filed Feb. 1, 1884. (No model.)

Claim.—A hatchet the body of which is made of cast-iron, and cast upon a steel blade formed with a dovetail extension, and an aperture through which the metal of the body flows, substantially as and for the purpose specified.

297,716.

297,717. RULER. PEREZ C. REX, Boston, assignor to Charles J. Bailey and Julius M. Clapp, both of Newton, Mass. Filed Feb. 29, 1884. (No model.)



Claim.—1. As an improved article of manufacture, a ruler composed of a roller and a bar loosely connected each with the other by links which hold the pivots for the bar, whereby the ruler may be used at will with either side of the bar uppermost, the under side thereof then resting flat on the paper below it, to operate substantially as and for the purpose described.

2. In a ruler, a roller and flat bar joined together by links, and having a stop to arrest the movement of the bar with relation to the roller, whereby either side of the flat ruler may be laid upon the paper, substantially as described.

3. In a ruler, a roller and flat bar and links to join them, the said roller being provided with a scale, and the links with an index to operate, substantially as described.

297,718. MACHINE FOR UNITING THE UPPERS AND SOLES OF BOOTS OR SHOES. STILLMAN W. ROBINSON, Columbus, Ohio, assignor of one-half to Orlando E. Lewis, same place. Filed Aug. 2, 1883. (No model.)

Claim.—1. In a nailing-machine, a support for the stock, the uniformly-reciprocated working-head and the spring-pressed sleeve carried thereby, and the spindle therein and its grippers *a*, adapted to engage the fastening strip or wire, and to drive the same into the stock, the grippers acting to drive the said strip or wire into the stock after the sleeve is arrested in its downward movement, substantially as described.

2. The uniformly-reciprocating working-head, the spindle provided with grippers to engage the fastening strip or wire, and the sleeve to receive the spindle, and adapted to be lifted with the working-head and to descend therewith until arrested by the stock on the work-support, combined with the screws or projections 7, carried by the working-head, to act upon the grippers *a* and force them toward each other, to grasp and drive the strip or wire into the stock, substantially as described.

3. The work-support and the working-head and its grippers, both working in unison with an unvarying length of stroke, combined with the reciprocating sleeve D', spindle B therein, and grippers *b b*, the latter having a varying stroke determined by the thickness of the stock, all co-operating to insert the fastening strip or wire, to insure the production of a fastening therefrom in accordance with the thickness of stock being operated upon, substantially as set forth and described.

4. The spindle B and its throat-piece 17, having an opening or channel corresponding in cross-section with the cross-section of the fastening strip or wire, combined with means, substantially as described, to partially rotate the spindle, the latter turning the strip or wire with it, as set forth.

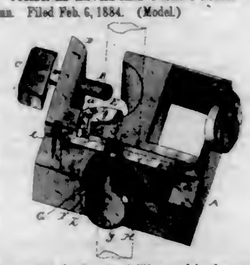
5. In a nailing-machine, the combination of mechanism, substantially as described, to drive the end of the fastening strip or wire into the stock, with the grippers to engage and partially turn or rotate the driven strip or wire after its insertion into the stock, whereby the grooved edges of the strip are enabled to cut into portions of the stock, notorn or abraded by the grooved edges of the strip or wire when being driven into the stock, substantially as described.

6. The combination of the working-head, sleeve D', partially-rotating spindle B, grippers *a a*, and adjusting-screws 7 7 with the grippers *b b*, ring *e*, bars *e' e'*, block *e*^{3}, and spring *e*^{2}, as described.

7. The combination of the spindle B, grippers *b b*, and ring *e* with vertical bars *e' e'*, to operate the said ring and grippers, substantially as described.

8. The working-head D and sleeve D', combined with the lever *d* and spring to act upon and press the nose of the sleeve upon the stock, substantially as described.

9. The combination of the partially-rotating rod and projections *f* thereon, and levers E E, for operating the cutters, as described.

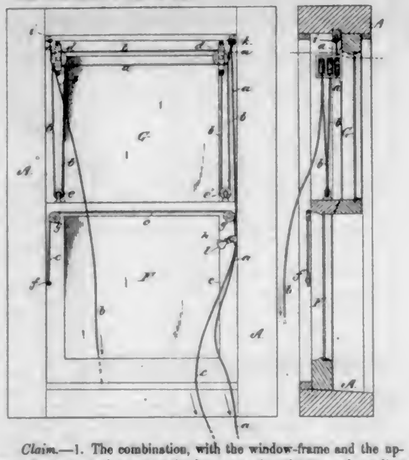


10. The working-head, sleeve, and spindle B and grippers *a b*, combined with the levers and cutters to cut off the driven wire next the stock, substantially as described.

11. The combination of the feed-bar *g* with the bar *g'*, having a slot at its back end and a pin, *g*^{2}, at its front end, as and for the purpose described.

12. The work-support and the spindle through which the fastening strip or wire is extended, and means, substantially as described, to reciprocate and to partially rotate the said spindle, combined with grippers to engage the fastening strip or wire and drive it into the stock to hold and partially rotate the strip or wire in the stock, as set forth.

13. The herein-described method of uniting pieces of leather, which consists in forcing into the same a wire, portions of which are grooved or serrated, while other portions are smooth, and thereafter partially rotating the said wire in the leather and cutting off the wire, substantially as and for the purposes set forth.



297,719. COMBINED LEVEL AND BORING-GUIDE. ALBERT ROOT, Hamden, Conn. Filed Feb. 6, 1884. (Model.)

Claim.—1. An attachment for drilling and boring tools, consisting of a block or plate, means, substantially as described, for attaching the same to the tool, an indicator disk or dial attached to said block or plate, a rim or ring loosely mounted on and adapted to move circumferentially around said disk or dial, and having a suitable pointer thereon, and a weighted pointer pivotally attached to the disk or dial, with capability of oscillating therein, substantially as set forth.

2. The attachment for drilling and boring tools herein described, consisting of a block or plate having means, substantially as described, for attaching the same to the tool, and indicator-dials or disks attached to said block or adjacent sides thereof, each dial being provided with an indicator-ring loosely mounted on the circumference thereof, and a pivoted weighted pointer, substantially as and for the purpose set forth.

297,720. SASH-BALANCE. S. HOWLAND RUSSELL, New York, N. Y. Filed Jan. 11, 1884. (No model.)

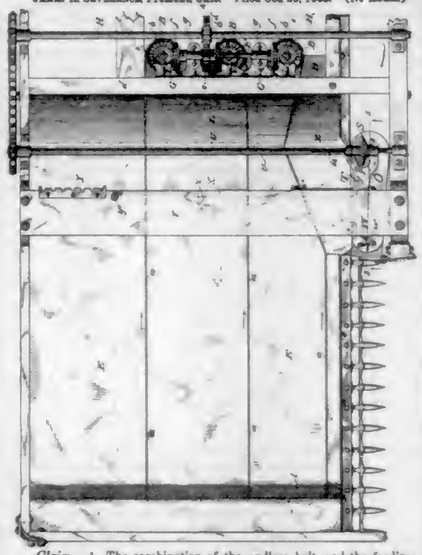
Claim.—1. The combination, with the window-frame and the upper sash, of the closing-cord *a*, fixed at one end to the frame depending in a loop therefrom, and passing under pulleys on the upper sash, thence over a pulley, *k*, fixed to the frame, and thence depending therefrom for manipulation, substantially as and for the purpose set forth.

2. The combination, with a window-frame and the lower sash, of the closing-cord *c*, fixed at one end to the frame, and passing over a pulley, *g*, on the sash, and thence depending for manipulation, substantially as herein set forth.

3. The combination, with a window-frame and its upper and lower sashes, of the two pulleys *d d''*, affixed to the top of the upper sash, and the two pulleys *e e'*, affixed to the top of the lower sash, with the opening-cord *b* fixed at one end to one of the sashes, thence passing in successive loops over the respective pulleys, and finally depending for manipulation, substantially as and for the purpose set forth.

297,721. BALE-TIE. HALBERT RUST, Jeffersonville, Ind. Filed Feb. 28, 1884. (No model.)

Claim.—1. In a bale-tie, the plates A, each being provided with a raised cross-bar, *a*, and an end bar, *b*, for attachment of band, and having a tongue turned from the plane of the plate, and an opening for passage of a tongue, substantially as and for the purpose described.



2. In a bale-tie, two plates, A, provided with tongues *c*, raised bars *a*, end bars, *b*, and openings for passage of tongues, in combination with a band with its ends applied to said plates, substantially as shown and described.

297,722. PENCIL-CLASP. GUSTAVUS A. SCHLEICHTER, Reading, Pa. Filed Nov. 16, 1883. (No model.)

Claim.—A pencil clasp or holder composed of a tubular body, A, open at both ends, having a longitudinal slot, C, extending from one end to a re-enforce head, B, near the opposite end, a presser-foot E, and pin F attached to said head, and having near its slotted end a female bead, D, in combination with a reversible holder, G, provided with a male locking-bead, I, and a hook or eye, J, adapted to slide in the slot C, and its respective ends provided with a pen and rubber, substantially as and for the purpose set forth.

297,723. GRAIN-DELIVERING APPARATUS FOR HARVESTERS. JAMES R. SEVERANCE, Fremont, Ohio. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination of the endless belt, and the feeding-teeth rigidly secured to the side and crosswise of the belt and projecting from its edge, substantially as and for the purpose hereinbefore set forth.

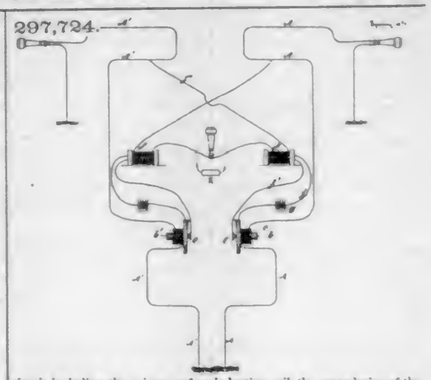
2. The combination, substantially as hereinbefore set forth, of the slotted surface or platform-cover, driving and driven pulleys rotating with their faces in a plane parallel to the slotted surface, endless belts beneath the slotted surface and passing around said pulleys, and the feeding-teeth rigidly secured to the sides and crosswise of the belts and projecting from their edges, for the purpose described.

3. The combination of the platform having the slotted surface, the endless carrier, and the pulleys by which the front section of the carrier is deflected inwardly at the inner front corner of the slotted surface, substantially as and for the purpose hereinbefore set forth.

4. The combination of the platform having the slotted surface lowered at its inner front corner, the endless carrier, and means by which the front section of the carrier is deflected inwardly to leave an unobstructed space above the lowered inner front corner of the platform's surface, substantially as and for the purpose hereinbefore set forth.

5. The combination, substantially as hereinbefore set forth, of the platform having the slotted surface, the endless carrier, means by which the front section of the carrier is deflected inwardly to provide an unobstructed space at the inner front corner of the platform's surface, and the adjustable butter, for the purpose described.

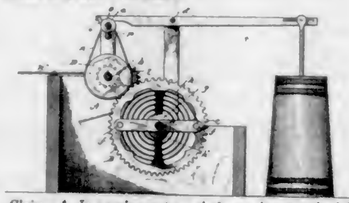
6. The combination, substantially as hereinbefore set forth, of the platform, the batter, its frame, the batter-actuating shaft, the suspending-bracket sliding along said shaft, and with which the batter-frame is connected at its inner end, and the support for the outer end of the batter-frame and by which it is allowed vibratory and longitudinal movement, for the purpose described.



7. The endless butter composed of the chain having the inclined teeth secured to its detachably-united links, substantially as and for the purpose hereinbefore set forth.

297,724. TELEPHONE-REPEATER. DANIEL E. SMITH, Hartford, Conn. Filed Sept. 27, 1883. (No model.)

Claim.—1. The combination of two main wires to and from the repeating-station which ground at that station, repeating-magnets in the main-line circuits, microphones in the primary circuit of the induction-coils, a local battery in the latter circuit, and a rheostat interposed between the induction-coils in their secondary circuit, the said secondary circuit being completed by joining the free ends of the wire to the opposite main-line wires at the repeating-station and beyond the repeating-magnet on the wire to be transmitted into, all substantially as described.



2. In a telephone repeating apparatus, the combination of the main-line wires that ground at the repeating-station directly through the repeating-magnets in the line-circuits, the said repeating-magnets in operative proximity to michrophones in local-battery circuits, each battery-

297,724.

circuit including the primary of an induction-coil, the secondaries of the two induction-coils connected in series and with the line beyond the repeating-magnets, and the resistance included in said secondary circuit, all substantially as described.

297,725. SPRING-MOTOR. ALFRED D. STANSBURY, Collier's, W. Va. Filed Feb. 13, 1884. (No model.)

Claim.—1. In a spring-motor, a shaft, *a*, and a gear-wheel, B, loose on said shaft, provided with a yoke composed of the bar *e* and posts *f*, and a drum, *g*, fast on said shaft, combined with a spring connected at one end with said drum, and at the other with one of the posts *f*, substantially as and for the purpose described.

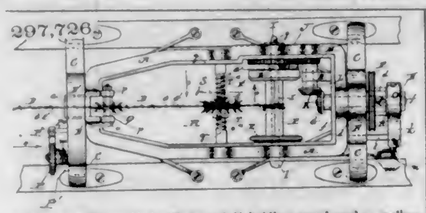
2. The shaft *a*, wheel B, loose thereon, and the spring connected to said shaft and wheel, substantially as described, combined with the gear C on said shaft, and the shaft *b*, having gear *i*, and clutch-gear *k*, arranged as set forth.

3. The shaft *a*, wheel B, loose thereon, and the spring connected to said shaft and wheel, substantially as described, combined with the winding or intermediate idler-pinion, *l*, located between the wheel B and clutch-gear *k*, as set forth.

4. The shaft *a*, wheel B, loose thereon, and the spring connected to said shaft and wheel, substantially as described, the gear C on said shaft, and the shaft *b*, having gear *i*, and clutch-gear *k*, combined with the pawl *t*, to engage wheel B, all arranged to operate as set forth.

5. The shaft *a*, wheel B, loose thereon, and the spring connected to said shaft and wheel, substantially as described, the gear C on said shaft, and the shaft *b*, having gear *i*, and clutch-gear *k*, combined with the pawls *t* and *u*, to engage wheels B and C, respectively, all arranged to operate as set forth.

6. The shaft *a*, wheel B, loose thereon, and the spring connected to said shaft and wheel, substantially as described, the gear C on said shaft, and the shaft *b*, having gear *i*, clutch-gear *k*, and band-pulley D, combined with the cranked shaft *c*, the beam or lever *q*, connected with said cranked shaft, and a belt, *n*, for transmitting motion from shaft *b* to shaft *c* to vibrate the lever, all arranged and operating as set forth.

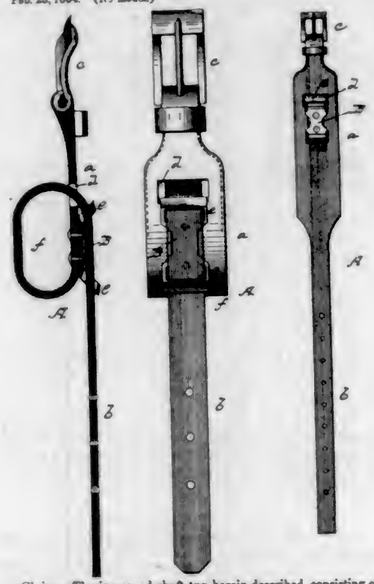


7. In a spring-motor, the rock-shaft *d*, combined with a pendulum having one or more spring-coils in its arm, and an adjustable weight, substantially as and for the purpose described.

297,726. MACHINE FOR TWISTING AND SPOOLING BARBED-WIRE FENCING. DANIEL C. STOVER, Freeport, assignor to I. L. Ellwood & Co., De Kalb, Ill. Filed Mar. 2, 1883. (No model.)

Claim.—1. The combination of a holding-spring, A, with the spool E, driving spur-gear J, and revolving frame A, in which said spool and gear are supported, substantially as and for the purposes set forth.

2. The combination, with the pulley H, shaft *f*, frame A, supporting-frame C, spool E, and gearing between the spool E and shaft *f*, of



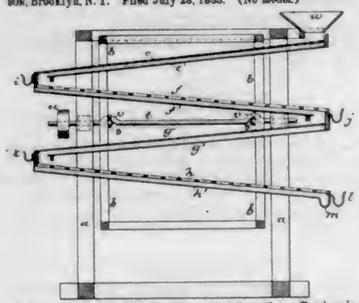
297,726.

friction-strap O, provided with arms *k k'*, holding part *l*, cord *m*, pulleys *n*, ratchet-wheel P, provided with hub P', and pawl P², substantially as and for the purposes set forth.

3. The combination of the frame A and spool E with one or more springs, *h*, spur-gear J, pinion M, shaft L, bevel-gear K, bevel-gear G, shaft *f*, and the means for holding said shaft, substantially as and for the purposes set forth.

297,727. SHAFT-TUG. PHINEAS B. SWICK, Tecumseh, Mich. Filed Feb. 23, 1884. (No model.)

Claim.—The improved shaft-tug herein described, consisting of the single strap A, having the broad loop portion *a*, narrow strap portion *b*, the transverse slot *d*, and the buckle *c*, and provided with the plate B, secured on the outer face of the loop portion, having end loops, *e e*, to receive the strap *b* after the latter is passed through the slot *d* in forming the shaft-loop *f*, the whole constructed and arranged as shown, described, and for the purpose set forth.



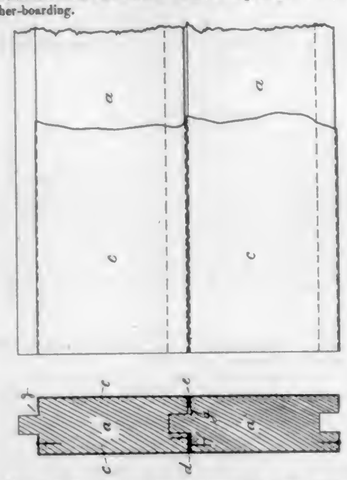
297,728. DIAMOND-HOLDER FOR STONE-DRESSING TOOLS. ABE L. TEETOR, Cambridge City, Ind. Filed June 28, 1883. (No model.)

Claim.—1. The combination, with a recessed head, of the follower, one end of which is provided with a series of notches, so as to accommodate diamonds of various shapes, and a screw for moving the follower, substantially as set forth.

2. The combination, with a recessed head, of a reversible follower, one end of which is provided with a series of notches, and the opposite end plain, and a bolt for securing the diamond between the follower and head, substantially as set forth.

297,729. COFFEE SEPARATOR AND ASSORTER. JOHN S. THOMPSON, Brooklyn, N. Y. Filed July 28, 1883. (No model.)

Claim.—1. A sieve for separating round from flat coffee-berries, provided with oblong meshes of a width and length to admit the flat berries, and sides of prolonged depth equal to their width, or sufficient to prevent the rotation of the round berries therein, whereby the flat berries drop through the meshes, while the round berries pass off the top of the sieve, substantially as herein set forth.



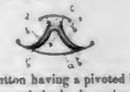
2. A sieve for separating round from flat coffee-berries, formed of narrow strips set up edgewise and fastened together in a supporting-frame at fixed intervals, and sufficiently apart to form oblong meshes between the strips, which meshes have a prolonged depth equal to their width, or nearly so, substantially as and for the purpose set forth.

3. A coffee-assorting machine for separating round from flat berries, formed with a series of successively-arranged screens of successively-diminishing mesh over which the coffee is passed successively, the said screens being formed alternately with mesh of shallow depth—such as *e g*—and mesh of prolonged depth—such as *f h*—whereby the coffee is separated into round and flat berries of different sizes, substantially as herein shown and described.

4. In a coffee sifting and separating machine, the successively-arranged series of screens *e f g h* of diminishing mesh, the screens *e g* having round-holed mesh of immaterial depth, and the screens *f h* slotted mesh of prolonged depth, arranged and operating substantially as and for the purpose set forth.

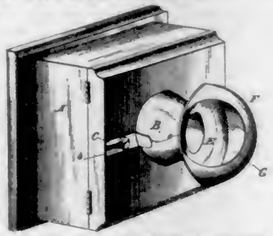
297,730. FIRE-RESISTING WEATHER-BOARDING. PETER TOGLIO, Charleston, S. C. Filed Feb. 5, 1884. (No model.)

Brief.—Weather-boards saturated with non-inflammable material are covered with thin sheets of metal, having flanges secured to the weather-boarding.



Claim.—1. Fire-resisting weather-boarding for frame houses, consisting of weather-boards saturated with uninflammable material and with their surfaces protected by coverings of thin sheet metal, substantially as herein described and shown.

2. In combination with fire-resisting weather-boarding, the coverings of thin sheet metal *c c*, made with flanged edges *d* and *e*, and fast-

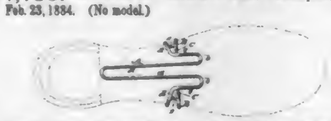


oned to the weather-boards, substantially as described and shown, and for the purpose set forth.

297,731. SLEEVE-BUTTON. JOHN B. VAN HOUTEN, Newark, N. J. Filed Apr. 6, 1883. (No model.)

Claim.—In a sleeve-button having a pivoted back or shoe, the combination, with the face-plate and the back or shoe, of a bifurcated tubular shank, the diverging ends of which are secured to the face-plate, and a spring contained therein, as described, arranged to engage with a lug upon said shoe, as shown, to hold the latter in operative and inoperative relations to the face-plate, substantially as and for the purposes set forth.

297,732. TELEPHONE MOUTH AND EAR PIECE. FRANCIS WARE, Boston, Mass. Filed Jan. 14, 1884. (No model.)



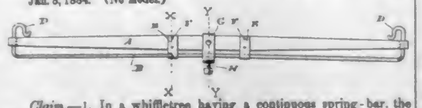
Claim.—1. A mouth or ear piece for telephones, consisting of two hemispherical sections joined by a conical section, substantially as described.

2. A mouth or ear piece for telephones, consisting of two hemispherical sections joined by a conical section, the outer hemisphere having an opening in its side.

3. In a mouth or ear piece for telephones, the combination, with the flaring connecting-piece E, of the hemispherical piece F, having an opening, G, the construction being such that the latter may be turned upon the former, to bring the opening into any desired position.

4. The combination, with the case of a telephone, of a mouth and ear piece consisting of two hemispherical sections joined by a conical section, and means for attaching the same to the telephone-case, as set forth.

297,733. ICE-CREEPER. CHARLES F. WEST, Philadelphia, Pa. Filed Feb. 23, 1884. (No model.)



Claim.—1. An improved ice-creeper consisting of a shank, clips at the sides thereof, and spurs projecting from the clips formed of a continuous piece of wire, substantially as and for the purpose set forth.

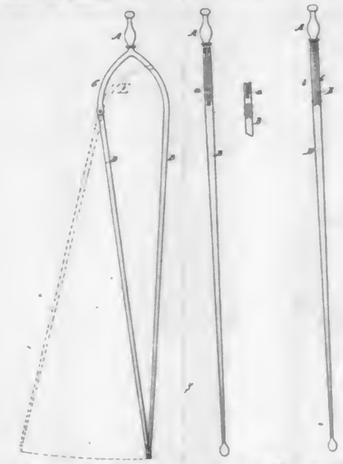
2. The shank A, clips B, and spurs C, formed of the parts *a b c d e f*, continuous of each other, substantially as described.

3. An ice-creeper formed of a continuous piece of wire having a shank, clips, and spurs, said shank consisting of two elastic arms, *a a*, which are united by a bend at the rear of the shank, substantially as and for the purpose set forth.

297,734. WHIFFLETREE. JAMES WHITCOMB, San José, Cal. Filed Jan. 3, 1884. (No model.)

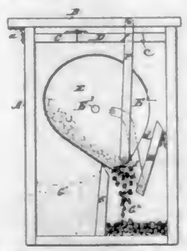
Claim.—1. In a whiffletree having a continuous spring-bar, the fixed band G, provided with a set-screw, H, which by tightening or loosening causes the spring-bar to act with a greater or less resilience, substantially in the manner as herein set forth and specified.

2. The combination and arrangement of the beveled wooden bar, continuous spring-bar, angle-irons or fulcrum, and the fixed band provided with the adjusting set-screw, constructed and operating substantially in the manner as herein set forth and specified.



297,735. SPRING FOR STEAM AND OTHER PRESSURE GAGES. EDWIN A. WOOD, Utica, N. Y. Filed Jan. 16, 1884. (Model.)

Claim.—1. As a new article of manufacture, a diaphragm-spring for pressure-gages, composed of plates or disks of brass or other suitable metal, compressed or compacted into the required shape and tempered by the action of rolls, as set forth.



2. A diaphragm-spring for pressure-gages, composed of an upper plate having its edges turned downward and then inward and upward, in combination with a lower plate having its edges turned down to interlock with the upturned edges of the upper plate, and soldered thereto, as set forth.

297,736. TONGS. WILLIAM E. WOOD, Houston, Tex. Filed Aug. 22, 1883. (No model.)

Claim.—In a pair of tongs, the stationary leg B, having the slot *a*, and the stationary arm C, having the slot *b*, in combination with the movable leg D, pivoted to the arm C, and having the extension E, substantially as shown and described.

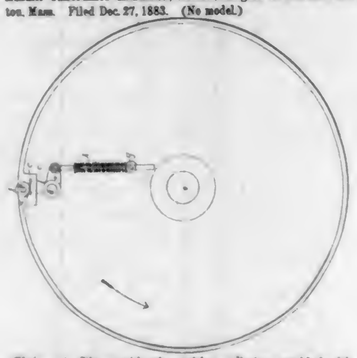
297,737. ASH-SIFTER. WILLIAM T. ADAMS, Baltimore, Md. Filed Dec. 10, 1883. (No model.)

Claim.—1. The sifter or screen made in the shape of a cylindrical receptacle having a longitudinal opening, and hung centrally upon bearings in the case, combined with the case and bearings, the lid B, and a link-bar connecting the two for oscillating and inverting the sifter, as shown and described.

2. The combination, with the case A and the hinged lid B, of the stationary top having smaller hinged lid D, adapted to sustain and form a brace for the lid B when they are opened, as described.

3. The combination, with a containing-case having two compartments in its bottom, of a hinged lid, B, a vibrating screen, a link-bar connecting the hinged lid to the vibrating screen, a hinged chute-board covering the coal-compartment, and a link-bar connecting the screen to the chute-board for the simultaneous operation of the lid B, screen, and chute-board, substantially as shown and described.

297,738. CAN-TOP. HORACE R. ALLEN, Indianapolis, Ind. Filed July 7, 1883. (No model.)



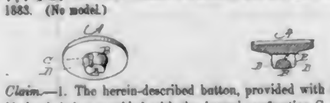
Claim.—1. As an article of manufacture, a wire covered with solder capable of use for soldering joints in metallic vessels, substantially as described and specified.

2. As an article of manufacture, a wire covered with solder having a shape in cross-section corresponding to that of the parts adjacent to the seam to be soldered, and capable of use for soldering joints in metallic vessels, as set forth.

3. As an article of manufacture, a wire covered with solder, a portion of the wire being bare of solder and to be used for soldering joints in metallic vessels, as described and specified.

4. For soldering and opening joints in metallic vessels on the metallic sheets to be soldered, a coating of any mixture that will act as a resist and keep the solder from adhering to the plates at all points except when the coating has been purposely removed, in combination with a solder-covered wire, substantially as described, and for the purposes specified.

297,739. GRIPPER MECHANISM FOR BRONZING-MACHINES, &c. ALBERT THEOPHILUS ANDERSON, Chelsea, assignor to Wm. H. Forbes, Boston, Mass. Filed Dec. 27, 1883. (No model.)

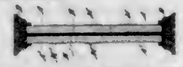


Claim.—1. The combination, with a cylinder provided with a gap, of a gripper-shaft which substantially fills said gap, and a suitable gripper-plate on said shaft, substantially as described.

2. The combination, with a cylinder having a gap of nearly circular outline, of a shaft which is nearly cylindrical and substantially fills said gap, and a gripper-plate attached to said shaft, and suitable operating mechanism, substantially as described.

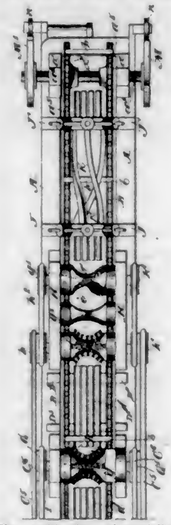
3. The combination, with a cylinder having a gap, of a bushing therein, said bushing having a longitudinal groove which is filled by the gripper-shaft, and a suitable gripper-plate on said shaft, substantially as described.

4. The combination of the cylinder having a gap, the bushing C therein extending to the periphery of the cylinder at C', but being slightly lower at C², the gripper-shaft *a*, and suitable operating mechanism therefor, and the gripper-plate *b*, its outer surface curved on the same circle as the cylinder, substantially as described.



297,740. BUTTON. JAMES F. ATWOOD, Boston, Mass. Filed Oct. 8, 1883. (No model.)

Claim.—1. The herein-described button, provided with the shank B, said shank being provided with the lateral perforation C, the opposite mouths or ends of which deepen or curve downward toward the outer end of said shank, as shown, thus causing the portion of the shank forming the bottom of the perforation to be convex in shape, whereby a wire fastening may be applied without causing a sharp bend therein, substantially as and for the purpose set forth.



2. The herein-described button, provided with the shank B, said shank being provided with a lateral perforation and with opposite vertical grooves, D, leading from the foot or outer end of the shank to said perforation, substantially as and for the purpose described.

297,741. LUMINOUS SIGN. GEO. H. BABCOCK, Plainfield, N. J. Filed Apr. 20, 1882. (No model.)

Claim.—The sign herein described, consisting of the glass plates A A', placed back to back, with a single coat of luminous paint, B, between the plates, the face of each plate having opaque letters, and the whole secured within the double frame D, as set forth.

297,742. MACHINE FOR HUSKING, SILKING, AND CUTTING CORN. GEORGE E. D. BALDWIN, Baltimore, Md., assignor, by direct and mesne assignments, to Lawrence W. Counselman and Albert L. Scott, both of same place. Filed Sept. 18, 1883. (No model.)

Claim.—1. The combination, substantially as described, with the bed of the machine, of the standards D' E, provided with circular heads D² and E', the guide-bars *d'*, secured within the heads D², and the knives *e*, located in the head E', as set forth.

2. The combination, with the circular head E', of the radial spring-impelled bars *e'*, provided with knives *e*, and the feed-belt B, passing through said head and between said knives, for the purpose set forth.

3. The combination, in a corn husking and silking machine, of a series of radial inwardly-pointed knives for longitudinally splitting the husk, and feed mechanism, substantially as described, for carrying the ear between said knives, as set forth.

4. In combination with the head E', provided with radially-arranged sleeves *e²*, the bars *e'*, knives *e*, springs *e³*, head D², and spring-guards *d'*, as set forth.

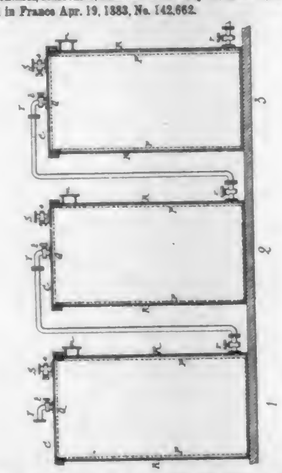
5. The combination, in a corn-husking machine, of a series of inwardly-pointed radial knives for slitting the husk longitudinally, a pair of concave brushes for removing the husk from the ear, and a continuous feed mechanism for impelling the ear consecutively through these devices, substantially as set forth.

6. The combination, with the bed of the machine, of the knives for slitting the husk, the concave brushes, knives for removing the corn from the ear, and continuous feed mechanism, as described, for impelling the ear, as set forth.

7. The combination, with the bed of the machine, of knives for removing the corn from the cob, feed mechanism for forcing the ear between said knives, and reciprocating sieves located below said knives, substantially as and for the purpose set forth.

8. The combination, with the bed of the machine, of knives for cut-

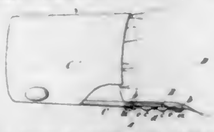
ting off the ends of the ears, knives for slitting the husk longitudinally, concave brushes for removing the husk, and a continuous feed mechanism, substantially as described, for propelling the ear of corn, as set forth.



9. The combination, with the bed of the machine, of knives for cutting off the end of the ear of corn, knives for slitting the husk longitudinally, brushes for removing the husk, and knives for removing the corn from the cob, a feed-trough, sections of which are interposed between each of the devices, and a continuous feed mechanism, substantially as described.

10. In combination, the bed of the machine and the following mechanisms mounted consecutively thereon and operated simultaneously, viz: a knife for cutting off the end of an ear of corn, radial knives for slitting the ear longitudinally, concave rotary brushes for removing the husk and silk, and a continuous feed mechanism for impelling the ear entirely through the machine.

11. The combination, with the bed of the machine and a feed mechanism for impelling the ear entirely through the machine, of devices for cutting off the ends of the ears, devices for slitting the husk, devices for removing it from the ears, and mechanism for cutting the corn from the cob, all arranged and operating substantially as set forth.



12. The combination, with the bed of the machine and a feed mechanism for impelling the ear entirely through the machine, of devices for removing the husk from ears of corn, and devices for removing the grain from the cob, substantially as set forth.

297,743. EXTRACTION OF OILS AND FATS FROM OLEAGINOUS AND FATTY BODIES. IVAR AXEL BANG, Paris, and CHARLES ALBERT SANGUINETTI, Marseilles, France. Filed May 31, 1883. (No model.) Patented in France Apr. 19, 1883, No. 142,662.

Claim.—The method herein described for treating oleaginous and fatty bodies in order to extract oil therefrom, which consists in first reducing the substance to a finely-divided state, then saturating it with a volatile deodorized product of petroleum, then drawing off the free liquid, and then passing the superheated vapor of a portion of the said volatile liquid through the mass in order to remove therefrom the remaining portions of the volatile solvent, substantially as set forth.

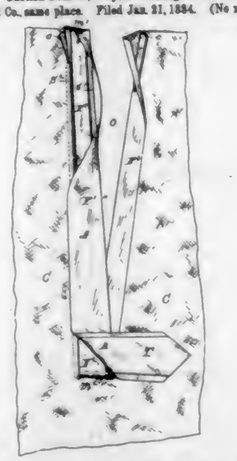
297,744. CUFF-HOLDER. HERMON D. BISHOP, West Hampton, N. Y. Filed Mar. 10, 1884. (No model.)

Claim.—1. A device for attaching and adjusting cuffs to shirt-sleeves, composed of two spring-metal strips or pieces formed with meeting jaws at their opposite ends, and united intermediately of their length, and constructed to open at either of said ends on pressure being applied to bring the strips together between such ends and the point of attachment of the strips, substantially as specified.

2. As a new article of manufacture, the cuff attaching and adjusting device, consisting of a corrugated spring-metal strip, A, having opposite end concave jaws, *a a*, with swells or protuberances *c c* between said jaws, and a spring-metal strip, B, having like concave jaws, *b b*, at its opposite ends, and united with the strip A between the protuberances *c c*, essentially as described.

3. The spring-metal strip B, having jaws *b b* at its opposite ends, and constructed with central side wings, forming clips *d d*, in combination with the corrugated spring-metal strip A, having jaws *a a* at its reverse ends, substantially as shown and described.

297,745. WAGON-TONGUE SUPPORT. JACOB BOWER, Lafayette, Ind. Filed Dec. 21, 1883. (No model.)

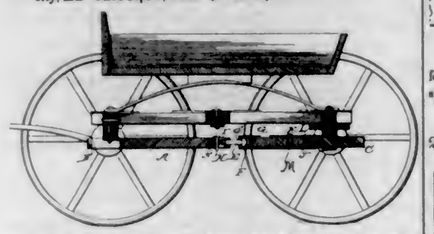


Claim.—1. In a wagon, the tongue C, provided with the pivoted button E, arranged upon the upper side of the tongue and adapted to act in connection with the hounds, substantially as and for the purposes set forth.

2. The tongue C, provided upon the under side with a spring having the hook H, in combination with the chain G, held by the hounds under the spring, substantially as and for the purposes set forth.

3. The tongue C, provided upon the upper side with the pivoted button E, in combination with the spring F, attached to the under side of the tongue, and the chain G, attached to the hook and eye *d f*, secured in the hounds of the wagon, substantially as and for the purposes set forth.

297,746. COMBINED BUTTON-LAP AND STAYING-PIECE FOR GARMENTS. GEORGE BOXLEY, Troy, N. Y., assignor of one-half to George P. Ide Bruce & Co., same place. Filed Jan. 21, 1884. (No model.)

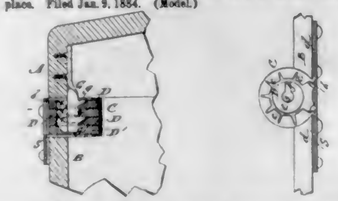


Claim.—1. In combination with the slip-opening of a garment, the tapering strip or placket A, made in one piece that is oppositely folded to produce the facings F′ F² F³, with the adjacent edges of the facing-folds F′ F³ on one side united, as shown, and the remaining free edge of the fold F² sewed to one side of the slit, and the free edge of said fold F′ to the garment exterior, with the facing-fold F³ on its inner edge sewed to the adjacent edge of the slit, and its other edge to the garment exterior, and with said connected parts cross-sewed to the garment and to each other below the slit, as described.

2. In a combined button lap and stay for garment slit-openings, the combination of the strip or placket A, made in one piece and reversely folded to produce the facing-folds F′ F² F³ and tab-end stay T, the stitching S′, uniting on one of their sides the edges of the folds F′ F³, the stitching S² S³, connecting said fold-facings F′ F³ to the edge of the slit-opening and the exterior of the garment, the stitching S² S², uniting the said facing-fold F³ to one side of the slit and to the garment exterior, the cross-stitching S³, joining said connected folds to the garment and to each other below the slit, and the stitching S⁴, uniting said tab-end stay to the garment below the slit, as shown.

3. In a button fly lap and stay for garment slit-openings, the combination of the tapering strip or placket A, made in one piece, the reversing-folds *w′ w²*, made in the strip, the facing-folds F′ F² F³, the stitching S′, connecting on one side the adjacent edges of the facings F′ and F³, and said facings F′ F² F³, adapted to attach to the garment-slit and garment exterior, as shown and described.

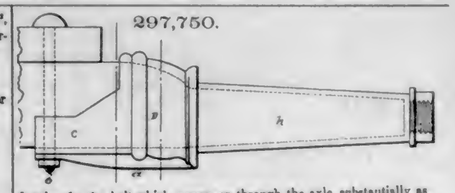
297,747. VEHICLE RUNNING-GEAR. JAMES M. BRADLEY, Tyner City, Ind. Filed Sept. 3, 1883. (No model.)



Claim.—The herein-described running-gear for vehicles, comprising a reach consisting of the rear section, C, having a recess, F, in its front end, and having a plate, G, provided with an aperture, G′, secured around its front end, front section, A, provided at its rear end with a horizontal recess, N, and a longitudinal slot, I, connecting piece or hinge D, provided at one end with a bolt, E, and having its other end adapted to fit within the horizontal recess N, and bolt H, working in the slot I, and adapted to secure one end of the hinge D movably within the recess F, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

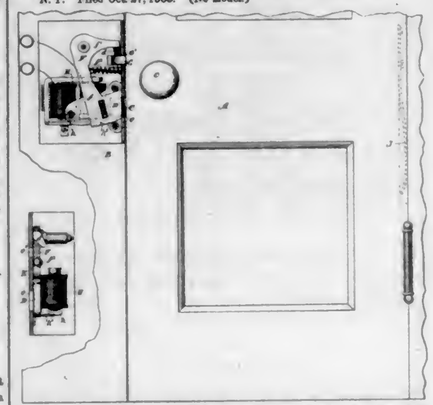
297,748. APPLE PARER AND SLICER. WILLIAM F. BROCK, Dunellen, N. J. Filed Sept. 24, 1883. (Model.)

Claim.—A parer and slicer having a blade, A, of sheet metal bent or creased longitudinally, as described, to form a cutting-edge, *d*, and a guiding-edge, *e*, and having a longitudinal slot, *a*, cut out along the crown or bend *b* of the blade, forming a discharge-opening, all substantially as herein shown and described.



297,749. PERMUTATION-LOCK. WM. M. BROOKE, Brooklyn, N. Y., assignor of one-third to John F. Sias and Lewis M. Swasey, both of same place. Filed Jan. 9, 1884. (Model.)

Claim.—1. The lock herein described, consisting of the sheet-metal case provided with a circular chamber, C, interned notched portion, *c*, on the upper and lower edges of said chamber, securing-flanges *d*, bent from the opening *b* in the case in opposite directions, and a series of horizontally-arranged permutation-disks within said chamber, in combination with a suitable hasp, substantially as set forth.



2. A lock-case formed from a sheet-metal blank, E, said blank being provided with the notched central portion, *c*, and bent to form the circular chamber C, of which the notched portion *c* forms the top and bottom, opening *b*, and flanges *d*, bent in opposite directions from said opening, substantially as set forth.

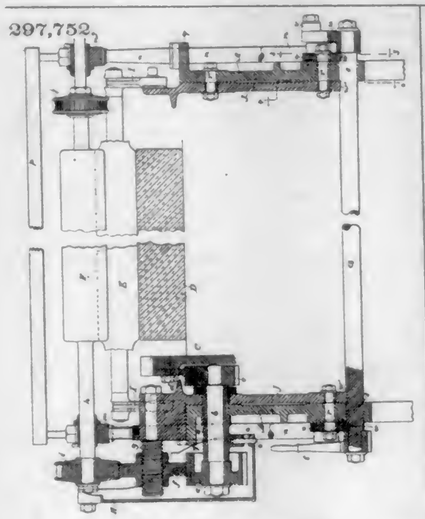
297,750. AXLE-SKEIN. WILLIAM PATTERSON BROWN, Zanesville, Ohio. Filed Apr. 28, 1883. (No model.)

Claim.—As an improved article of manufacture, the axle-skein described, consisting of the spindle portion A, provided at its inner end with the box-shoulder, and in rear of said shoulder with a swell-extension, having an interior shoulder and a strengthening circular rib, in rear of said rib an open top rectangular extension, and the keel-flange *a* extending from the box-shoulder to the end of the said extension, and provided at said end with a raised flattened base to seat the securing-nut, and a perforation for the bolt which passes up through the axle, substantially as specified.

297,751. ELECTRIC DOOR-OPENER. JESSE H. BUNNELL, Brooklyn, N. Y. Filed Oct. 27, 1883. (No model.)

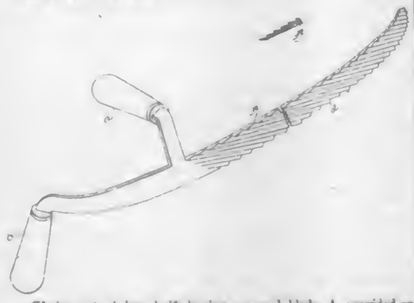
Claim.—1. The combination, substantially as described, with a sliding latch, of the pivoted plate F, formed with the extension or latch plate D at its lower extremity and an arm, *f′*, at its upper portion, and provided with a cam, *d*, a projection on the door for engaging the extremity of the arm *f′*, and acting to force the plate D into the path of the latch, an electro-magnet, its armature, and a suitable stop, *h′*, for retaining the device in locking position against the force of a retracting-spring, *f³*, substantially as set forth.

2. The combination, substantially as described, with a sliding latch, of the pivoted plate F, formed with the extension or latch plate D at its lower extremity, and an arm, *f′*, at its upper portion, a projection on the door moving with the same and acting to force the plate D into the path of the latch, but yielding in the opposite direction to pass the arm *f′*, an electro-magnet, its armature, and a suitable stop, *h′*, for retaining the device in locking position against the force of a retracting-spring, *f³*, substantially as set forth.



297,752. MECHANISM FOR RAISING THE ROLLERS OF PRINTING-PRESSES. ANDREW CAMPBELL, Brooklyn, assignor to John and Edmund McLoughlin, both of New York, N. Y. Filed Sept. 11, 1883. (No model.)

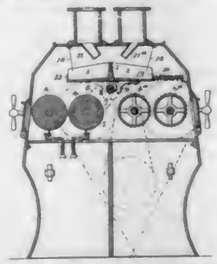
Claim.—1. In a printing-press, the combination, with the set of form-rollers and the set of distributing-rollers, each set mounted in movable bearings capable of being moved independently of the bearings of the other set, of the said bearings and means, substantially as described, for simultaneously lifting said movable bearings to different heights, whereby the form-rollers are lifted from the form and the distributing-rollers from the form-rollers, for the purposes specified.



2. In a printing-press, the combination of the form-rollers, a frame capable of vertical motion and affording bearings in which said rollers are mounted rotatively, the distributing-rollers, another frame bearing said distributing-rollers and also capable of vertical motion, and means, substantially as set forth, for lifting both said frames, and thereby lifting the form-rollers out of contact with the form and the distributing-rollers out of contact with the form-rollers, substantially as set forth.

3. The combination of the form and distributing rollers, mounted substantially as shown, the sliding frames in which said rollers are mounted, constructed and arranged substantially as shown, the cam-shafts G G, provided with cams *w w* and *w′ w′*, and arms *u u*, and bar *v*, substantially as and for the purposes set forth.

297,752.



297,753. HAY-KNIFE. WALLACE H. CARTER, Hallowell, Me. Filed Jan. 9, 1884. (No model.)

Claim.—1. A hay-knife having a curved blade, A, provided on one side with grooves *c c*, running at an acute angle to the edge and quite across the blade, all substantially as described.

2. In a curved hay-knife, a series of grooves inclined on the side toward the edge and approximately vertical on the other, and extending quite across the blade, as and for the purpose set forth.

297,754. FEED-BOX FOR ROLLER-MILLS. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

Claim.—1. A double-vibrating feed-box provided with a central partition, in combination with two hopper-spouts, whereby a different class of material may be fed to each of two sets of rolls, as set forth.

2. A double-vibrating feed-box provided with a central partition and one common means whereby both are vibrated, in combination with two hopper-spouts and two sets of rolls, as and for the purpose set forth.

3. In a roller-mill, a duplex shaking box and elastic hangers for supporting the same from above, in combination with two sets of rolls, substantially as shown and described.

4. In a feed apparatus for roller-mills, a suspended box divided into two compartments, and a common eccentric shaft, in combination with suitable driving mechanism, as set forth.

5. In a roller-mill, the combination of two sets of rolls and a duplex feed-box with an eccentric or cam-shaft passed through the case of the machine parallel with the said rolls, as and for the purpose set forth.

6. In a feed apparatus for roller-mills, the combination of the pulley on the shaft of the roll 4, the pulley 7, the eccentric shaft 8, and duplex feed-box 1 2, substantially as and for the purpose set forth.

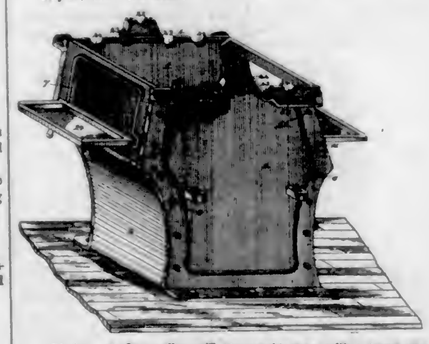
7. In a feed apparatus for roller-mills, the combination of the box 1 2, the spring 10, and eccentric 8.

8. The combination, with two pairs of rolls, of a vibrating feed-box adapted to supply each pair of rolls from its respective sides with an equal and uniform quantity of material, as set forth.

9. A vibrating feed-box having shallow bridges over which the material sifts, in combination with means for imparting a lateral vibratory motion thereto, substantially as set forth.

10. A vibrating feed-box having adjustable bridges over which the material sifts, in combination with suitable means for imparting motion to said box, as set forth.

11. A duplex feed-box, in combination with two pairs of rolls and one common means whereby a lateral vibratory motion is imparted to said box, as set forth.



12. In a roller-mill, the combination of a feed-box, elastic hangers for supporting the same, and means for imparting a vibratory motion to said box, as set forth.

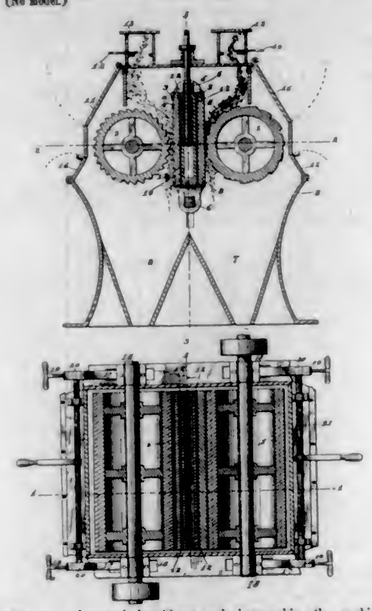
13. In a roller-mill, the combination of two sets of rolls and a duplex feed-box with an eccentric for imparting motion to said box in one direction, and a spring for returning it, substantially as set forth.

14. In a roller-mill, the combination, with a vibrating feed-box, of an eccentric shaft, a pulley on said shaft, a belt, and a pulley on one of the roll-shafts, as and for the purpose set forth.

15. In a roller-mill, the combination, with a feed-box, of an eccentric for imparting a horizontally-reciprocating motion thereto, and means for driving said eccentric from one of the crushing-rolls.

297,755. CASING FOR ROLLER-MILLS. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

Claim.—1. In a roller-mill, the combination, with a frame constructed of duplicated end and side plates, of a cap or cover similarly constructed, the meeting edges of said parts being formed complementary to each other, as set forth.



2. The combination of the end plates, 2 and 7, constructed as herein described and shown, and adapted for use at either end of the machine, with the side plates, 1, as set forth.

3. The cap or cover comprising the duplicated plates 15 and 19 and top plate, 18, arranged in the manner and for the purpose herein shown and described.

4. The combination of the lower portion, 1 1 2 2, of the frame or casing and the cap or cover 15 18 19, constructed and adapted for use substantially as herein set forth.

5. The combination, with the duplicate side plates, 1, having the journal-boxes for the stationary rolls cast therewith, of the duplicate plates 15, cast with housings for said journals, and adapted for use on either side of the machine, as set forth.

297,756. GRINDING-MILL. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

Claim.—1. In a grain breaking or reducing machine, the combination of a pair of grinding-rolls and a stationary grinding-plate interposed between said rolls and extending above and below the horizontal plane of their axes, as and for the purpose set forth.

2. In a grain breaking or reducing machine, the combination of a pair of grinding-rolls and a stationary grinding-plate having parallel faces interposed between said rolls and extending above and below the horizontal plane of their axes.

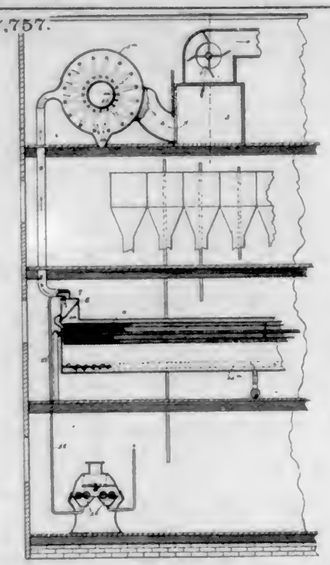
3. In a grain breaking or reducing machine, the combination, with a pair of rolls and a grinding-plate interposed between the adjacent faces of said rolls and extending above and below the horizontal plane of their axes, of means for adjusting said plate vertically, as set forth.

4. In a grain breaking or reducing machine, the combination, with a pair of rolls, a grinding-plate interposed between said rolls and extending above and below the horizontal plane of their axes, and means for adjusting said plate vertically, of means for locking it in any position in which it may be set, as described.

5. In a grain breaking or reducing machine, the combination, with a pair of grinding-rolls and a stationary grinding-plate interposed between the adjacent faces of said rolls and extending above and below the horizontal plane of their axes, of means for adjusting the distance asunder of the rolls.

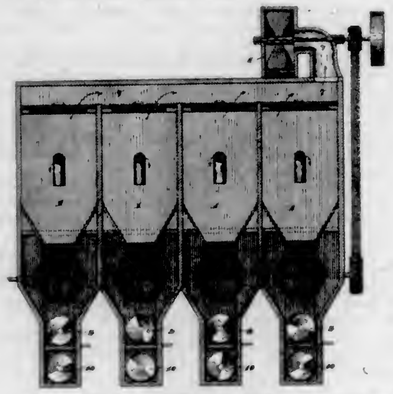
6. In a reduction-machine, the combination, with two rolls, of a grinding-plate for use between them, constructed of a central frame and removable face or grinding-plates, as set forth.

7. In a reduction-machine, the combination, with two rolls, of a grinding-plate for use between them, constructed of a central frame, removable face or grinding-plates, and suitable elastic packing interposed between said plates and frame, as set forth.



8. In a gradual-reduction machine, the combination of casing 3, hopper-spouts 13 13, rolls 1 2, interposed grinding-plate, and delivery-hoppers 7 8, all constructed and arranged substantially as herein shown and described.

297,757. APPARATUS FOR MANUFACTURING FLOUR. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

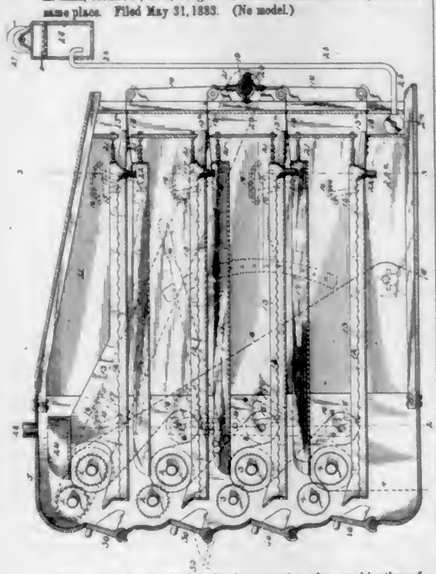


Claim.—1. The combination of a series of rolls or breaking-machines, a series of pneumatic elevating-pipes of a small area, a series of settling-chambers, an exhaust-pipe of larger area, a dust-catcher, and a fan, all arranged substantially in the manner and for the purposes set forth.

2. The combination, with a series of pneumatic elevating-tubes of small area, a series of settling-chambers, and an exhaust-pipe of larger area, of a second pneumatic elevating-tube of small area, a second settling-chamber and a second exhaust-pipe of larger area, and an air-trunk and fan common to all, arranged substantially in the manner and for the purpose set forth.

297,757.

297,758. ATMOSPHERIC ELEVATOR FOR FLOUR-BOLTS. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)



Claim.—1. The combination, with a rotary flour-bolt, of a pneumatic elevating-pipe, a settling-chamber or bolt-hopper of much larger area, into which said pipe delivers, a suction-fan exhausting the air and dust from said settling-chamber, and a feed-spout communicating from said chamber to the bolt, whereby the dust and impurities are carried off before the material reaches the bolt, as set forth.

2. The combination of the rotary bolt 5, elevating-pipe 2, suction-fan 6, settling-chamber 1, valve 3, and automatic valve 4, substantially as and for the purposes set forth.

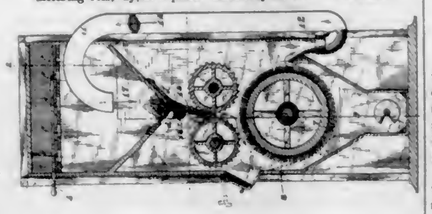
3. The combination of a series of rotary bolts, 5, pneumatic elevating-pipes 2, settling-chambers 1, and an air-trunk and suction-fan common to all, substantially as shown and described.

4. The combination of a bolting-reel, a fan, an elevating-tube, and a practically air-tight settling chamber or hopper into which a current of air is drawn, and the material to be bolted thereby elevated and purified by one common fan before it reaches the bolt, as set forth.

297,759. GRADUAL-REDUCTION MACHINE FOR MILLING. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

Claim.—1. In a gradual-reduction machine, the combination of a vertical series of rolls, riddles, and return-boards, an iron frame, in which are mounted the rolls and the gearing for driving the same, and a wooden frame of any necessary length, extending therefrom and supporting the ends of the riddles and return-boards, substantially as set forth.

2. In a gradual-reduction mill, the combination, with a vertical series of paired rolls, of a belt-tightening pulley located between each two pairs of said rolls, in the manner and for the purpose set forth, and means for simultaneously operating said pulleys, as described.

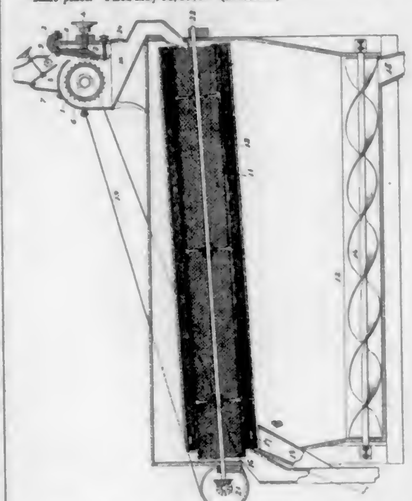


3. In a gradual-reduction mill, the combination, with a vertical series of roll-driving pulleys and a belt passing over said pulleys, of a series of tightening-pulleys located in positions relatively to the roll-pulleys to adapt them to take the belt as it passes from each roll-pulley and deflect it out of its natural course, whereby it is made to encircle a greater part of the peripheries of the roll-pulleys, and means for simultaneously adjusting said series of tightening-pulleys for taking up slack in the belt, substantially in the manner set forth.

4. The combination of the eccentric shaft 20, having a box fitted loosely thereon, the riddle-straps 18, suitable horizontal friction-pulleys, and springs 21, for imparting a vibrating motion to the riddles, as set forth.

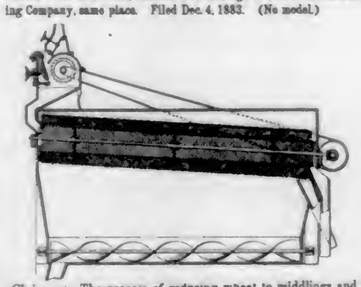
5. The combination of two or more riddles and their connecting-straps with an eccentric shaft common to all, a box loosely fitted thereon, and springs acting in opposition to said straps for imparting a shaking movement to said riddles in opposite directions, so that each will counteract the momentum of the other, as explained.

6. The combination of a riddle, a return-board, suspending-hangers and an adjusting-support common to both, substantially as and for the purposes set forth.



297,760. GRADUAL-REDUCTION MACHINE FOR MANUFACTURING FLOUR. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

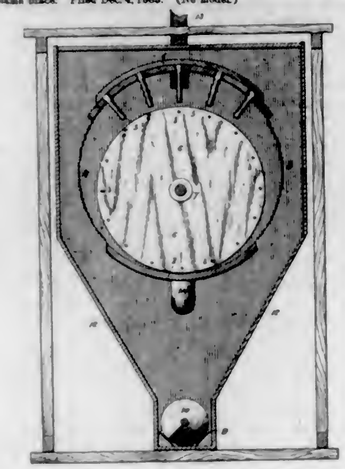
Claim.—1. In a gradual-reduction machine, a pair of rolls made in sections graduated in fineness, in combination with separate settling-compartments over the roll-sections, pneumatic elevators communicating with the settling-compartments, separate valves to regulate the flow of air from the settling-compartments, and a feed-valve and feed-roller, constructed and operating as herein set forth, at the bottom of each settling-compartment, to prevent the flow of air upward to the said compartment while passing the material therefrom.



2. The combination, with the pair of sectional crushing-rolls, of a screen, 8, brush 7, a series of pneumatic elevating-pipes, and a series of settling-chambers located over the respective sections of the rolls, as set forth.

297,761. GRAIN REDUCTION AND SEPARATING MACHINE. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed May 31, 1883. (No model.)

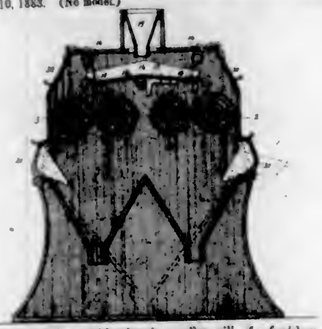
Claim.—The herein-described grain reducing and separating machine, comprising the grain-cracking devices, the compound reel consisting of an inner wire-cloth screen, 11, and a finer outer screen, 12, of bolting-cloth, the spouts 10 16 18, and the driving-connections between the cracking devices and the compound reel, all mounted in the same frame, substantially as described.



297,762. PROCESS OF REDUCING GRAIN TO MIDDLINGS AND FLOUR. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Dec. 4, 1883. (No model.)

Claim.—1. The process of reducing wheat to middlings and flour, which consists in passing the grain through the following successive operations: first, splitting the grain and removing the germ as far as possible; second, crushing the grain; third, passing the crushed grain through a disintegrating-machine for dislodging and separating the flour-producing parts from the bran; fourth, treating the product of middlings and flour thus obtained in bolts, in the usual manner.

2. The process herein described, which consists in first splitting the wheat and removing the seam impurities and germ product, then alternately passing the unfinished product through crushing-rolls and disintegrating-machines a sufficient number of times to remove and separate the flour-producing parts from the bran



297,763. DISINTEGRATING AND SEPARATING MACHINE. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Dec. 4, 1883. (No model.)

Claim.—1. The combination, with an outer stationary screen, of pins projecting thereinto and a beater-cylinder mounted and revolving eccentrically therein, as and for the purpose set forth.

2. The combination, with the stationary cylinder, consisting of concaves 1 2 and sieves or screens 3 4, of pins 5, projecting thereinto, and a beater-cylinder mounted and revolving eccentrically therein, as and for the purpose set forth.

297,764. FEED-BOX FOR ROLLER-MILLS. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination, in a roller-mill, of a feed-box, means for imparting motion thereto in one direction, and spring-hangers for suspending it and producing a counter movement, substantially as set forth.

2. In a roller-mill, the combination of a feed-box, coil-spring hangers for suspending said box, and means for imparting motion thereto, as set forth.

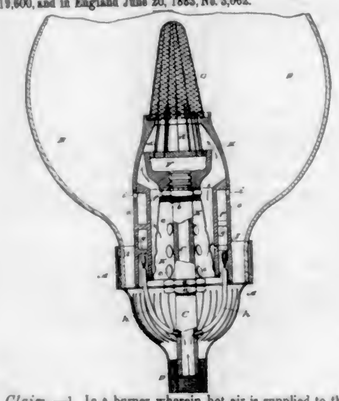
3. In a roller-mill, the combination, with a feed-box, of suitable springs coiled in opposite directions for suspending said box, and means for imparting motion thereto, as set forth.

4. In a roller-mill, the combination of a feed-box, a cam-shaft for imparting motion thereto in one direction, and spring-hangers for suspending said box and imparting a counter movement thereto, substantially as set forth.

297,765. CAR-COUPLING. A. JUDSON CRAPEL, Arkansas City, Kans. Filed Jan. 23, 1884. (No model.)

Claim.—1. In an automatic car-coupling, the combination, with the link C, double beveled at its ends, as shown, and a draw-bar, A, provided with holes in its upper and lower faces, of the same configuration as a horizontal section of the coupling-pin, of a coupling-pin composed of a head, B, having sides *a a*, circular arc *b*, shoulders *c c*, and a central tongue or flange, D, having its outer edge downwardly and rearwardly beveled near its lower end, substantially as shown and described.

2. The combination, with the draw-bar A and coupling-pin B B' D, having an eyebolt secured to its rear end, of the lever *x*, fulcrumed in studs secured to the draw-bar, and having its inner end passing through the eye of the eyebolt, substantially as shown and described.



297,766. PROCESS OF PREPARING OZOCERITE AND OTHER SOLID HYDROCARBONS. JEAN CHARLES OCTAVE GHEMIN, Paris, France. Filed July 28, 1883. (No specimens.)

Claim.—1. The herein-described method of treating or preparing ozocerite and other similar hydrocarbons, which consists in first removing the earthy insoluble impurities by the means substantially as described, then heating the thus purified substance in a retort in connection with sulphur in about the proportions specified, and submitting the same to the action of superheated steam in the retort until it distills over, substantially as set forth.

2. The herein-described method of treating or preparing ozocerite and other similar hydrocarbons, which consists in first removing the earthy insoluble impurities, substantially as described, then distilling the thus purified hydrocarbon in combination with flowers of sulphur, substantially as specified, and then removing the oils and lighter hydrocarbons in the manner described, substantially as and for the purposes set forth.

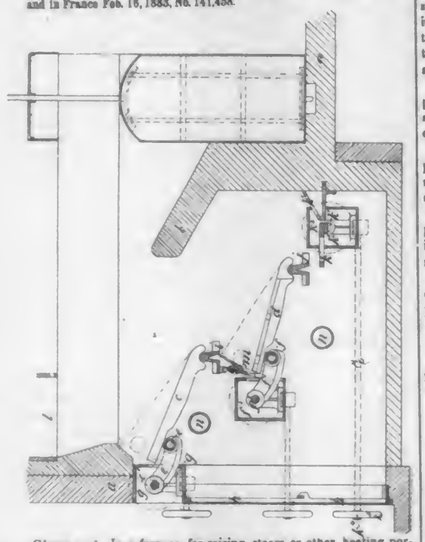
3. The herein-described method of purifying and bleaching ozocerite and similar hydrocarbons, which consists in first removing the earthy insoluble impurities, as herein set forth; second, distilling the thus purified hydrocarbon mixed with flowers of sulphur in about the proportions specified; third, removing the oils and lighter hydrocarbons by heat and pressure, or the specified equivalent of the same; fourth, fusing in a bath with amylic alcohol, cooling and pressing, digesting with animal charcoal while in a molten state, and finally filtering through animal charcoal, substantially as set forth

297,767. ILLUMINATING-BURNER. CHAS. CLAMOND, Paris, France. Filed Jan. 8, 1884. (No model.) Patented in France May 20, 1880, No. 136,771; in Belgium May 28, 1880, No. 61,763; in Italy June 17, 1881, No. 19,600, and in England June 20, 1883, No. 3,062.

Claim.—1. In a burner wherein hot air is supplied to the flame, the combination, with the imperforated axial gas-inlet tube C, bearing on its upper end a gas-chamber and jet apparatus, of the annular flame-chamber arranged exterior thereto and provided with heating gas-jets at its base, and the annular air passage or conduit arranged and adapted to be heated, substantially as set forth.

2. In a burner wherein hot air is supplied to the flame, the combination, with the imperforated axial gas-inlet tube C, bearing a gas-chamber and jet apparatus, of the drum I, made in one piece and containing the annular flame-chamber, and the gas-jets *h*, arranged at the base of said chamber, the flame-chamber being arranged exterior to the annular

passage through which the air passes upward to the burning-point, substantially as set forth.

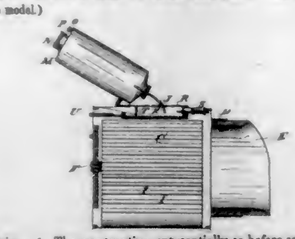


3. The means for heating the air in its passage to the burning-point, comprising the perforated bell E, the annular cylinder I, and the pipes *h*, for admitting gas to the jets at the base of said cylinder, all constructed substantially as set forth.

4. In a burner, the combination, with the dome H, provided with an orifice for the passage of the jet-tubes, and the imperforated gas-inlet pipe C, provided with a gas-chamber, F, of the slender jet-tubes *d*, inclined inward, as shown, and extending upward into the aperture in the dome, substantially as set forth.

5. The combination, in a burner, of the gas pipe or tube C, the gas-chamber F, the small jet-tubes *d d*, the magnesian basket G, the cone H, the annular cylinder I, the perforated bell E, and jet-tubes *h h*, all arranged substantially as set forth.

6. The combination of the basket G, the gas-chamber F, and the jet-tubes *d*, made very slender, of unequal length, and inclined inward, as described.



297,768. FURNACE. JEAN PIERRE COTIART, Havana, Cuba. Filed Apr. 10, 1883. (No model.) Patented in England Feb. 3, 1883, No. 500, and in France Feb. 16, 1883, No. 141,458.

Claim.—1. In a furnace for raising steam or other heating purposes, the combination, substantially as set forth, of a deflecting fire-bridge, two or more movable inclined layers of fire-bars, a tumbling-plate, and a steam-blast pipe or pipes.

2. In a furnace for raising steam or other heating purposes, the combination, substantially as set forth, of a layer of fire-bars, a stationary bearer supporting one end of said fire-bars, and a raising and lowering shaft connected by bracket-arms to a roller which supports the other end of the fire-bars.

297,769. INHALER. JAMES NAPOLEON DODGE, Springfield, Mass., assignor of one-half to Solomon J. Gordon, same place. Filed Oct. 25, 1883. (No model.)

Claim.—1. The combination, substantially as before set forth, with the case provided at one end with a flexible mouth-piece and at the opposite end with an adjustable air-gate, of the removable saturation-conduit, which consists of a ribbed cage and a strip of flannel wound back and forth across the cage around the ribs thereof.

2. The combination, substantially as before set forth, of the case provided at one end with a flexible mouth-piece and at the opposite end with an adjustable air-gate, the removable saturation-conduit, constructed as described, and the adjustable hinged anæsthetic-reservoir provided with a drop-tube.

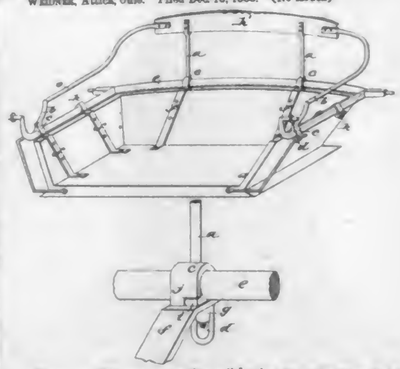
3. The anæsthetic-reservoir provided with a drop-tube and an adjustable vent-valve.

4. The combination, substantially as before set forth, of the case containing the saturation-conduit, the hinged cover thereof, and the adjustable hinged anæsthetic-reservoir provided with a drop-tube passing through a slot in said hinged cover of the case.

297,770. FINISHING AND GLOSSING THE SURFACES OF FABRICS HAVING A COATING OF SOME PYROXYLINE COMPOUND. JARVIS B. EDSON, Adams, Mass. Filed Mar. 17, 1884. (Specimens.)

Brief.—Improvement on Letters Patent Nos. 289,240 and 289,242, dated November 27, 1883, and No. 290,553, dated December 18, 1883.

Claim.—1. The process herein described of continuously glossing sheeted xylonite or other pyroxyline compound, which consists in passing it through a fluid acting as a solvent to the compound, or carrying the same to it, as by a feed-roller fountain method, sufficiently to partially dissolve the surface of the sheet and leave the extreme surface in a flowing condition.



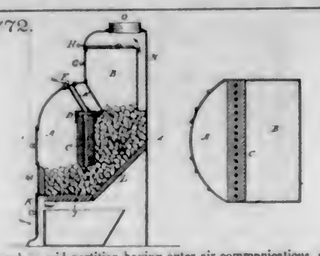
2. The process of producing a gloss upon sheeted xylonite or other pyroxyline compounds, which consists in passing the same through fluid acting as a solvent of the xylonite or similar material, and which, upon evaporation, leaves the desired glossy appearance.

3. The process herein described of glossing sheeted xylonite or other pyroxyline compound, which consists in subjecting one surface of the same to a solvent or a fluid acting as a solvent, without affecting the other surface.

4. The process of glossing sheeted xylonite or other pyroxyline compound, which consists in first heating the same, and then immersing it in a solvent, or otherwise, as described, and allowing it to dry by evaporation, substantially as described.

5. As a new article of manufacture, a fabric composed of a base coated on one or both surfaces with xylonite or other pyroxyline compound, and having its xylonite or similar surface glossed, substantially as and for the purpose described.

297,771. SHIFTING BUGGY-TOP. GEORGE ENGELHART and CHARLES WEIDNER, Attica, Ohio. Filed Dec. 13, 1883. (No model.)



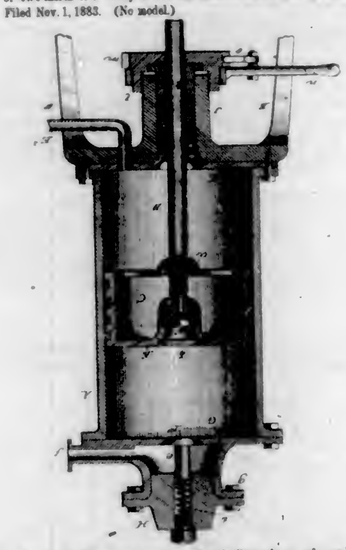
Claim.—1. The top-supporting rail having the extensions, in combination with the notched hook-clips of the seat-back supports, said extensions fitting into opposite notches of said clips, substantially as and for the purpose set forth.

2. The top-supporting rail *c*, having flat-bottomed bearing-sections *a*, with extensions *i*, in combination with the notched hook-clips *c* of the seat-back supports *a* and arm *b*, and with the seat-irons *f*, substantially as described.

297,772. STOVE AND HEATER. THOMAS MARA FELL, Brooklyn, N. Y. Filed July 29, 1881. Renewed Oct. 25, 1883. (No model.)

Claim.—1. As an improvement in stoves and heaters, the combination of the hollow pendent partition dividing the fire-place into two chambers, one of them being a combustion-chamber and the other a distilling-chamber, said partition having outer air-communications, and an air-heating chamber, the partition also having perforations at its bottom, which adapts it to supply highly-heated air in fine streams at or near the surface of the fuel, substantially in the manner shown and described.

297,772.

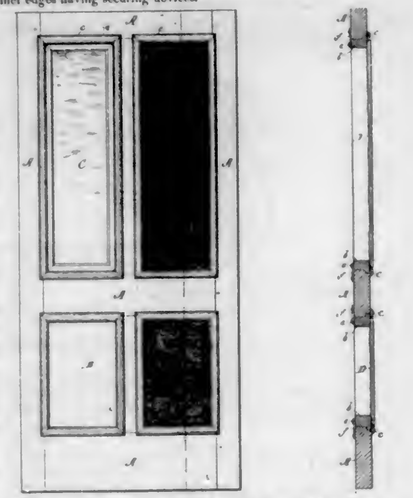


2. The combination, in stoves and heaters, of the pendent hollow and perforated partition, said partition having an air-heating chamber and outer air-communications, and adapted to supply highly-heated air in fine streams at or near the surface of the fuel, plate L, grate-bars I, distilling-chamber B, and combustion-chamber A, all arranged for joint operation substantially as herein shown and described, and for the purpose set forth.

3. In stoves or heaters, the heating and dividing chamber D, fitted with the pipes E, passing across the exit-flue, and receiving a supply of cold air from without, in combination with the hollow pendent partition delivering the heated air downward at or near the surface of the fuel, for the purposes and in the manner substantially as described.

4. In stoves or heaters, an air-regulator opening into pipes E, and a heating-chamber, D, connecting with a hollow pendent partition, in combination with grate-bars I, damper H, and back plate, L, all in the manner substantially as described.

297,773. GAS-PUMP. WILLIAM J. FERGUSON, Baltimore, Md., assignor of two-thirds to J. Olney Norris and Isaac T. Norris, both of same place. Filed Nov. 1, 1883. (No model.)



Claim.—1. The combination, with a hollow piston, of a rod secured to one end of the piston and having a headed end wholly within the piston, and an upwardly-opening valve having its upper face flush with the upper end of the piston when said valve is closed, and arranged upon the end of the rod to slide thereon and be guided and limited in its motion, substantially as described.

2. The combination of the hollow piston C, the rod D, secured to one end of the piston, and having a headed end, the valve E, having its upper face, when closed, flush with the piston and guided upon the end of the piston-rod, and the detachable plate-cap or plate *b*, secured to the valve flush with the same, as described.

3. The combination, with the cylinder, its head, and rod D, of the frame B, having gland *j*, the tube *k*, the nut *l*, provided with ratchet *m*, and a lever bearing a pawl for said ratchet and swiveled upon a support concentric with relation to said ratchet, substantially as and for the purpose described.

297,774. DOOR. GEORGE E. FILER and ALBERT H. NEFF, Sheldon, Iowa, assignors of one-third to H. C. Love, same place. Filed Feb. 11, 1884. (No model.)

Brief.—The door-framing having its outer edge rabbeted to receive detachable panels of wood, glass, or woven wire, the outer edges of which panels are provided with an overlapping lip to enter the rabbet, and the inner edges having securing devices.

Claim.—The combination, with the stile or framing of the door, having its outer edge grooved or rabbeted, of the detachable panels of wood, glass, or woven wire, consisting of a framing, *b*, of a thickness equal to that of the stile, and having a lip or flange fitting in the rabbet, the panel proper applied to the outside, the bead *c*, securing the edges of the same, and means upon the inside of the door for securing the panel, substantially as and for the purpose described.

297,775. REEL AND ROD FOR WINDING PAPER AND PROTECTING THE SAME IN THE ROLL. JOS. L. FERN, Jersey City, N. J. Filed Feb. 10, 1883. (Model.)

Claim.—1. A paper-roll head-holding rod provided with threaded ends, and socketed caps adapted to be applied thereto to admit of the rotation of the rod to roll paper thereon, substantially as shown and described.

2. A mill-wound roll of paper having a central rod, directly upon which the paper is wound, and heads attached to and secured by said rod, substantially as shown and described.

3. The combination of the rod, the winding-frame and its counterbalance, means to feed the paper to said rod, and means to operate said rod, substantially as described.

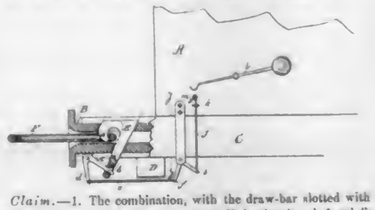
297,776. INSERTIBLE DIAMOND SAW-TOOTH. EMANUEL FOERSTER, New York, N. Y. Filed Oct. 6, 1883. (No model.)

Claim.—The combination, with a recessed saw-blade, B, of an in-

297,776.

sertible saw-tooth, A, means for securing the same to the recessed saw-blade, said tooth being made of soft-tempered steel, and of an auxiliary holder or holders for the diamonds, said holder or holders being made of hard-tempered material and shrunk into the recess of the saw-tooth, substantially as set forth.

297,777. DEVICE FOR PREVENTING HORSES FROM CRIBBING. JOHN O. FOSTER, Watertown, Ill. Filed July 7, 1883. (No model.)



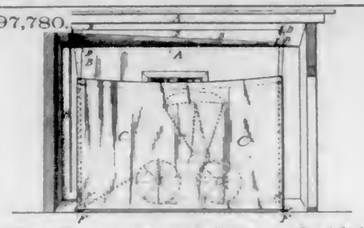
Claim.—1. In a device for the purpose stated, the combination, with a metal strip, A, provided with spurs *a*, and with a strap, B, for securing said strip in place, of a flexible perforated guard, C, and springs for supporting said guard, substantially as described.

2. In a device for the purpose stated, the combination, with the metal strip A, provided with spurs *a*, and with a strap, B, of a perforated guard, C, and spiral springs *a'*, placed around said spurs *a*, between the said strip A and guard C, substantially as described.

3. In a device for the purpose stated, the combination, with the strap B and the strip A, provided with spurs *a*, of a flexible guard, C, bent over the spurs and secured at its edges to said strap, and of springs *a'*, placed upon the spurs, for upholding the said guard, substantially as set forth.

4. In a device for the purpose stated, the combination, with the strap B and the strip A, provided with spurs *a*, of covering-straps B', and a flexible perforated guard, C, secured at its ends to the said straps B' and at its edges to the strap B, substantially as and for the purposes set forth.

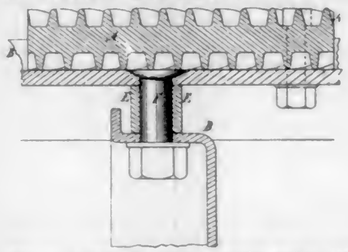
297,778. CAR-COUPLING. ALEXANDER MILLER FRASER, Bathurst, New Brunswick, Canada. Filed Feb. 21, 1884. (No model.)



Claim.—1. The combination, with the draw-bar slotted with inclined guide-holes, of the coupling-hook E, having bevel-faced lip *a*, sliding loosely in inclined direction in said slot, as and for the purpose described.

2. The combination, with the draw-bar B, slotted as described, of the sliding coupling-hook E, having bevel-faced lip *a*, crank-arms *c d*, pull-rod *e*, shaft G, with arms *f* and *i*, rod *j*, link *m*, and weighted lever *l*, as and for the purpose described.

297,779. METHOD OF PRODUCING ORNAMENTAL RELIEF BORDERS OR FOREGROUNDS FOR PHOTOGRAPHS. CROSBY M. FRENCH, Garrettsville, Ohio. Filed June 4, 1883. (No specimens.)

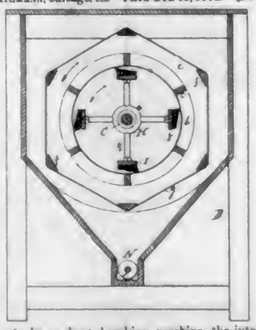


Claim.—The method of producing photograph-borders, consisting in first making a bas-relief border of any desired design, then taking a negative of such design, and finally using this negative in "printing in," in conjunction with a portrait-negative, as a border, substantially as and for the purpose set forth.

297,780. CARRIAGE-COVER. HENRY H. PECK, Fricks, Pa. Filed Oct. 22, 1883. (No model.)

Claim.—The combination, with the bolsting-ropes B and the independent weights F, attached thereto, of the carriage-cover C, formed of thin flexible material, and having at its vertical angles passages for said ropes, through which they are rove, all as shown and described, to operate as specified.

297,781. BEATER FOR THRASHING-MACHINES. RICHARD GARRETT and FRANK GARRETT, Leiston Works, County of Suffolk, and JOHN DEVONSHIRE ELLIS, Sheffield, County of York, England. Filed Sept. 3, 1883. (No model.) Patented in England Feb. 5, 1883, No. 607.

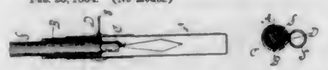


Claim.—1. A reversible beater for a thrashing-machine, consisting of a bar having oblique ribs on opposite faces, the ribs on one face having an inclination toward the right, and the ribs on the other face having an inclination toward the left, substantially as and for the purpose herein described.

2. A reversible beater for a thrashing-machine, consisting of a bar having opposite faces rounded or convex in a transverse direction, and formed with oblique ribs on both faces, the ribs on one face having an inclination toward the right, and the ribs on the other face having an inclination toward the left, substantially as and for the purpose herein described.

3. The combination, with the disks or heads D, of the chairs B, secured on the peripheries of said disks or heads and having concave seats in their faces, and the reversible beaters A, having opposite faces transversely rounded or convex to fit said seats, and provided with oblique ribs, the ribs on one face having an inclination toward the right, and the ribs on the other face having an inclination toward the left, substantially as and for the purpose herein described.

297,782. MACHINE FOR BRUSHING AND SCOURING GRAIN. LOUIS GATHMANN, Chicago, Ill. Filed Dec. 13, 1882. (No model.)

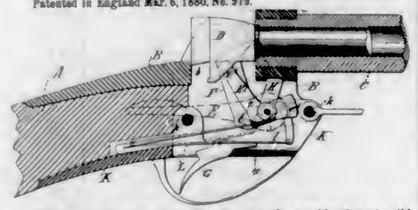


Claim.—1. In a wheat-brushing machine, the interior cylindrical metallic screen, *d*, and an exterior bolting-cloth screen, *g*, both applied to the one rotating frame A, in combination with the rotating brushes I, substantially as and for the purpose set forth.

2. In a wheat-brushing machine, the interior cylindrical screen, *d*, and the exterior bolting-cloth screen, *g*, in combination with the rotating brushes I, extending through the middle section of such screen *d* only, all substantially as and for the purpose set forth.

3. In a wheat-brushing machine, the rotating cylindrical metallic screen *d* and the exterior bolting-cloth screen, *g*, in combination with the rotating brushes I, extending through the middle section of screen *d* only, and the bristles of such brushes forming surfaces that are oblique to the radial lines of the screen, all substantially as described and shown, for the purpose specified.

297,783. CHAIN-BAR. JOSEPH U. GEROW, Brooklyn, N. Y. Filed Feb. 28, 1884. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, of the tubular bar having a longitudinal slot, the inner tube forming a receptacle for a tooth-pick or other article, and the outer tube connected to the inner tube by a pin passing through the slot of the bar.

2. The combination, substantially as hereinbefore described, of the tubular bar having a longitudinal slot, the inner tube or receptacle crimped annularly for increasing its friction, with the tooth-pick or other article inserted therein, and the outer tube connected to the inner tube by a pin passing through the slot of the bar.

3. The combination, substantially as hereinbefore described, of the tubular bar having a longitudinal slot, the inner tube having a stop-shoulder for determining the position of the article inserted therein, and the outer tube connected to the inner tube by a pin passing through the slot of the bar.

297,784. BREECH-LOADING FIRE-ARM. PHILIP THOMAS GODSAL, Elon, County of Buckingham, England. Filed Dec. 19, 1883. (No model.) Patented in England Mar. 6, 1880, No. 979.

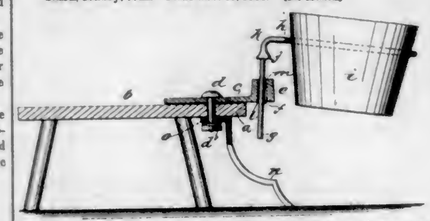
Claim.—1. In a breech-loading fire-arm, the combination of a sliding breech-block, a cranked piece, E', one arm of which engages with said breech-block, and the other arm of which is provided with a lateral extension, e^3, a side lever connected with said cranked piece for operating it, and a pivoted extractor, against which said lateral extension e^3 acts to eject a shell, all substantially as herein described.

2. In a breech-loading fire-arm, the combination of a sliding breech-block, a cranked piece, E', one arm of which engages with said breech-block, and the other arm of which is provided with a lateral extension, e^3, a side lever connected with said piece E', for operating it, a pivoted hammer, on the tumbler of which said lateral extension e^3 acts to force back the hammer, and a pivoted extractor, on which said lateral extension e^3 acts to eject a shell, substantially as herein described.

3. In a breech-loading fire-arm, the combination, with a sliding breech-block, of a cranked piece, E', one arm of which engages with said breech-block, and the other arm of which has a lateral extension, e^3, the two said arms being joined at an angle, *s'*, the pivoted extractor H, against which said lateral extension e^3 acts to eject a shell, and a spring bearing upon said angle *s'* of the piece E', and serving to actuate said piece to close the breech-block after said piece E' has been started forward by the operation of inserting a cartridge, substantially as herein described.

4. In a breech-loading fire-arm, the combination of a sliding breech-block, a cranked piece, E', for actuating the same, a side lever for operating said piece E', and a spring arranged to bear on one or other of the arms of said cranked piece E', and thereby serving to hold the breech-block open or closed, substantially as herein described.

5. In a breech-loading fire-arm, the combination of a sliding breech-block, a cranked piece, E', one arm of which engages with the breech-block, and the other arm of which has a lateral extension, e^3, a side lever connected with said piece E', a pivoted extractor, H, against which said lateral extension e^3 acts, a pivoted hammer, and a mainspring, L, the stand side of which bears upon said cranked piece E' to hold the breech-block in an open or closed position, and the other side of which is connected with the tumbler of said hammer, substantially as herein described.



297,785. BUTTON-FASTENER. JOHN H. GOODFELLOW, Troy, N. Y., assignor to the Beaton Button Fastener Company, Providence, R. I. Filed Sept. 19, 1883. (No model.)

Claim.—1. A button-fastener consisting of a ∩-shaped loop, C, and legs *d d*, bent directly outward and upward in opposite directions and in different parallel planes about at right angles to the plane of the loop, as shown and described.

2. A button-fastener consisting of the ∩-shaped loop C and legs *d d*, having their ends beveled in opposite directions to each other, and said legs being bent directly outward and upward in opposite directions and in different parallel planes about at right angles to the plane of the loop, as shown and described.

297,786. MILKING-STOOL. CHAR. D. GOODMAN and FREDERICK J. SMITH, Granby, Conn. Filed Nov. 28, 1883. (No model.)

Claim.—1. The combination of the pail-holding attachment consisting of the plate *c*, having a socket-head, *e*, and being suitably attached to the stool-seat, and the pail-ring *h*, having a pivot-stem, *g*, integral therewith, fitting the socket of head *e*, with a milking-stool, *b*, substantially as described.

2. The combination of the bar *e*, provided with a socket, *f*, with the stem *g*, and a pail-holding ring, *h*, formed integral therewith, the said socket being of a greater diameter than the stem, whereby the stem and its ring will be held at any desired height by the friction of the stem on the opposite edges, *l m*, of the socket, substantially as set forth.

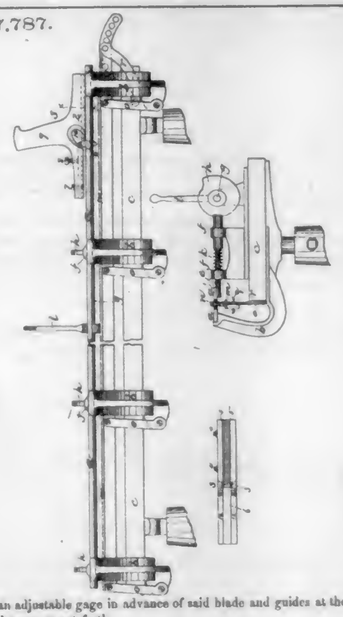
3. A milking-stool provided with a pail-holding attachment, in combination with the strut *a*, bent outward beyond the end of the stool, as shown, and provided at its upper end with a securing-flange, by which it may be secured to the stool, substantially as set forth.

4. The strut *a*, attached to the stool *b* by the angle-head *c*, bolt *d*, and nut *d'*, in combination with the pail-holding attachment, also attached to the stool by the said bolt *d* and nut *d'*, substantially as described.

297,787. TRACE-TRIMMING MACHINE. WILLIAM GORDON, Boston, and J. WESLEY DODGE, Malden, Mass. Filed Jan. 19, 1884. (No model.)

Claim.—1. The combination, in an organized machine for trimming the edges of leather traces or straps, of a pair of elongated jaws, adapted to hold and release a strap and to serve as a gage for the cutter, and a trimming-tool adapted to move along the upper edge of the strap and impart the desired form to the edge thereof, as set forth.

2. In a trace or strap trimming machine, the combination of the elongated jaws *a a'*—the one fixed and the other movable—and means, substantially as described, for moving the movable jaw with relation to the fixed jaw to grasp or release a trace or strap between said jaws, as set forth.



3. In a trace or strap trimming machine, the combination of the elongated parallel jaws—one fixed and the other movable—means, substantially as described, for moving the movable jaw with relation to the fixed jaw, a vertically-adjustable elongated gage arranged to support the lower edge of the strap, and means for positively holding said gage in any position to which it may be adjusted, as set forth.

4. In a trace-trimming machine, the combination of the fixed elongated jaw *a*, the movable elongated jaw *a'*, secured to bars *e*, adapted to slide in bearings *f f*, the rock-shaft *g*, having cams *h*, bearing against the bars *e*, and springs *k*, arranged to press the bars *e* against the cams, as set forth.

5. In a trace-trimming machine, the combination, with the fixed and movable elongated jaws *a a'*, of the elongated gage *m*, located under said jaws, the pivoted links supporting said gage and permitting it to be raised or lowered by an endwise movement, and devices, substantially as described, for holding the gage.

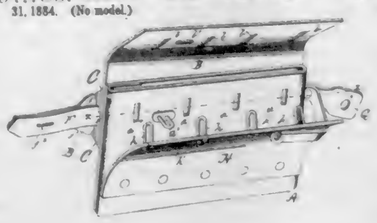
6. The improved trace-trimming tool composed of the stock 2, provided with a cutting blade, 3, parallel with the bottom of the stock, and

297,787.

with an adjustable gage in advance of said blade and guides at the sides of said gage, as set forth.

7. The tool-stock 2, divided longitudinally into two parts, having lips 5 5 and connecting-screws 4, whereby the blade may be detachably held in the stock, as set forth.

297,788. GRAPPLE FOR HOSE. ALONZO H. GREEN, Clear Lake, Iowa. Filed Feb. 29, 1884. (No model.)



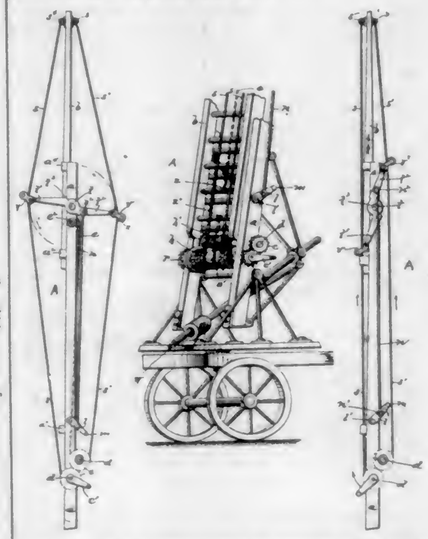
Claim.—1. A hose-grapple consisting of sections of tubes having jointed grappling-irons applied to them whereby the hose is grasped evenly, substantially as described.

2. The grapple herein described, consisting of the parts A and B, pivoted together, and provided at their ends with curved pieces D D, and having handle *a* and link *a'*, substantially as and for the purposes described.

3. In combination with the grapple A B, constructed as described, having an eye, *a''*, on one of its parts, the strap, F, substantially as described.

4. A grapple consisting of the parts A and B, pivoted together, and having on the inner face of each of their jaw ends a curved piece, D, substantially as described.

297,789. MAIL-BAG. FREDERIC GREGSON, Dolington, Pa. Filed Mar 31, 1884. (No model.)



Claim.—1. The improved mail-bag herein described, consisting of the bag proper provided with staple-openings, the covering-flap, the strap-casing, the front flap, and the fastening-strap provided with hooks, substantially as set forth.

2. The combination, with the bag proper having staple-openings *a*, and provided with staple *a'*, the covering-flap provided with staple-openings *b* and *b'*, the front flap provided with staples *h* and openings *h'*, and the fastening-strap, all arranged and adapted for use, substantially as set forth.

3. The combination of the bag having staple-openings, the covering-flap, and the front flap of the strap F, provided with hooks, and secured at one end to the front flap, and provided near said end with a handle-tongue, substantially as set forth.

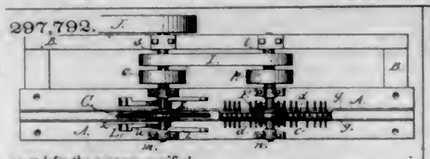
297,790. FIRE-ESCAPE LADDER. HORACE P. GREWOLD, Providence, R. I. Filed Jan. 2, 1884. (No model.)

Brief.—The pivoted spreaders which tighten the flexible braces are operated by a crank-arm and connecting-rod.

Claim.—1. In an extension-ladder, the combination of the flexible braces *s s'* and geared drums *h h'* with the spreader *t*, the latter being pivoted to the ladder *a* and operated by means of the connection *n* and crank-lever *l*, pivoted to the lower end of said ladder, all substantially as shown and set forth.

2. In an extension-ladder, the flexible braces *s s'*, secured to the top end of the sliding ladder *b*, and also connected with the geared drums *h h'* of the ladder *a*, in combination with the pivoted spreaders *t*, provided with arms *t t'*, adapted to receive said braces, and further provided with means for operating said spreader, all substantially as shown and set forth.

297,791. CONCRETE COMPOUND FOR PAVING STREETS, WALKS, &c. LEVI HAAS, Chestar, Pa. Filed Dec. 21, 1883. (No specimens.)



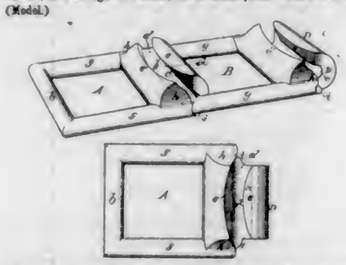
Claim.—1. A concrete compound composed of furnace-slag, gravel, Portland cement, metallic screenings obtained by washing ores, glass cinders, wood and coal ashes, Trinidad asphaltum, and coal-tar pitch in the proportions substantially as described.

2. A concrete compound for the manufacture of tile and ornamental brick, composed of furnace-slag, gravel, Portland cement, metallic screenings obtained by washing ores, glass cinders, wood and coal ashes, Trinidad asphaltum, and coal-tar pitch, and refuse slate for coloring-matter, substantially as described.

297,792. CAPSULE-MACHINE. ALBERT B. HALL, Indianapolis, Ind. Filed Oct. 8, 1883. (No model.)

Claim.—1. In a capsule-machine, a mold for forming capsules, consisting of a pair of parallel bars suitably connected to form a frame, and a series of rods journaled and adapted to revolve in said frame, each of said rods being provided with a pulley, *f*, all combined substantially

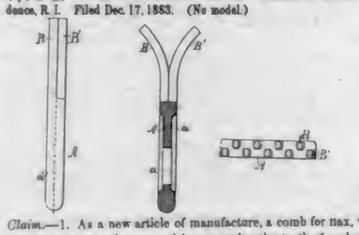
297,792.



as and for the purpose specified.

2. The combination, with a capsule-mold formed of a pair of parallel bars suitably connected to form a frame, and a series of rods journaled and adapted to revolve in said frame, of a device adapted for cutting to a length capsules formed on said rods, said device consisting of the following elements, combined substantially as specified, namely: a bed-plate having parallel guides thereon, adapted to receive and guide the bars of said mold, a knife or knives attached to said bed-plate in such position as to come in contact with the rods of said mold, means for propelling said mold along said bed-plate between said guides, and a friction-wheel arranged to impinge against said rods, and to revolve them by the frictional contact of its periphery therewith.

3. In a capsule-machine, the combination of plate A, having guides *g g* thereon, friction-wheels F and D, shafts *l* and *n*, and disk *h*, mounted in a yielding bearing and adjustably secured to said plate, all substantially as and for the purpose specified.

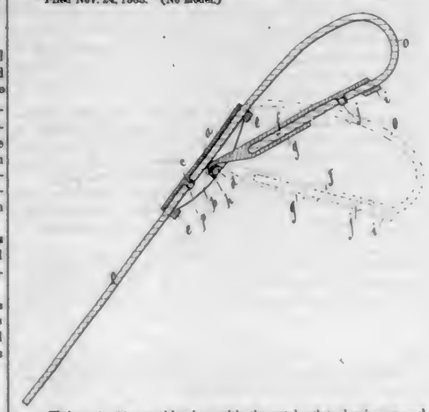


4. In a capsule-machine, the combination of plate A, having guides *g g* thereon, friction-wheels E and C, shafts *s* and *m*, and friction-wheels *u* and *v*, mounted in yielding bearings secured to said plate, and arranged to revolve in a plane at an acute angle with said guides, substantially as and for the purpose specified.

297,793. DRIVE-CHAIN. THEODORE F. HALL, Marietta, Ohio, assignor, by direct and mesne assignments, of part to Alfred J. Richards, W. E. Conner, and George W. Lovell, all of same place. Filed Oct. 9, 1882. (Model.)

Claim.—A drive-chain link consisting of side bars, *g g*, straight bar *b* at one end, and open hook D at the opposite end, the socket or bearing in which the pivot-bar works being straight and its throat or slot being curved—that is to say, convex on the side next to the pivot of the hook and concave on the opposite side next to the end bar—and having the projections *i i* extending into said socket, substantially as shown and described.

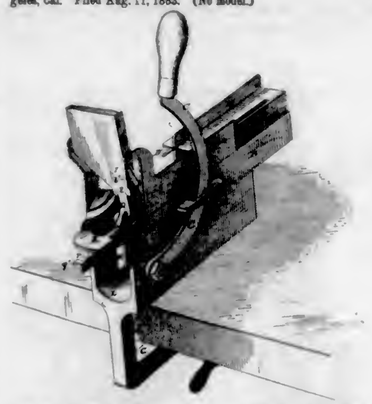
297,794. COMB FOR FLAX, WOOL, &c. WILLIAM P. HALL, Providence, R. I. Filed Dec. 17, 1883. (No model.)



Claim.—1. As a new article of manufacture, a comb for flax, wool, hair, &c., having its teeth arranged in two series, the teeth of each series being opposite the spaces between the teeth of the other series, substantially as and for the purposes set forth.

2. An improved comb for flax, wool, hair, &c., having its body formed with a depressed portion and a raised edge, and formed on its upper edge with two series of teeth, the teeth of one series being opposite the spaces between the teeth of the other series, substantially as described.

3. As a new article of manufacture, the comb herein described, consisting of the body A, centrally depressed, and provided with the raised edge *a'* and hole *a*, and the teeth B B', formed upon the upper edge of the body, and arranged as described.



297,795. REIN-FASTENER. NORMAN N. HAZELTON, Lamoni, Iowa. Filed Nov. 24, 1883. (No model.)

Claim.—1. The combination, with the catch-plate having an end loop, a nib, and side flanges provided with a cross-bar, of the hooked plate having an end loop and a nib, substantially as and for the purpose set forth.

2. In a tag and rein fastener, the combination, with the catch-plate having an end loop, a nib adjacent to said loop, and a cross-bar arranged beyond a longitudinal plane touching the outer end of the nib, of the hooked plate having a nib and a loop at one end, substantially as and for the purpose set forth.

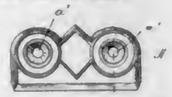
297,796. CARTRIDGE IMPLEMENT. HENRY T. HAZARD, Los Angeles, Cal. Filed Aug. 11, 1883. (No model.)

Claim.—1. In an implement substantially such as described, the combination of a frame, A, provided with an anvil, K, a swinging magazine, a tube, Q, provided with spring-jaws S, and a slide, B, provided with plunger E, to press the shell against the anvil, and with arm *r*, having lateral projection *q'*, to move the magazine-tube away from the anvil, substantially as set forth.

2. In combination with frame A, having anvil K and support W, a slide, B, provided with decapping-plunger D and recapping-plunger E, and the hand-lever C, pivoted to the frame A and working between lugs on the side of slide B, whereby movement of the lever is caused to move the slide.

3. The priming mechanism consisting of a reciprocating plunger, a stationary anvil, and a movable cap-tube having a passage-way across it, substantially as shown, whereby the shell is advanced upon the primer and receives it into the pocket thereof.

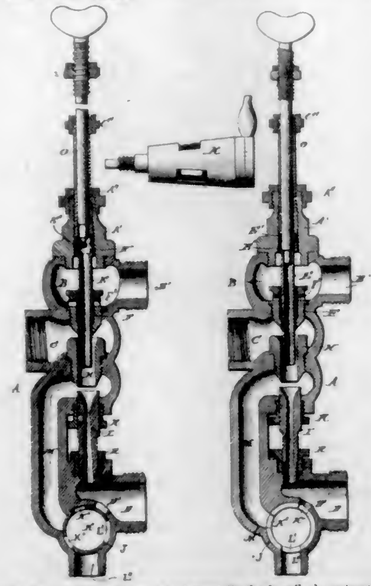
4. In combination with a plunger adapted to carry a shell, and with a fixed anvil in line with the center of the plunger, a primer-feeding mechanism consisting of a tube closed at its lower end, and having a passage across it closed by movable jaws, substantially as shown, whereby the primers are held in position to be seated in an advancing shell.



5. In an implement such as described, the combination of a frame provided with a support, W, cut out, as shown, to support a cartridge-shell without covering the primer-pocket, and having stationary anvil K below the support W, plungers D and E, the former in line with support W, and provided with a decapping-pin, the latter in line with anvil K, and means, substantially as described, for moving said plungers, whereby a shell may be deprimed by the plunger D and carried by gravity into position to be primed by the plunger E.

6. In combination with frame A, plunger E, and means, substantially as shown and described, for imparting a reciprocating motion to said plunger, a flat detachable reservoir, I, provided with tube Q and spring-jaws S, said jaws preventing the escape of primers in applying the magazine or reservoir to the frame or in handling after filling.

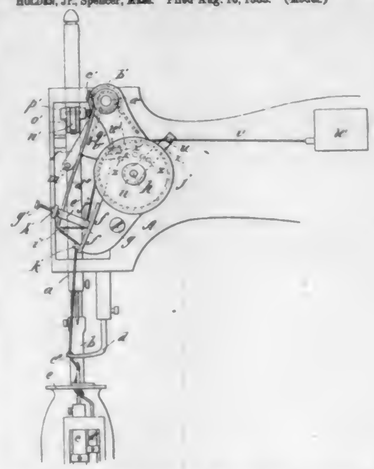
7. In combination with reservoir I, a spring-arm, *b*, within the reservoir, provided with an outwardly-projecting incline, *b'*, and an operating-lever, C, and capping-plunger E, said lever arranged, substantially as described and shown, to act upon the incline *b'*.



8. In combination with frame A, reservoir I, cap-tube Q, and plunger E, slide B, carrying said plunger, and provided with an incline to enter a slot, *l*, in the cap-reservoir beneath the caps, and an operating-lever, C, applied substantially as shown.

297,797. ART OF MAKING PLUMBERS' TACKS. CHARLES EBERHARD HEEB, Chicago, Ill., assignor of one-half to James N. Raymond, same place. Filed Dec. 20, 1883. (No model.)

Claim.—The herein-described process for the manufacture of plumbers' tacks, the same consisting in first casting a strip of lead of suitable width for the tacks, and then cutting and stamping said strip into tacks by suitable cutting and stamping dies, substantially as and for the purposes set forth.



297,798. INJECTOR. LOVREN EDWIN HOGUE, Sandy Lake, Pa. Filed Nov. 3, 1883. (Model.)

Claim.—1. In an injector of substantially the described construction, the combination of the shell A, provided with a forcing-tube, the lower section of which, I, is adapted to be raised or lowered, a lifting tube or nozzle, F, provided with apertures F', a hollow steam-tube, E, having a lower tapering end, and provided with apertures E', and an exterior screw-thread upon its central part to adapt it to be raised or lowered, and a valve-stem, O, as and for the purpose shown and set forth.

2. In an injector of substantially the described construction, the combination of the shell A, provided with a combined lifting and forcing tube, the lower section of which, I, is adapted to be raised or lowered, a lifting tube or nozzle, F, provided with apertures F', a hollow steam-tube, E, having a lower tapering end, and provided with apertures E', and an exterior screw-thread upon its central part to adapt it to be raised or lowered, a valve-stem, O, overflow-pipe M, chamber J, three-way cock K, hot and cold water overflow L'', and lever or connecting-rod P, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

297,799. TENSION DEVICE FOR SEWING-MACHINES. HIRAM HOLDEN, Jr., Spencer, Mass. Filed Aug. 10, 1883. (Model.)

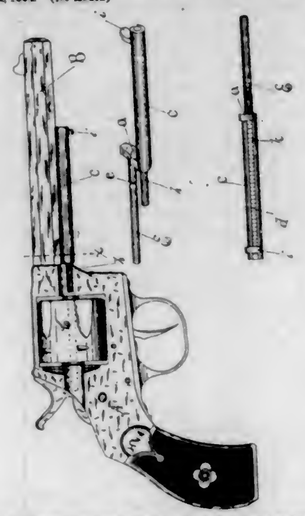
Claim.—1. The combination, with the plate *f*, having stud *h* and shifting tension-wheels *i j*, the rod *u*, having guide-eyes, and a wax-cup or spool, of the supporting-arm *x*, pivoted on stud *h* between said plate and wheel *i*, and having a stud-pin, *y*, fitted in one of a circle of holes, *z*, in said plate, whereby the thread-guides may be set higher or lower, as described.

2. The plate *f*, having flange *f'*, with eyes *k'*, and stud *a'*, with adjustable collars *b' b'*, the take-up wires *d'''*, coiled around said collars and having guide-eyes *i'*, the slotted posts *c'*, provided with adjusting device *g' k'*, and the guide *d*, having eye *c''*, in combination with the lever *l'*, having arm *m'*, the pivoted dog *n'*, the awl-bar having collar *p'*, with ears *o'*, and the needle, operated substantially as described.

3. The combination, in a tension device, of duplicate tension-wheels *i j*, arranged on a stud, *h*, and provided with sleeve *k*, nut *n*, spring *m*, and washer *s'*, for adjusting wheel *i*, and collar *l*, nut *q*, spring *p*, and washer *o*, for adjusting wheel *j*, substantially as described.

4. The tension-wheels *i j*, mounted on a stud, *h*, attached to plate *f*, which plate also carries the take-up wires *d''* and lever *l'* by the stud *a'*, and also carries the guide-posts *c'* and eyes *k'* by flange *f'*, and is adapted to be attached to the awl-bar-carrying head of a sewing-machine, substantially as described.

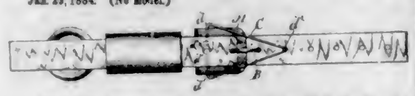
297,800. MANUFACTURE OF MEDICATED LOZENGES OR TABLETS. ALVAH W. HOLWAY, Boston, Mass. Filed Feb. 9, 1884. (No specimens.)



Brief.—Improvement on the invention of Letters Patent No. 75,272, dated March 10, 1868.

Claim.—1. A tablet or lozenge consisting of sugar, cream of tartar, and acid phosphate, substantially as set forth.

2. The process herein described of forming a tablet or lozenge of sugar and acid phosphate, which consists in boiling the sugar and incorporating the acid phosphate by kneading while the compound is very hot, substantially as set forth.



3. A tablet or lozenge in which sugar and acid phosphate constitute a base, substantially as expressed.

297,801. REVOLVER. SAMUEL S. HOPKINS, Norwich, Conn. Filed Feb. 4, 1884. (No model.)

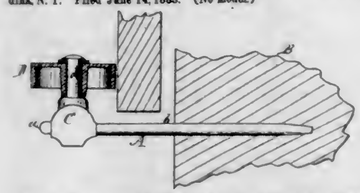
Claim.—In combination with a revolver frame and cylinder, a removable axial pin having secured to its outer end, or formed as an integral part thereof, a tube containing a spring-pressed ejector-rod whose forward end has a flange by means of which said rod may be forced rearward, the tube and ejector-rod being (when in place) in longitudinal alignment with the chambers of the cylinder, all arranged substantially as and for the purpose specified.

297,802. HARNESS-BUCKLE. ELIAS HOXIE, Red Creek, N. Y. Filed Jan. 29, 1884. (No model.)

Claim.—In a harness-buckle, the combination, with the buckle, of a safety appliance, its forward end formed with a hook and its divergent arms provided with inwardly-projecting ends adapted to enter beneath the strap, substantially as described, and for the purpose set forth.

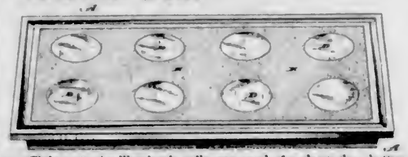
297,803. GARMENT-CLASP. JAMES C. HYDE, West Haven, Conn., assignor to the West Haven Buckle Company, same place. Filed Mar. 17, 1884. (No model.)

Claim.—1. The combination of the two hinged jaws A B, the wire loop C having its two legs fixed to the tail of one of the jaws and extended to form a helical spring between the two jaws, the end of the spring arranged to bear upon the opposite jaw, substantially as described.



2. The combination of the two hinged jaws A B, the wire loop C attached to the tail of one of the jaws, the said loop extended to form a helical spring between the two jaws, and so as to bear upon the opposite jaw, with the wire guard *m m* hinged to the said other jaw and to the loop, substantially as described.

297,804. GARMENT-CLASP. JAMES C. HYDE, West Haven, Conn., assignor to the West Haven Buckle Company, same place. Filed Mar. 17, 1884. (No model.)



Claim.—The combination of the two jaws A B, hinged together, the helical spring *b*, arranged between the jaws to hold them in their closed condition, the loop C, made from wire, the upper end of one jaw bent around the lower bar of the loop, and the U-shaped guard made from wire, the upper end of the other jaw turned around the bend of the guard, and the two legs of the guard extending upward and hinged to the loop, substantially as described.

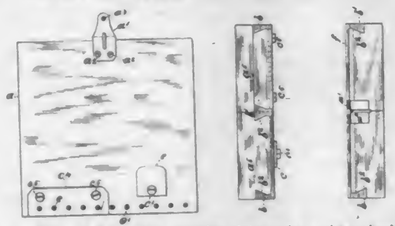
297,805. STAY-ROLLER FOR SLIDING DOORS. SAMUEL IDE, Medina, N. Y. Filed June 14, 1883. (No model.)

Claim.—A stay-roller for sliding doors, consisting of a staple cast into a head of cast-iron, the rounded end of the staple projecting back outside of the casting, and serving to receive the blows of the hammer in driving, and a roller mounted on top of the casting, as set forth.

297,806. ILLUMINATING-TILE. JACOB JACOBS, New York, N. Y. Filed Feb. 16, 1884. (No model.)

Claim.—1. An illuminating-tile composed of a sheet-glass bottom and a superimposed body of cement provided with glass lenses, substantially as and for the purpose specified.

2. An illuminating-cover for areas, vaults, &c., composed of tiles having each a sheet-glass bottom and a superimposed body of cement provided with glass lenses, in combination with a supporting-frame which receives and contains said tile, substantially as and for the purpose shown.



297,807. TRUSS-BRACE FOR VEHICLE-AXLES. AARON JENKINS, Wabash, Ind. Filed Dec. 17, 1883. (No model.)

Claim.—1. A clip for axle truss-braces, formed to fit under the face of the axle, and having its ends extended upward against the sides thereof, and terminating in hooks to fit over the truss-rods, substantially as shown, and for the purpose described.

2. The combination, with the axle provided with skeins formed with side eyes, and the truss-braces arranged against the sides of the axle, above the lower line thereof, and adjustably secured to the skeins, of the truss-clips formed to fit the under face of the axle, and their ends extended up to form ears terminating in hooks adapted to engage with and thereby be held in position by the tension of the truss-braces, substantially as described.

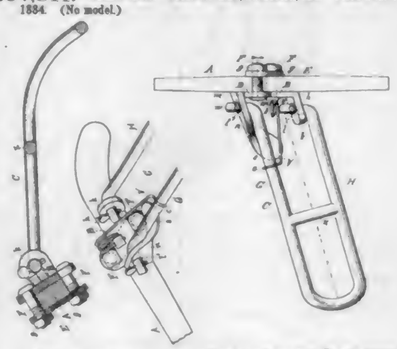
297,808. FURNACE-DOOR. LEMAN F. JOHNSON, Cleveland, Ohio. Filed Dec. 3, 1883. (No model.)

Claim.—A furnace-door consisting of the casting or plate *a*, having the side pieces, *b b'*, and the air-space *f* and holes *d'*, in combination with the bricks a^2 and holding-pieces *a'* and *c*, substantially as and for the purposes described.

297,809. FOLDING ROCKER. JAMES R. JONES, Reading, Mich., assignor to the Colby Wringer Company. Filed Dec. 3, 1883. (No model.)

Claim.—1. In a folding rocking-chair, the combination, with the rockers having pins *p t* and buttons *v*, and the front and rear legs, of an adjustable fastening consisting of a slotted and notched link pivoted to the rear leg and to the rocker, and constructed to engage with the pins on the rocker, substantially as described.

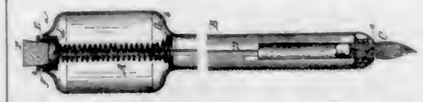
2. In a folding rocking-chair, the combination of the rockers A A, having pins *p t* and buttons *v*, the side pieces, B B and C C, flexible seat D, and the adjustable links E E, having slots *m* and notches *s*, substantially as described.



297,810. APPARATUS FOR BOILING SAP OR CANE-JUICE. OBED H. JONES, Kortright, N. Y. Filed Feb. 7, 1884. (No model.)

Claim.—1. In an apparatus for boiling sap, juice, or similar fluids, the combination of a pivoted track having one end projecting over a furnace or fire-place, a truck traveling upon the track and having means for suspending the boiling-pan, and weights at the end of the track, being sufficiently heavy to tilt the end of the track over the fire-place upward when the desired quantity of water has been evaporated, as and for the purpose shown and set forth.

2. The combination, in an apparatus for boiling sap, cane-juice, or similar fluids, of a fire-place, a track having the end placed over the fire-place bent at an obtuse angle to the other end of the track, pivoted upon an upright or uprights, and resting with its ends alternately upon abutments at each end, a truck traveling upon the track, and having the boiling-pan suspended from it by means of chains, a weighted rope passing over a pulley at the end of the track away from the fire-place, a rope passing over a pulley at the fire-place, both ropes attached to the truck, an adjustable stopping-block fitting upon the track, and a receptacle for weights sufficiently heavy to tilt the track when the sap or juice has attained its desired consistency, all constructed as and for the purpose shown and set forth.

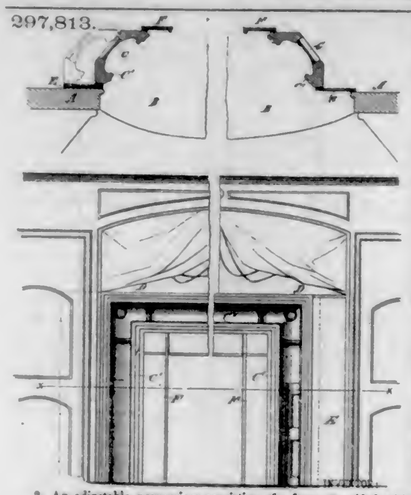


297,811. DRAG-ROD. JOHN N. KEY, Princeton, Ind. Filed Feb. 4 1884. (No model.)

Claim.—1. The combination, with the hinge-plate B, constructed substantially as shown and described, having the forwardly-extending arms provided with perforations to receive the journal ends of the drag-rod, the arm *n*, bent inwardly and downwardly to form an under support for the said rod, the spring-arm V having its inner end secured to the said hinge-plate, and its outer end bent over and engaging the drag-rod, the drag-rod, and means for securing the hinge-plate to a plow-beam, substantially as specified.

2. The combination, with the loop-form drag-rod, of the hinge-plate having bearings receiving the journal ends of the rod, a supporting-arm extending under the rod, and a bearing-spring attached to the hinge-plate and engaging the rod, substantially as specified.

297,812. MARKING IMPLEMENT. WILLIAM A. KIBBE, Leavenworth, Kans., assignor to Martin A. Norton, same place. Filed Aug. 13, 1883. (Model.)



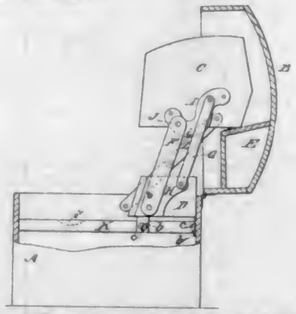
Claim.—1. The combination, in a paint striping and marking machine, of the reservoir A, tube B, and threaded nozzle E, connected to the brush-holding tube extending down through the reservoir A into the tube B, and carrying the marking-brush at its lower end, substantially as set forth.

2. The combination, in a paint marking and striping machine, of a reservoir, A, and tube B, and threaded nozzle E, having milled rib *s* and cap F, and connected to the upper end of the rod D, extending down into the tube B, and carrying the piston G and the marking and striping brush, substantially as described.

297,813. ADJUSTABLE PROSCENIUM. ISAAC KIRALFY, New York, N. Y. Filed Feb. 1, 1884. (No model.)

Claim.—1. The combination, with a proscenium-wall, of an adjustable proscenium-frame, arranged behind the wall, and adapted to partly fill the opening in the said wall, substantially as herein shown and described.

297,813.



2. An adjustable proscenium consisting of a frame provided with wings for increasing or decreasing the size of the said frame, substantially as herein shown and described.

3. An adjustable proscenium consisting of a frame formed of a top piece, C', and standards C', provided with doors or openings, substantially as herein shown and described.

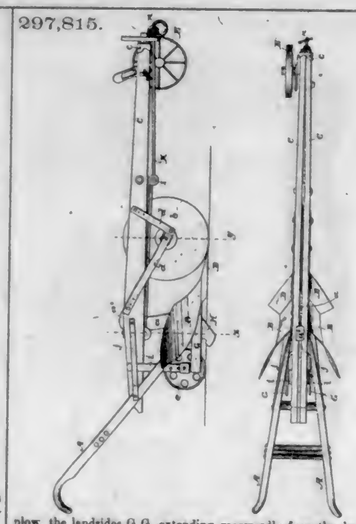
4. An adjustable proscenium consisting of a frame formed of a top piece, C', two standards, C', and corner-pieces D, substantially as herein shown and described.

297,814. TRUNK. WILLIAM J. LARSH, Brooklyn, N. Y. Filed Feb. 14, 1884. (No model.)

Claim.—1. The tray D, having the tray C hinged to it, and provided with the plates *b* and screws *c*, or similar means for securing it in the body A, substantially as and for the purposes set forth.

2. The tray C, having the stay-rod J passing through it, in combination with the tray and hinging-arms F, substantially as and for the purposes set forth.

3. The plates I, projecting below the bottom of the tray C, and adapted to enter the recesses *i'* when the tray is closed, substantially as and for the purposes set forth.



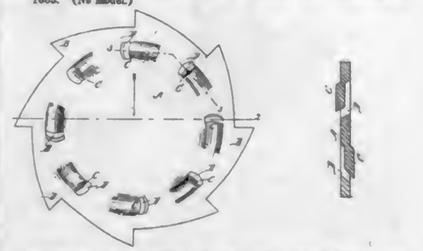
4. The tray E, formed in the cover B, and arranged to fill the space above the auxiliary tray D when the cover is closed, and to support the tray C when the lid is open and the said tray C is swung upward out of the body of the trunk, substantially as shown and described.

297,815. DOUBLE PLOW. JOHN L. LAUGHLIN, Louisville, Ky., assignor to B. F. Avery & Sons, same place. Filed Feb. 14, 1884. (No model.)

Claim.—1. In combination with a double or duplex beam, a revolving colter arranged to rotate partially within the slot or space afforded for its accommodation between the two parts of said duplex beam, all substantially in the manner and for the purpose set forth.

2. In combination with the beam and standard of a double-nosed

297,815.

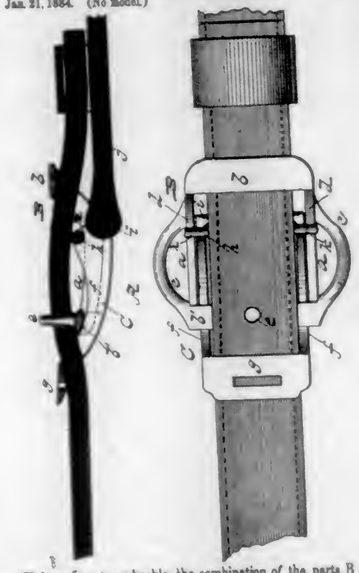


plow, the landsides G G, extending rearwardly from the lower portion of the standard, the vertical bars *i i*, secured at their lower portions to the landsides and at their upper ends to the beam, and a carrying-wheel, *e*, the whole constructed and operating substantially as described, for the purposes set forth.

3. In combination with the double or duplex frog *h h* and the two landsides G G, to which the parts of said frog are secured, an intermediately-arranged standard, *a*, the whole constructed, arranged, and operating in substantially the manner and for the purposes set forth.

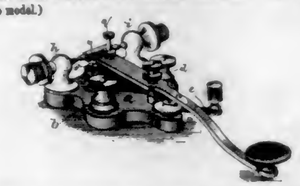
4. The combination, with the double plow, a duplex or a slotted beam, and a colter revolving partially within said beam, of the landsides G G, having frogs *h h*, the bars *i i*, a carrying-wheel, *e*, and the fixed rudder-plate H, all substantially as shown and described.

297,816. SAW. JOSEPH LEDWARD, Westerly, R. I. Filed Aug. 24, 1883. (No model.)



Claim.—A saw-blade having cutting-edges C, made integral with the blade, in combination with throats or openings D through the blade, substantially as and for the purpose specified.

297,817. BRAIDING ATTACHMENT FOR SEWING-MACHINES. FREDERICK LEHR, New York, N. Y. Filed Aug. 31, 1883. (Model.)



Claim.—A sewing-machine braiding attachment consisting of a presser-foot having a braid-guiding passage of unequal diameters extending longitudinally thereof, the plane of the longer diameter of said passage being inclined relative to a vertical plane, said foot having also a needle-hole arranged at the side of and intersecting said braid-guiding passage, substantially as set forth.

297,818. TRACE-BUCKLE. WM. LENCHEN, Lake City, Colo. Filed Jan. 21, 1884. (No model.)

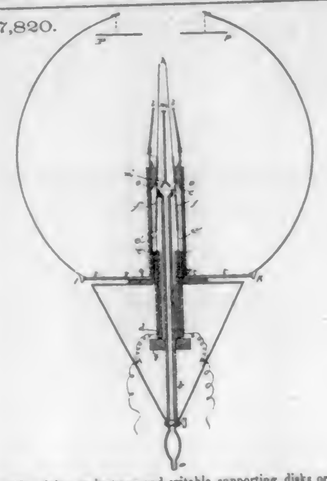
Claim.—In a trace-buckle, the combination of the parts B and C, the latter provided with curved side bars *f f*, connected by the bars *g i* A, the latter extending outwardly on each side of the bars *f f*, and the portion B, having the curved side bars *a a*, loops *c c*, said bars connected by the cross-bars *b b'*, the latter bar having the tongue *e*, the whole operating as shown and described.

297,819. TELEGRAPH-KEY. CHARLES W. LEWIS, Chicago, Ill., assignor to the Western Electric Company, same place. Filed Sept. 8, 1882. (No model.)

Claim.—In a telegraph-key, a spring-lever pivoted or centered at its extreme end by a cross-bar mortised and shouldered thereon, in combination with the adjustable spring and contact-points, substantially as and for the purpose specified.

297,820. GASO-ELECTRIC LAMP. JOHAN HERN LODER, Brussels, Belgium. Filed Jan. 17, 1883. (No model.) Patented in England Dec. 8, 1882, No. 5,961; in Belgium Dec. 9, 1882, No. 43,512; in France Dec. 11, 1882, No. 140,314, and in Germany Dec. 16, 1882, No. 120,725.

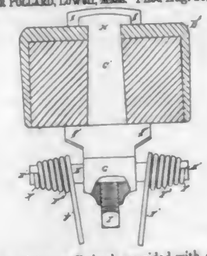
Claim.—1. In a gaso-electric lamp, the combination of a gas-burner, electrical conductors, air supplying and regulating devices, and devices for regulating the position of the said electrical conductors, substantially as described.



2. In gaso-electric lamps, the combination, with the gas-burner, of flexible conductors, holder-arms, and carbon or other pencils, all operating substantially as specified, and for the purposes set forth.

3. In gaso-electric lamps, the combination, with the gas-burner, of regulating mechanism bearing upon the pencil-holders, which are operated by movable screw mechanism, all substantially as specified.

4. In gaso-electric lamps, the combination, with said lamps, of exit-chambers or plates, into or through which the flame will pass for a short distance for the purpose of giving increased steadiness to said flame, all substantially as specified.

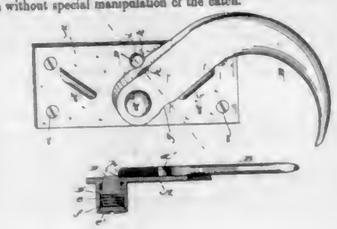


5. In gaso-electric lamps, the combination, with said lamps, of

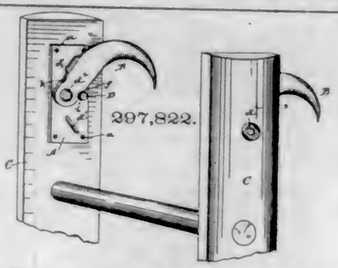
297,820.

movable globes or lanterns and suitable supporting disks or plates, by the movement of which the air-feed to the lamp can be regulated, substantially in the manner described.

297,821. PICKER-STAFF CHECK FOR LOOMS. OLIVER D. LOMBARD and SYLVESTER POLLARD, Lowell, Mass. Filed Aug. 30, 1883. (No model.)



Claim.—1. A picker-staff check provided with a shank adapted to reach through the picker-staff slot of a lay-beam, and having means to engage directly with said lay-beam, substantially as specified.

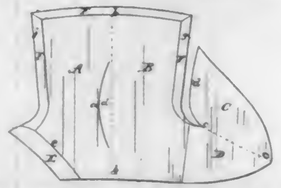


2. A picker-staff check provided with a shank adapted to reach through the picker-staff slot of the lay-beam, and having a pair of ears adapted to rest upon the top of said beam or its cap, and having another pair of ears adapted to press against the under side of said lay-beam, substantially as specified.

3. The combination of the wire bent into connected spirals, and having an arm, the spindle provided with holes to receive the ends of said wire, the block, means of attaching said block to a lay-beam, and a set-screw turning in said block and thrusting against said spindle, substantially as and for the purpose specified.

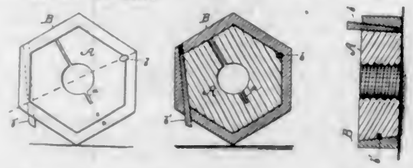
297,822. LADDER-HOOK. JOHN F. MANAHAN, Lowell, Mass. Filed Mar. 28, 1884. (No model.)

Brief.—The hooks are positively locked in operative position upon their base-plates by a spring-catch, and detachably secured in inoperative position by the same catch, so they can be shifted into operative position without special manipulation of the catch.



Claim.—1. In a ladder-hook, the combination, with a base-plate and hook proper, of a spring-controlled catch or lock for positively locking the hook to the base-plate, substantially as hereinbefore set forth.

2. A ladder-hook comprising a base-plate, a spring-controlled locking pin or bolt mounted in said plate, and a pivoted hook, combined to operate substantially in the manner and for the purposes hereinbefore set forth.

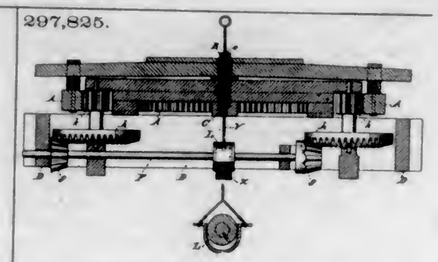


3. The combination of the base-plate provided with stops, the pivoted hook arranged to bring up against one or the other of said stops when opened or closed, and the spring-controlled locking pin or bolt adapted to automatically lock the open hook, and to be overlapped by the beveled or equivalently-formed portion of the closed hook, substantially as and for the purposes hereinbefore set forth.

297,823. UPPER. STEPHEN MARVIN, Burnettsville, Ind. Filed Dec. 30, 1881. (No model.)

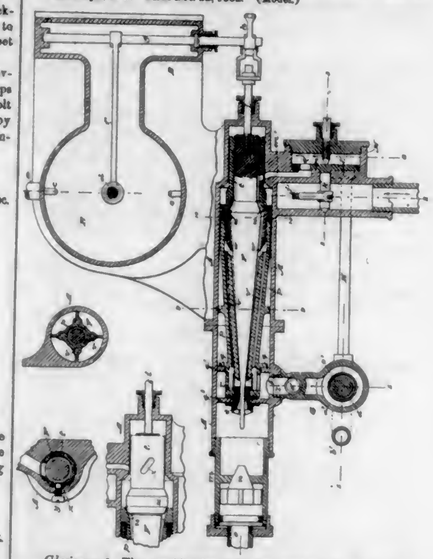
Claim.—A boot or shoe upper cut through along the line *a*, the edges and near parts crimped till the edge *a'* can be lapped over the edge *a* and stitched or otherwise fastened down, for the purpose of incurving the line *b b*, all substantially as described.

297,824. NUT-LOCK. JACOB C. MCAFEE, Dallas, W. Va. Filed Sept. 26, 1883. (No model.)



Claim.—1. The combination of a split nut, an inclosing-band, and a key arranged between the band and the nut, to press the sections of the nut to closer contact with the bolt, substantially as shown and described.

2. The combination of the split nut and inclosing-band, having their adjacent faces made tapering, and the key *b'*, arranged at the joint of the nut and band, and disposed in the plane of the nut, as and for the purpose described.



297,825. HORSE-POWER. JOHN T. MCCARNEY, Columbus Junction, Iowa. Filed Feb. 26, 1884. (No model.)

Claim.—In a horse-power, the combination, with the master-wheel having a central block or hub seated on a perpendicular center-pin, of the line-shaft F, friction-wheel L, rigidly connected thereto under the center-pin, as shown, the friction-brake Z, constructed as described, having its operating-arm V extending up through a passage, *e*, in the center-pin, and terminating in a handle, substantially as specified.

297,825.

297,826. LIFTING FEED-WATER INJECTOR. WILLIAM MCELROY, Brooklyn, N. Y. Filed Dec. 22, 1882. (Model.)

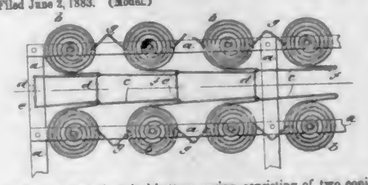
Claim.—1. The combination, with the injector, of an ejector, a float-chamber arranged between the injector and the water-source, a pipe or water-conduit leading from the water-source to the float-chamber, and a pipe leading from said chamber to the injector, a float in said chamber connected with and arranged to actuate a steam-valve in a steam-chest by its rise and fall, said steam-chest arranged to receive steam from a generator, and said valve arranged to control the admission of steam to the injector and ejector, whereby the passage of water through the float-chamber on its way to the injector serves to cut off the steam from the ejector and admit it to the injector, substantially as set forth.

2. The combination, in an automatic lifting-injector, of an injector proper, an ejector arranged to exhaust the air from and through the injector, whereby the water is caused to rise and fill the injector, and means, substantially as described, whereby the passage of water on its way to the injector cuts the steam off from the ejector and admits it to the injector, substantially as and for the purposes set forth.

3. The combination of a float arranged to rise and fall with the rise and fall of the water in a steam-generator, a valve actuated by said float and arranged to stop the passage of steam from the generator to an injector, the said injector, the steam-chest M and the steam-pipe leading thereto, a valve, *n'*, a float-chamber, I, connected with water-source by a pipe, J, and with the injector by a pipe, K, a float in said chamber I arranged to actuate the valve *n'*, and an ejector connected with the injector and arranged to exhaust the air therefrom, said valve *n'* being arranged to control the steam ports and passages leading from the steam-chest to the injector and ejector, respectively, all arranged to operate substantially as set forth.

4. The ejector comprising the shell *a'*, provided with a coned seat, *f'*, the tubular perforated shell *d'*, arranged to screw into the bottom of the shell *a'*, and its upper end arranged to rest on the seat *f'*, the axial spindle *e'*, secured to the shell *d'*, and the check-valve *c'*, all combined

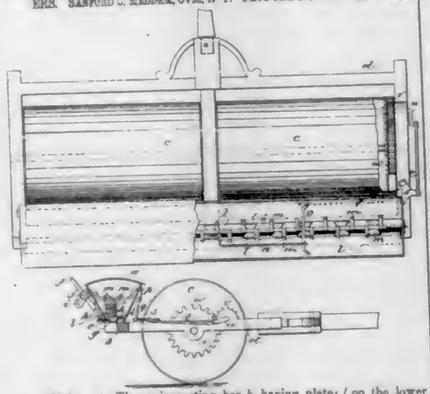
and arranged substantially as set forth.



5. The combination, with the shell A of the injector provided with internal flanges, q' q^2, the cone p, provided with a flange, q, passages v v, and apertures w, the tubular screw r, guide s, valve n, spindle F, and shell t, all arranged substantially as set forth.

6. The combination, with the shell of the injector, of the spindle F, arranged to play longitudinally therein, the cone p, the shell t, screwed onto the base of the cone, and provided with an oblique slot or groove, x, and the screw y, mounted in the shell of the injector and arranged to engage said groove x, all constructed substantially as and for the purposes set forth.

7. The combination of the injector proper, the ejector, the float-chamber I, water-supply pipe J, pipe K, float L, lever j', shaft k', valve n', steam-chest M, and steam-pipe l from the generator, and the steam-pipe H, leading to the ejector, all combined and arranged to operate substantially as set forth.

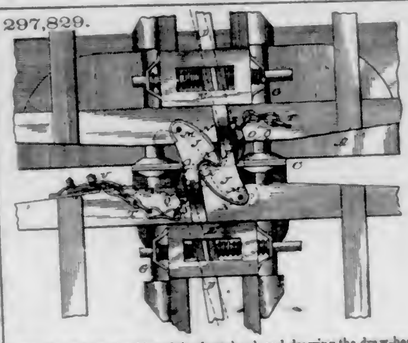


8. The chamber I, provided with a main pipe, K, leading from its top to the injector, and an auxiliary pipe, p', leading from said chamber at a lower point, whereby water is supplied to the injector from said chamber I before the float L rises to its highest point, substantially as set forth.

297,827. SPRING BED-BOTTOM. JOHN MCILHONE, St. Louis, Mo. Filed June 2, 1883. (Model.)

Claim.—A one-piece bed-bottom spring consisting of two conical coils, b b, and a tie formed of the elongated loops f f, the arms c c, bent at e, and the cross-head d, as shown and described.

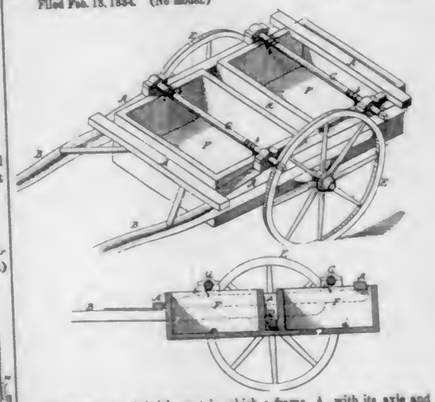
297,828. FERTILIZER-DISTRIBUTING ATTACHMENT FOR ROLLERS. SANFORD C. MEDDICK, Ovid, N. Y. Filed Jan. 17, 1884. (No model.)



Claim.—1. The reciprocating bar k, having plates l on the lower edge, and the prongs m on the upper edge, and being arranged in the hopper over slot g of the bottom of said hopper, and geared with one of the roller-shafts by mechanism, substantially as described, for operating it.

2. The reciprocating bar k, having plates l, both of the side edges of each plate inclining inwardly to the slot g of the hopper, in combination with the means for reciprocating said bar, substantially as shown and described.

297,829. CAR-COUPLING. ISAAC JOHNSON MERRICK, Conetton, Ohio. Filed Mar. 7, 1884. (No model.)

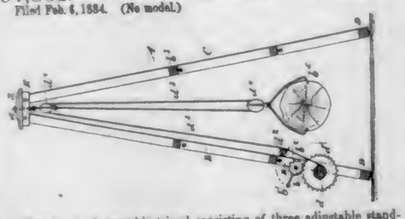


Claim.—The combination, in a car-coupling, of a draw-head having a slightly-hooked shoulder and a horizontal slot or recess behind the shoulder, a block or lever pivoted horizontally in the said slot, a chain attached to the outer end of the said lever or block, and means for drawing the said chain to one side, tilting the inner end of the lever into the

297,829.

space behind the shoulder of the draw-head, and drawing the draw-head to the side, as and for the purpose shown and set forth.

297,830. CART. JOHN MILLS and JAMES MILLS, Wilmington, Del. Filed Feb. 13, 1884. (No model.)



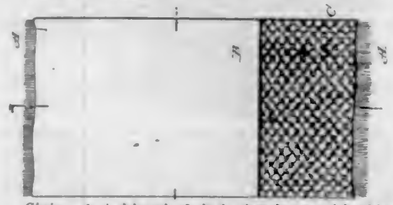
Claim.—1. A brick-cart in which a frame, A, with its axle and wheels, is combined with two receptacles, F, one in advance and the other in the rear of the axle, all substantially as set forth.

2. A brick-cart in which a frame, A, with its axle and wheels, is combined with two receptacles, F, one in advance and the other in the rear of the axle, and with mechanism for raising and lowering said receptacles, all substantially as set forth.

3. The combination of the frame A, having an axle and wheels, and the body comprising two receptacles, F, with intervening space, d, for the reception of the axle, as set forth.

4. The combination of the frame A, having an axle and wheels, the body comprising two receptacles, F, with intervening space, d, for the reception of the axle, and mechanism for raising and lowering said body, as set forth.

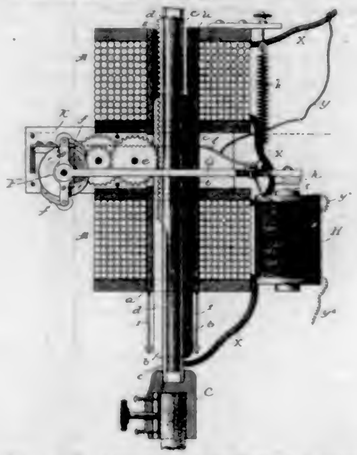
297,831. HOISTING-DERRICK. ANDREW R. MORRISON, Litchfield, Ill. Filed Feb. 6, 1884. (No model.)



Claim.—1. A portable tripod consisting of three adjustable standards, two of which are secured by their inner ends to a cross-piece, all of said standards being joined to a metal plate at their outer ends, said

plate supporting tackle-blocks, with rope connection to winding mechanism secured to the outside of said standards.

2. A tripod-derrick consisting of the standards B B and C, the cross-bar D, binding-rod b^3, and the metal cap E, in combination with the eye-bolt a, pulley-blocks d^3, roller d^2, drum d, shaft b, arms b', gear-wheels b^2 and d', caps c, rope d^3, and the weight b^3, all arranged and operated substantially as shown.

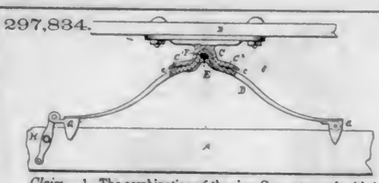


297,832. PLASTERING. JAS. MORRISON, Jr., New York, N. Y. Filed Aug. 7, 1883. (Model.)

Claim.—1. A slab made of plastic plastering material and long strands of cocoanut fibers extending longitudinally the length of the slab and embedded therein, as set forth.

2. As an improved article of manufacture, a slab made of plastic plastering material and long strands of cocoanut fibers embedded therein, the upper face of the slab being roughened to receive a hard finish, as set forth.

297,833. ELECTRIC-ARC LAMP. PHILIP P. NUNGESSER, Cleveland, Ohio. Filed Oct. 4, 1883. (No model.)



Claim.—1. In an electric lamp, an electro-magnet in the main circuit, having a tubular case, a, a slotted magnet-core, b, a tube, c, within the magnet-core, held by frictional contact and carrying the carbon-holder, a rod, d, having a rack-edge adapted to the slotted tube and armature, an escapement-wheel, and pallet-connections with a lever and electro-magnet in a shunt, the parts being combined and operating substantially as described.

2. In combination with the electro-magnet having hollow case, the hollow slotted magnet-core b and tube c, carrying the carbon-holder, the rod d, having rack-edge, the escapement-wheel, lever G, and arms g g, carrying pallets, the electro-magnet H H, armature A on lever G, shunt-circuit, and platinum points, all substantially as described.

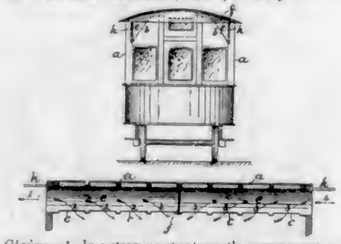
3. In combination with the rack-edge of the feeding-rod of the lamp, the escapement-wheel and pallets, the train of gearing, and the lever carrying an armature acting in the described relation to the shunt-magnet, said escapement-wheel, train of gearing, and lever being carried upon a sliding frame, whereby the gears may be disconnected from the rack, as set forth.

297,834. VEHICLE-SPRING. SOLOMON E. OVIATT, Lansing, Mich. Filed Aug. 10, 1883. (No model.)

297,834.

Claim.—1. The combination of the riser C, constructed with braces C' C², having opposite depending flanges, the spring D, fitting between the flanges of the riser, and a bolt, E, passing transversely through the flanges of the riser under the spring, substantially as described.

2. The combination of the riser C, having a central recess, and braces C' C², provided with depending flanges, the spring D, bent upward at its center to fit in the recess and between the flanges of the riser, and a bolt, E, passing transversely through the flanges of the riser under the bent portion of the spring, substantially as described.



3. The combination of the spring D, having its ends provided with the clasps G, the riser C, having a flanged top, and a bolt, E, passing transversely through the riser under the spring, substantially as described.

4. The combination of the riser C, having a stationary flanged top, the spring D, fitting the riser, and having a clasp, G, at each end, and means for firmly uniting the spring and riser, substantially as described.

5. The combination, with a vehicle-spring, of a cushion adapted to receive the thrust at one end of the spring and to prevent the travel of said end of the spring, substantially as described.

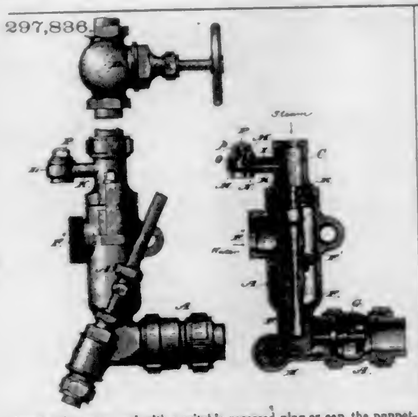
6. A vehicle-spring consisting of spring D, riser C, and means for properly securing the two together, said springs provided with suitable end clasps, and, in combination therewith, a suitable cushion secured beneath one of the said clasps, substantially as described.

297,835. VENTILATING RAILROAD-CARS. JAMES M. PALMER, Cambridge, Mass. Filed Dec. 11, 1883. (No model.)

Claim.—1. In a steam or street car, the passage-way e, open at both ends, and provided with a partition, f, at or near the center of its length, and apertures c, communicating with the interior of the car, substantially as and for the purposes described.

2. In a steam or street car, the passage-way s, open at both ends, and provided with a partition, f, at or near the center of its length, and apertures c, fitted with slides d, for regulating the supply of fresh air admitted to the interior of the car, substantially as shown and described.

297,836. INJECTOR. WILLIAM R. PARK, Taunton, Mass., assignor to the Hancock Inspirator Company, of Massachusetts. Filed Nov. 3, 1883. (No model.)

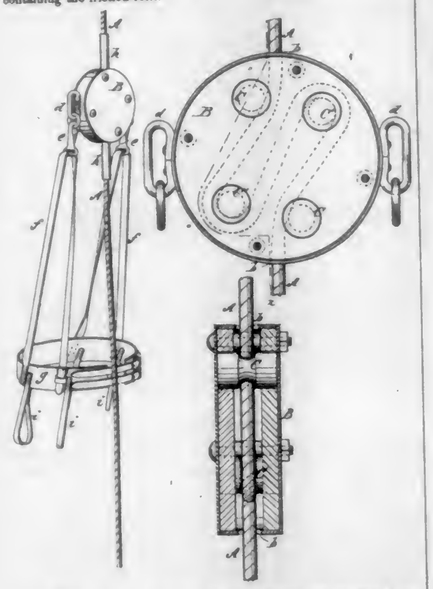


Claim.—1. In combination with an injector, a vacuum-relief valve applied between the steam-valve and the discharge end of the steam-nozzle, and adapted to be opened by the pressure of the atmosphere when the pressure within the steam pipe or chamber falls below that of the air without, substantially as and for the purpose described.

2. In combination with an injector, an automatic valve adapted to remain normally closed against the egress of air or steam from the steam chamber or pipe, and to be opened by the pressure of the atmosphere to admit air from without into said chamber or pipe when a vacuum occurs therein, substantially as and for the purpose set forth.

3. In combination with the injector and the passage opening into the steam chamber or pipe between the steam valve and nozzle, the automatic valve situated in such passage, and adapted to normally close it against pressure from within, and to be opened by the pressure of the air without, to admit air to the chamber or pipe when a vacuum occurs therein, substantially as and for the purpose set forth.

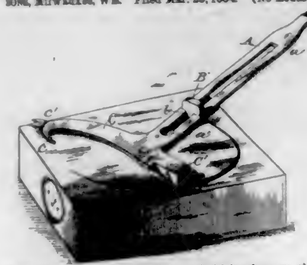
4. In combination with the passage extending from the steam-chamber and the passage intersecting the outer end of said passage, and



297,836.

closed at its upper end with a suitable recessed plug or cap, the puppet-valve closing the opening into the lower end of the intersecting passage, and having its stem fitting in and guided by said lower end of the passage and the recess in the plug or cap, but so formed as not to close them, substantially as and for the purpose set forth.

297,837. FIRE-ESCAPE. FRANCIS DAY PARKELEE, Hillsdale, Mich. Filed May 31, 1883. (No model.)

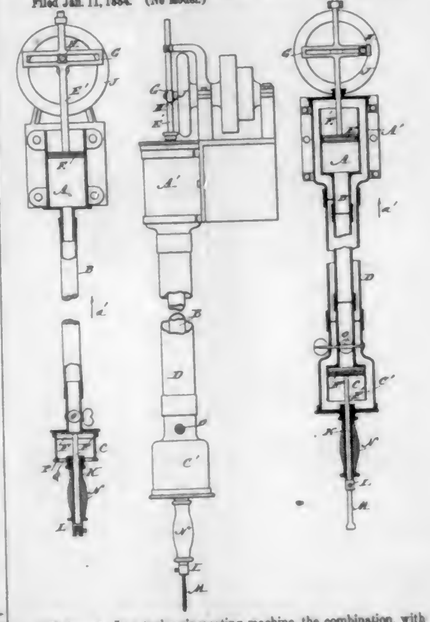


Brief.—Flexible tubes are attached to the openings of the case containing the friction-rolls.

Claim.—1. In a fire-escape, the combination, with the case B, having upper and lower openings, *b*, and provided with the flexible tubes *h* and the loops *d*, on opposite sides, to receive the suspension-straps, of the pulleys C C', the pulleys C being arranged on opposite sides of the said openings and the pulleys C' on opposite sides of and a little below and above the pulleys C, respectively, substantially as herein shown and described.

2. The combination, with the friction-pulley frame or case B, having oppositely-arranged apertures or guides *b b*, and the resistance pulleys, wheels, or rollers C C', of the flexible tubes *h h*, attached to said case in continuation of said guides, for use in connection with a pendent rope, band, or chain, substantially as specified.

297,838. COMBINED HOUSEHOLD IMPLEMENT. FOSTER E. PARSONS, Milwaukee, Wis. Filed Mar. 25, 1884. (No model.)



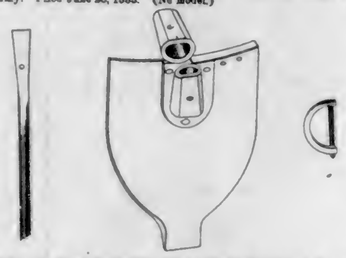
Claim.—1. In a combined household implement, the combination of the lever-handle A, provided with the slot *a* and aperture *a'*, with the knife B, having square shank *b*, and head B', the ends of which are adapted to overlap the edges of said slot, and the shank to be moved longitudinally therein, and the pivot-blade D, having flat base *d* and round shank *d'*, substantially as set forth.

2. In a combined household implement, the combination of the lever-handle A and curved head C, terminating in the hook *c*, substantially as set forth.

3. The combined household implement described, consisting of the curved fruit-can opener, the straight lever-handle with adjustable cutting-blade, the pivot-blade, and the screw-driver, tack-hammer, and tack-drawer, all as set forth.

297,839. MACHINE FOR RECIPROCATING TOOLS. FRED R. PATCH, Sutherland Falls, Vt., assignor of one-half to Redfield Proctor, same place. Filed Jan. 11, 1884. (No model.)

Claim.—1. In a tool-reciprocating machine, the combination, with two cylinders, each having an open and a closed end, and connected together by a tube, of pistons in the said cylinders provided with piston-rods projecting from the open ends of the cylinders, and a regulating-valve in the connecting-tube, substantially as herein shown and described.



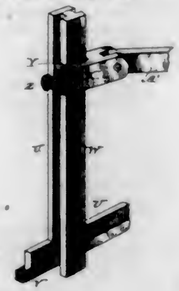
2. The combination, with two cylinders, each having an open and a closed end, the closed ends being connected by a tube, of a piston in each cylinder, a piston-rod on each piston, the piston-rods projecting from the open ends of the cylinders, closed casings surrounding the cylinders, and a tube connecting the casings and surrounding the tube connecting the cylinders, substantially as herein shown and described.

3. In a tool-reciprocating machine, the combination, with the cylinders A C, the tube B, connecting the cylinders, and the valve O in the said tube, of the pistons E F, provided with rods E' F', and the guide-tube K, through which the piston-rod F' passes, substantially as herein shown and described.

4. In a tool-reciprocating machine, the combination, with the cylinders A C, the tube B, connecting the cylinders, and the valve O in the said tube, of the pistons E F, provided with piston-rods E' F', the guide-tube K, and the handle-piece A, surrounding the guide-tube, substantially as herein shown and described.

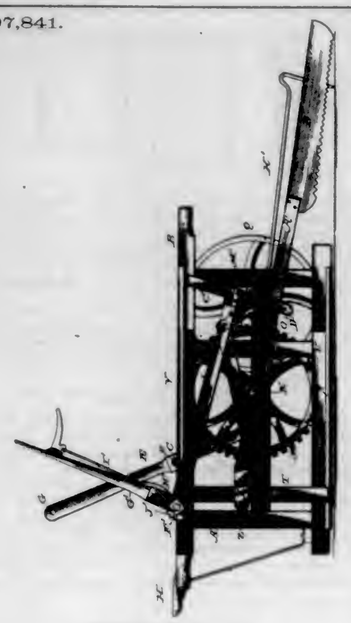
5. In a tool-reciprocating machine, the combination, with the piston-cylinders A C and the tube B, connecting them, of the valve O in said tube, substantially as herein shown and described.

297,840. INTRENCHING-TOOL. JOHN H. PATTERSON, United States Army. Filed June 20, 1883. (No model.)



Claim.—1. In an intrenching-tool or similar implement, the combination of the blade, having two handle-sockets placed at approximately right angles with each other in the direction of the stroke of the tool, the one on the rear face, the other on the top or shoulder of the blade, and a suitable handle therefor, whereby the tool may be used either as a hoe, pick, or shovel, substantially as described.

2. In an intrenching-tool or similar implement, the combination of the blade, two shoulder-sockets thereon, located, the one on the face, the other at the top or shoulder of the blade, at approximately right angles to each other in the direction of the stroke of the tool, and each having a perforation in its side, a perforated handle, and a pin, whereby the handle and tool may be securely fastened together, substantially as described.



3. In combination with the blade of an intrenching or similar tool having a slit or flange secured to its upper edge, two handle-sockets set at approximately right angles to each other in the direction of the stroke of the tool, the one on the rear face, the other on the top or shoulder of the blade, the handle adapted for insertion in the sockets, and the locking-pin, substantially as described.

297,841. DRAG-SAW. JOHN R. PAYNE, Freedom, Ind. Filed Mar. 13, 1884. (No model.)

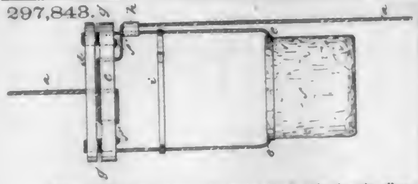
Claim.—In a machine for sawing, the combination of a reciprocating frame having its rear end piece provided with a flange T-shaped in cross-section, a block having a recess T-shaped in section and sliding upon the flange, and provided with a set-screw, a saw-bearing bar hinged to the said block, and a bar having a frame at its forward end provided with an anti-friction roller at its lower end adapted to have the saw-bearing bar sliding upon it, and having means for raising or lowering the bar, as and for the purpose shown and set forth.

297,841.

297,842. HAY-RACK. CHARLES AUGUSTUS PEASLEY and ISAAC F. DODGE, Gowen, Mich. Filed Oct. 6, 1883. (No model.)

Claim.—1. In a hay-frame, the front standard, C, provided with a vertical slot and cross-bar, in combination with the binder-pole having a hook at its front end, and provided at its rear end with ropes H H, which pass over pulleys attached to the rear cross-bar of the rack, substantially as shown.

2. A binder-pole for hay-racks, made in two or more sections, and provided at its front end with a hook and at the joints with links F, and hooks *f*, located on the upper edge of the pole, substantially as shown.



3. The clamp G, adapted for use in connection with the hay-rack and frame, as described, consisting of two members pivoted to each other, and provided with a wedge-shaped portion, and binding-link *k'*, adapted to be clamped upon the binder-pole, and provided with eyes for the reception of the ends of the ropes H.

4. In a hay-rack, the combination of the front post, C, side racks, B B, having pulleys *b*, the binder-pole, and clamp G, adapted to be secured to the binder-pole, and provided at its lower end with ropes H, which pass over the pulleys *b*, secured to the side rack, the parts being organized substantially as shown, and for the purpose set forth.

297,843. FIRE-ESCAPE. CHARLES INGLIS PITTMAN, Halifax, Nova Scotia, Canada. Filed July 9, 1883. (No model.)

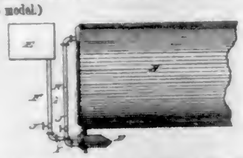
Brief.—A brake-block to which the sling is suspended is arranged above the friction-block through perforations in which the escape-rope is rove. Cushion-springs are secured between the ends of the two blocks.

297,843.

Claim.—1. In a fire-escape, the brake-block *d*, having the sling *e* suspended from it, in combination with friction-block *c*, having the rope *a* rove through it, substantially as described.

2. In a fire-escape consisting of rope *a*, friction-block *c*, sling *e*, and brake-block *d*, the sling-rope extended up through block *c*, and also up and down through block *d*, and attached to block *c*, substantially as described.

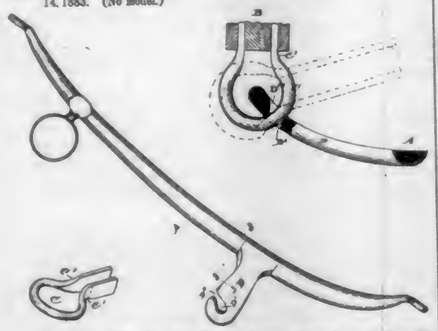
3. The cushion-springs *g*, in combination with friction-block *c*, sling-rope *e*, and brake-block *d*, said springs being arranged between blocks *c d* and the sling-rope, substantially as described.



4. The combination of guide A with rope *a*, sling-rope *e*, friction-block *c* and brake-block *d*, substantially as described.

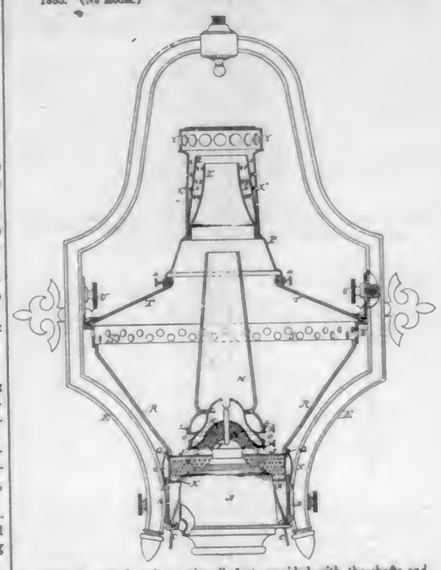
297,844. SULPHO-CONJUGATED VIOLETS OF PARIS. ALCIDE FRANCOIS POIRRIER and DANIEL AUGUSTE ROSENSTIEHL, Paris, France, assignors to the Société Anonyme des Matieres Colorantes et Produits Chimiques de St. Denis. Filed Jan. 17, 1884. (No specimens.)

Claim.—1. The improvement described in the manufacture of sulpho-conjugated Paris violets, consisting in treating the crude coloring-matter with potash, soda, ammonia, zinc, magnesia, or other suitable base, so as to transform the excess of acid into soluble sulphate.



2. The product of the described treatment, the same being a composition of sulpho-conjugated Paris violet, with the free acid neutralized by a suitable substance in the nature of those above specified and having the characteristics set forth.

297,845. SMOKE-BURNING ATTACHMENT FOR FURNACES. WM. A. PORTER, Alliance, and WM. HESTON, Mount Union, Ohio. Filed Dec. 29, 1883. (No model.)



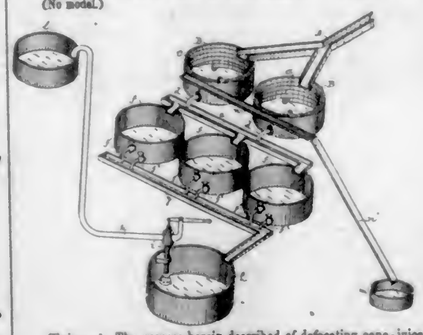
Claim.—The smoke-consuming attachment for steam-boiler furnaces and similar furnaces, consisting of a cylindrical nozzle contracting at its perforated end, a steam-pipe having its open end contracted, and a water-pipe having its outer open end bent downward over the opening of the steam-pipe, as and for the purpose shown and set forth.

297,846. HAME. JERMAIN P. QUINETTE, St. Louis, Mo. Filed May 14, 1883. (No model.)

Claim.—As a new article of manufacture, a hame, having a hook, D, formed in one piece therewith, said hook having a main opening, D', to fit the loop of the tug-clip, a narrow entrance, D'', to the main opening, to admit only a thin portion connecting an arm to the loop of the clip, and a recess, D''', on one side of the inside of the main opening, to permit the clip to be swung outward, as set forth.

297,847. LAMP. ELIAS B. REQUA, Jersey City, N. J. Filed Sept. 3, 1883. (No model.)

Claim.—1. In a lamp, the oil-font provided with the shafts and gear-wheels for raising and lowering the wick, in combination with the band B, having a concave vertical plate, *n*, substantially as set forth.



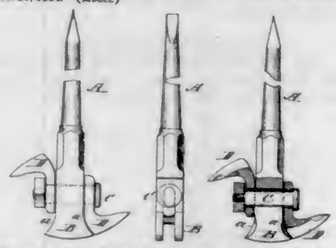
2. In a lamp, the oil-font, the wick-tube, arms I, foraminous cone H, deflector G, and rim L, provided with apertures within the line of the chimney, in combination with the band B, the foraminous band K, and inverted cone-shaped globe R, substantially as set forth.

3. The reflector T, the perforated ring S, and dome P, in combination with the inverted-cone-shaped globe R and the burner and chimney, substantially as set forth.

4. In a lamp, the oil-font, burner, chimney, globe, reflector, and dome, in combination with the ring B, foraminous band K, and detachable foraminous band X, substantially as set forth.

5. In a lighting device, the reflector T, globe, and burner, in combination with the bracket-frame E, screws U, and slotted plates V, the latter being secured to opposite sides of the reflector, and the frame being provided with apertures to receive the screws, substantially as specified.

297,848. PROCESS OF AND APPARATUS FOR DEFECATING CANE-JUICE. WM. A. RUGG, Sr., New Orleans, La. Filed Oct. 6, 1883. (No model.)



Claim.—1. The process herein described of defecating cane-juice, the same consisting in first boiling the cane-juice in its natural state as soon as it comes from the mill, in removing the skimmings during the said boiling process, and in drawing off the boiled juice or sirup into suitable tanks wherein it is treated with lime or other alkalies, substantially as and for the purpose set forth.

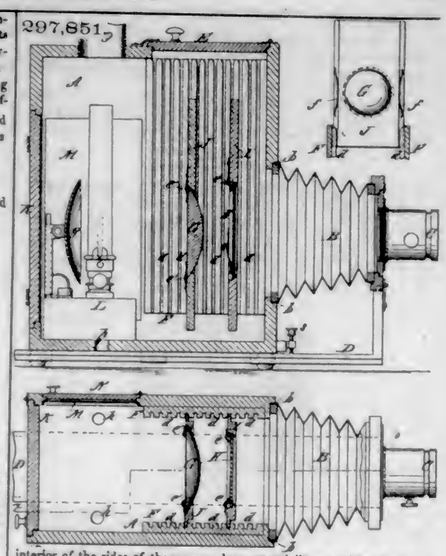
2. The apparatus herein described for defecating cane-juice, consisting of the boiling-tanks B, provided with steam-pipes *c* and faucets *d*, in combination with the defecating-tanks *f*, having two or more draw-off cocks or valves, located as described, and for the purpose specified.

3. The cane-juice-defecating apparatus herein described, consisting of boiling-tanks B, provided with heating-pipes *c* and faucets *d*, the defecating-tanks *f*, provided with faucets, as described, the trough *g* and tank A, pump *i*, with pipe *k*, and the receiving-tank *l*, all arranged as described, and for the purpose set forth.

297,849. CLAW-BAR. HUGH ROBERTSON, Breckenridge, Minn. Filed Feb. 25, 1884. (Model.)

Claim.—1. In a nail or spike extractor, the combination, with the bar with its enlarged end provided with outwardly-curved or concaved faces, of the auxiliary claws with their inner sides of a coincident curvature with the concaved faces of the enlarged end of the said bar, and means for fastening said claws to said bar, substantially as and for the purpose set forth.

2. In a nail or spike extractor, the bar having an enlargement with concaved sides, in combination with the auxiliary claws, with their inner sides of a coincident curvature with the sides of said enlargement of the bar, and having right-angled shanks, and means for reversibly connecting them to said bar, substantially as and for the purpose set forth.



3. In a spike or nail extractor, the bar provided with an enlargement at one end, said enlargement having concaved or outwardly-curved sides or faces, in combination with the slotted auxiliary claws having their inner sides of a coincident curvature with the concavities of said enlargement of the bar, and the bolt securing the right-angled shanks of said claws to said bar, said bolt passing through a slot in said bar, substantially as and for the purpose set forth.

297,850. HALTER. CYRUS R. ROBINSON, Concord, N. H. Filed July 30, 1883. (No model.)

Claim.—As an improved article of manufacture, a halter or hitching-strap consisting of the two straps A B and the two rings or eyes C D, the former being equal in size or larger than the latter, connected and arranged as described, and adapted to be passed around the neck of the animal to be secured, and thence through the bit-ring, as shown and described.

297,851.

Claim.—1. In an enlarging-camera, the box A, having a series of interior slideways in its front end portion, a lid or door for insertion and removal of a lamp and reflector, *g*, within and from its rear portion, one or more air-feeding inlets in its bottom, and a chimney in its top, over the place occupied by the lamp, substantially as specified.

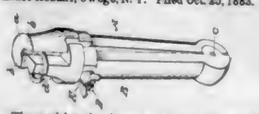
2. The combination, with the box A, having a series of interior slideways or grooves in its forward end portion, for the insertion, removal, and adjustment up or down and toward or from each other of a negative or picture carrying slide and condensing-lens slide, or diffusing-glass, of a lamp and reflector, *g*, in the rear portion of the box, and a front lens or lens-tube in close adjustable connection with the forward end of the box, essentially as described.

3. In an enlarging-camera, the box A, having a series of interior slideways in its front end portion, a lid or door for insertion and removal of a lamp and reflector, *g*, within and from its rear portion, one or more air-feeding inlets in its bottom, and a chimney in its top, over the place occupied by the lamp, substantially as specified.

4. In an enlarging-camera, the box A, having a series of interior slideways in its front end portion, a lid or door for insertion and removal of a lamp and reflector, *g*, within and from its rear portion, one or more air-feeding inlets in its bottom, and a chimney in its top, over the place occupied by the lamp, substantially as specified.

5. The combination, with the box A, having a series of interior slideways or grooves in its forward end portion, for the insertion, removal, and adjustment up or down and toward or from each other of a negative or picture carrying slide and condensing-lens slide, or diffusing-glass, of a lamp and reflector, *g*, in the rear portion of the box, and a front lens or lens-tube in close adjustable connection with the forward end of the box, essentially as described.

6. In an enlarging-camera for operation by artificial light, the camera-box provided with a non-actinic glass in one or both of its sides, at or near its rear end, and constructed to form a lamp-chamber at said end, essentially as and for the purposes specified.



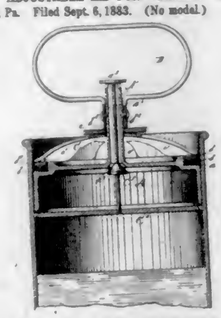
297,852. MANUFACTURE OF YELLOW AND ORANGE COLORING-MATTERS. ZACHARIE ROUSSIN and DANIEL AUGUSTE ROSENSTIEHL, Paris, France, assignors to the Société Anonyme des Matieres Colorantes et Produits Chimiques de St. Denis. Filed Nov. 30, 1883. (No specimens.)

Claim.—1. In the production of azoic coloring-matters, the substitution of the radical of carbonic acid for that of sulphuric acid, substantially as described.

2. The azoic coloring-matters described, the same being characterized by the presence of the radical of carbonic acid in place of the sulphuric-acid radical heretofore present in such matters, substantially as set forth.

3. The improvement in the preparation of coloring-matters varying from yellow to orange, and even red, consisting in substituting the amidocarboxylated acids—such as amidobenzoic acid ($C_6H_4NH_2CO_2H$)—for the corresponding sulpho acids—such as the sulpho acid $C_6H_4NH_2SO_3H$—in the manufacture of azoic coloring-matters in the state of free acid, these coloring-matters being insoluble in water, but their alkaline salts being sufficiently soluble for practical purposes, substantially as described.

297,853. WATCH-MAKER'S HAND-VISE AND RING-BENDER. CHARLES BURNETT RUBERT, Owego, N. Y. Filed Oct. 25, 1883. (No model.)



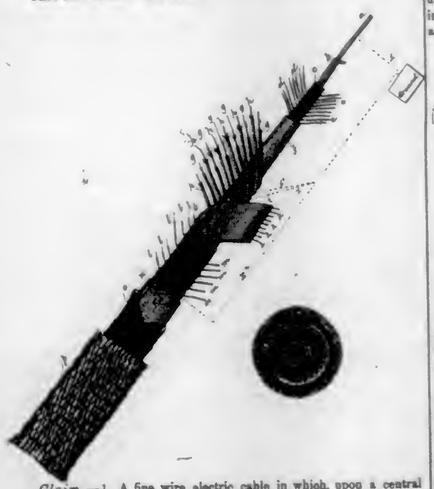
Claim.—1. The tool herein shown and described, consisting of the jaw A, having cheek-pieces *b b*, and the jaw B, having the nose *d*, adapted to close in between the cheek-pieces, substantially as and for

the purposes set forth.

2. The jaws A B, having formed through them the passages *e e*, and slots *e' e'*, in combination with the bolt D, having cross-head *f* at one end, and provided at the other with the thumb-nut E, substantially as and for the purposes set forth.

3. The jaws A B, having passages *e e*, and slots *e' e'*, in combination with bolt D, having cross-plate *f*, the jaw A, having recesses e^2 e^2, formed at the back, substantially as and for the purposes set forth.

297,854. ADJUSTABLE LID FOR VESSELS. HENRY C. SAMPLE, Philadelphia, Pa. Filed Sept. 6, 1883. (No model.)

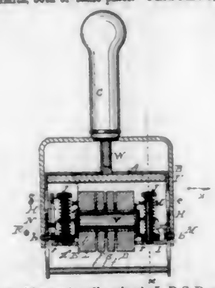


Claim.—1. A cover adapted to be pressed entirely within a vessel, and having a vent-tube and valve adapted to allow the escape of air beneath the cover, in combination with a spring-plate and means for expanding the same to secure the cover, substantially as shown and described.

2. A cover formed with an annular recess containing a rubber packing-ring and a metal expanding ring, and provided with a vent-tube having a valve to regulate the passage of air, in combination with spring-plate having its edges resting upon the expanding ring, and a handle adapted to expand the plate and gasket, to secure the same at any desired point within the vessel, substantially as shown and described.

3. The cover A, formed with the recess *a*, containing the gasket *b* and ring *b'*, and provided with the vent-tube A', formed with the valve-seat *a'* at its lower end, in combination with the handle B, having the cam or cams b^2 on its lower ends, the concavo-convex spring-plate C, valve-stem a^2, having the thumb-piece a^3 and valve C', and the plate C^2, substantially as and for the purpose herein described.

297,855. ELECTRIC CABLE. WILLIAM H. SAWYER, Providence, R. I. Filed Dec. 29, 1883. (No model.)



Claim.—1. A fine wire electric cable in which, upon a central heavy wire and insulated therefrom, are a series of fine covered wires and a series of fibrous threads braided together, the wires running spirally in one direction and the threads in the opposite direction, substantially as described, and for the purpose set forth.

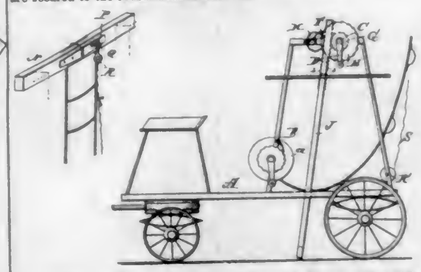
2. An electrical cable in which, with a series of spirally-wound rubber-covered wires, is wound a series of fibrous-covered wires lying in the depressions between the rubber-covered wires, substantially as and for the purpose set forth.

3. The cable composed of the central cotton-covered wire, *a*, rubber covering *c*, braided fine wires and threads *d* and *e*, fibrous covering *f*, alternate spirally-wound rubber cover and fibrous-covered wires *g* and *h*, fine wires *k*, inclosed between spiral rubber strips, braided wires *l*, and threads *m* and a water-proof covering, substantially as described.

4. An electric cable in which a central body has wound about it in running spirals a series of wires inclosed between two strips of rubber, substantially as described.

297,856. SELF-INKING HAND STAMP AND DATER COMBINED. ERNST SCHMITZ, Chicago, Ill., assignor to himself, J. Frank Tenney, and Richard Schmitz, both of same place. Filed June 5, 1882. (No model.)

Claim.—1. The rubber die-wheels L P S D, provided with metal boxes E, in combination with the round shaft *v*, as specified.



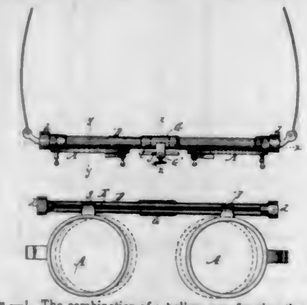
2. The combination of the rubber die-wheels L P S D, boxed as stated, with the washers *f f f*, to separate the rubber, as and for the purpose specified.

3. The combination of the frame *z z*, for supporting the die-wheel, with the die-plate I, posts H H, and springs *n n*, as and for the purpose specified.

4. The combination of the lever F G *r r*, constructed as described, with the rubber die-wheels, frame *z z*, and shaft *v*, as specified.

297,857. FIRE-ESCAPE. GEORGE SHIFIELD, Portland, Oreg. Filed Apr. 6, 1883. (No model.)

Brief.—A racked bar arranged between the toothed wheels carries up a cross-bar to be placed across the window, which bar may be made in two hinged sections, and to which the ladder is secured. Hand-loops are secured to the ladder-sides at intervals.

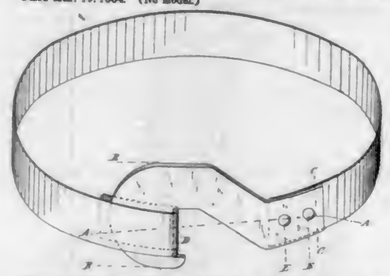


Claim.—1. The combination, with a rope ladder consisting of the side ropes, K, united by cross ropes or rungs L, of hand-loops M, secured to the side ropes, K, substantially as described, and for the purpose set forth.

2. The combination, with the pole J, arranged between the toothed wheels G H, and provided with racks *b b* on its opposite sides, of the cross-bar N, secured to the upper end of the pole, and a rope ladder, K K L, attached to said cross-bar, substantially as shown and described.

3. The combination, with the pole J, arranged between the toothed wheels G H, and provided with racks *b* on its opposite sides, cross-bar N, formed of two sections hinged together and secured to the upper end of the pole, and a rope ladder secured to said cross-bar, of the slotted latch P, staple Q, and pin R, substantially as shown and described.

297,858. TRIAL-FRAME FOR OCULISTS AND OPTICIANS. ANDREW L. SMITH and E. MERRETT COLE, Geneva, N. Y. Filed Mar 3, 1884. (No model.)



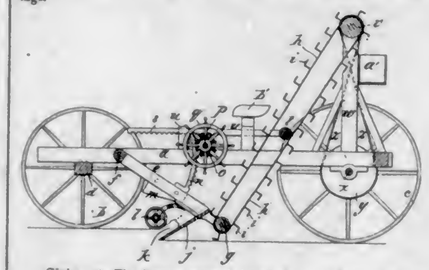
Claim.—1. The combination of a hollow case forming the frame, a right-and-left screw passing longitudinally through the case, and eye pieces or sockets having lugs forming nuts through which the screw passes, as set forth.

2. The combination of the hollow case, the collar resting and turning upon the case, the nose-piece passing through the collar, and a set-screw for securing the nose-piece in place, as set forth.

3. The combination of the hollow case, the right-and-left screw passing through the case, the eye-pieces having lugs forming nuts, through which the screw passes, the collar turning on the case, the nose-piece passing through the collar, and the set-screw for securing the nose-piece, as set forth.

297,859. BALE-TIE BUCKLE. CHARLES R. SMITH, Oxolona, Miss. Filed Mar. 19, 1884. (No model.)

Claim.—The herein-described bale-fastening device, consisting of the strap or band proper and the hook-shaped tie-piece, rigidly connected to said band, substantially as described.



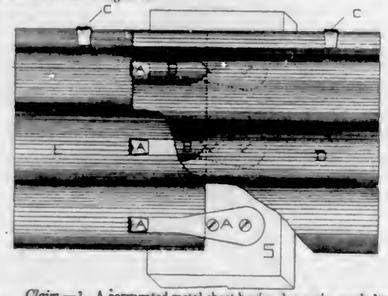
297,860. BAGGAGE-CHECK. CLARENCE CARSON SMITH, Camptown, Pa. Filed Mar. 7, 1884. (No model.)

Claim.—The changeable baggage-check herein shown and described, consisting of the side plates having curved name-slots, strap-slots I I, and central oblong slots or bearings C, circular name-disk having center-pin B working in the slots C, and notches *a*, fixed teeth G, and strap or straps J, constructed and combined substantially as and for the purpose shown and set forth.

297,861. DITCHING-MACHINE. ELMER H. SMITH, Quinton, N. J. Filed Nov. 14, 1883. (No model.)

Brief.—A scoop-plow is secured to a frame pivoted to the truck or main frame, and which carries a roller gage-wheel, flaring ditch-widening plates, and a cogged segment for its vertical adjustment, engaging and supported by a pinion and shaft, which pinion also engages sliding rack-bars carrying a belt-tightener for an elevator, the lower roller of which is carried by the plow-frame and the upper in fixed bearings.

Claim.—1. The frame *e*, suspended from the truck-frame by pivots *f*, toothed bars *n*, pinions *o*, and regulating-shaft *p*, and having plow *j* and lower elevator-roller *g*, in combination with the endless elevator arranged on driving-drum *v*, and having tightener *i*, mounted in sliding toothed bars *s*, gearing with said regulating-shaft, *p*, substantially as described.



2. The gage-wheel *l*, in combination with vertically-adjusting frame *e*, plow *j*, roller *g*, and endless elevator *h i*, substantially as described.

3. The gage-wheel *l*, in combination with frame *e*, pivoted to frame *a*, and geared with the regulating-shaft *p* by pinions *o* and toothed bars *n*, said frame having plow *j*, and being arranged with the elevator *h i*, substantially as described.

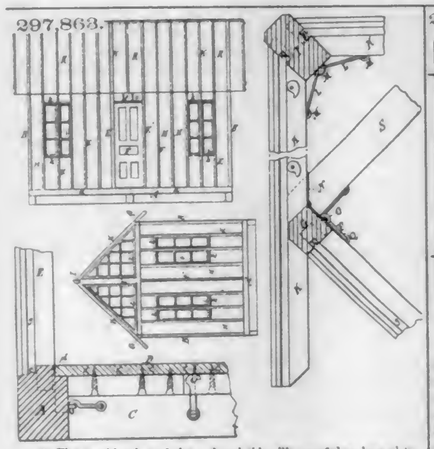
4. The combination of the flaring ditch-widening plates *m*, with the frame *e*, plow *j*, and the elevator *h i*, substantially as described.

297,862. FASTENING FOR CORRUGATED METAL SHEETS. JOHN SMITH, Kansas City, Mo. Filed Feb. 29, 1884. (No model.)

Brief.—Hooks secured to the roof-timber are located in depressions in the edge of a corrugated metal sheet. Hooks at the sides of the sheets conform to the corrugations.

Claim.—1. A corrugated metal sheet having depressions or indentations B stamped or rolled upon one edge or side, such indentations being situated within the longitudinal concavities of the sheet, substantially as shown and described.

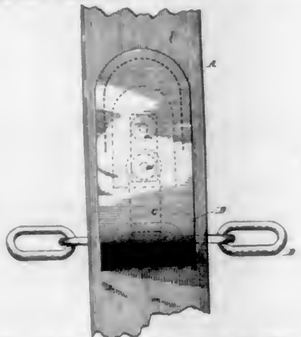
2. In corrugated sheets of metal for roofs of buildings, the sheet D, having impressions B fixed along one edge or side, longitudinal fastenings A, secured to timber S, and side fastenings, C, curved as shown, all substantially as described, and for the purposes herein set forth.



297,863. PORTABLE HOUSE. OTIS HALL SMITH, Cambridge, Mass. Filed Mar. 14, 1884. (No model.)

Brief.—The end and side sills are lapped together at their ends, and the posts are tenoned into the laps and secured to the side sills by separable connections. The wall-plates, rafters, and ridge-piece are connected together and to the posts by separable connections.

Claim.—1. The end and side sills scarfed or lapped together at their ends, in combination with the posts tenoned into the laps, and secured in place by separable connections or hasps, staples, and hooks, all being substantially as represented.



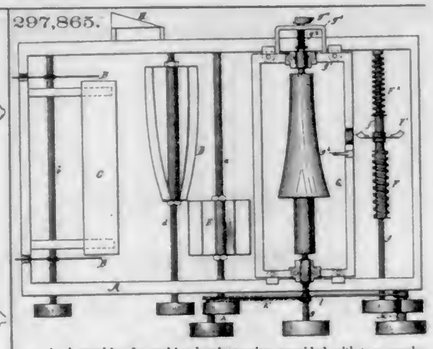
2. The ridge-piece and each side sill, composed of two pieces equal or about equal in their length, and hinged together, in combination with each wall-plate, consisting of three pieces equal or about equal in their lengths, and connected by hinges.

297,863.

3. The combination of the end and side sills scarfed or lapped together at their ends, with the posts tenoned into the laps and secured to the side sills by separable connections, and with the wall-plates, the rafters, and the ridge-piece, arranged and adapted and connected together and to the posts by separable connections, substantially as set forth.

297,864. TRACE-CARRIER. WILLIAM M. SMITHER, Keene, Ky. Filed Jan. 31, 1884. (No model.)

Claim.—In a trace-carrier, the combination, with the loop, of a pendulous hook pivoted in the upper end of the said loop, and adapted to vibrate or swing in the direction of the chain or trace, and a plate having on its surface a lug which forms the pivot on which the hook swings, the parts being secured together and to the back-band of a harness by rivets, one of which passes through the lug on the plate, as and for the purpose described.

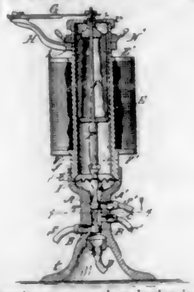


297,865. MACHINE FOR MAKING INSULATOR-PINS. WILLIAM SNEE, West Elizabeth, Pa., assignor of one-half to Milton A. Walton, Cameron, W. Va. Filed Jan. 10, 1884. (No model.)

Claim.—1. In a turning-lathe, the combination of a traveling carriage, blank-centering shafts or spindles, of which one is longitudinally movable on said carriage, and a fixed switch, H, the latter having on its outer side an incline with which the inclined surface of the centering-shafts engage by means of said traveling carriage, substantially as shown and described.

2. In a turning-lathe, the combination, with a frame, of the shafts *d e*, journaled on the under side, a carriage, G, traversing the upper side, a rotary blank-holder arranged on said carriage, and two rotary cutters arranged diagonally to each other on said shafts, as and for the purpose specified.

3. The combination, with a pin-holder carriage having the finger g^4, of a rotary shaft, *f*, carrying the spring-pressed longitudinally-movable worm F, and threading-tool f', whereby a spiral thread may be cut on the pin, as described.



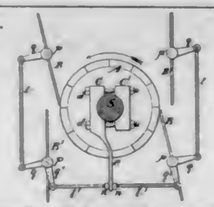
297,865.

4. A machine for making insulator-pins, provided with two revolving saws separated a distance equal to the length of the pin, two revolving cutters placed in rear of said saws, a revolving shaft provided with a laterally-sliding cutter and means for laterally moving said cutter, and a carriage sliding lengthwise of the machine and provided with means for receiving, centering, and revolving the pin-blank, all arranged substantially in the manner described, whereby an insulator-pin is completed in a single continuous operation, as set forth.

5. In a turning-lathe, the combination, with a supporting-frame, of a traversing-carriage provided with the blank-holder, two saws to first size the length of pin, two succeeding rotary shapers, and a spiral threader to act on the previously length sized and shaped pin, substantially as described.

297,866. ELECTRIC REGULATOR. ELMER A. SPERRY, Chicago, Ill. Filed Mar. 20, 1883. (No model.)

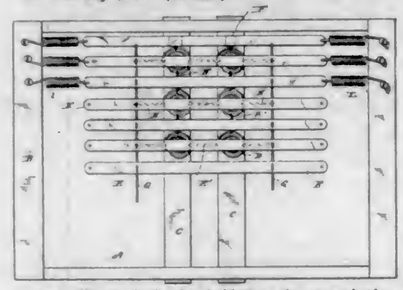
Claim.—1. An electric-current regulator having in combination a mechanism for actuating a valve or valves by means of variations in an electric current, a valve or valves arranged to be so actuated, a fluid or gas supply and exhaust brought into and out of action by the movement or position of such valve or valves, a counterbalanced reservoir or reservoirs, to and from which the fluid or gas is caused to flow and increase or decrease the weight thereof, and suitable mechanical connections for transmitting motion from said reservoir or reservoirs, substantially as described, and for the purpose set forth.



2. The combination, with the gravitating reservoirs secured to the opposite ends of a tilting-lever, of connections for transmitting motion from said reservoirs, and means controlled by an electrical current for causing a fluid or gas to flow to and from said reservoirs alternately, substantially as described, and for the purpose set forth.

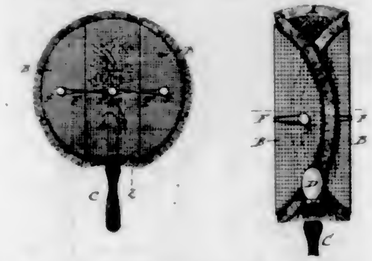
3. The combination, with the cylinder T, the connected pipes S and S', pipe C', and a suitable exhaust, of the connected valves A and B and the core of an axial magnet connected with said valves, substantially as described.

297,867. COMMUTATOR AND BRUSH FOR ELECTRIC MOTORS AND GENERATORS. ELMER A. SPERRY, Chicago, Ill. Filed June 9 1883. (No model.)



Claim.—1. The combination, with the commutator of a magneto-electric generator or motor, of two pairs of brushes, and mechanism for automatically bringing said pairs of brushes alternately in contact with said commutator in accordance with its direction of rotation, substantially as described.

297,867.

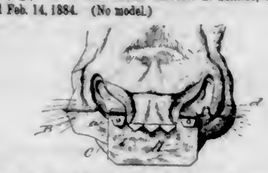


2. The combination, with the commutator and two pairs of brushes, substantially as described, of automatic devices controlled by the rotation of the commutator-shaft for shifting one pair of brushes out of and the other pair into contact with said commutator, when its direction of rotation is reversed.

297,868. SPRING BED-BOTTOM. DAVID F. STAMBAUGH, Effingham, Ill. Filed May 7, 1883. (No model.)

Claim.—The combination, in a bed-bottom, of a rectangular frame provided with a series of cross-slats, C, a series of spiral springs, D, located thereon, the links B', connecting the upper ends of the springs, the longitudinal slats H, secured to said springs, the cords G, connecting the slats, and the longitudinal spiral springs I, connecting the slats at the ends to the frame, substantially as and for the purposes specified.

297,869. FAN. FRIEDMAN STERNHEIMER, New York, N. Y. Filed Mar. 8, 1884. (No model.)

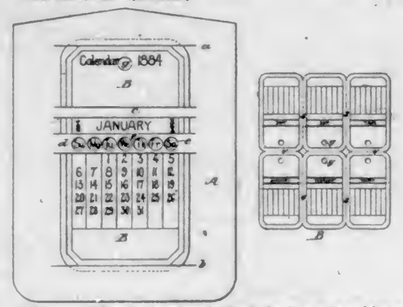


Claim.—1. The combination, in a fan, of a middle web-section, having a fixed handle, and hinged side sections, the middle and side sections being applied to a flexible connecting foundation-piece, whereby a natural spring is imparted to said web-sections, substantially as set forth.

2. The combination of the middle web-section having a handle, hinged side sections, a connecting flexible foundation-piece, that imparts a natural spring to the web-sections, and means whereby the side sections are held in folded position on the fan, substantially as set forth.

3. The combination of the middle section, A, having a handle, C, and spring-clasp D, with hinged side sections, B B, to which a natural spring is imparted by being applied to a flexible foundation-piece, E, substantially as set forth.

4. The combination, with the middle section, A, having a handle, C, and a spring-clasp, D, of hinged side sections, B B, a flexible foundation-piece, E, and an elastic loop or band, F, attached to the convex sides of the web-sections A and B B, so as to re-enforce the natural spring of the fan, substantially as set forth.

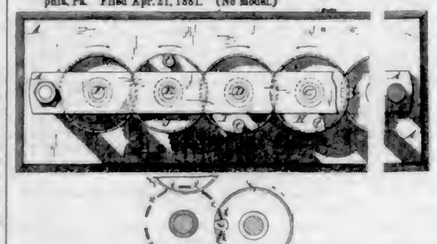


297,870. CALF-WEANER. HOOPER B. STRAUT, Culbertson, Nebr. Filed Feb. 14, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a calf-weaner consisting of a plate having integral teeth arranged as described, and extensions at each side of said teeth bent to form loops for the purpose set forth, and securing-rod pointed at its ends and bent near one end, substantially as specified.

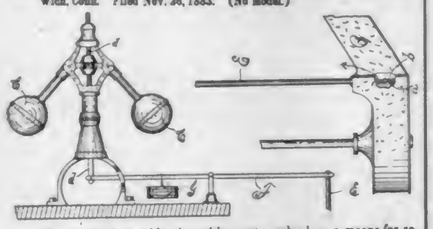
2. As an improved article of manufacture, a calf-weaner consisting of a plate having integral teeth arranged as described, and extensions at each side of said teeth bent to form loops for the passage of a securing-rod, and a rod pointed and bent at each end when in position, substantially as specified.

297,871. CALENDAR. JOSHUA FROST TANNATT, Springfield, Mass. Filed Feb. 8, 1884. (No model.)



Claim.—1. The calendar-sheet holder A, having upper and lower cross-cuts, *a b*, or either, and intermediate transverse incisions, forming or leaving straps *c d*, for holding the calendar-sheet by friction and admitting of its adjustment, also for the successive exposure of the months on the sheet between said straps, substantially as specified.

2. The calendar-sheet B, having its tables of months, with days of the week and dates to correspond printed on both of its sides, and arranged to admit of a separate or consecutive exposure of the months by first folding the sheet centrally in one direction, as at *v*, and afterward doubling over such folded portions into equal divisions upon themselves, as at *s s*, substantially as shown and described.



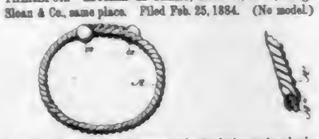
3. The combination of the folded sheet B, having its months, days of the week, and dates printed in separate columns or tables on both sides of the sheet, and the holder A, having cross-cuts *a b*, and intermediate transverse incisions, forming an upper strap, *c*, and lower strap, *d*, having perforations *e* in it, essentially as specified.

297,872. ENGINE-REGISTER. FREDERICK W. TATTERSALL, Philadelphia, Pa. Filed Apr. 21, 1881. (No model.)

Claim.—In an engine-counter, a train of registor or dial wheels, each provided with a double-flanged rim, one edge of which rim having a driving-tooth in a slot or interval therein, and the other or opposite edge having a series of notches therein, said train of wheels being constructed, combined, and arranged in successive relation to each other in the manner shown, and for the purposes described.

297,873. WATER-WHEEL REGULATOR. CHARLES F. THAYER, Norwich, Conn. Filed Nov. 26, 1883. (No model.)

Claim.—1. In combination with a water-wheel, as a means for securing quick action to admit or exclude the supply of water, the two-part gate *a b*, part *a* being secured rigidly in the case of the wheel, said part *b* being adapted to slide vertically, both of said parts *a b* having horizontal slots or openings, which, as gate *b* is raised or lowered, are opened to each other or closed, as hereinbefore described.



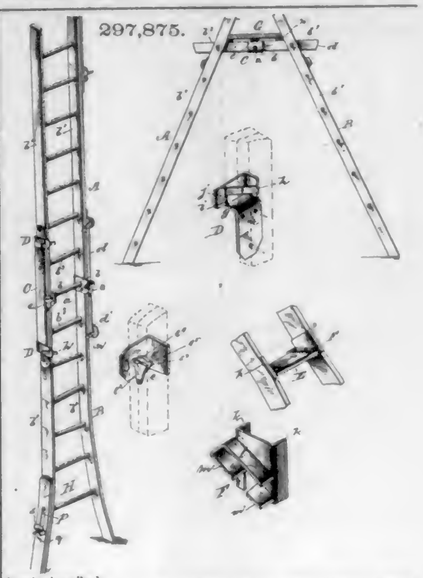
2. In combination with a water-wheel having a fixed slotted gate, as at *a*, a vertically-sliding slotted gate, as at *b*, and a series of friction-pulleys, *c*, so located that said sliding gate acts against said pulleys to reduce friction in the act of raising or lowering *b*, as described.

3. In combination with a water-wheel having a fixed slotted gate, as at *a*, an auxiliary slotted gate arranged to be raised or lowered to admit or exclude the supply of water, and having on its outer side, between slots *c*, V-shaped ribs *h*, as described, and for the purpose specified.

4. In combination with a water-wheel having a slotted fixed gate, the sliding gate *b*, having V-shaped ribs, and the friction-rolls *c*, all arranged as and for the object specified.

5. In combination with a water-wheel having the fixed slotted gate *a* and vertically-sliding slotted gate *b*, the gate-shaft E, lever-arm F, counter-balance G, and a suitable fly-ball governor, all so arranged and connected, as hereinbefore described, that said fly-ball governor acts to rise or lower gate *b*, as and for the purpose specified.

297,874. BRACELET AND MODE OF ORNAMENTING WIRE THEREFOR. EDOUARD A. THIERY, Newark, N. J., assignor to Carter, Sloan & Co., same place. Filed Feb. 25, 1884. (No model.)



Claim.—1. A bracelet composed of tubular twisted wire of quarter-foil or analogous form, substantially as and for the purpose set forth.

2. That improvement in the art of ornamenting wire or stock for bracelets which consists in inserting a core of soft metal or alloy in tubular wire, then drawing it into quarterfoil or analogous form, next forming kerfs in the grooves between the flutes, and afterward twisting it, substantially as described.

297,875. LADDER. GEORGE P. THORP and MILTON E. THORP, Paola, Kans. Filed Feb. 14, 1884. (No model.)

297,875.

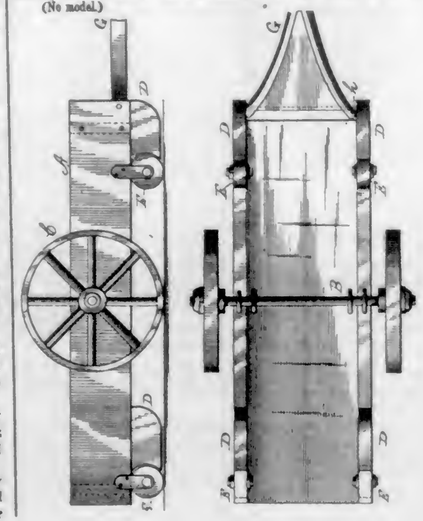
Brief.—Consists of two ladder-sections pivoted at their upper ends to a third short section provided with brackets and catches, which engage to lock said ends in position when the end sections are turned down to form a step-ladder. A detachable platform having beveled ends rests on the central section. Metallic plates embrace the edges of the standards, and are provided with sockets adapted to receive the ends of steps, each plate having an opening in the lower central portion to receive the round, and the step being grooved on its under face, so as to rest upon said round.

Claim.—1. The combination, in a ladder, of two ladder-sections pivotally secured to a third section, brackets secured to said third section and adapted to receive the ends of the first-mentioned sections when turned, as herein described, and a catch for engaging said bracket to lock said ends in position, substantially as set forth.

2. The combination, in a ladder, of three ladder-sections, pivoted and operating as herein described, of slotted brackets and pivoted catches secured to the central section, said catches being adapted to engage the notches of the brackets, substantially as and for the purpose specified.

3. The combination, in a ladder, of two ladder-sections pivotally secured to a third section, and having their ends cut away, as herein set forth, brackets secured to the third section and pierced by a round, and devices for engaging the brackets, substantially as described.

4. The combination, in a ladder, of two ladder-sections pivotally secured to a third section, and a detachable platform having beveled sides adapted to rest on the central section, substantially in the manner herein described.

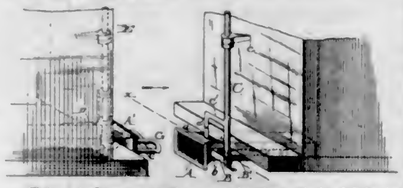


5. The combination, in a ladder, of three ladder-sections, pivoted and operating as herein described, of brackets and catches secured to one of said sections, said catches being provided with a series of projections and adapted to engage the brackets, substantially as specified.

6. The combination, in a ladder, of plates bearing against the sides of the said ladder, and provided with sockets adapted to receive step-sections, substantially as and for the purpose described.

7. The combination, in a ladder, of plates provided with ribs engaging the sides of said ladder, and provided with sockets adapted to receive the ends of step-sections, substantially as set forth.

8. The combination, in a ladder, of plates bearing against the sides of the said ladder, and each provided with a socket having one end open for the purpose specified, and an opening in the lower central portion of the same to receive the round upon which it rests, and a step for insertion therein, grooved on its under face, substantially as set forth.

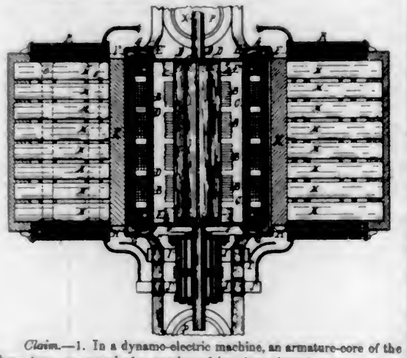


297,876. TRUCK. JOHN H. TIFFANY, Dimock, Pa. Filed Jan. 29, 1884. (No model.)

Claim.—1. In a vehicle, the combination of a set of wheels with runners which are adapted to co-operate with the wheels to sustain the load when the vehicle is in motion, substantially as described.

2. In a vehicle, the combination of a set of larger wheels, the smaller wheels, the runners, and the flexible tongue adapted to each other, substantially in the manner and for the purpose set forth.

297,877. CAR-COUPLING. GEORGE ULSOMER, Harbstadt, Ind. Filed May 11, 1884. (No model.)



Claim.—1. In an automatic car-coupler, the vertical rod C, having a coupling-pin, *c*, and a depression adapted to engage the slotted arm B, in combination with the draw-head A and a spring, B', substantially as and for the purpose set forth.

2. In a car-coupling, the vertical rod E, having an enlarged portion, *f*, and a curved end, *g*, adapted to adjust a coupling-link, in combination with a draw-head having an eye, *e*, and groove *e'*, substantially as and for the purpose set forth.

3. The draw-head A, having the perforations *a* and *b*, in combination with the slotted arm B, metal plate *a'*, and a spring, B', substantially as and for the purpose set forth.

4. In a car-coupling, the combination of the draw-heads A A', vertical rods C and E, constructed substantially as shown, the coupling-link G, the slotted arm B, metal plate *a'*, and a spring, B', all constructed to operate substantially as and for the purpose set forth.

297,878. DYNAMO-ELECTRIC MACHINE. CHAS. J. VAN DEPOELE, Chicago, Ill. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a dynamo-electric machine, an armature-core of the drum type, composed of a number of iron bars riveted to two or more solid iron rings, the whole, when put together, forming a cylinder or drum, a number of iron rings composed of galvanized iron wire placed upon said cylinder and distanced from one another, and an equal number of iron bars corresponding with the inner ones placed outside the iron and wire rings, the inner and outer bars being placed opposite one another and parallel with the axis of rotation of the said drum, substantially as described.

2. In a dynamo-electric machine, an armature-core composed of a number of galvanized iron-wire rings placed upon a cylinder built up of iron bars and solid iron rings, in combination with iron bars placed on the outside of the iron rings and opposite the bars on the inside of the rings, the whole being covered with proper insulating material, as described and set forth.

3. In a dynamo-electric machine, the armature-core composed of two or more iron rings having riveted on their inside a number of iron bars so distanced from each other as not to touch each other longitudinally, in combination with a number of galvanized iron wire rings placed upon the cylinder, also distanced from one another, and iron bars properly secured to the outside of the rings and opposite the bars on the inside of the cylinder, as described and set forth.

4. In a dynamo-electric machine, an armature-core of the drum type, consisting of iron bars and rings, substantially as described, in combination with the armature-coils wound in sections over the armature-core, the wire coils being so wound that each section shall correspond to a pair of iron bars, and directly placed or wound over the same and parallel therewith, substantially as described.

5. An armature of the drum type, composed of iron bars and rings, substantially as described, in combination with armature-coils wound in sections over said bars, each single section having one or more extra loops or terminals brought to the outside, which are connected to commutator-sections, the circuit from the inner to the outer terminal of each section being continuous, as described and set forth.

6. An armature for dynamo-electric machines having copper conductor wound in sections, each section being continuous from its inner to its outer terminal, and also provided with an intermediate additional terminal placed in the circuit of said sections or coils, and proper connections between said terminals and the commutator of the armature, in order to collect from said sections only part of the current at a time, and successively, as described and set forth.

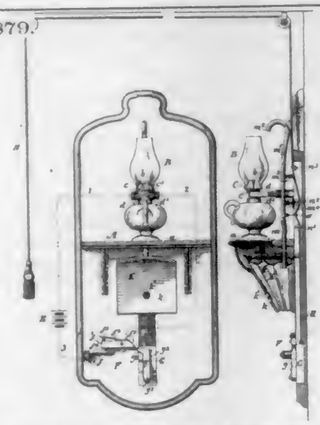
7. An armature for dynamo-electric machines having its copper conductor wound over a core built up of iron rings and bars, as described, said copper conductor being divided in sections corresponding in number to the iron bars in said core, the inner terminal of each section being connected to the outer terminal of the next in order, until the whole forms one closed circuit, and an additional terminal placed and connected so as to divide the copper conductor in each individual section or coil, all of said terminals being connected to separate sections of a commutator from which the current produced in the armature-coils is to be collected.

8. In a dynamo-electric machine, an iron field-magnet core, around which the copper conductor is wound, built up of a number of soft-iron plates, M M, all riveted together, but leaving an air-space between each plate and the next, in combination with a back plate, N, of cast-iron, cast solid to one end of said plates, substantially as described, and a pole-piece secured to the free end of said soft-iron plates, in front of which the armature is to revolve, as set forth.

9. In a dynamo-electric machine, an iron core and frame forming the field-magnet, consisting of the plates M M, &c., riveted together, and an iron back plate, N, cast thereto, in combination with the pole-pieces K, the top and bottom plates, O' and O², to which the plates N and N' are bolted, forming together a solid frame, the lower plate, O', being provided with proper extensions from its sides, upon which the bearings or boxes for the armature-shaft are secured, substantially as described.

10. In a dynamo-electric machine, the field-magnets for the same, consisting of soft-iron cores built up as described, around which the copper conductors for field-coils are wound, in combination with the cast-iron bottom and top plates, the bottom plate so constructed as to support the field-cores by the plates N N' and the adjustable screws *a a'*, said bottom plate also being provided with extensions P in its neutral part, upon which the posts are fixed, carrying the armature, and in combination with the cast-iron cover or top plate, serving to strengthen the general frame and protect the armature and field coils.

11. In a dynamo-electric machine, an armature wound with two independent circuits—one circuit to do the outside work, the other to keep up the magnetic field of the machine when operating in combination with the cable-helices or field-coils of the machine, as described—and proper means for allowing the current to circulate through a greater or smaller number of the insulated wires constituting said cable, in order to modify the efficiency of the machine, as described and set forth.



12. In a dynamo-electric machine, an armature wound with two sets of coils—one set to furnish current for the work outside of the machine, the second set to be made available to energize the field-magnets of the machine by transmitting its current through the field-helices, consisting of a number of fine insulated wires made up in a cable—and proper means for cutting out or in circuit a larger or smaller number of individual conductors in said cable for the purpose of modifying the production of current in the coils doing the outside work, substantially as described.

13. In a dynamo-electric machine, the field-magnet coils, consisting of a cable made up of a number of well-insulated fine wires, in combination with a set of independent coils on the armature of the machine, not in common with the armature-coils furnishing the working-current, the current of the independent set of coils to circulate through all the insulated conductors of the cables, connected in multiple arc whenever the machine is doing its maximum duty, or through a smaller number when the machine is working at less than full capacity, substantially as set forth.

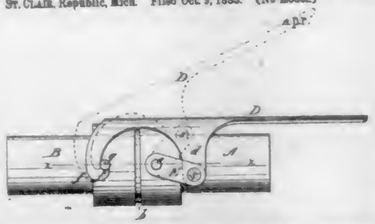
297,879. COMBINED ELECTRIC-LAMP LIGHTING AND EXTINGUISHING DEVICE. HENRY VAN HOEVENBERGH, Elizabeth, N. J. Filed Oct. 6, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with a lamp, an electrode for igniting the same, and a battery, of a bellows, a tube leading from said bellows, and a device which may be so actuated as to either complete the circuit of said battery through said electrode a sufficient time to ignite said lamp or to compress said bellows

297,879.

and simultaneously cause said tube to extend above said lamp.

2. The combination, substantially as hereinbefore set forth, of a lamp, an electrode for lighting the same, a battery, means for placing the said electrode in the circuit of said battery, a circuit-closing device, a cord for actuating said circuit-closing device, whereby the circuit of said battery may be completed through said electrode, and means, substantially such as described, operated by said cord for extinguishing said lamp.

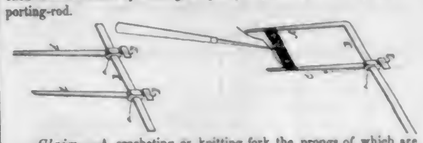


3. The combination, substantially as hereinbefore set forth, of a battery, a lamp adapted to be ignited by a current of electricity from said battery, a circuit-closing device, a cord, by means of which said circuit-closing device may be operated by a slight pull to close the circuit of said battery, and by a harder pull to again open the circuit of said battery, and means, substantially such as described, whereby said lamp may be extinguished under the influence of the harder pull.

4. The combination, substantially as hereinbefore set forth, with a lamp, and means, substantially such as described, for igniting said lamp, of a bellows, a tube leading from said bellows into proximity to the chimney of said lamp, and a device which may at will be so operated as to either actuate said igniting device, or to cause said bellows to be compressed and a current of air forced through said tube into said chimney.

5. The combination, substantially as hereinbefore set forth, with a shelf for supporting a lamp, of a bellows, a tube leading from said bellows and normally held in a given position, and a cord for compressing said bellows and simultaneously causing said tube to extend above the chimney of said lamp, whereby said lamp may be extinguished.

6. The combination, substantially as hereinbefore set forth, with a shelf for supporting a lamp, of a bellows, a tube leading from said bellows above said shelf, the extremity of which tube is turned downward, a spring for normally holding said tube in a given position, and a cord for simultaneously causing the extremity of said tube to be moved into a position above the chimney of said lamp and simultaneously forcing a current of air from said bellows through said tube, whereby the lamp may be extinguished.



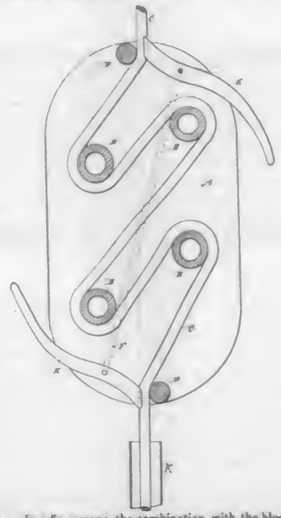
297,880. HOSE-COUPLING. GARRETT M. VAN RIPER and JAMES O. ST. CLAIR, Republic, Mich. Filed Oct. 9, 1883. (No model.)

Claim.—The combination, with the male and female sections A B of the coupling, of the elastic packing-ring C, the locking-pins *g* on the one section, the pivots *e* on the adjacent section, in like central longitudinal line with the coupling as the pins *g*, the handle-piece D, constructed with hooks *f* at its one end for engagement with said pins, and the links E, uniting said handle-piece with the pivots *e*, for operation in connection with the elastic ring C, substantially as shown and described.

297,881. CROCHETING-FORK. JOSEPHINE VETTER, Mount Vernon, N. Y. Filed Oct. 10, 1883. (No model.)

Brief.—This invention obviates the necessity of having a different-sized fork in the manufacture of fork-work—such as insertions, &c.—for each width of fabric by making the prongs adjustable on the leg or supporting-rod.

Claim.—A crocheting or knitting fork the prongs of which are adjustable, so that the distance between them may be changed as desired, substantially as and for the purpose described.



297,882. PITMAN-COUPLING FOR HARVESTERS. JOHN WAGGONER, New Hampton, Mo. Filed Feb. 15, 1884. (No model.)

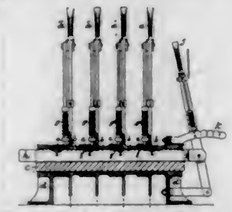
Claim.—The combination, in a pitman-coupling for harvesters, of the sickle-bar head provided with the rounded or beveled ears or projections C F, the coupling pin or bolt, the pitman-rod screw-threaded at its inner end, and having an eye for the insertion of the bolt, the cup-shaped nut adapted to fit the rounded or beveled shoulders F and bear against the same, and the jam-nut whereby the cup is held in its adjusted position, substantially as and for the purpose shown and set forth.

297,883. FIRE-ESCAPE. DAVID WARE and CHARLES W. RICHMAN, Philadelphia, Pa. Filed Jan. 31, 1884. (No model.)

Brief.—The rope is passed over the friction-pins, and levers connected by a rod arranged obliquely to the frame bear against the rope at the point where it passes over the end friction-pins.

Claim.—In a fire-escape, the combination, with the block A, having the friction-pins B D, and rope C, of the levers E, arranged at opposite ends and on opposite sides of said ends of said block, said levers being connected by an oblique connecting-rod F, substantially as and for the purpose set forth.

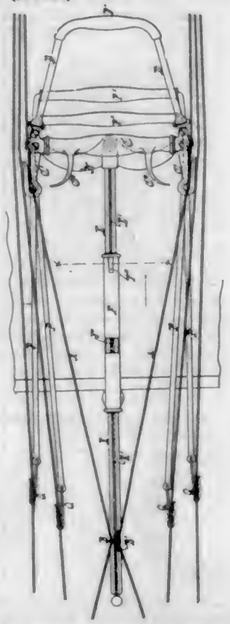
297,884. LATHE-DOG. OLIVER D. WARFIELD, Chicopee Falls, Mass., assignor to Charles H. Wood, Providence, R. I., and Edward E. Holton, Chicopee, Mass. Filed July 16, 1883. (No model.)



Claim.—In an improved lathe-dog, the combination of an adjusting-screw turned into one end of the dog, with its threaded end projecting into the eye or opening which receives the work, a movable shoe located in a socket on the other side of the eye, and a cam-lever pivoted in the shank to force said shoe to toward the adjusting-screw, substantially as described.

297,884.

297,885. INTERLOCKING-MACHINE FOR SIGNALS AND SWITCHES ON RAILROADS. SAMUEL WARREN, Battle Creek, Mich. Filed Oct. 15, 1883. (No model.)



Brief.—The signal-levers rotate upon a grooved shaft which carries a notched sliding locking-bar, the notches of which correspond in width to the respective widths of the hubs upon the signal-levers. Consequently when the lock-bar is shifted to clear one lever the rest are locked.

Claim.—1. The combination of the signal-levers *a a' a'' a'''*, the grooved shaft *c*, and recessed lock-bar A, all substantially as set forth, and for the purpose specified.

2. The recessed lock-bar A, in combination with the hand-levers *a a' a'' a'''*, and immediately engaging or disengaging the same, and operated solely by its own lever, and arranged either outside or inside the hub *b* of the levers, all substantially as described.

297,886. REIN-CONTROLLER. ALBIN WARTH, Stapleton, N. Y. Filed Oct. 10, 1883. (No model.)

Claim.—1. The combination, with a pair of reins for driving horses, of a loop attached to one such rein at a point approximately opposite the horse's tail, to receive the other rein, substantially as and for the purpose described.

2. A rein-controller consisting of a handle having its opposite ends provided with jointed hooks for receiving the reins, substantially as described.

3. A rein-controller consisting of a handle having its opposite ends provided with jointed hooks, in combination with reins having a series of holes to engage the hooks, substantially as and for the purpose described.

4. A rein-controller consisting of a handle having its opposite ends provided with jointed hooks for receiving the reins, in combination with a central pivotal support for the handle, substantially as and for the purpose described.

5. A rein-controller consisting of a handle having its opposite ends provided with means for holding reins, and having branches on opposite sides of its center projecting in curved lines forwardly and laterally therefrom, substantially as and for the purpose described.

6. The combination of a handle having its opposite ends provided with means for holding reins, and having branches on opposite sides of its center and a pivotal support for the handle, substantially as and for the purpose described.

7. The combination of a handle having its opposite ends provided with means for holding reins, a pivotal support for the handle, and a handle-strap connected to the opposite ends of the handle to project rearwardly therefrom, substantially as and for the purpose described.

8. The combination of a handle having its opposite ends provided with means for holding reins, a handle-carrier, and a pivotal support, substantially as and for the purpose described.

9. The combination of a handle-carrier, a pivotal support, and an adjustable stop for regulating the position of the handle-carrier when in use, substantially as and for the purpose described.

10. The combination of a rein-holder, a sliding rod supporting the rein-holder, a guide for the sliding rod, and a friction-spring arranged on the rod-guide to act on the rod, substantially as and for the purpose described.

11. The combination of a rein-holder, a sliding rod supporting the rein-holder, a guide for the sliding rod, and a pivotal support for the rod-guide, arranged to permit it, together with the rod, to assume a horizontal or vertical position, substantially as and for the purpose described.

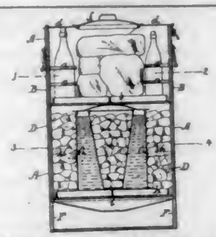
12. The combination of a rein-holder, a sliding rod supporting the rein-holder, a guide for the sliding rod, a vertical spindle having a pivotal connection with the rod-guide, a socket forming an axial bearing for the spindle, and a friction-spring arranged on the socket to act on the spindle, substantially as and for the purpose described.

13. The combination of a rein-holder, a sliding rod supporting the rein-holder, a guide for the sliding rod, a vertical spindle having a pivotal connection with the rod-guide, a socket forming an axial bearing for the spindle, substantially as and for the purpose described.

14. The combination of a rein-holder, a sliding rod supporting the rein-holder, a guide for the sliding rod, a pivotal support for the rod-guide, and an adjustable stop for sustaining the rod-guide, together with the rod, in the desired position when in use, substantially as and for the purpose described.

15. The combination of a rein-holder, a sliding rod supporting the rein-holder at its rear end, a guide for the sliding rod, a spindle united to the forward end of the rod-guide by a horizontal pivot, and a set-screw arranged in a projection of the rod-guide to impinge against the spindle for sustaining the rod-guide and rod in a horizontal or other position, substantially as described.

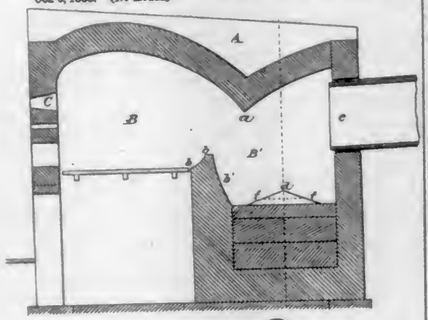
16. The combination, with a handle-carrier, of the cross-head having an eye or eyes at the opposite ends, and a handle strap or straps having the ends drawn forwardly through the eye or eyes of the cross-head, and provided with means for holding reins, substantially as and for the purpose described.



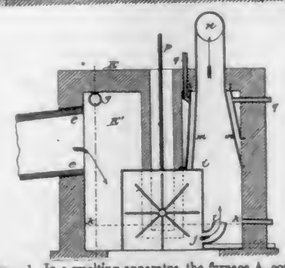
17. The combination, with the sliding rod E, of the cross-head on such rod, having an eye or eyes at the opposite ends, and a handle strap or straps having the ends drawn forwardly through the eye or eyes of the cross-head, and provided with means for holding reins, substantially as and for the purpose described.

18. The combination, with the sliding rod E, of the cross-head on such rod, having an eye or eyes at the opposite ends, a handle having its opposite ends provided with means for holding reins, a central pivotal support on the cross-head for such handle, and a handle strap or straps having the ends drawn forwardly through the eye or eyes of the cross-head, and provided with means for holding reins, substantially as and for the purpose described.

297,887. COMBINED CREAM-FREEZER AND REFRIGERATOR. ABRAHAM WATSON, Georgetown, Demerara, British Guiana. Filed Aug. 13, 1883. (No model.)



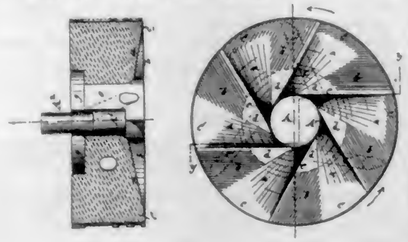
Claim.—1. The combination of the outer casing, A, with the cream-vessel G, having a central ice-receptacle, I, and the refrigerating-vessel B, comprising a central ice-chamber and surrounding bottle-racks, and located above the vessel G, as set forth.



297,887.

2. The combination of the vessel B, having a bottle-rack, *a*, and central ice-chamber, with the cover comprising the outer locked rim, *d*, and central detachable lid, *f*, as set forth.

297,888. FURNACE FOR SMELTING ORES. JOHN W. WEBB, Denver, Colo., assignor of one-half to Charles F. Burrell, same place. Filed Oct. 6, 1883. (No model.)



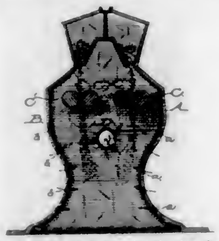
Claim.—1. In a smelting apparatus, the furnace A, comprising the combustion and melting chambers, and having the tunneled conical or prismatic rise *d* located on the sump of the latter, substantially as and for the purpose described.

2. In an apparatus for continuous smelting and condensing, comprising a smelting-furnace and a condenser, the combination, in the latter, of a water-pipe, *g*, the rotary section paddle-wheel *j*, box *i*, pipe *l*, and hood *m m*, substantially as described.

297,889. MILLSTONE. JOHANN CARL WEDEKIND, Nordhausen, Prussia, Germany. Filed Nov. 8, 1883. (No model.)

Claim.—1. A millstone provided with tangential lands and intermediate tangential inclined ventilating-sections, the latter increasing in width and decreasing in depth from the eye toward the skirt, and with vertical air-channels extending from the inner ends of said ventilating-sections to the upper face of the stone, and with a concentric depression in the upper face of the stone, substantially as described.

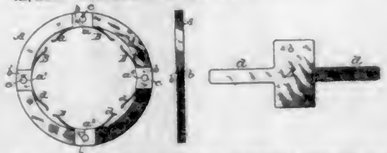
2. A millstone provided with tangential lands, intermediate tangential inclined ventilating-sections, the latter increasing in width and decreasing in depth from the eye toward the skirt, vertical air-channels extending from the inner ends of said ventilating-sections to the upper face of the stone, and with inclined air-channels extending from the upper face of the stone to the lower ends of said vertical air-channels, substantially as described.



3. A millstone provided with tangential lands, intermediate tangential inclined ventilating-sections, the latter increasing in width and decreasing in depth from the eye toward the skirt, and with vertical air-channels and inclined air-channels extending from the upper face of the stone to the lower ends of said vertical air-channels, said inclined channels being provided with hoods at their upper ends, substantially as described.

4. A millstone provided with tangential lands and intermediate tangential inclined ventilating-sections, the latter increasing in width and decreasing in depth from the eye toward the skirt, the furrows of said lands being parallel to the succeeding ventilating-sections, and the inner ends thereof opening toward the ventilating-sections in advance of the lands, substantially as described.

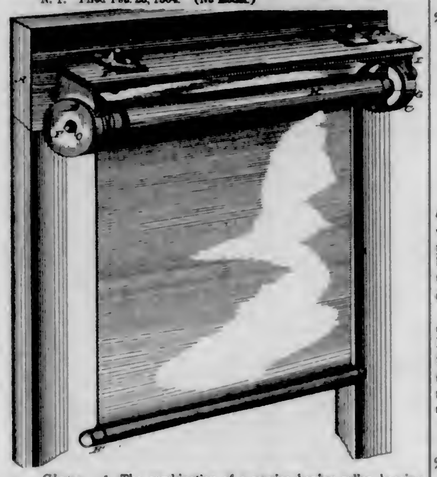
5. A millstone provided with tangential lands, intermediate tangential inclined ventilating-sections, the latter increasing in width and decreasing in depth from the eye toward the skirt, and with concentric grinding-surfaces at the outer ends of the ventilating-sections, the furrows of said lands being parallel to the succeeding ventilating-sections, and the inner ends thereof opening toward the ventilating-sections in advance of the lands, substantially as described.



6. A millstone provided on its face with inclined ventilating-sections *a*, having concentric grinding-surfaces *c*, alternating lands *b b*, having smooth inner ends, *d d*, vertical channels *e* at the inner ends of the ventilating-channels, and diagonally-inclined air-channels *d'*, extending from the points near the lower ends of the supply-channels *e e* to the top of the stone, and having hoods *f f* at the top of the stone, substantially as described.

297,890. ROLLER-MILL. ROSIA W. WELCH, Baltimore, Md., assignor of one-half to Wm. CAMMACK, Washington, D. C. Filed Feb. 18, 1884. (No model.)

Claim.—The rolls C C' and their casing, having the lower portions of the sides perforated at *b b*, in combination with the central interior tube, D, arranged below the rolls, and provided with slots *d d*, the lower central slot rendering said tube self-clearing, and the exhaust-pipe E, all constructed, arranged, and operated as set forth.

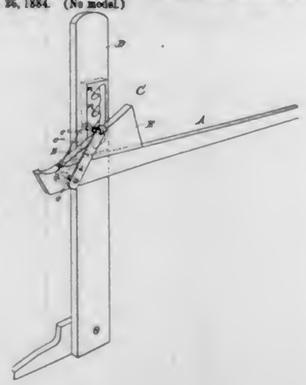


297,891. METALLIC RING PACKING. JEROME WHEELOCK, Worcester, Mass. Filed Jan. 21, 1884. (No model.)

Claim.—1. The combination, with an expansible or contractile packing-ring, of springs having one or more integral lugs projecting from the edge of the spring and at right angles therefrom, substantially as described, whereby said springs may be secured to one or both sides of said rings by transverse rivets through the lug or lugs of the spring and the ring, as set forth.

2. The combination, with expansible or contractile metallic packing-rings, of springs having integral lugs secured to one or both sides of said rings and overlapping or breaking the joints thereof, substantially as described.

297,892. WINDOW-SHADE. EDWIN V. WHITAKER, Gloversville, N. Y. Filed Feb. 28, 1884. (No model.)

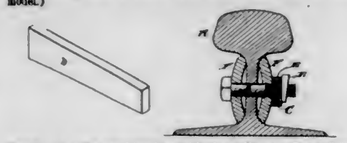


Claim.—1. The combination of a cornice having roller-bearing brackets, with brackets having projecting clamping-lips adapted to clamp the cornice, and having set-screws passing through the lips bearing against the cornice, as and for the purpose shown and set forth.

2. The combination, in a window-shade, of the roller, with a bracket having a longitudinally-slotted base-plate and screws passing through the slots, the said slots sliding upon the said screws, as and for the purpose shown and set forth.

3. The combination, in a window-shade, of the roller, with a bracket having the end of the roller pivoted in it, having slots in its base-plate extending from its inner edge, and sliding with the said slots upon screws, as and for the purpose shown and set forth.

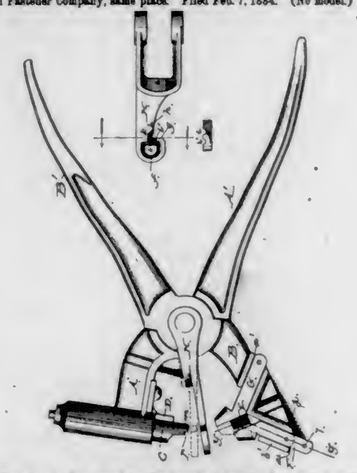
4. In a window-shade, the combination of a bracket forming a flat cylindrical casing or barrel covered by a recessed plate, a helical spring secured to the inner side of the barrel and to a shaft turning in the barrel, a shaft turning in the barrel, having the inner end reduced and provided with a ratchet-wheel, a cog-wheel turning upon the shaft and having a pawl engaging the ratchet-wheel, a cog-wheel having a pinion meshing with the aforesaid cog-wheel, a sleeve having a pinion upon its inner end, turning upon the reduced inner end of the shaft, and having its inner end polygonous, and a shade-roller pivoted in a bracket at its other end, and having a recess or perforation in its end adapted to receive the end of the sleeve, as and for the purpose shown and set forth.



297,893. LIFTING-JACK. ADDISON WHITE, Lynnville, Iowa. Filed Feb. 26, 1884. (No model.)

Claim.—1. The combination of the stirrup B with the slotted and notched support D and the lateral lever A, substantially as specified.

2. In a lifting-jack, the combination of the standard D, stirrup B, and lever A, working in the stirrup against the side of the standard, with the wedge E, substantially as and for the purpose set forth.



297,894. NUT-LOCK. ARETUS A. WILDER, Detroit, Mich., assignor of one-half to Corydon B. Palmer, same place. Filed Apr. 25, 1882. (No model.)

Claim.—1. The combination, with the ordinary railway fish-plates, of a screw-bolt having a slot through its threaded portion, means for preventing the bolt from turning on its axis, a nut fitting upon said threaded portion, and a wedge-shaped key fitting vertically within the slot in the bolt, with its wider end uppermost, whereby it is adapted to slide and take up the space vacated by the nut in tightening the same on the bolt, substantially as described.

2. The combination, with the ordinary railway fish-plates, of a screw-bolt flattened or squared under its head to enter a corresponding hole in one of the fish-plates, and having a slot formed through its threaded portion, a nut to fit upon said threaded portion, and a wedge-shaped key to fit vertically within said slot, with its outer end uppermost, whereby it is adapted to slide to take up the space vacated by the nut in tightening the same on the bolt, substantially as described.

297,895. APPARATUS FOR SECURING BUTTONS TO FABRICS. ALEXANDER G. WILKINS, Meadville, Pa., assignor to the Wilkins Shoe-Button Fastener Company, same place. Filed Feb. 7, 1884. (No model.)

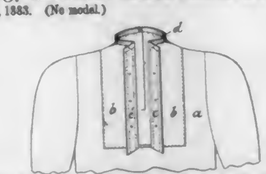
Claim.—1. In a machine for securing button-fasteners, a spring holding and centering device, in combination with a detent-catch to hold the jaws apart while a fastener is being inserted.

2. In a machine for securing button-fasteners, the jaw B, provided with diverging ways in which slide jaws F G, and the hole *b* of greater pitch than said ways, in combination with the binding rod or wire *b''*, secured to jaw F, all constructed, arranged, and operated as set forth.

3. In a machine for securing button-fasteners, the spring-jaws F G, provided on their faces with the vertical grooves *e e'*, of a combined depth less than the diameter of the fastener-shank I, for the purpose described.

4. In a machine for securing button-fasteners, the spring button-holding plate H, provided with the curved recess *k*, and having its bottom and side conforming to the dimension and shape of a portion of the button-eye, as and for the purpose described.

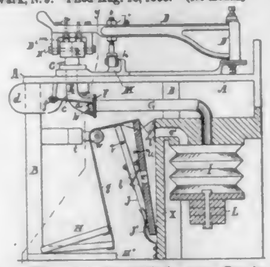
5. In a machine for securing button-fasteners, the spring-bolt C, provided on its lower end with a stop integral with said bolt for the button-eye to bring up against, as set forth.



6. In a machine for securing button-fasteners, the bolt C, provided with a projection, *m*, having its inner surface, *n*, curved to conform to

the curvature of a portion of the button-eye, substantially as described.

7. In a machine for securing button-fasteners, the bolt C, provided with the flat face *p*, and the projection *m*, having the inner curved face, *n*, in combination with the button-holding plate H, having the depression *f*, depressions *i i'*, and curved recess *k*, for clamping and securing the button-eye, to act as a mandrel to resist the fastener-shank during the clinching, as described.

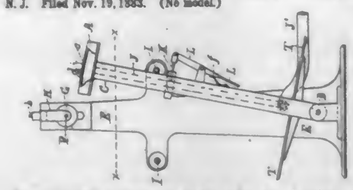


8. In a machine for securing button-fasteners, the spring-bolt C, having the flat face *p*, and provided with the slot *5*, opening through its end, and the stop or projection *m*, in combination with plate H, cut away at *h*, and having the depressions *i i'*, and the curved recess *k*, whereby the button is readily removed from the fastening-point, all constructed, arranged, and operated as set forth.

297,896. SHIRT-BOSOM. FRANCIS S. WILLIAMS, Boston, Mass. Filed Nov. 17, 1883. (No model.)

Claim.—A shirt-bosom made with two single front plaits capable of being lapped one over the other, and provided with corresponding holes for the insertion of studs, each plait being free at the lower end, and both to be secured to the neckband by a single stud in front, all as shown and described.

297,897. CIGAR-WRAPPER-CUTTING MACHINE. JOHN R. WILLIAMS, Newark, N. J. Filed Aug. 18, 1883. (No model.)

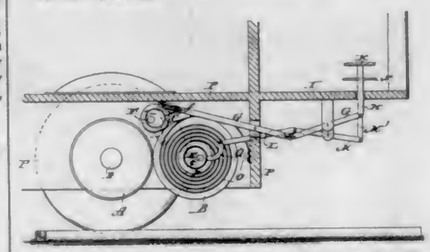


Claim.—1. The combination, with the cutter C and arm D, carrying a compound presser-roller, R, of an adjustable guide-roll, A, attached to the arm and fitted to a rail or guide, substantially as and for the purpose set forth.

2. The combination, with the carrying-arm D, of the compound presser-roller R, having its parts arranged to rise and fall independently, as and for the purpose set forth.

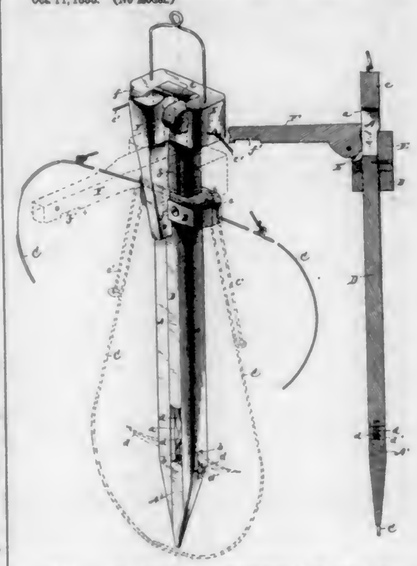
3. The combination, with the arm D and the compound roller R, fitted to rise and fall, as described, of the elastic pressers applied to the upper side of the roller, substantially as herein shown and described.

297,898. CIGAR-WRAPPER CUTTER. JOHN R. WILLIAMS, Newark, N. J. Filed Nov. 19, 1883. (No model.)



Claim.—1. The combination of the roller, the vibrating arm, the blank-cutter mounted on said arm, a perforated platen within the cutter, and a pipe or tube connecting the exhausting mechanism with the cutter and adapted to move with said cutter, as specified.

2. The combination, with the roller G and the cutter A, of the hollow vibrating arm C, provided with gate or valve K, substantially as described.

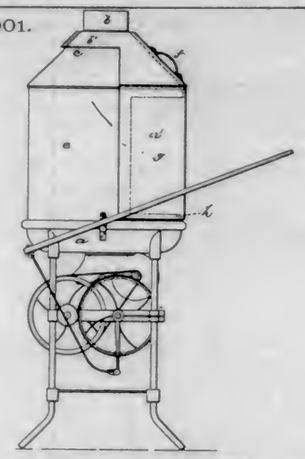


3. The combination, with the roller G and convex cutter A, of the upright arm C, pivoted at the bottom, as described, and the treadles T T, affixed to the arm at opposite sides, substantially as and for the purpose set forth.

297,899. CAR-STARTER. JOHN WILSON, Chicago, Ill. Filed Dec. 28, 1883. (No model.)

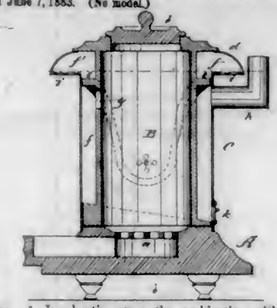
Claim.—The combination, in a car-starter, of the drum A on the car-axle, spring-drum B on the eccentric-shaft *e*, and the intermediate drum, C, on the eccentric-shaft F, the said eccentric-shafts *e* and F being respectively connected with foot-treadles K N, arranged to be manipulated by the driver, substantially as described.

297,900. HAY-FORK. SULLIVAN S. WILSON, Litchfield, Mich. Filed Oct. 11, 1883. (No model.)



Claim.—1. In a hay-fork, the combination of the sheath provided with the block B, the sliding bar carried within said sheath, the prongs *d d*, pivoted to the lower end of said sliding bar, the sliding head-block E, rigidly attached to said sliding bar, the cam-lever F, pivoted on said head-block, the side arms, C C, pivoted to the blocks B, and the connecting-cords *d' d'*, substantially as and for the purpose set forth.

2. In a hay-fork, the bars A A, the block B, secured to said bars, the sliding bar carrying prongs, the block E, rigidly attached to said sliding bar, the cam-lever pivoted on said block and provided with a notch at its outer end, the arms C C, pivoted to the block B, and cords *d' d'*, connecting said arms and said block E, the parts being arranged and combined substantially as and for the purpose set forth.



297,901. HOOD FOR FORGES. JAMES F. WINCHELL, Springfield Ohio. Filed Sept. 7, 1883. (No model.)

Claim.—In a forge, the combination, with a hood having a door-space and a conical top, of a revolving door supported on the hood-top by a cap-ring, substantially as specified.

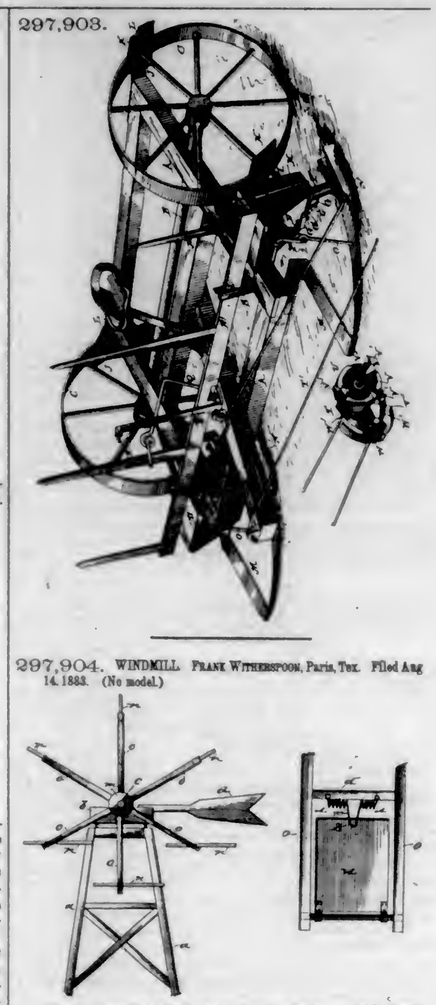
297,901.

297,902. HEATING-STOVE. WILLIAM ARMSTEAD WINFREE, Elizabethton, Tenn., assignor of one-half to Phil F. Cogan, Jersey City, N. J. Filed June 7, 1883. (No model.)

Claim.—1. In a heating-stove, the combination, with the outer cylinder, C, provided with the escape-flue A and cold-air entrance *c*, of the inner concentric cylinder, B, having the escape-opening *g* diametrically opposite the flue A, and the flange *e*, extending from above the openings A *g* downward on each side and below the opening *c*, dividing the annular space between the cylinders into a lower smoke-chamber and an upper hot-air chamber, the latter of which is provided with escape-openings, substantially as herein shown and described.

2. The combination, in a heating-stove, of an inner and an outer cylinder, and the inclined flange or partition dividing the space between the two cylinders into a smoke-chamber and a hot-air chamber, the latter being provided with openings for the escape of the heated air, substantially as described.

3. In a heating-stove, the outer cylinder, C, formed with the enlarged top portion, *d*, in combination with the combustion-chamber B, provided with the opening *g*, and the flange *e*, dividing the space between the two cylinders into chambers *f f'*, substantially as herein shown and described.



297,903. CORN-PLANTER. FERDINAND WISKOCIL, Prairie du Sac, Wis. Filed Dec. 10, 1883. (No model.)

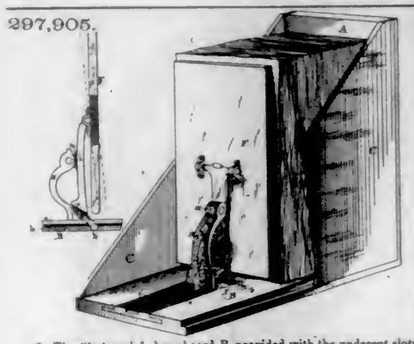
Claim.—1. The combination of the frame A, seed-boxes D, having apertures D', slides E, having adjustable plates E' and set-screws E'', springs H, levers I, adjustable chutes F, wheels C, having cams J and flanges K, and openers N, having longitudinal slots N', and connected to the front ends of the frame A by means of adjustable springs M, constructed and arranged to operate substantially in the manner and for the purpose shown and set forth.

2. As an improvement in corn-planters, a marker consisting of the frame T', wheel V, having teeth V', and having its periphery notched or recessed, as at V'', and catch W, constructed to operate substantially in the manner and for the purpose shown and described.

3. The combination, with the frame A, of the hinged frame T', wheel V, having teeth V', and having its periphery notched or recessed, as at V'', and catch W, constructed as described.

297,903.

297,904. WINDMILL. FRANK WITHERSPOON, Paris, Tex. Filed Aug 14, 1883. (No model.)



Claim.—In a wind-wheel, the combination of the turn-table, crank-shaft *e*, carrying the pinion *h*, the shaft *c*, having the gear *f*, the wheel having radial arms extending from the same hub, with beams at right angles from their outer ends, to which the sails are attached, and the said radial arms and bar *p*, having detents for controlling the sails, substantially as specified.

297,905. PAPER-FILE. EDMUND W. WOODRUFF, Washington, D. C. Filed Mar. 28, 1884. (No model.)

Claim.—1. The head and base boards of a paper-file, the file-board, and a supporter for the same, the lower end whereof has a sliding connection with the base-board, combined with a brace hinged at its upper end to the file-board supporter, the lower free end of said brace bearing on the base-board, and adapted to clamp and lock the file-board when pushed to a point on the base-board nearly in line with the axis of the hinge, as set forth.

2. The head-board A, base-board B, and the file-board F, with its supporter *i*, having at its lower end a sliding pivotal connection with said base-board, combined with a brace, H, hinged at its upper end to said file-board supporter, the free end of said brace bearing on the base-board, and adapted to clamp and lock the file-board when pushed to a point on the base-board nearly in line with the axis of the hinge, as set forth.

297,905.

3. The file-board A, base-board B, provided with the undercut slots or grooves, and the file-board F, combined with the plate *i*, provided at its lower end with the lugs K, and the brace H, hinged to the upper end of said plate *i*, whereby the clamping strains are not transmitted to nor through the file-board F, as set forth.

4. The head-board A, base-board B, and file-board F, combined with the plate *i*, having a sliding pivotal connection with said base-board, and provided with the shoulder *p*, and the hinged brace H, whereby when the file-board is tilted backward it is supported in its angular position by said shoulder independent of said brace, as set forth.

5. The head-board A and base-board B, combined with the supporter *i*, having a sliding pivotal connection with said base-board, the brace H, hinged to said supporter, and the file-board F, also hinged to said supporter at about the middle of length of said file-board.

297,906. PLOW. CHARLES ANDERSON, South Bend, Ind., assignor to the South Bend Iron Works, same place. Filed Feb. 14, 1884. (No model.)

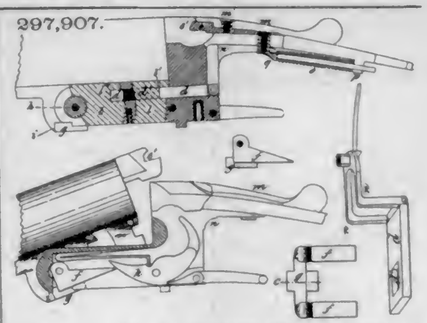
Claim.—1. The combination, with a plow-standard provided with a dovetail recess in its nose portion, of a sectional landside, the front section being provided with a dovetail projection that fits within the correspondingly-shaped recess in the nose of the standard, substantially as set forth.

2. The combination, with a plow-standard having an opening in its nose portion adapted to receive a reversible plow-point, of a solid share having a slip-nose shank on its under side constructed to fit into said opening in the nose of the standard, substantially as set forth.

3. The combination, with a plow-standard and mold-board, said standard constructed to allow of a reversible wing and point being applied thereto, of a solid share provided with a projection on its under side adapted to fit into the opening in the nose portion of the standard, substantially as set forth.

4. The combination, with the standard and mold-board, of the solid share and wedge-shaped plate secured between the standard and share, substantially as set forth.

5. The combination, with the mold-board and standard, of the solid share and the wedge-shaped plate, the latter being provided with two perforated arms at its rear ends, and bolts for securing the arms to the share and standard, substantially as set forth.

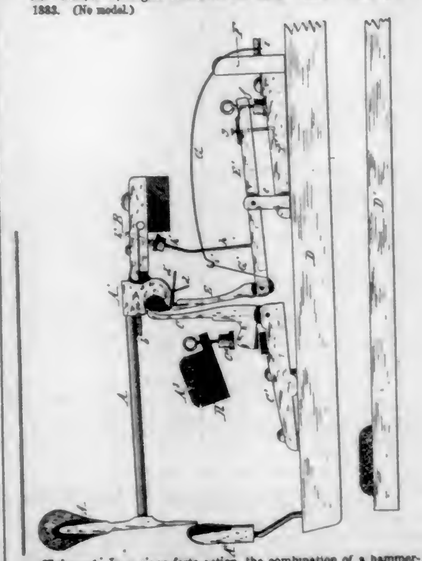


6. The combination, with the mold-board brace, of a handle-brace made in a single piece and detachably secured to the mold-board brace, said handle-brace being constructed with flanged arms to which the ends of the handles are bolted, substantially as set forth.

7. The combination, with the handle-brace, to which the ends of the handles are secured, of a two-armed brace centrally secured to the mold-board, and provided at one end with a hole for the passage of a bolt to secure the handle thereto, the opposite end of the arm being provided with a teat or projection that engages the handle, substantially as set forth.

297,907. BREECH-LOADING FIRE-ARM. WILLIAM ANSON and JOHN DEELEY, Birmingham, County of Warwick, England. Filed Nov. 7, 1883. (No model.) Patented in England Apr. 11, 1883, No. 1,833.

Claim.—1. In a breech-loading fire-arm, the combination of the



297,907.

drop-barrel having the lug *l*, provided with front and rear recesses, *l' l''*, and the recess *d'* at the upper portion of the breech end, the lower bolt, *d*, having the slot *d''* and angle-piece *n*, the upper bolt, *a*, the lever *m*, swinging on a fixed pivot, m^2, at the upper side of the breech, a pivot, *m'*, connecting the upper bolt with the lever at one side of its pivot m^2, and a connection between the rear end of the upper bolt and the rear end of the angle-piece *n* on the lower bolt, substantially as described.

2. In a breech-loading fire-arm, the combination of the drop-barrel having on its under side the projection *i*, the separated lifters *f f*, rigidly connected by the transverse bridge-piece or bar *g*, a single pivot-pin, on which both the lifters are journaled above their connecting-bar, said pivot-pin being concentric with the joint of the barrel and breech, and the pivoted hammers *k*, the said projection on the barrel, when the latter is dropped, acting on the bridge-piece or bar to simultaneously swing the connected lifters and cock the hammers, substantially as described.

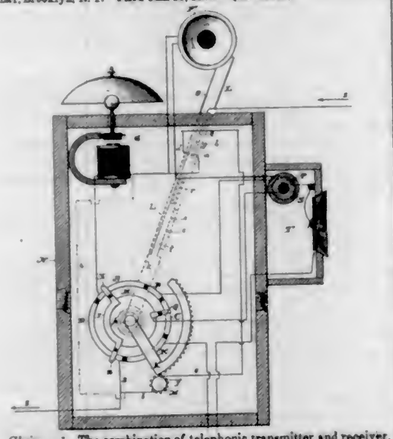
297,908. REPETITION-ACTION FOR PIANOS. FRANCIS L. BERKER, New York, N. Y., assignor of one-fourth to Gustav Becker. Filed May 7 1883. (No model.)

Claim.—1. In a piano-forte action, the combination of a hammer-butt having two shoulders, one above the other, a lifting-jack, a balancing-jack, a hitching device by which the balancing-jack is retained on the lower shoulder of the hammer-butt, and a balancing-spring applied to the balancing-jack so as to impart a constant backward tension thereon, substantially as set forth.

2. In a piano-forte action, the combination of a hammer-butt having two shoulders, one above the other, a lifting-jack, a balancing-jack, a hitching device by which the balancing-jack is retained on the lower shoulder of the hammer-butt, a balancing-spring applied to the balancing-jack, and a fulcrumed balancing-lever to which the balancing-jack

is pivoted, substantially as specified.

3. In a piano-forte action, the combination of a hammer-butt having two shoulders, one above the other, a lifting-jack, a spring-actuated balancing-jack, a hitching device by which the balancing-jack is retained on the lower shoulder of the hammer-butt, said hitching device consisting of a hitch-pin applied to the hammer-butt and of a slitted hitching-strap applied to the balancing-jack, substantially as set forth.



4. In a piano-forte action, the combination of the hammer-butt having two shoulders, one above the other, a lifting-jack acting upon the upper shoulder, a spring-actuated balancing-jack hitched to the hammer-butt below the lower shoulder, a fulcrumed balancing-lever, and a balancing-spring that is applied to a fixed supporting-post, and connected by a looped cord that extends around the lower end of the balancing-jack to a point above the pivot of the same, so as to impart a backward motion to the balancing-jack, substantially as and for the purpose set forth.

5. In a piano-forte action, the combination of a hammer-butt having two shoulders, one above the other, a lifting-jack, a spring-actuated balancing-jack hitched thereto, a fulcrumed balancing-lever, and a balancing-spring which is applied by a tension-regulating screw to a supporting-post of the key-lever, and connected to the balancing-jack by a looped cord which extends around the lower end of the same to a point above its pivot, substantially as described.

6. In a piano-action, the combination of the hammer-butt A, having two shoulders, *a a'*, a lifting-jack, C, a balancing-jack, E, hitched to the hammer-butt, a fulcrumed lever, E', having check-hook *g* and regulating-button *f*, a balancing-spring, G, applied by a tension-screw, *i*, to an upright post, F', and by a looped cord, G', to the balancing-jack, the balancing-spring being supported in the grooved upper end of the post F', and provided with a hook-shaped end for attaching the connecting-cord, substantially as specified.

7. In a piano-forte action, the combination of a hammer-butt, A, having two shoulders, *a a'*, one above the other, a lifting-jack, C, a balancing-jack, E, hitched to the hammer-butt, a fulcrumed balancing-lever, E', a balancing-spring, G, applied to a connecting-post, F', and by a looped cord, G', to the balancing-jack, the balancing-lever E' being provided with a check-wire and button, *h h'*, that abut against a block-screw, h^2, on the hammer-butt arm, substantially as set forth.

297,909. TELEPHONE-STATION APPARATUS. EDWARD M. BENTLEY, Brooklyn, N. Y. Filed Jan. 10, 1884. (No model.)

Claim.—1. The combination of telephonic transmitter and receiver, one being fixed to a support and movable relatively to the other, a signaling-generator, and means for operating the same, said means being actuated by the relative approach or recession of said transmitter and receiver to or from their adjacent operative position.

2. The combination of telephonic transmitter and receiver, one being fixed to a support and movable relatively to the other, a signaling-generator, means for operating the same, said means being actuated by the relative approach or recession of said transmitter and receiver to or from their adjacent operative position, and switching devices, also operated by said movements of the telephone apparatus.

3. The combination of a telephone-support, a telephonic receiver fixed thereto with electric connections, a signaling-generator, and mechanism driving said generator, and actuated by the movement of said support.

4. The combination of a lever-arm, a telephone supported thereby and fixed thereto, and a toothed sector on the axis of said lever-arm gearing into a pinion on the shaft of a magneto-generator.

5. The combination of a telephone, a movable support attached thereto, a normally predominating retracting device for said support, a signaling-generator, and means for actuating said generator by the movement of said support.

6. The combination of a lever-arm, a telephone fixed thereto and supported thereby, a signaling-generator operated by said arm, and a sustaining-retractor for said arm, overcoming the weight of the telephone.

7. The combination of a call-bell and telephonic apparatus, a signaling-generator, an operating device for said generator to which the telephone-receiver is attached, and a switch actuated by said device, for including the telephone apparatus in the main line.

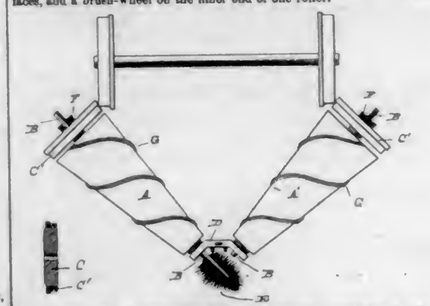
8. The combination of a lever-arm, a receiving-telephone fixed thereto, a signaling-generator, and means for operating said generator by the movement of said arm.

9. The combination of a telephone-support, a telephone carried thereby, electric conductors on said support, and an independently-operated switch also on said support, for changing the circuit formed by said conductors.

10. The combination of a telephone-support, a telephone carried thereby, circuit-connections therefor, an electric generator, and a switch on said support, controlling the circuit of said generator.

11. The combination of a telephone call-box, calling apparatus inclosed therein, a swinging door for the same, and a separately-inclosed transmitting-telephone on the said door.

12. The combination, with a transmitting-telephone, of an adjacent receiving-telephone, a swinging supporting-arm therefor having freedom of vertical and lateral movement, and switching devices actuated by the movement of said arm, for including said telephone in the main line.



13. The combination, with a transmitting-telephone, of a receiving-telephone and a support therefor adapted to maintain it in a position for conversation adjacent to the transmitting-telephone, said receiving telephone having also freedom of lateral movement relatively to the transmitting-telephone.

14. The combination of a lever-arm, a receiving-telephone fixed thereto, a signaling-generator, means for including said generator in circuit without the telephone, and means for operating said generator by the movement of said arm.

15. The combination of a telephone fixed to a movable support, a generator actuated by the movement of said support, an induction-coil and local battery, and means for closing the circuit of said local battery by the movement of said support.

297,910. TRACK-CLEARER. EPHRAIM B. BISHOP, San Francisco, Cal., assignor of one-half to Elijah H. Gadsby, same place, and Charles R. Allen, Oakland, Cal. Filed Nov. 23, 1883. (No model.)

Brief.—Rubber-faced wheels on the outer ends of the conical rollers operate the same by contact with the car-wheels. The rollers are provided with spirally-arranged brushes or rubber bands upon their surfaces, and a brush-wheel on the inner end of one roller.

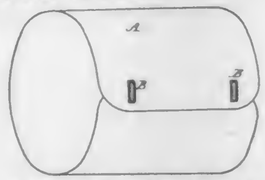
Claim.—1. A track-clearer for railway-cars, consisting of two conical rollers hung from the car-floor in suitable journal-boxes, and operated by the frictional contact of the car-wheels with rubber-faced wheels upon the spindles of the rollers, substantially as shown and described.

2. In a track-clearer for railroad-cars, the conical rollers A A', suitably journaled beneath the body of the car, and having spindles B B, and rubber-faced friction-wheels C C, constructed, arranged, and operating substantially as shown and for the purpose set forth.

3. In a track-clearer for railroad-cars, the conical rollers A A', provided with spirally-arranged brushes or raised rubber bands G G, and brush-wheel E, substantially as shown, for the purpose set forth.

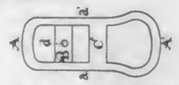
297,911. HAIR-CRIMPER. GILBERT H. BLAKESLEY, Bristol, Conn. Filed Oct. 17, 1883. (No model.)

297,911.



Claim.—1. A hair-crimper having a non-elastic metal strip inclosed within a paper body provided with a braided covering, substantially as set forth.

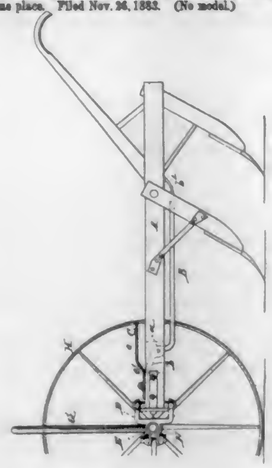
2. A hair-crimper having a non-elastic metal strip inclosed with a paper or other suitable body provided with a braided covering and with metallic clips, substantially as set forth.



3. The combination, with the paper body, the central portion of which is considerably increased in size, and the flattened wire situated within the body, of a braided covering and metallic clips secured to the ends of the crimper, substantially as set forth.

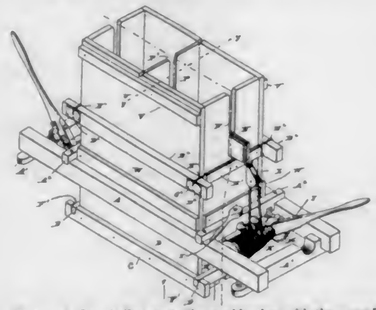
297,912. CUFF. THOMAS R. BOONE, Rochester, N. Y., assignor, by mesne assignments, to Clara E. Boone, same place. Filed May 18, 1883. Renewed Feb. 29, 1884. (No model.)

Claim.—A cuff or collar having button-holes of rectangular form, worked around their edges, and having a clear space between the edges of substantially uniform width, sufficient to prevent the joining of the edges when the cuff or collar is starched and ironed, substantially as and for the purpose herein specified.



297,913. BREECHING-SUPPORTER. RUSSELL S. BOULTER, Saco, Me. Filed Dec. 8, 1883. (No model.)

Claim.—1. The rim A *a* A′ *a*′, having the part A depressed, as herein specified, in combination with the alternately-depressed cross-bars, as and for the purpose set forth.



2. The rim A *a* A′ *a*′ and cross-bars B and C, depressed in manner and form as hereinbefore shown and described, and provided with stud *d*, the whole to form an improved article of manufacture.

297,914. DRAG-BAR FOR CULTIVATOR-BEAMS. BYRON C. BRADLEY, Chicago, Ill., assignor to the Furst & Bradley Manufacturing Company, same place. Filed Nov. 26, 1883. (No model.)

Claim.—The combination, with a beam, A, of the drag-bar B, having a projecting end, *b*, and a spring or spring-plate, C, having an opening, *c*, substantially as and for the purposes specified.

297,915. COTTON-PRESS. WILLIAM H. BURGESS, Rich Square, N. C. Filed Jan. 23, 1883. (No model.)

Claim.—1. In a baling-press, the combination, with the reversible side doors provided with projecting and recessed battens, of the slotted end boxing, adapted to be removably secured to the side doors and to the lint-box below the sills, for the purpose of holding the lint-box and press-box in perfect line with each other, substantially as described.

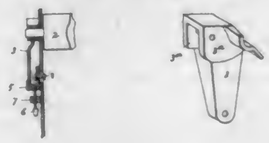
2. In a baling-press, the combination, with the sides of the baling-box, of the lint-box, provided with battens having recesses, and the end boxing having projecting battens which fit into said recesses, substantially as specified.

3. The combination of the longitudinal sills, the intermediate cross-sills, and the eccentric levers with the end boxing slotted top and bottom, and projecting battens provided with recesses, and the lint-chamber having battens and recesses adapted to receive the projecting battens, substantially as and for the purpose set forth.

4. The combination, in a baling-press, of the vertical movable partitions extending across the baling-chamber, and provided with vertical slats, and a cutter whereby a series of independent bales may be formed, substantially as specified.

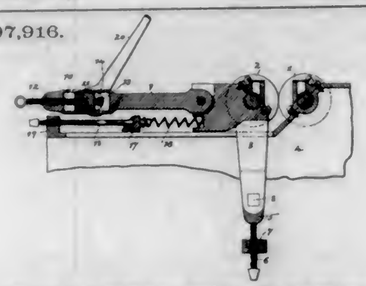
5. The combination, in a baling-press, of a windlass having a cylindrical and cone-shaped portion provided with right and left hand guide-grooves for the purpose of guiding the ropes more evenly and regulating the speed and power of the press, substantially as set forth.

6. The combination, in a baling-press, of a lint-chamber located below the sills, with a pressing-box having doors above the sills for permitting the box to be conveniently filled and the bales to be arranged and handled, as set forth.



7. The combination, in a baling-press, of a lint-chamber below the sills, a pressing-chamber above the sills, and an upper and lower follower, and mechanism for operating the same, substantially as specified.

8. The combination, in a baling-press, of a movable partition with upper and lower followers, and mechanism for operating the same, whereby a number of bales may be pressed at the same time, substantially as specified.

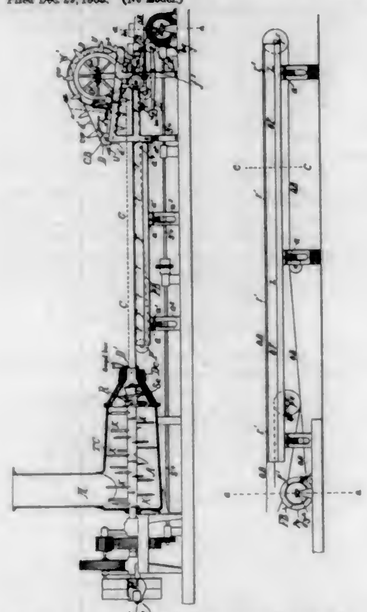


9. The combination, in a baling-press, of a lint-box below the sills, a pressing-box above the sills, and provided with reversible sides, and the removable end boxing slotted top and bottom, and having projecting battens which have bearings in the projecting battens on the side of the lint-box, and also provided with movable cross-ties for holding the sides firmly together, substantially as described.

10. The combination, in a baling-press, of the movable doors, provided with battens at their ends, and cross beams and ties, whereby the baling-box may be inverted, substantially as and for the purpose specified.

297,916. ADJUSTING AND LEVELING DEVICE FOR ROLLER-MILLS. JOHN M. CASE, Columbus, Ohio, assignor to the Case Manufacturing Company, same place. Filed Mar. 31, 1884. (No model.)

297,916.



Claim.—1. In a leveling device for roller-mills, the combination, with arm 3, journal-box, and the casing having lug 7 and a guiding-slot in its flange, of block 5, clamp-bolt 8, and adjusting-screw 6, bearing in said lug, as and for the purpose set forth.

2. In a roller-mill, the links 9, hand-screws 12, followers 11, shaft 14, provided with eccentric ends 13, and lever 20, in combination with suitable means for holding the rolls in grinding position with a yielding pressure, as and for the purpose set forth.

3. The combination, with links 9, adjustable followers 11, and shaft 14, provided with eccentric ends 13, of the adjustable springs 16, as and for the purpose set forth.

297,917. BRICK-MACHINE. CYRUS CHAMBERS, Jr., Philadelphia, Pa. Filed Dec. 29, 1883. (No model.)

Claim.—1. The improvement in the means for fitting the socketed thrust-plate onto the end of the pugging-shaft, consisting in providing the latter with a shoulder and longitudinal indentations, and said thrust-plate with a corresponding bearing or shoulder, and internal lugs adapted to register with and enter said indentations in the shaft, the bearing-surfaces being trued up, all substantially as and for the purposes specified.

2. The screw-case lining adapted to be rotated to different positions with relation to the case and the expressing-screw, and provided with means, substantially as shown, for securing the same in such different positions, substantially as and for the purpose described.

3. The combination of the screw-case, the rotatable lining having the slots r^3, and the fastening-lugs r^3, substantially as and for the purpose specified.

4. The inlet-pipe having its lower extremity extended into the tempering-case beyond the inside periphery thereof, in proximity to the circle described by the subjacent knives, and of curvilinear form, substantially as shown, and for the purpose set forth.

5. In combination with the screw-case and the pivoted eye or lock bolt, the hinged die-case provided with the fulcrum-lugs L, arranged with relation to the eyebolt as and for the purpose specified.

6. In combination with clay expressing and molding devices, the propulsion-belt and cut-off mechanism, and frame F, with means, substantially as shown, for adjusting the said frame vertically, for the purpose specified.

7. The endless cut-off belt or carrier having plates D secured thereto, the guideways G, substantially as and for the purpose set forth.

8. The endless cut-off belt or carrier, the plates D, with their sides extending beyond the edges of said belt, the bows U, and cut-off wires mounted thereon, and the guideways G, all constructed, combined, and adapted to operate substantially as and for the purposes stated.

9. The clay-expressing mechanism, the propulsion-belt, the cut-off mechanism consisting of a series of wires mounted transversely upon an endless belt or carrier, arranged with relation to the propulsion-belt and the moving bar of clay thereon, substantially as shown, and adjustable frictional devices, substantially as shown, for conveying auxiliary motion to said propulsion-belt, all combined, constructed, and operating substantially as and for the purposes set forth.

10. The following elements in combination, to wit: clay-expressing devices, an endless belt running over pulleys journaled in a frame, and adapted to receive thereupon the bar of clay issuing from the die of the machine, a pulley, as P^w, on the shaft of the forward one of said pulleys, a positively-driven pulley, as P^x, an idler, as I R, on a pivoted adjustably-weighted lever, as L L′, a slack or friction belt running over said last-mentioned pulleys and in contact with said idler, together with mechanism for severing the moving bar of clay into bricks, consisting of a series of wires mounted on an endless belt or carrier, arranged with relation to the propulsion-belt and the bar of clay thereon, as shown, all constructed and adapted to operate and co-operate substantially in the manner and for the purposes set forth.

11. The combination of the propulsion-belt, the cut-off mechanism, the pulleys P^w and P^x, the idler I R, the friction-belt, and the weighted pivoted lever L L′, composed of two independent arms adjustable with relation to each other, substantially as and for the purpose described.

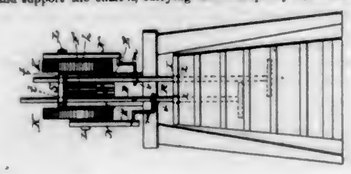
12. In combination with the endless wire cut-off belt or carrier, the plates D, when provided with the upturned flanges *d*′, substantially as and for the purposes specified.

13. In combination with the propulsion-belt and cut-off mechanism, the independent roller I, having the tapering form shown, and for the purpose specified.

14. In combination with the pulley P^w and the deflecting-wings H, the detachable scraper S, adjustably mounted on the latter, substantially as and for the purpose specified.

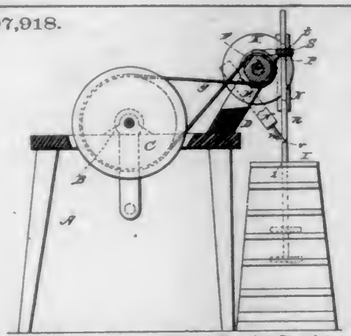
15. The combination, with the cut-off belt running over pulleys P^y and P^w, mounted in the frame F′, of the tightener-frame having the pulley P^t journaled therein, and the adjusting-screw r^t, working in said tightener-frame, and having its forward end abutting against a projection, T^w, located between said pulleys P^t and P^t, as and for the purpose specified.

16. In combination with the off-bearing belt and its frame and rollers, the cap-pieces r^2, in proximity to the edges of said belt and rollers, and having their top surfaces elevated slightly above the belt, as and for the purposes specified.



17. In combination with the off-bearing belt rollers, the cap-pieces r^2, covering the journals of the rollers, and extending over near to the ends of the latter and beyond the bearings thereof, as and for the purpose specified.

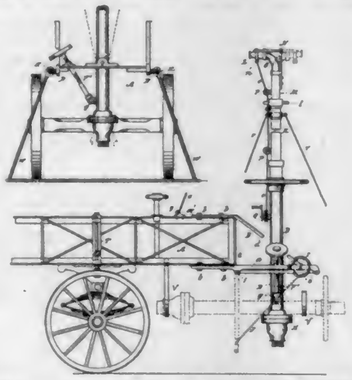
18. The combination, with the off-bearing-belt rollers, of the cap-pieces r^2 and corner-pieces r', the ends of the journals of said rollers being nearly in contact with said corner-pieces.



19. The combination, with the rollers r', of the longitudinally-adjustable bearing-strips z, cap-pieces r^2, and corner-pieces r', constructed and arranged as specified.

297,918. CHURN. JOHN JAMES CURD, Rockfield, Ky. Filed May 12, 1883. (No model.)

Claim.—The churn-motor herein described, consisting of the frame A, having bearings B for the journals of the large pulley C, the bracket D, composed of arms E E, which are secured, as shown, to the frame A, and support the shaft A, carrying the small pulley F, the said arms



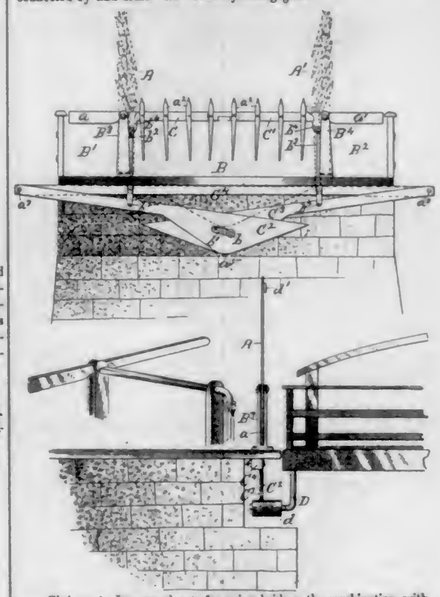
297,918.

being extended outward horizontally, as indicated at P, and connected by the transverse bar S, which is provided with perforations *t*, for guiding the dasher-rods R, the crank-wheels K, secured to the lateral extensions of the said shaft A, the arms N, connected near their upper ends eccentrically to the crank-wheels, and at their lower ends to the dasher-rods by means of the bent wire pivot-arms *m*, the pulley-belt *g*, and operating crank-arm, substantially as specified.

297,919. TOWER-PIPE ATTACHMENT FOR TRUCKS. JOHN R. DAY, New York, N. Y., assignor of three-fourths to Jacob Cohen and Ferdinand W. Hofele, both of same place. Filed Sept. 11, 1883. (No model.)

Claim.—1. The combination, with an ordinary hook-and-ladder truck, of the bracket B, constructed and attached to said truck, as described, and the swinging platform C and pipe D, said platform C being pivoted to said bracket, as described, and provided with the pivoted ring E, within which the pipe D is secured, the whole constructed and arranged in connection with suitable means for locking said platform when raised, as shown and described.

2. In combination with the bracket B, the swinging platform C, pivoted to said bracket, and provided with the pivoted ring E, the pipe D, secured within said ring E, the swiveled plate G, and the screw-rod F', said plate G being provided with a screw-threaded opening at its center, in which said screw-rod F' works, and said screw-rod F' being pivoted at its lower end to the pipe D, the whole constructed and arranged as shown and described, for the purpose set forth.

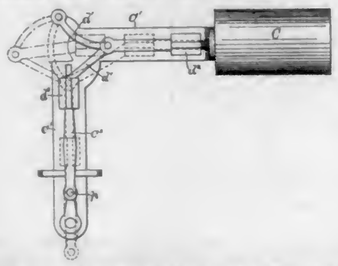


3. The swiveled plate G and screw F', in combination with the pipe D, platform C, and pivoted ring E, as and for the purpose set forth.

4. The pipe D, provided with the flanges *p* and *p'*, carrying the hand-wheel R, in combination with the ring E, coupling H, and cylindrical sleeve *r*, said ring and coupling being provided with the recesses *q* and *q'*, respectively, and connected by said sleeve, as and for the purpose set forth.

5. The discharge-nozzle herein described, composed of the piece L, pipe M, tapering flexible and elastic hose O, and hinge N, provided with the opening *m*, constructed and arranged as set forth.

297,920. GUARD-GATE FOR SWING-BRIDGES. WILLIAM M. DOTY, Chicago, Ill., assignor of one-half to A. Montgomery Ward, same place. Filed Dec. 26, 1883. (No model.)

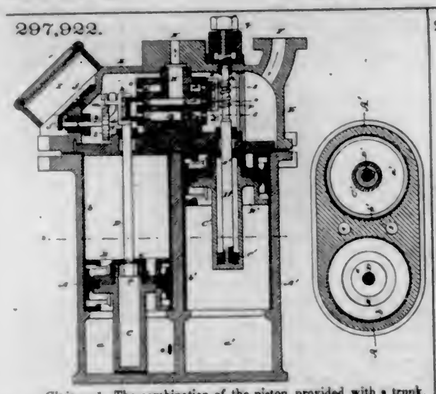


Brief.—A bent arm on the bridge has a friction-roller which engages the beveled or inclined inner ends of a pair of companion levers pivoted at their outer ends to an abutment. The companion levers are connected by link-arms with vertically-tilting gates.

Claim.—1. In a guard-gate for swing-bridges, the combination, with the gates A A', of the arms b^2 b^2, and the companion levers C^2 C^2, having the outer ends pivoted to the timber C^4, while the inner ends are widened and beveled, as described, whereby said gates are raised or lowered by the opening and closing of the bridge, substantially as set forth.

2. In a guard-gate for swing-bridges, the combination, with a bridge, of the angular lever D, the friction-roller *d*, the companion levers C^2 C^2, the vertical arms b^2 b^2, the gates A A', and the posts B^2 B^4, whereby said gates are automatically opened and closed by the movement of the bridge.

297,921. LOCOMOTIVE DRIVING-GEAR. GOTTLIEB ENGHOFER, Attleborough, Mass. Filed Dec. 31, 1883. (No model.)



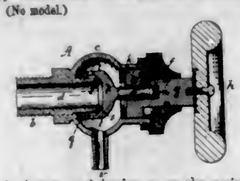
Claim.—1. A locomotive-engine driving-gear arranged in such manner that each full return-stroke of the piston shall produce two complete revolutions of the driving-wheels.

2. The combination, with the cylinder and frame C' C', of the piston-rod and crank-rod and the toggle-joint *d'*.

3. The combination, with the cylinder and the frame C' C', carrying the projection *d*, of the piston-rod, crank-rod, and toggle-joint, arranged and operating as described.

297,922. WATER-METER. ALPHONSE FRAGER, Paris, France, assignor of one-half to Société Michel et Cie, same place. Filed Feb. 16, 1884. (No model.) Patented in France Nov. 9, 1882, No. 152,009.

297,922.



Claim.—1. The combination of the piston provided with a trunk, the valve-stem provided with a button on one end and a claw on the other, the valve, and a spring arranged between the claw and the valve, all substantially as set forth.

2. In a fluid-meter comprising two cylinders, two pistons, two valve-seats, and two valves actuated directly by the pistons, the valve actuated by one piston controlling the ports leading to the cylinder containing the other piston, the means, substantially as herein described, for displacing the valve with reference to its ported seat, whereby the integrity of the meter, as to leakage, may be tested, as set forth.

3. The combination of the piston, the valve, the valve-stem provided with a screw, *p*, arranged to engage a half-nut carried by the valve, and the key *q*, arranged to engage and turn the end of the valve-stem, substantially as and for the purposes set forth.

4. The combination, with the ratchet-wheel *l*, of the pawl *m*, provided with a tail, *n*, to prevent the engagement of more than one tooth, the valve, and the valve-stem provided with a claw to embrace the valve, all arranged substantially as set forth.

297,923. GAGE-COCK. LOUIS B. FULTON, Pittsburg, Pa. Filed Nov. 21, 1883. (No model.)

Claim.—1. A gage-cock having an annular projecting valve-seat and a box surrounding the same, and constituting the valve, and provided with means of rotation under the force of escaping steam or water, substantially as described.

2. A gage-cock having an annular projecting valve-seat with cylindrical body externally, and a box having an internal flange or two or more projections fitting said cylindrical body, and said box constituting the valve, substantially as described, whereby the valve is guided and centered.

3. In a gage-cock, the combination, with an annular projecting valve-seat, of a valve having extended walls embracing and surrounding said seat, said walls having one or more angular ports, substantially as shown and described.

4. In a gage-cock, the combination, with an annular projecting valve-seat, of a valve having extended walls embracing and surrounding said seat, and provided with an angular port or ports adapted to rotate said valve under the propulsive force of escaping steam or water, substantially as described.

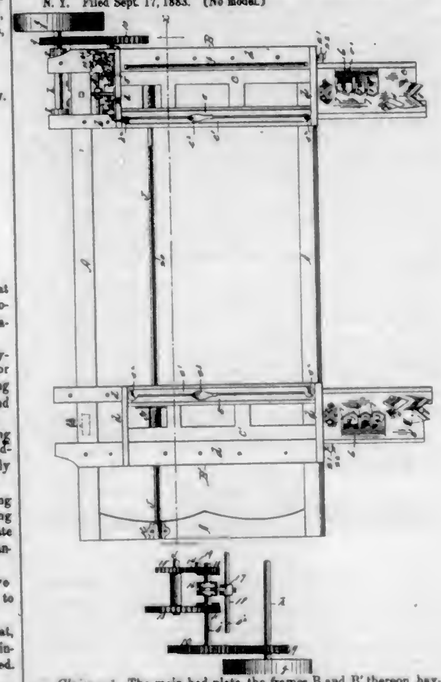
5. In a gage-cock, the combination of the annular cylindrical valve seat *a*, box-valve *s*, having port or ports *t*, and guide-pin *o*, adapted to aid in guiding said valve, substantially as described.

6. In a gage-cock, the combination, with the valve and valve-seat, of the boiler-fitting *b*, neck *k*, and bars or frame *w*, with the space inclosed between said parts open and exposed, substantially as described.

297,924. APPARATUS FOR THE PRODUCTION AND UTILIZATION OF SECONDARY ELECTRIC CURRENTS. LUCIEN GAULARD and JOHN DIXON GIBBS, 18 Warwick Street, Regent Street, County of Middlesex, England. Filed Mar. 4, 1884. (No model.) Patented in England Feb. 6, 1884, No. 2,858.

297,924.

Claim.—1. In apparatus for producing secondary currents, the combination, with a single primary, of a set of insulated secondary conductors laid parallel thereto and connected in multiple-arc, substantially as described.



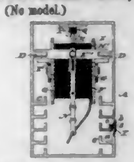
2. In a system for distributing electricity by means of induction-coils, the combination, with the main or generating circuit including the primaries of the induction-coils in series, of the consumption-circuits including translating devices and the secondaries of said coils, each secondary comprising a set of insulated conductors laid parallel to the primary conductor, and connected in multiple arc, substantially as described.

3. In a system for inducing secondary currents, the combination of a number of sets of insulated conductors laid parallel with the primary, the conductors of each individual set being connected in multiple arc, and the several sets being connected the one with the other, either in multiple arc or in series, substantially as hereinbefore described.

4. In an induction-coil, a cable made of a flat conductor for the primary current, surrounded by a number of wires or strips for the secondary currents, substantially as hereinbefore described.

5. In an induction-coil, a cable made of a conductor for the primary current, surrounded by a series of smaller wires or strips for the secondary current, the said wires or strips being separated by threads, strips, or layers of insulating material, and the said smaller wires or strips and separating threads, strips, or layers being connected together by insulating threads or material, substantially as hereinbefore described.

297,925. BOX-MAKING MACHINE. JACOB S. GIBBS, Bridgeport, Conn., assignor to the United States Box Machine Company, New York, N. Y. Filed Sept. 17, 1883. (No model.)



Claim.—1. The main bed-plate, the frames B and B' thereon, having suitable clamping mechanism to retain the boards, reciprocating cutters in said frames, and a shaft and change-gear for driving said cutters, the gear consisting of a large and a small wheel on the driving-shaft, similar wheels in reverse order on the counter-shaft, and a clutch adapted, as described, to throw one or the other system of gears into operation,

all being in combination, as set forth.

2. The main frame, the clamping-frame supported thereon, and suitable clamping mechanism in said frame, and the reciprocating cutter-bar moving in said frame by means of suitable driving mechanism, said cutter-bar having raised ribs 7 thereon and knives B secured between and projecting obliquely beyond said ribs, all in combination as set forth.

3. The cutter-frame having angular bearings for sliding cutter-bar, as *c*, the cutter-bar arranged in said bearings, and a tapering gib, 21, in the bearing at the edge of the cutter-bar, all in combination as set forth.

297,926. UNDERGROUND CONDUIT FOR ELECTRIC WIRES. CHRISTIAN H. GOEBEL, Philadelphia, Pa., assignor to the Goebel Sectional Electric Underground and Pneumatic Delivery Company, of New Jersey. Filed Sept. 21, 1883. (No model.)

Claim.—1. A conduit formed of a tube with ledges and reel-supporting tracks having serrated edges, substantially as and for the purpose set forth.

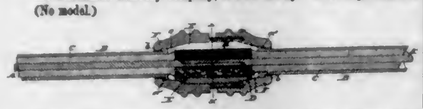
2. A conduit formed of a tube having reel-supporting tracks, with serrated edges, and a motor-receiving way, substantially as and for the purpose set forth.

3. A conduit formed of a tube having an opening, in combination with a closing-cap consisting of a head, *b*, and a slotted shank, *c*, and the key T, the latter being on the inner face of the conduit, substantially as and for the purpose set forth.

4. A conduit formed of a tube having serrated tracks on which a wire-holding reel is supported and moved, said reel having means for interlocking with said tracks, substantially as and for the purpose set forth.

5. A wire-holding reel for a conduit provided with a pawl, and having a drum formed with serrated heads, said pawl being disengaged from the heads by the advance of the reel, substantially as and for the purpose set forth.

6. A wire-holding reel for a conduit, having a drum with a serrated head, a pawl mounted on the frame engaging with said head, and a sliding rod connected with said pawl operated by the motor of the reel, substantially as and for the purpose set forth.

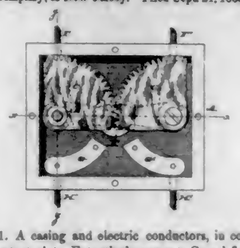


7. A wire-holding reel for a conduit having a pawl and check-pawl, and a drum provided with ratchet-heads the teeth whereof are pitched in reverse order, substantially as and for the purpose set forth.

8. A wire-holding reel for a conduit, provided with means for locking its drum and frame, said means being released by the power applied to advance the reel, substantially as and for the purpose set forth.

9. A wire-holding reel for a conduit having a rear guiding-arm adjustably connected with the frame, substantially as and for the purpose set forth.

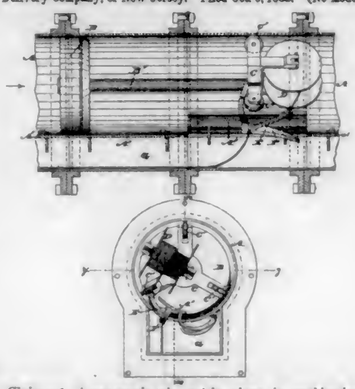
10. A wire-holding reel provided with a drum or reel proper with serrated heads and a frame with supporting cross-bars, a locking-pawl, locking-dogs, a sliding rod, and a check-pawl, in combination with a conduit and a motor, said conduit having serrated tracks on which the reel is supported and moved, and a way for the passage of the motor, substantially as and for the purpose set forth.



297,927. CONDUIT FOR ELECTRIC WIRES. CHRISTIAN H. GOEBEL, Philadelphia, Pa., assignor to the Goebel Sectional Electric Underground and Pneumatic Delivery Company, of New Jersey. Filed Sept. 21, 1883. (No model.)

Claim.—1. In a conduit for electric wires, a split or divided collar of compressible material encircling the connected ends of the wires, segmental plates of rigid material with tapering backs surrounding said collar, and a clamping-sleeve with tapering inner faces fitted over said segmental plates, combined and operating substantially as and for the purpose set forth.

2. In a conduit for electric wires, a coupling consisting of a split or divided collar of compressible material encircling the connected ends of wires, segmental plates of rigid material surrounding said collar, a clamping-sleeve fitted over said segmental plates, and tubing inclosing the wires formed at the ends within the coupling with shoulders, substantially as and for the purpose set forth.



297,928. ELECTRIC CUT-OFF. CHRISTIAN H. GOEBEL, Philadelphia, Pa., assignor to the Goebel Sectional Electric Underground and Pneumatic Delivery Company, of New Jersey. Filed Sept. 21, 1883. (No model.)

Claim.—1. A casing and electric conductors, in combination with tongues G, a contact-plate, E, toothed segments C, and fingers D D′, said fingers being connected with said segments and adapted to engage simultaneously with said contact-plate in one position of the segments, or simultaneously with said tongues in the other position thereof, substantially as and for the purpose set forth.

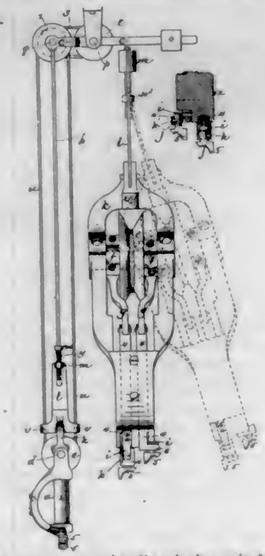
2. A casing and electric conductors, in combination with two toothed segments geared together, fingers connected with said segments, a contact-plate, and two tongues, said contact-plate being common to the two fingers when the latter are removed from the tongues, substantially as and for the purpose set forth.

297,929. UNDERGROUND CONDUIT FOR ELECTRIC WIRES AND PNEUMATIC TUBE COMBINED. CHRISTIAN H. GOEBEL, Philadelphia, Pa., assignor to the Goebel Sectional Electric Underground and Pneumatic Delivery Company, of New Jersey. Filed Oct. 6, 1883. (No model.)

Claim.—1. A pneumatic tube and its piston, in combination with a supplemental tube or conduit for electric wires attached thereto, and wire-laying devices carried by said piston, substantially as set forth.

2. A pneumatic tube provided with movable doors or sections, in combination with a wire-holding conduit, into which said sections open, and means within said pneumatic tube for opening said sections and laying wire in said tube, substantially for the purpose set forth.

3. A conduit for wire, in combination with a pneumatic tube provided with wire-laying apparatus, and means for opening communication between said conduit and tube, substantially as described.

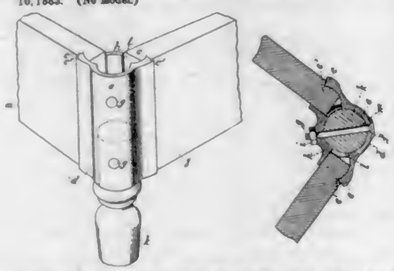


4. A combined pneumatic tube and wire-conduit communicating by means of movable sections or doors intermediate thereof, in combination with the carrier of said tube, provided with wire-laying apparatus, substantially as and for the purpose set forth.

297,930. SOLE-EDGE-BURNISHING MACHINE. WILLIAM GORDON, Boston, assignor of one-half to J. Wesley Dodge, Malden, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a sole-edge-burnishing machine, the combination of the slide 4 and its operating devices, the burnishing-tool having a recessed shank adapted to rise and fall in said slide, and a spring, *k′*, secured to the slide and projecting at its free end into the recess in the tool-shank, as set forth.

2. In a sole-edge-burnishing machine, the combination of the slide 4 and its operating devices, the burnishing-tool having a recessed shank adapted to rise and fall in said slide, a spring, *i*, bearing on the upper

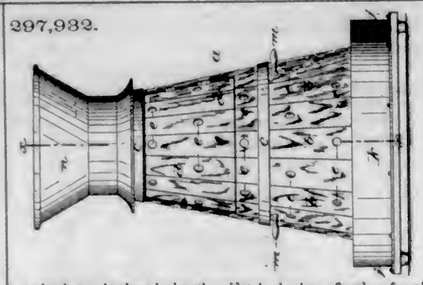


297,930.

end of the tool-shank, and a spring, *k′*, projecting at its free end into the recess in the tool-shank, as set forth.

3. In a sole-edge-burnishing machine, the combination of the movable stock having a burnishing tool or tools, and operating mechanism therefor, substantially as described, the pivoted rod *b*, supporting said stock, and the laterally-yielding or elastic plate connecting the stock to the rod, as set forth.

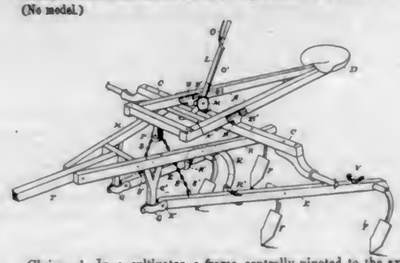
297,931. TABLE-LEG FASTENING. H. WILLIAM GROSS, Vincennes, Ind., assignor of one-half to James A. Plummer, same place. Filed Oct. 10, 1883. (No model.)



Claim.—The combination, with the adjacent rails *a* and *b*, having shouldered seats in their outer faces at their ends, of the outer casting having flanges to fit the seat, and the body portion provided with perforations and the inner angular concavo-convex perforated castings, and the bolts, table-leg, and securing-nuts, substantially as specified.

297,932. METHOD OF AND MEANS FOR CULTIVATING FRUITS AND VEGETABLES. JOHN WILLIAM GROVES and VALENTINE MINION, South Oil City, Pa., assignors of one-half to Mathew Blakeley Clemenger, same place. Filed Aug. 20, 1883. (No model.)

Claim.—1. The combination, with the perforated vessel *a*, adapted to be filled with earth, of the centrally-disposed upright tube *o*, penetrating the earth to near the bottom of vessel *a*, and having a series of apertures, *p*, arranged at regular intervals along its length, said tube having a flared or funnel-shaped mouth, *q*, and the bottom reservoir, *k*, within which the vessel *a* is pivoted and arranged to rotate, substantially as and for the purpose set forth.



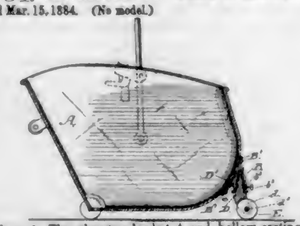
2. The perforated vessel *a*, adapted to be filled with earth, in combination with the vase *n*, removably superposed upon the said vessel, and the centrally-disposed upright tube *o*, penetrating the earth to near the bottom of the vessel, and having a series of apertures, *p*, arranged at

297,932.

regular intervals along its length, said tube having a flared or funnel-shaped mouth, *q*, and the bottom reservoir, *k*, within which the vessel *a* is pivoted and arranged to rotate, substantially as and for the purpose set forth.

297,933. ADJUSTABLE SEAT-LIFT CULTIVATOR. CHAS. H. HILL, Lombardville, Ill., and JAS. T. RYAN, Manning, Iowa. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a cultivator, a frame centrally pivoted to the axle or frame of the cultivator, and having a seat upon its rear end, in combination with a pulley secured to the forward end of said pivoted frame, and a chain or other flexible bond passing over said pulley and fastened at its ends to the plow-beams of the cultivator, whereby the weight of the driver in said seat shall support said plow-beams and permit them unequal and opposite vertical motion, as set forth.

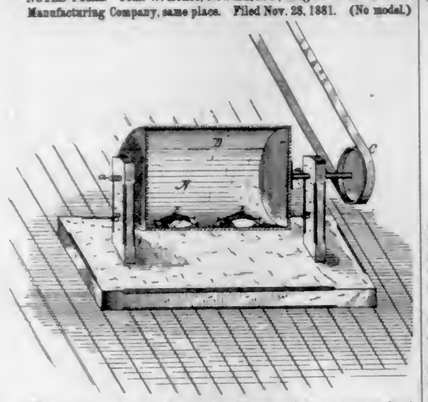


2. The frame A, seat D, and bearings B, in combination with the pulley P, chain S, and the beams E of a cultivator, for the purpose described.

3. The frame A, seat D, bearings B, and pulley P, in combination with the chain S, hooks S′, beams E of a cultivator, the yoke R, and stirrups R′, substantially as specified.

4. In a cultivator, the frame A, having several bolt-holes therethrough, in combination with the bearings B, having corresponding bolt-holes, and pivoted to the axle or frame of a cultivator, and the bolts or pins B′, whereby the leverage of said frame A may be changed without altering the longitudinal position of the same.

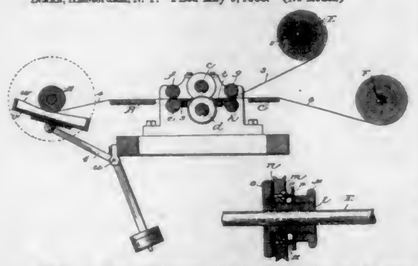
5. The combination, in a cultivator, of a frame centrally pivoted to the axle or frame thereof, and having a seat upon its rear end, and means whereby the plow-beams are suspended from the front end of the said pivoted frame, so that these plow-beams shall counterpoise each other and enable the elevation and depression of one to oppositely affect the other, for the purpose set forth.



297,934. ELEVATOR-BUCKET. CHARLES W. HUNT, New York, N. Y. Filed Mar. 15, 1884. (No model.)

Claim.—1. The elevator-bucket A and hollow casting B, having projections *b*, in combination with the stem D, provided with a groove, D′, and flanges *b b′*, the wheel E, and set-screws *b²*, all constructed to operate substantially as and for the purpose set forth.

2. The elevator-bucket A, constructed as herein shown and described, in combination with the swiveled wheel E, substantially as and for the purpose set forth.



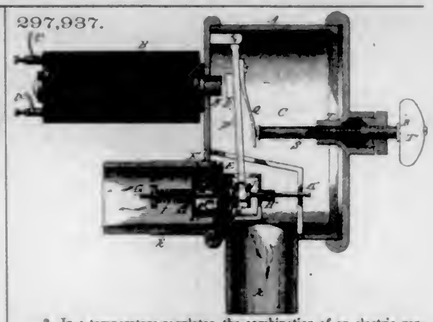
297,935. PROCESS OF DESICCATING PYROXYLINE IN COMMINUTED FORM. JOHN W. HYATT, Newark, N. J., assignor to the Celluloid Manufacturing Company, same place. Filed Nov. 28, 1881. (No model.)

Claim.—1. In the manufacture of celluloid and other compounds of pyroxyline, the process hereinbefore described, which consists in, first, grinding the nitro-cellulose in water, and, second, removing the aqueous particles by agitating the nitro-cellulose in contact with an absorbent.

2. The process hereinbefore described of treating nitro-cellulose after it has been ground to a pulp in a liquid and prior to its conversion, which consists in agitating the pulp about absorbent material inclosed in porous coverings, the whole being within a closed vessel.

297,936. PAPER SLITTING AND WINDING MACHINE. HORACE INMAN, Amsterdam, N. Y. Filed May 9, 1883. (No model.)

Claim.—1. The combination, with the winding-shaft, of the flanged sleeve *l*, the loose pulley on the sleeve, the pressure-springs, and the nut M, all adapted to operate substantially as described.



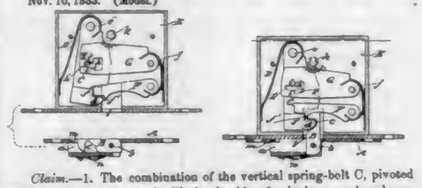
2. Combined with the grooved winding-shaft, the rod *s*, of greater diameter than the depth of the groove, and adapted to slide longitudinally in such groove, for the described purposes.

297,937. HEAT-REGULATOR. WARREN S. JOHNSON, Whitewater, assignor of one-half to William Plankinton, Milwaukee, Wis. Filed Jan. 18, 1884. (No model.)

Claim.—1. In a temperature-regulator, the combination, with an electric generator, of an electric valve and of two thermostats in circuit therewith, one of said thermostats being situated close to the steam-generator, and serving to close the circuit when said generator is in use, and the other thermostat being located in the apartment which the steam-generator is intended to heat, and serving to close the circuit and actuate the electric valve, whereby the steam is shut off when the desired temperature has been attained, substantially as set forth.

2. In a temperature-regulator, the combination of an electric generator, two main conductors leading therefrom, and two or more wires in multiple-arc circuit with reference to said electric generator, each of the wires of the multiple-arc circuit containing a thermostat and an electric valve, whereby the steam is shut off from a radiator whenever the temperature in one or more apartments in which the thermostats are located has attained the desired limit, substantially as set forth.

297,937.



3. In a temperature-regulator, the combination of an electric generator, two main conductors leading therefrom, two or more conducting-wires in multiple-arc circuit with said electric generator, each of said wires including a thermostat and an electric valve, and a thermostat located in the main circuit and adapted to be closed automatically by the heat of the steam-generator when it is in use, substantially as set forth.

4. The combination of an electro-magnet whose coils are external to the steam-chamber, but whose field of magnetic force lies within said chamber, the valve-chamber which is in proximity to the field of magnetic force having walls and parts of non-magnetic substance, and of a suitable valve mechanism situated within said chamber, whereby when the electro-magnet is excited by a current of electricity it will actuate the electric valve, substantially as set forth.

5. The combination, with a valve-casing containing an electric valve situated in and adapted to close a steam-passage, the said valve having an armature-lever provided with a spring, of a rod passing through a stuffing-box in said casing, and provided with a hand-wheel, whereby the end of the said rod may be forced against the spring or the lever of the armature and serve to close the valve when the radiator to which it is attached is not desired for use, substantially as set forth.

297,938. TRUNK-LOCK. EDWD. A. JUDD, New Britain, Conn. Filed Nov. 10, 1883. (Model.)

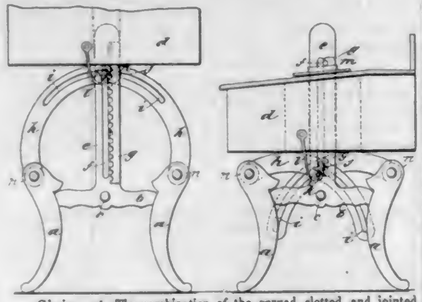
Claim.—1. The combination of the vertical spring-bolt C, pivoted within the case, and formed with the shoulder *f* at its lower end, and constructed to be operated by a key at its upper end, with the horizontal spring-operated stop F entirely within the case and extending across the path of the keeper and resting at its free end on the lower part of bolt C, and a suitable keeper, whereby when the bolt C is retracted the stop will automatically engage the shoulder *f* and hold the bolt retracted, and release the bolt upon the entrance of the keeper, substantially as set forth.

2. The bolt C, formed with stud *g* and acted upon by spring D, in combination with slotted and spring-actuated tumblers G, stop F, located within the case, and pivoted keeper B, all arranged to operate substantially as described.

3. The pivoted and folding keeper, in combination with the lock proper, having the spring-operated bolt C and stop F, arranged for releasing the bolt upon the entrance of the keeper into the lock, substantially as set forth.

4. The combination, in a lock, of the notched and pivoted keeper B with the spring-actuated bolt C, having nose *d* and shoulder *f*, and the spring-actuated keeper F, having projection *f''*, substantially as described, and for the purpose set forth.

297,939. DEVICE FOR RECORDING TIME. JOHN KELLER and JOHN F. PERLBACH, New York, N. Y. Filed Jan. 3, 1884. (No model.)

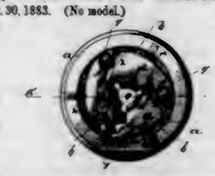


Claim.—1. The box A, provided with the transverse orifices *b b*, ribbon M, and the roller D, combined with the ratchet F, pawls G and H, lever I, and handle J, which, together with said pawl H, are carried by the lever I, substantially as shown, whereby the strip or ribbon, M, of paper may at will be drawn through the orifices *b b*, to expose a fresh surface and conceal that already used.

2. The box A, provided with a hinged lid and a wide orifice therein, combined with the ledge E, detached from the movable lid, but located therein, to constitute narrow slits *b b*, the roller D, provided with the ratchet F, pawls G H, arm I, centered upon the axis of the roller D, curved slot K, and operative handle J, whereby the cover may be raised to expose the internal mechanism without disturbing any of said mechanisms, as set forth.

3. The combination, substantially as shown, of the box A, provided with a hinged lid having a transverse orifice, and within said orifice, flush with the upper edge of the same, a ledge attached to the box independent of the lid, to produce the two slits or apertures *b b*, the rollers C D, the ratchet F, pawls G H, and the arm I, on which the pawl H is carried, and the handle J, whereby the paper is exposed on or above the level of the lid, and the lid may be raised to uncover the mechanism without disturbing it.

297,940. DESK. JACOB KLAR, Rodney, Miss. Filed Oct. 10, 1883. (Model.)



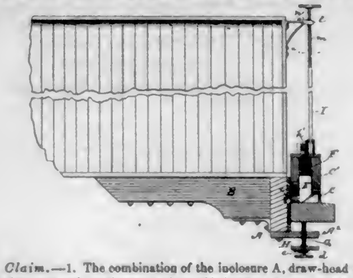
Claim.—1. The combination of the curved, slotted, and jointed arms A, shaft *j*, and pinions *k* with the desk or table supporting bench, the top *d*, and the vertical slotted standard *e*, having toothed racks *g*, substantially as described.

2. The bench consisting of legs *a*, cross-bars *b*, and connecting-rod *c*, and having the curved slotted arms A pivoted to it, and the vertical slotted standards *e* attached to the cross-bars, in combination with the desk or table top *d*, and means, substantially as described, for shifting it and supporting it thereon at any desired height, as set forth.

3. The combination, with the supporting-bench provided with standards *e*, of the table or desk top *d*, provided with vertical openings at each end, extending through the same, and forming guides for the said standards, and the covers *m*, hinged to the upper surface of said top, substantially as herein shown and described, whereby the openings may be closed when the desk is raised to its highest position, as set forth.

4. The slotted curved pivoted arms A, the posts *a*, and the stay-rods *n*, in combination with the slotted standards *e*, desk-top *d*, shaft *j*, pinions *k*, and the toothed bars *g*, substantially as described.

297,941. SCREW-CUTTING DIE. OSWALD J. KOSIOL, Louisville, Ky. Filed Nov. 30, 1883. (No model.)



Claim.—1. A die for cutting screw-threads, consisting of a disk or head having a circular recess and a central aperture, a series of cutting dogs or dies, recessed and shouldered at one end and shouldered at the other, and a series of screws having their heads abutting against said shoulders, whereby the dogs or dies are removably and adjustably confined in the head, substantially as specified.

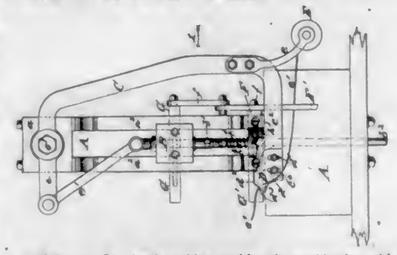
2. The combination, with the recessed head having a central aperture and a series of adjustable cutting dies or dogs, of the confining-screws, whereby the dogs or dies are held in place, and the adjusting-screws, whereby the said dogs or dies are adjusted centrally, substantially as and for the purpose specified.

3. The combination, with the recessed head provided with a central aperture, of the cutting dogs or dies, shouldered as described, and provided with recesses *i*, the confining-screws, and the adjusting-screws, all adapted to operate substantially in the manner specified.

297,942. CAR-COUPLING. GEORGE C. LOAR, Quincy, Ill., assignor of one-half to Joseph L. Morgan, same place. Filed Oct. 9, 1883. (No model.)

Claim.—1. The combination of the inclosure A, draw-head C, arranged transversely to the car, and provided with spring-seated locking-bolt E, set-screw G, and means for holding the draw-head level in its adjustments, as set forth.

2. The combination, with the draw-head C, arranged at right angles to the length of the car, the set-screw G, leveling-bar H, with pins or supports *f f*, the ratchet-wheel *e*, and detent *g*, as and for the purpose described.



3. The combination, with the draw-head having spring-seated locking-bolt E, arranged vertically above the same, of a vertical shaft, I, and drum J, and a chain or flexible connection extending from the drum to the said bolt, as described.

4. The combination of the draw-head C, having spring-bolt E, the shaft I, with drum J, and a chain connecting said drum to the bolt, and the side rods, *k*, having chains connecting them to the drum, as set forth.

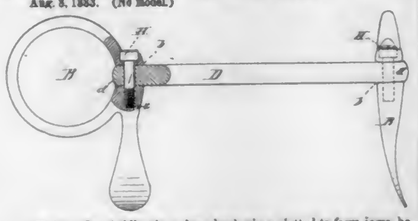
5. The combination, with the vertically-adjustable draw-head C, having spring-bolt E, the shaft and drum I J, connected with the bolt E by chains, and swiveled in the draw-head, the upper end of said shaft being notched or grooved longitudinally, and provided with a detent, substantially as set forth.

6. The link-bar M, having an opening in one end, and having the other enlarged and made hollow, and provided with a pin-hole to form a supplemental draw-bar, as described.

297,943. BOTTLE-CORKING MACHINE. THOMAS R. LOWERRE, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. In a bottle-corking machine, the combination, with the ordinary plunger *b*, of a knife provided with a cord or wire, and arranged to slit the lower end of the cork and leave a portion of the cord therein just before the cork is driven into the bottle, substantially as and for the purpose specified.

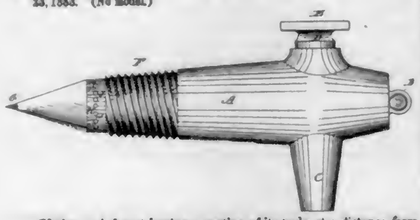
2. In a bottle-corking machine, the combination, with the descending plunger *b*, of the knife D, having an inclined cutting-edge, and a hole, d^2, in rear of and a little below the highest point of the cutting-edge, said knife being arranged to move transversely to the motion of the said plunger, substantially as and for the purpose set forth.



3. In a bottle-corking machine, the combination, with a descending plunger, *b*, and the cord-carrying knife D, moving transversely to the said plunger, of the shears F F', having its movable jaw F'' connected to receive its motion from the movement of the sliding block B and plunger, substantially as specified.

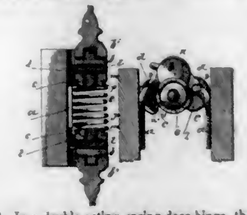
4. In a bottle-corking machine, the combination of the plunger-carrying sliding block B, the lever C, oscillated by the movement of the said block, and provided with a cord-spool, E, and having upon its lower arm, c^3, the cord-carrying cutting-knife D, moving by the oscillation of the lever C transversely to the plunger, substantially as and for the purpose set forth.

5. In combination with the plunger b and the knife D, moving transversely to the plunger, the cork-holder H, provided with the perforated lug h^3 and slotted stop h^3, substantially as and for the purpose set forth.



6. In combination with a plunger-block, B, and with the cord-carrying knife D, moving transversely to the said block, the shears F F', adjustable link f'', and the slotted bars G G', for adjusting the length of the cord, substantially as specified.

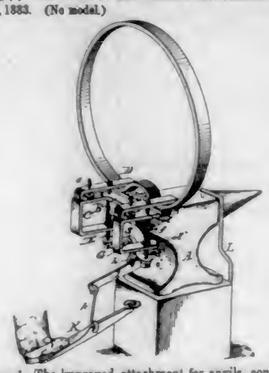
297,944. BRIDLE-BIT. JOHN MURPHY, Springfield, Mass. Filed Aug. 8, 1883. (No model.)



Claim.—In a bridle-bit, a ring cheek-piece slotted to form jaws, between which the apertured end of the bit-bar is clamped, said jaws having a countersunk and tapped bore to receive a headed screw-pin, said bore being elongated beyond the length of the pin, so that when the jaws are distended to their maximum extent there will be a space below the point of the screw-pin, substantially as set forth.

297,945. FAUCET. EDWARD AYERS, Webb City, Mo. Filed Aug. 23, 1883. (No model.)

Claim.—A faucet having a portion of its body at a distance from either end threaded, and one end and the contiguous portion perforated with a series of fine holes, in combination with an auger-bit secured in the end thereof, as described, whereby the faucet is adapted to bore its own hole of entrance, and then to strain the fluid from the shavings so made, as described.

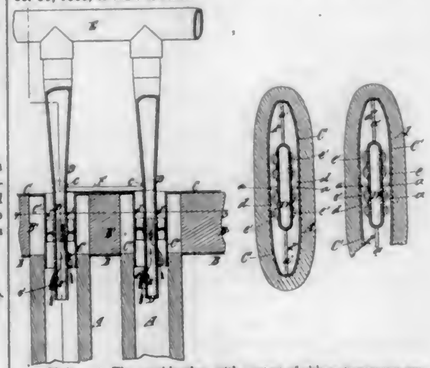


297,946. SPRING-HINGE. DAVID NICKEL and CHARLES ZATTAN, Morris, Ill. Filed Feb. 4, 1884. (Model.)

Claim.—1. In a double-acting spring door-hinge, the inner spring center plate, l, having the central inner projection, p, to engage the end of the spring, and the shouldered cam-dog z, in combination with the outer center plate, w, also having a cam-dog, z', and pivoted to the inner plate, substantially as specified.

2. In a double-acting spring door-hinge, the combination, with the hinge-plates having raised bearings and marginal bearing-loops, of the shifting spring centers pivoted together, and having cam dogs or lugs adapted to engage the bearings of the loops and slide thereon, substantially as specified.

297,947. TIRE-UPSETTER. JAMES NYCE, Dockertown, N. J. Filed Dec. 20, 1883. (No model.)

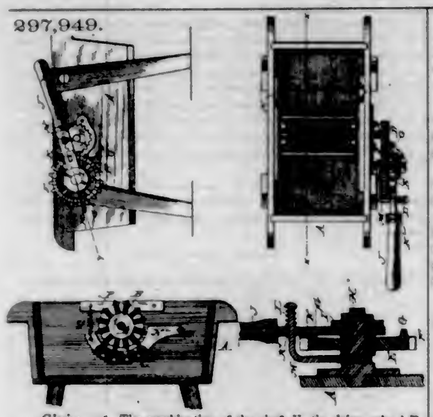


Claim.—1. The improved attachment for anvils, consisting of the bed B, made of a single piece, and having members C formed thereon, in combination with the holders D, having bent ends, and means for depressing the same upon the bed-piece, substantially as shown, and for the purpose set forth.

2. In an attachment for anvils, the bed-piece B, provided with members C, perforations $d\,d'$, and upwardly-projecting pins a, in combination with the holders D, having their rear ends bent, as shown, and provided with downwardly-projecting bars E, with spring elevating means, and a cross-bar, G, attached to each of the bars, and provided with means for depressing the same, the parts being organized substantially as shown, and for the purpose set forth.

297,948. APPARATUS FOR TAKING OFF AMMONIA FROM BONE-BLACK RETORTS. FRIEDRICH OMMER, Brooklyn, N. Y., assignor of one-third to Matthias Hopke, same place. Filed Dec. 5, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 287,570, dated October 30, 1883, to same inventor.



Claim.—1. The combination, with a retort of oblong transverse section, of a flue, also of oblong transverse section, arranged within the retort for conducting away the ammonia or other noxious gases, the said retort being extended considerably beyond the flue in the direction of the major axes, substantially as and for the purpose herein described.

2. The combination, with the retort and flue, both being oblong in their transverse section, and the retort being extended considerably beyond the flue in the direction of their major axes, of the feeding floor or plate, and bearers secured to the floe and serving to support the same by resting on said floor or plate, substantially as and for the purpose herein described.

3. The combination, with the retort A, of oblong transverse section, of the flue D, also of oblong transverse section, and provided with escape-holes e, and with hoods e' on its exterior, the said retort being extended considerably beyond the flue in the direction of their major axes, substantially as and for the purpose herein described.

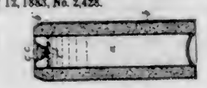
297,949. WASHING-MACHINE. FERDINAND POLLMILLER, Eddyville, Iowa, assignor of one-half to James B. Bickford, same place. Filed Sept. 4, 1883. (No model.)

297,949.

Claim.—1. The combination of the shaft H, the drive-wheel E, journaled upon said shaft, and having a double set of cogs, F and G, set at right angles to one another, lever or handle J, slotted at K and K', bent arm M, projecting with its free end through slot K', and spring L, constructed and combined substantially as and for the purpose shown and set forth.

2. The combination of the suds-box A, rotary reciprocating rubber B, having pinion D, shaft or pintle H, drive-wheel E, having a double set of cogs, F and G, set at right angles to one another, lever-handle J, slotted at K and K', bent arm M, projecting with its free end through slot K', and spring L, all constructed and combined substantially as and for the purpose shown and set forth.

297,950. GLOVE-FASTENER. GEO. W. PRENTICE, Providence, R. I. Filed Mar. 7, 1884. (No model.)

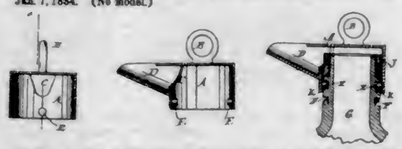


Claim.—1. A fastener or lacing-hook for gloves or other articles, consisting of a head, provided with one, two, or more spurs and a prong, the said prong adapted to be forced through the material of the glove or other article from the under side thereof, bent upon itself to bring its free end adjacent to the upper surface of the material to which it is to be secured, and sufficiently removed therefrom to permit the passage of a lacing-cord between said end and the material, substantially as set forth.

2. The combination, with a glove having a wrist-opening, or analogous article having an opening, of a number of lacing-hooks consisting of heads and prongs, the said prongs adapted to be forced through the material composing the glove from the under side and at each side of the wrist-opening, and bent upon themselves, with their free ends or points adjacent to the upper surface of the material, and adapted to permit the passage of a lacing-cord between the said free ends and the material, means for firmly holding the hooks to the glove, and a lacing-cord secured to the glove at the wrist-opening, and adapted to engage the hooks, substantially as set forth.

3. The combination, with a glove having a wrist-opening, and a lacing-cord secured to said glove at the wrist-opening, of a number of lacing-hooks, each consisting of a head having one, two, or more spurs secured to the under side of the glove, and a prong integral with the head, the said prong projecting through the material of the glove from the under side near the wrist-opening, and bent upon itself toward the wrist-opening, with its point or free end curved or directed toward the heel or post of the prong, and adjacent to the material, and sufficiently removed therefrom to permit the passage of the lacing-cord between said point and the material to engage the hook, all substantially as and for the purpose specified.

297,951. BLASTING-CARTRIDGE. ROBERT PUNSHON and ROBERT R. VIVER, London, England. Filed Dec. 8, 1883. (No model.) Patented in England May 12, 1883, No. 2,428.

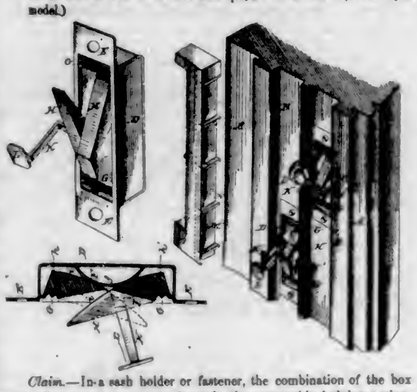


Claim.—1. A cartridge for blasting or similar purposes, consisting of a vessel of glass or other acid-proof and friable substance containing nitric acid, and closed by a glass or other acid-proof ball covered with cement or similar material, which vessel is arranged in combination with a vessel or receptacle containing picric acid, substantially as set forth.

2. In a cartridge containing substances which, when mixed, form an explosive compound, a glass or other vessel having an aperture and a conical passage or tube at one end, in combination with a glass or other acid-proof ball for closing the said aperture, substantially as set forth.

3. The combination of the vessel a, having the aperture or passage c, provided with the ribs or projections c', with the ball c^2, substantially as and for the purpose set forth.

4. In a cartridge, a vessel containing nitric acid arranged in combination with a vessel or receptacle containing picric acid mixed with nitrate of potash, nitrate of soda, nitrate of baryta, carbon, or similar substances, in order to vary or reduce the explosive power of the compound, substantially as set forth.

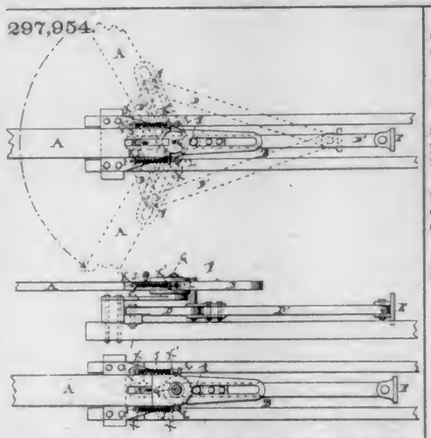


297,952. BOTTLE-STOPPER. MAX RUBIN, Philadelphia, Pa. Filed Jan. 7, 1884. (No model.)

Claim.—1. In a bottle-stopper, the combination, with the male and female parts of the stopper, of the spiral groove or grooves F, having stops K and straight grooves H upon or attached to the bottle, and the pin or pins E, substantially as herein shown and described, whereby the stopper can be readily opened and closed and the movable part can be detached when required, as set forth.

2. In a bottle-stopper, the combination, with the neck G of a bottle provided with spiral and longitudinal grooves F-H, and the shoulder I and the packing J, of the top A, provided with the handle B, the spout D, and the pins E, substantially as herein shown and described.

297,953. SASH-FASTENER. ISAAC J. SALTZER, Prescott, Pa., assignor of one-half to John G. Eckert, same place. Filed Feb. 14, 1884. (No model.)



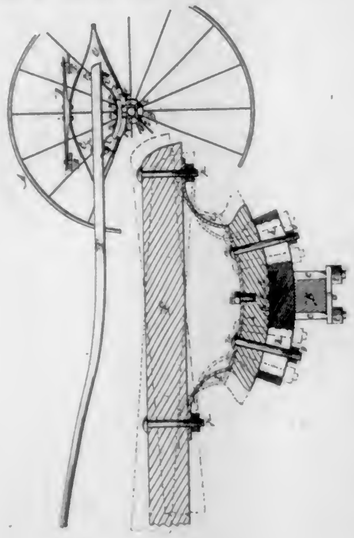
Claim.—In a sash holder or fastener, the combination of the box having the cross bars at opposite ends, the removable bulging spring, the two bolts or wedge-shaped catches hung removably upon the cross-bars at opposite ends of the box, crossing each other with their free ends and bearing against the spring at their point of intersection, and the thumb-lever projecting from the side of one of the wedge-shaped catches, as and for the purpose shown and set forth.

297,954. LEVER-POWER. DAVID W. SEELEY and WILLIAM W. SEELEY, Albany, N. Y. Filed Apr. 3, 1884. (No model.)

Claim.—1. A sweep for a lever-power, consisting of two sections fastened together by a pin, and around which the two sections may be turned, one of which sections shall have a semicircular recessed head, and the other a semicircular head to fit into the semicircular recess in the other, and one of which sections shall be slotted, as described.

2. A sweep for a lever-power, consisting of two sections fastened

297,954.



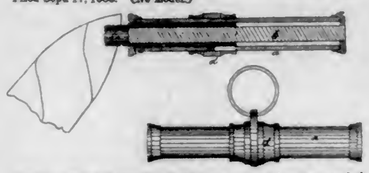
together by a pin, and around which the two sections may be turned, one of which sections shall have a semicircular recessed head, and the other a semicircular bead to fit into the semicircular recess in the other, and one of which sections shall be slotted, and in one of which sections there shall be a slide or rod to be inserted in a hole or recess in the other section, for the purpose set forth, and as described.

3. The combination, in a lever-power, of one or more springs placed on the sides of one section of a double-section slotted sweep, and a sweep consisting of two sections joined together, one of which sections shall be slotted, as described.

4. The combination, in a lever-power, of a sweep made of two sections joined together, in one of which sections there shall be a slot, the two arms of a knuckle-jointed lever, and a pin which is inserted in one of the arms forming said knuckle-joint, and passes through and is operated upon by the slotted portion of said sweep, as described.

5. The process of shortening the purchase-power of a sweep of a lever-power as the resistance of the material pressed is increased, as described.

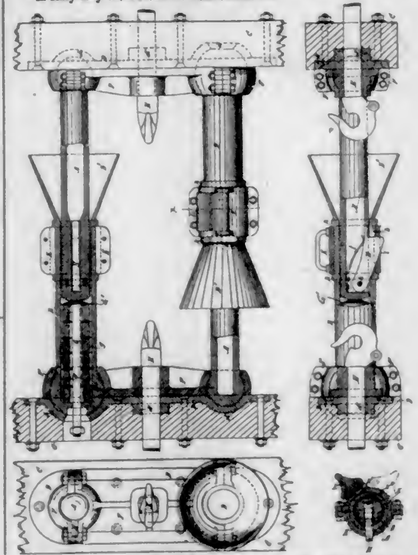
297,955. TWO-WHEELED VEHICLE. EUGENE E. P. TRUESDELL, Belvidere, Ill. Filed Feb. 23, 1884. (No model.)



Claim.—1. The combination, with the axle-tree and with the thills, of a two-part pillow-block of segment form, made adjustable within each other, substantially as and for the purpose set forth.

2. The two-part pillow-blocks of segment form, corrugated on their meeting surfaces and made adjustable in the direction of their length to vary their relative positions, substantially as and for the purpose set forth.

3. The combination, with the two-part pillow-blocks of segment form, made adjustable within each other, of clamping-bolts to fix the parts in their adjusted position, substantially as and for the purpose set forth.



4. The combination, with the axle-tree and with the thills, of a two-part pillow-block of segment form, and a bracket-support to the thill, constructed and arranged to operate substantially as and for the purpose set forth.

297,956. CIGAR-PIERCING DEVICE. JACOB UNGERER, Newark, N. J. Filed Sept. 17, 1883. (No model.)

Claim.—The combination of the case, a center bar arranged therein and fixed in its relation thereto, a sliding tubular cutter working between the bar and case, and a finger-piece arranged outside the case and connected to the cutter, substantially as set forth.

297,957. CAR-COUPLING. FRANZ FORCHER VON AINBACH, Hautzenbuchl, and ANTON HAUSER, Judenburg, Styria, Austria-Hungary. Filed June 11, 1883. Renewed Mar. 25, 1884. (No model.) Patented in Germany Apr. 29, 1883, No. 24,720; in France Apr. 30, 1883, No. 155,187; in Belgium May 1, 1883, No. 61,287; in England May 2, 1883, No. 2,239, and in Italy May 12, 1883, XVII, 15,420, XXX, 419.

Claim.—1. The combination, with a male and female coupling on the same car, of an intermediate hook, E, arranged between said couplings, as shown and described.

2. The buffer-beam C, provided with a supporting-plate, D, having the sockets *d*, in combination with the transverse head F, provided at both ends with rings, whereby the spherical heads of the coupling may be held, as described.

3. The combination, with the coupling-cylinder having shoulders *k k* and the pivoted spring-pressed plate H, of the sleeve K, slotted at *l*, and made adjustable around said cylinder, as and for the purpose specified.

4. A car-coupling composed of a cylinder fixed by means of a ball-and-socket joint to the buffer-beam of one car, and a piston fixed in the same manner to the buffer-beam of the opposite car, the said piston being provided with a longitudinal groove in which a catch is pivoted, which catch is adapted to enter a notch or slot in the cylinder, substantially as herein shown and described, and for the purpose set forth.

5. In a car-coupling, the combination, with a cylinder mounted on one car and a piston on the opposite car, of a catch in the piston, and of a loose sleeve on the cylinder, which sleeve is provided with a notch or slot, substantially as herein shown and described, and for the purpose set forth.

6. In a car-coupling, the combination, with a cylinder mounted on one car and a piston on the opposite car, of a catch in the piston, and of a loose sleeve on the cylinder, which sleeve is provided with a notch or slot, and with a handle for turning it, substantially as herein shown and described, and for the purpose set forth.

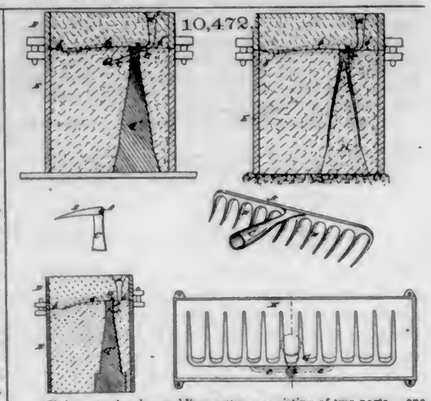
7. In a car-coupling, the combination, with a cylinder on one car and a piston on the opposite car, of a buffer-rod in the cylinder, and of a spring surrounding the buffer-rod, substantially as herein shown and described, and for the purpose set forth.

8. In a car-coupling, a supporting-plate, D, on the buffer-beams, in which plate the boxes *d*, of spherical shape, are formed, and through which passes the traction-rod E, in combination with the transverse head F, placed loosely behind the hook of the traction-rod, and bearing at each extremity a ring with spherical faces, which hold the balls of the piston A and of the cylinder B against the boxes *d* of the supporting-plate D, so as to connect the double coupling to the traction-rods with which all the cars are provided, substantially as herein shown and described, and for the purpose set forth.

297,958. ADJUSTABLE HAME FOR HARNESS. MARK A. R. WYCOUFF, Batesville, Ark. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a hame, the adjustable plate D, provided with a projecting push end, *d*, and an engaging projection, *d'*, said plate being actuated by the plate *b*, secured to said plate D, substantially as and for the purpose set forth.

2. A hame having a grooved edge, having holes or notches in the bottom thereof, a sliding bar or plate moving in said groove, one end of the bar having a projection to engage with the holes in the groove, the opposite end extending upward and out of the groove, and a hand-plate, *b*, secured to and adapted to move said sliding bar, substantially in the manner and for the purpose set forth.



3. A hame having a grooved edge, a notched or perforated plate in the bottom of said groove, an adjustable plate or bar provided with an outwardly-projecting end and downward-projecting point, a handle-plate, *b*, secured to the sliding bar, and a spring interposed between the sliding bar and the handle-plate, as and for the purpose set forth.

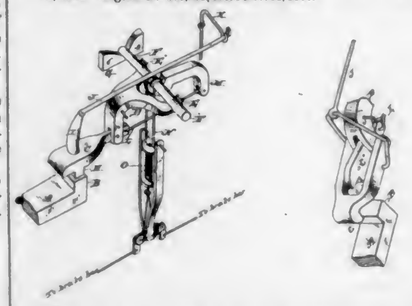
4. A hame provided with an adjustable hook, E, and an adjustable bar, D, sliding in a groove, *g*, at one end of said hame, the sliding bar having a plate, *b*, and ring B secured thereto, substantially in the manner and for the purpose set forth.

REISSUES.

10,472. PATTERN AND MEANS FOR MOLDING GARDEN AND OTHER RAKES. JOHN F. HAY, Erie, Pa. Filed Aug. 3, 1883. Original No. 273,683, dated Mar. 6, 1883.

10,472

Claim.—1. A rake-molding pattern consisting of two parts—one for forming the mold for the rake portion, and the other for forming the external mold for the socket portion—the line of division between said parts being the neck of the socket-pattern, whereby the rake-mold may be divided horizontally, the mold for the rake portion may be formed horizontally, and the exterior mold for the socket portion may be formed vertically, substantially as set forth.



2. The herein-described rake-molding device, consisting of a two-part flask divided horizontally, and a two-part pattern, the latter being divided between the rake-head portion and the socket portion at the point of least diameter, whereby the mold may be divided horizontally, the exterior mold for the socket may be formed in an upright position and the mold for the rake-teeth may be formed in a substantially horizontal position, substantially as set forth.

3. The rake-molding device consisting of two sand-box sections, D E, placed one above the other, and divided by the joint *b*, and a pattern consisting of the two pieces G G', jointed at *c*, whereby the two-part flask may be divided horizontally, the exterior mold for the socket may be formed in an upright position, and the mold for the rake-teeth may be formed in a substantially horizontal position, as set forth.

4. The herein-described two-part rake-mold, divided substantially horizontally upon the line of the rake-teeth, the mold for the rake-head portion being formed between said parts, and the external mold for the socket portion being formed in an upright position in one of said parts, in combination with a vertically-situated core for the socket portion, substantially as set forth.

5. The herein-described two-part rake-mold, divided substantially horizontally upon the line of the rake-teeth, the mold for said teeth being formed between said parts in a position slightly inclined, the points of said teeth being lowest, and the external mold for the socket portion being formed in an upright position in the lower of said parts, in combination with a vertically-situated core for the socket portion, substantially as set forth.

10,473. AUTOMATIC CAR-BRAKE. DAVID J. MACPHERSON, Sioux Falls, Dak., assignor of one-half to J. B. Young, same place. Filed Mar. 13, 1884. Original No. 288,461, dated Nov. 13, 1883.

Claim.—1. In an automatic car-brake, the combination of a lever or levers provided with suitable lugs or shoulders upon their outer free ends, with the draw-head A, having a double-faced flange, B, formed upon

its rear end, and against which the flange or shoulder upon the lever engages when the car is moved in either direction, substantially as shown.

2. In an automatic car-brake, the combination of the draw-head having the flange or shoulder upon it, the lever or levers provided with lugs or shoulders, a pivoted lever or levers, D, a cross-bar, F, and a mechanism connected to the cross-bar for removing and applying the pressure of the brakes to the wheels, substantially as described.

3. In an automatic car-brake, the combination of the draw-head provided with a flange, a pivoted lever provided with a lug or shoulder, and the pivoted levers D M, cross-bar F, and a mechanism for applying and removing the pressure of the brakes, substantially as set forth.

4. In an automatic car-brake, the combination of the draw-head provided with a flange, B, a pivoted lever, C, provided with a lug or shoulder, H, the levers D M, connecting-rod L, the projection I, connecting-rod J, and a crank-lever, K, the parts being combined and arranged to operate substantially as shown and described.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the District of Columbia.

U. S., EX REL. R. HOE & CO. AND GEORGE C. GILL, v. BENJAMIN BUTTERWORTH, COMMISSIONER OF PATENTS.

1. When the Commissioner of Patents stands in this court upon the ground that his decision in favor of an applicant's right to a patent is permanent, a legal duty to proceed to the next step consequent upon such permanent decision must arise, and a failure or refusal to so proceed presents the very evil which the writ of mandamus is designed to cure.
2. Which it appears by the Commissioner's return that he refused to prepare a patent out of deference to the action of the Secretary of the Interior in entertaining an appeal from and reversing his decision, that act of deference does not constitute an exercise by him of discretion as to his own executive functions in such a sense as would cause the writ of mandamus to be an interference with executive discretion.
3. In this proceeding for mandamus the inquiry is, whether the title of the petitioner has been so adjudicated already that he is entitled to the fruit of that adjudication by the performance of a merely ministerial duty. The remedy provided by Section 4915 R. S. is not an adequate remedy in such case.
4. The provisions of the statute giving the Secretary power of directing is general, and the provisions relating to the duties and powers of the Commissioner are specific. It is the latter which must control. When the sections of the statutes are considered together, it must be held that the Commissioner must perform his duties under the direction of the Secretary, except when he is already directed by the superior directory power of the legislature.
5. Applying the above rule of construction to the Commissioner's decisions in cases of interference, *Held* that they are not subject to the directory power of the Secretary, either by contemporaneous dictation or by appeal and reversal described as direction.
6. It appearing that what was intended to be a complete system of remedies by appeal from the decisions of the Commissioner has been provided by the same statute which provides for the directory power of the Secretary, *Held* that in the absence of any express provision for appeal to the Secretary an inferential right of appeal is excluded.
7. Upon the above considerations it is furthermore *held* that the appellate proceedings and reversal by the Secretary in the case at hand were unauthorized, and therefore a nullity; and that consequently the Commissioner of Patents, having finally adjudicated that the relators are entitled to a patent improperly refuses to issue the same, and *ordered* that the writ of peremptory mandamus shall issue.

Mr. Justice JAMES delivered the opinion of the court, as follows:

This is a petition for a writ of peremptory mandamus to the Commissioner of Patents to receive the final fee and to cause letters patent to the relators, R. Hoe & Co., to be prepared and presented to the Secretary of the Interior for his signature. It sets forth that on March 12, 1881, the relator Gill made application for letters patent for certain improvements in printing-machines; that on primary examination the Commissioner was of opinion that this application would interfere with an unexpired patent granted to Walter Scott on March 8, 1881; that such proceedings were had that an interference was duly declared, whereupon the Examiner of Interferences decided that Scott was the original and first inventor of said improvements; that upon appeal to the Examiners-in-Chief this decision was affirmed; that upon further appeal to the Commissioner the latter decided that the relator Gill was the original and first inventor, and entitled to a patent for said improvements, and that he finally decided, on June 4, 1883, that such patent should issue; that the relator Gill assigned to the other relators all his title to said invention, and requested the Commissioner to issue the letters patent therefor when granted to them; that the final fee was tendered to the Commissioner, who refused to accept it, and also refused to cause letters patent to be prepared and presented to the Secretary of the Interior for signature; that the relators were informed by the Commissioner that the only ground of his refusal was the pendency before the Secretary of the Interior of an appeal taken by Scott; that the Commissioner has not denied, and does not deny, that a patent should issue to Gill, unless the Secretary has the right to suspend the issuing thereof by reason of the appeal pending before him, and that the Commissioner has still later informed them that the Secretary has, upon said appeal, reversed his decision and decided that Scott is the original and first inventor of said improvements, and is entitled to a patent therefor.

In the communication last referred to, which is addressed to the relators' counsel, and is made part of the petition, the Commissioner says:

> If the decision of the Commissioner adjudging priority to your client is final, and not subject to review and reversal by the honorable Secretary of the Interior, then your client is entitled, on payment of final fee, to have his patent prepared and issued. But if the honorable Secretary has under the law jurisdiction on appeal to hear and determine the cause, then your client is not so entitled. The decision of the Commissioner of Patents is that your client Gill is entitled to the patent prayed for. On appeal from that decision the honorable Secretary decided that your client is not so entitled. In view of the facts related, I refuse to issue a patent for your client, or to prepare a patent for issue, or to take any steps whatever in that direction. I do this, not because I want further time to consider the case, but because the honorable Secretary has, on hearing the cause, reversed the decision of the Commissioner of Patents, as hereinbefore stated.

In his return the Commissioner says that the statements of the relators as to the applications, appeals, and decision of the Commissioner are true, and that this decision has not been reversed or modified by the Commissioner; that on the 14th of June, 1883, an appeal to the Secretary of the Interior was taken by Scott, and prosecuted under rules prescribed by the Secretary, and that on March 7, 1884, the Secretary made a decision reversing the decision of the Commissioner, and adjudging that Scott was the first inventor and that

Gill was not entitled to a patent; that pending that appeal—namely, on the 4th day of March, 1884—the relator did demand of respondent that he prepare a patent for issue to the relator Gill in pursuance of the decision of the Commissioner of Patents, and that respondent refused so to do, or to take any steps in that behalf; that after the decision of the Secretary had been pronounced the relator again demanded that the respondent prepare for issue a patent in accordance with the judgment of the Commissioner, tendering at the same time the final fee due; that respondent refused to accept said fee, and again refused to prepare said patent; that he so refused, not because he desired to make further inquiry, or to be further advised in that behalf, but that he based his refusal, and does so still, solely upon the ground that the Secretary of the Interior had entertained the appeal taken to him from said decision, and had entered a decision reversing that of the Commissioner of Patents, and awarded priority of invention to Walter Scott.

The return further states that on the 26th of February, 1884, the Secretary of the Interior advised respondent that in pursuance of an opinion of the Attorney-General to the effect that he could, on appeal to him, exercise the jurisdiction to review the decision of the Commissioner of Patents, he had exercised that jurisdiction, and that respondent, in deference to that opinion and the action of the Secretary, refused, and does refuse, to accede to the demand of the relator. In conclusion he says:

> Your respondent further says that if the judgment of the Commissioner of Patents, *which is, that the relator is entitled to receive his patent, as prayed for*, is final, and if upon such judgment it is the lawful duty of the respondent to accept said final fee and take the necessary and proper steps to prepare said patent for issue, as prayed, then your respondent has improperly refused to prepare said patent for issue; but if his decision is subject to review and reversal on appeal to the honorable the Secretary of the Interior, then such refusal on the part of your respondent to accept said fee and prepare said patent for issue is right and proper.

Upon these facts we are asked to require the Commissioner of Patents to accept the final fee tendered by the relators, and to prepare and submit to the Secretary of the Interior, for his signature, letters patent to them for the improvement in printing-machines described in the petition. The questions involved have been argued with very noticeable care and ability by counsel for the relators, and counsel appearing, as we understand, in fact, in the interest of Scott, but nominally as *amicus curiæ*, inasmuch as Scott is not a party to this proceeding. It is claimed by the latter that the relators are not entitled to the remedy of mandamus, first, because the Commissioner of Patents has no longer the legal power to do the act which would be commanded by the writ, that power having been superseded and taken away from him by a lawful appeal to the Secretary of the Interior, and a lawful and controlling decision by the latter that the relators are not entitled, and that Walter Scott, the adverse party to the interference, is entitled to a patent for the improvements in question; and, secondly, because, even if it should be held that the appeal to the Secretary of the Interior and his decision in the premises were unauthorized, and therefore, in contemplation of law, a nullity, the writ would do something more than command a merely ministerial act, and would, in fact, control what would still be a matter of executive discretion with the Commissioner himself; and, third, because the patent laws have provided for the relator a different and adequate remedy. Reversing the order of these propositions, we shall first consider whether, assuming that the Commissioner's decision upon a question of interference is final and conclusive as to the matters submitted to him so far as executive action is concerned, and is not subject to review by the Secretary of the Interior, the writ of mandamus is inapplicable under the circumstances of this case.

We find that the Commissioner has in his return defined the status of the proceedings reached in his own action. He

> admits that it is true that the Commissioner of Patents did decide and adjudge that the said George C. Gill was entitled to receive a patent, as set forth by the relator herein, * * * and that said decision has not been reversed or modified by the Commissioner of Patents.

He then states that when he refused the relator's demand for the issuance of a patent, it was "not because he desired to make further inquiry or to be further advised in that behalf;" and in the conclusion of his return he says:

> If the judgment of the Commissioner of Patents, *which is, that the relator is entitled to receive his patent, as prayed for*, is final, and if upon such judgment it is the lawful duty of the respondent to accept said final fee and take the necessary and proper steps to prepare said patent for issue, as prayed, then your respondent has improperly refused to prepare said patent for issue.

Now, we do not doubt that it is within the executive discretion of the Commissioner, even after making and communicating to an applicant a decision in his favor, and at any time before the issue of a patent for the signature of the Secretary, to reconsider that decision and to make a contrary one. In the ordinary course of business the whole matter rests in executive discretion, at least down to that point, and if nothing more appears the court will not interfere by the writ of mandamus to compel the issue of a patent as the next and consequent step. The Commissioner could answer a demand of the applicant by the simple statement that he had changed his mind, and had decided that the applicant was not entitled to a patent; and so long as he must be supposed to occupy that position he cannot be treated as if he had ceased to do so. It cannot yet be said that his only remaining duty is ministerial; but the respondent does not in any true and practical sense occupy that position. He has said, substantially, that the original decision of the Commissioner of Patents, to the effect that the relator was entitled to a patent as prayed for, has not been changed, that he does not even intend to re-examine it, and that it *is now his decision;* and it is important to observe that this was not merely a position taken in his official communications with the relators. It is the position on which he stands in this court. Now, a position thus assumed in a judicial proceeding may, for the purposes of that proceeding, be treated by the court as the conclusive legal attitude of the party. The executive decision which he thus presents to us and stands upon must be regarded here as a final fact, which is to determine legal consequences in the case. What, then, is the legal consequence of a fixed decision, or what we must treat as a fixed decision, that an applicant is entitled to a patent? No question could be raised if that decision were final, because the law had declared it to be final as soon as it was made. The legal consequence of that fixed decision would be the ministerial duty to issue the patent. We perceive no principle which should distinguish the Commissioner's duty in the case before us from his duty in the case supposed. On principle, the same duty must

accrue whenever his decision to issue a patent must be treated by the court as a fixed and permanent one. Although the law contemplates that the Commissioner may reverse such a decision, and *thereby* defeat the issuance of a patent, it clearly does not contemplate that he may adhere to and stand upon it in this court, and yet defeat the issuance of a patent by simply refusing to act in pursuance of that decision. The progress of executive duty may lawfully be reversed by a new and lawful executive action in a contrary direction; but it would be unreasonable that the law should be arrested at a half-finished stage simply by non-completion, and that there should be no remedy to compel its movement. It would be playing with words, substituting phrases for substance, to say that the writ of mandamus must not be applied in commanding the final step to be taken, on the ground that down to the actual issue of the patent the whole matter must still be regarded by us as resting in executive discretion whether a patent shall issue or not. When an officer stands in court, by his return, upon the ground that he has exhausted the uses of his executive discretion, and refuses to take the ministerial step which follows next when executive discretion has ended, he presents to the court the very evil which the writ of mandamus is designed to remove—a refusal, namely, to perform a ministerial duty. But it was suggested, further, that the determination of the Commissioner not to disregard the action of the Secretary was an exercise of executive discretion, and that, whether he was right or wrong in that determination, his executive action in that matter is not to be controlled by mandamus. It must be remembered that we are now considering the applicability of this remedy on the hypothesis that the Commissioner's control of the question before him was final, and that the Secretary was without power in the premises. On that hypothesis the Commissioner's forbearance or refusal to proceed according to his own judgment must be regarded in law as simply an act of deference. It was not a decision as to his own legal duty. However discreet such conduct toward the head of the Department may have been, it did not constitute an exercise of that kind of discretion with which a court must not interfere by mandamus.

It was also suggested that as the statute provides that "The Commissioner of Patents, under the direction of the Secretary of the Interior, shall superintend or perform all duties respecting the granting and issuing of patents directed by law," the Commissioner must be held to have construed this provision and to have acted upon that construction in refusing to proceed in pursuance of his own decision after the Secretary had undertaken to review and reverse it. This, it is claimed, was an exercise of executive power and discretion which the court must not control by mandamus. But it is apparent on the whole face of his return that the Commissioner, in refusing to follow up his own decision, did not, as a matter of fact, act upon any executive construction of his own as to that provision. It is to be gathered from his answer that the question whether that section gave revisory power to the Secretary was the one which he had not undertaken to settle. Instead of informing us, either expressly or inferentially, that his decision upon that question was the rule of his action in refusing to proceed in pursuance of his own original decision, he distinctly submits it as an unsettled question. Deference to the will of the Secretary, so far from being a decision upon this question, constituted an abandonment of any effort to decide it. Plainly he did not attempt to decide executively upon the effect of the provisions referred to. But the important point to be observed is, that it is wholly immaterial whether he acted upon a construction of that law. If his decision upon the original question before him was not subject to revision by the Secretary, and if he himself had so acted that only a ministerial duty remained to be performed by him, that ministerial duty would not cease to exist merely by reason of his deciding incorrectly that the whole of his power had been taken away. To interpose that decision would be merely to give a bad reason for refusing to perform his ministerial duty; and to describe it as an exercise of executive discretion, and thus to exclude the remedy of mandamus on the principle that it is never used to control executive discretion, would be to defeat the remedy by a mere misnomer. He had no executive discretion to deny his duty, either directly or by circuity.

It was next objected that this remedy is not applicable because a different and adequate remedy has been provided for the relators. This objection refers to Section 4915 of the Revised Statutes, which provides that—

> Whenever a patent is refused, either by the *Commissioner of Patents*, or by the Supreme Court of the District of Columbia upon appeal from the Commissioner, the applicant may have remedy by a bill in equity, and the court having cognizance thereof, on notice to adverse parties and other due proceedings had, may adjudge that such applicant is entitled according to law to receive a patent for his invention as specified in his claim. And such adjudication, if it be in favor of the right of the applicant, shall authorize the Commissioner to issue such patent on the applicant filing in the Patent Office a copy of the adjudication and otherwise complying with the requirements of law. In all cases where there is no opposing party, a copy of the bill shall be served on the Commissioner, and all the expenses of the proceeding shall be paid by the applicant, whether the final decision is in his favor or not.

This objection, that the relators have another remedy in this case, comes rather inconveniently from the party who makes it. His principal position is, that the decision of the Commissioner has been lawfully reversed by the Secretary. If that be true, it is the Secretary, not the Commissioner, who has refused them a patent, and this section does not provide them a remedy by a bill in equity on such refusal. We must consider the objection, however, on the hypothesis that the Secretary's action is a nullity. This section applies to interference cases as well as to applications *ex parte*. When there are adverse parties, notice must be given to them. They are let in as formal parties to the contest, and the contest is upon proofs and the merits of the adverse claims. The case is heard *de novo*. Can it be seriously claimed that the right to try his case in this manner, under the burden of paying all the expenses of the proceeding, is an adequate remedy to a party who *is already entitled* to his patent by the favorable decision of the Commissioner? We conceive that this is one of the cases in which a question is its own answer. Although it may be said that the object, both of the petition for the writ of mandamus and of the bill in equity, is to obtain a patent, the subject of inquiry and the basis of relief in the two proceedings are wholly different. In the proceeding for mandamus, the inquiry is, whether the right of the petitioner to a patent has already been decided, and in such a way that he is entitled to the fruit of that decision by performance of a

merely ministerial duty. In the equity proceeding, the inquiry is, whether he proves originally a right to have a patent. Clearly the right to have the latter inquiry and adjudication is not an adequate remedy to one who already has a sufficient determination of the same question and only asks for execution.

It was insisted at the argument that the objections which we have examined, or any one of them, would forbid the granting of a writ of peremptory mandamus in this case, even if the court should be of the opinion that the Secretary of the Interior does not possess revisory or appellate control over such decisions of the Commissioner of Patents, and that they should preclude an inquiry into the extent of the Secretary's powers. We have, therefore, considered them attentively, and we hold that if the power of the Commissioner of Patents to adjudicate the questions presented to him in the premises was final, so far as executive action was concerned, and was not superseded by a lawful appeal to the Secretary, there is nothing in these objections which precludes the application of the writ of mandamus. We proceed, therefore, to consider the question whether the power of the Commissioner to comply with the command prayed for has been taken away from him by a lawful appeal to the Secretary and a lawful decision by the latter reversing the decision of the Commissioner.

The claim of revisory power in the Secretary of the Interior was based in the argument upon the following provisions of the Revised Statutes:

Section 441. The Secretary of the Interior is charged with the supervision of public business relating to the following subjects: first, the census, when directed by law; second, the public lands, including mines; third, the Indians; fourth, pensions and bounty-lands; fifth, patents for inventions; sixth, the custody and distribution of publications; seventh, education; eighth, Government Hospital for the Insane; ninth, Columbia Asylum for the Deaf and Dumb.

Section 481. The Commissioner of Patents, *under the direction of the Secretary of the Interior*, shall superintend or perform all duties respecting the granting and issuing the patents directed by law.

Section 483. The Commissioner of Patents, *subject to the approval of the Secretary of the Interior*, may from time to time establish regulations, not inconsistent with law, for the conduct of proceedings in the Patent Office.

Section 487. For gross misconduct, the Commissioner of Patents may refuse to recognize any person as a patent agent, either generally or in any particular case; but the reasons for such refusal shall be duly recorded, and be *subject to the approval of the Secretary of the Interior*.

Section 4883. All patents shall be issued in the name of the United States of America, under the seal of the Patent Office and shall be *signed by the Secretary of the Interior* and countersigned by the Commissioner of Patents.

Especial emphasis, of course, was laid upon Section 481, which provides that the Commissioner shall perform his duties under the direction of the Secretary. It is claimed, broadly, that "the power of supervision and direction gives jurisdiction to the Secretary, upon application made to him in any form that he may prescribe, by appeal or otherwise, to affirm, reverse, or modify the action of the Commissioner."

The provisions referred to, and all of the provisions of the Revised Statutes which we shall have occasion to consider, were taken from the act of July 8, 1870, which was entitled "An act to revise, consolidate, and amend the statutes relating to patents and copyrights." In that work of consolidation Section 481 was taken without any change, except the rejection of redundant words, from the first section of the act of July 4, 1836, by which the office of Commissioner of Patents was first established. It is of some importance, therefore, to examine the extent of the supervisory powers of the Secretary of State as given by this same provision in the original act.

Section 7 of that act provided that the Commissioner should "make or cause to be made" an examination of every application for a patent, and that if, after certain proceedings had, he should decide that the applicant was not entitled to a patent, an appeal might be taken to a board of examiners, "to be composed of three disinterested persons," appointed for that purpose by the Secretary of State, one of them, at least, to be "selected, if practicable and convenient, for his knowledge and skill in the particular art, manufacture, or branch of science" to which the alleged invention appertained. This board might "reverse the decision of the Commissioner, either in whole or in part," and when their opinion was certified to him he was to be governed by it in the further proceedings to be had. Section 8 related to interference cases, and provided a like appeal, with like effect, from the Commissioner's decision.

The act of 1836 provided, then, that the Commissioner should perform his duties "respecting the granting and issuing of patents" "under the direction of the Secretary of State;" and it also provided that he should make a decision on the question whether an applicant was entitled to a patent; but it provided, further, that these decisions should be revised and controlled by a board of examiners. This revision was part of the regular course of executive administration, and the statute gave the Secretary no control over the board of examiners. It is obvious, then, that the Secretary's control over the Commissioner could not be exercised in the form of revisory power over his decisions. Now, it is nothing to the purpose to suggest here that a revisory tribunal no longer intervenes between the Commissioner and the Secretary's control, and that the decisions of the former are thus brought within the operations of the Secretary's direction. The point to be observed is, that the directory power of the Secretary of State and of the Secretary of the Interior was expressed in the same terms, and that that grant of power, as found in the act of 1836, did not pretend to give appellate and revisory power over the decisions which the Commissioner was authorized to make. Let us see whether anything in the act of 1870, which is found in the Revised Statutes, requires us to adopt a different rule in construing the same language.

It is important to observe just here that although Section 481 of the Revised Statutes, which gives the Secretary of the Interior directory power over the duties of the Commissioner of Patents, is found in the Title XI, relating to the organization of the Interior Department, and the sections which we shall consider are found in Title LX, relating to the subject of patents and copyrights. All of them were taken from the act of July 8, 1870. In that act they formed parts of one system, and were to be construed together as such. It is a settled rule of construction of the Revised Statutes that its contents are to be construed in the light of the original statutes from which they were taken. This section relating to directory power is therefore to be regarded as part of the general system, of which the sections now to be considered are also a part.

The following sections provide a system of appeals by which all applications, whether in interference

cases or *ex parte*, may be brought before the Commissioner for his decision:

Section 4904. Whenever an application is made for a patent which, in the opinion of the Commissioner, would interfere with any pending application, or with an unexpired patent, he shall give notice thereof to the applicants, or applicant and patentee, as the case may be, and shall direct the primary examiner to proceed to determine the question of priority of invention; and the Commissioner may issue a patent to the party who is adjudged the prior inventor, unless the adverse party appeals from the decision of the primary examiner, or of the Board of Examiners-in-Chief, as the case may be, within such time, not less than twenty days, as the Commissioner shall prescribe.

Section 4909. Every applicant for a patent, or for the reissue of a patent any of the claims of which have been twice rejected, and every party to an interference, may appeal from the decision of the primary examiner, or of the examiner in charge of interferences in such case, to the Board of Examiners-in-Chief, having once paid the fee for such appeal.

Section 4910. If such party is dissatisfied with the decision of the Examiners-in-Chief, he may, on payment of the fee prescribed, appeal to the Commissioner in person.

These sections, as we have said, provide a regular system of appeals, both in interference and *ex parte* cases, which brings every application to the Commissioner for decision. The statute commands him to decide, and, of course, it intends that he shall apply the usual processes of decision—in other words, the *judgment* of the person deciding. Can it be possible that the legislature intended, by giving the Secretary directory power, that he might intervene at this point of time and direct the Commissioner what decision he, the Commissioner, was to make? It must be kept in mind that the whole of the Secretary's power must be found within that one word "direction." It hardly seems worth while to reason upon the question whether a general power to direct authorizes the directing officer to dictate to one who is charged by the very same law with the duty and power of hearing the parties to a contest and of deciding between them accordingly what conclusion his mind must reach. Clearly he cannot, in the exercise of this power, dictate to the Commissioner touching his decision before he makes it or while he is making it. Can it be imagined, then, that the power of "direction," which cannot lawfully be applied to the Commissioner's action while he is deciding, was intended to be applied to the same matter after he had decided? Is it permissible to say that a power of direction which cannot be exercised *as* direction may be exercised by way of appeal and reversal, and all the time be called "directing?"

We are informed by the pleadings and exhibits that the Secretary of the Interior has acted upon the opinion of a former Attorney-General to the effect that this general provision of directory power controls the meaning of every section which assigns a duty to the Commissioner, just as if it had been inserted in each; and that the duty and power of hearing and deciding contested questions of priority of invention, for example, are to be construed as if the statute said they were to be performed under the direction of the Secretary. We hold that precisely the opposite rule of construction must be applied to the statute in order to ascertain correctly the intention of the legislature. It must be remembered that this provision is general, and that the provisions relating to the duties and powers of the Commissioner are specific. It is the latter which must control. When they are considered together, it must be held that the Commissioner must perform his duties under the direction of the Secretary, except when he is already directed what he must do by the superior directory power of the legislature. Applying this rule of construction to the Commissioner's decisions in cases of interference, we hold that they are not subject to the directory power of the Secretary, either by contemporaneous dictation or by the circumlocution of appeal and reversal described as direction. We are brought to this conclusion independently of the provisions of the patent laws, which remain to be considered, but we are still further confirmed by these provisions.

Section 4910, as we have seen, provides for an appeal to "the Commissioner in person." Section 4911 then provides that—

If such party, except a party to an interference, is dissatisfied with the decision of the Commissioner, he may appeal to the Supreme Court of the District of Columbia, sitting *in banc*.

By Section 4913 the Commissioner is required to furnish the court with "the grounds of his decision, fully set forth in writing, touching all the points involved by the reasons of appeal."

Section 4914 confines the revision here to the points set forth in the reasons of appeal, and provides that, after hearing the case, this court shall return to the Commissioner a certificate of its proceedings and decisions, which shall be entered of record in the Patent Office, "and shall govern the further proceedings in the case."

These sections authorize a revision of the grounds on which the Commissioner refuses a patent on application *ex parte*, and they do not authorize a revision of the grounds on which the Secretary may act. Manifestly it was the intention of Congress to provide a judicial revision which should be available in every case in which an application *ex parte* is refused—in other words, that refusal should not be made by an officer whose grounds of decision are not subjected to revision by this section.

Section 4915 provides a still further remedy in case of the refusal of a patent for application *ex parte*, and applies the remedy to refusal of an application in interference. It directs that—

Whenever a patent on application is refused, either by the Commissioner of Patents or by the Supreme Court of the District of Columbia upon appeal from the Commissioner, the applicant may have remedy by bill in equity, and the court having cognizance thereof, on notice to adverse parties and other due proceedings had, may adjudge that such applicant is entitled, according to law, to receive a patent for his invention as specified in his claim, or for any part thereof as the facts in the case may appear; and such adjudication, if it be in favor of the right of the applicant, shall authorize the Commissioner to issue such patent, on the applicant filing in the Patent Office a copy of the adjudication and otherwise complying with the requirements of law. In all cases where there is no opposing party a copy of the bill shall be served on the Commissioner, and all the expenses of the proceedings shall be paid by the applicant, whether the final decision is in his favor or not.

This section, and the provisions for appeal to this court which we have just considered, provide either a formal appeal or an original proceeding substantially appellate in its character, which seems manifestly intended to cover all cases in which a patent is "refused," whether they be cases of application *ex parte* or in interference. It is to be observed that in both cases a refusal *by the Commissioner* is the basis of the remedy, and that it seems to be thus implied that, so far as the executive department is concerned, the examination of a claim for a patent and the power to decide upon such claim terminate with him.

But another class of decisions was still to be provided for. The provisions which we have considered relate only to cases in which patents were refused; but it might happen that a patent was improperly granted. A remedy for such cases is found in section 4918, which provides that—

Whenever there are interfering patents, any person interested in any one of them, or in the working of the invention claimed under either of them, may have relief against the interfering patentee, and all parties interested under him, by suit in equity against the owners of the interfering patent; and the court, on notice to adverse parties, and other due proceedings had according to the course of equity, may adjudge and declare either of the patents void in whole or in part, or inoperative, or invalid in any particular part of the United States, according to the interest of the parties in the patent or the invention patented. But no such judgment or adjudication shall affect the right of any person except the parties to the suit and those deriving title under them subsequent to the rendition of such judgment.

In this review of the patent laws certain facts are prominent. The same statute which provides that the Commissioner of Patents shall "perform all duties respecting the granting and issuing of patents" under the "direction of the Secretary of the Interior" provides expressly and in detail for a regular course of examination; it provides expressly for a regular course of appeals from the primary examiners to the Examiners-in-Chief, from the Examiners-in-Chief "to the Commissioner in person," and for a decision by him upon the right of an applicant to receive a patent; it does not provide expressly for an appeal from the Commissioner's decision to the Secretary of the Interior; but it does provide expressly for an appeal and revision of those decisions by this court, or for an original judicial proceeding by which relief against those decisions may be had. These provisions of appeal and relief constitute a system, and when the legislature provides such a system we must suppose that it was intended to be complete and sufficient. As no place in that system was assigned to the Secretary of the Interior, it cannot have been intended that he should have one. Taken in connection with these provisions, his general power of "direction" must be construed to be a power to direct, except when the Commissioner is authorized by the same statute to make "decisions."

We hold, then, that the attempted reversal of the Commissioner's decision by the Secretary in the case before us was unauthorized, and therefore a nullity; and that, consequently, the Commissioner, having finally adjudicated that the relators are entitled to a patent, improperly refused to issue the same. The writ of peremptory mandamus will accordingly issue as prayed for.

Supreme Court of the United States.

GARRETSON *v.* CLARK *et al.*

Decided March 24, 1884.

When a patent is for an improvement, and not for an entirely new machine, the patentee, in order to entitle him to more than nominal damages, must give evidence tending to separate or apportion the defendant's profits and the patentee's between the patented feature and the unpatented features, and such evidence must be reliable or tangible, and not conjectural or speculative; or he must show by equally reliable and satisfactory evidence that the profits and damages are to be calculated on the whole machine, for the reason that the entire value of the whole machine as a marketable article is properly and legally attributable to the patented feature.

APPEAL from the Circuit Court of the United States for the Northern District of New York.

Mr. Jas. A. Allen for the appellant.
Mr. W. F. Cogswell for the appellees.

Mr. Justice FIELD delivered the opinion of the Court.

In this case the court below sustained the plaintiff's patents, adjudged that the defendants were infringers, and directed a reference to a master to ascertain and report the profits and gains made by the defendants. The master reported that no proof was presented to him that they had made any profit, or that the plaintiffs had suffered any damages. The court sustained the report, and the decree allowed the plaintiffs only nominal damages. From this decree the appeal is taken. (*Garretson* v. *Clark*, 15 Blatchford, 70.)

The patent was for an improvement in the construction of mop-heads, which may be described with sufficient accuracy as "an improvement in the method of moving and securing in place the movable jam or clamp of a mop-head." With the exception of this mode of clamping, mop-heads like the plaintiff's had been in use time out of mind. Before the master the plaintiff proved the cost of his mop-heads and the price at which they were sold, and claimed the right to recover the difference as his damages. This rule was rejected, and no other evidence of damages being offered the master reported as stated.

When a patent is for an improvement, and not for an entirely new machine or contrivance, the patentee must show in what particulars his improvement has added to the usefulness of the machine or contrivance. He must separate its results distinctly from those of the other parts, so that the benefits derived from it may be distinctly seen and appreciated. The rule on this head is aptly stated by Mr. Justice Blatchford in the court below:

The patentee [he says] must in every case give evidence tending to separate or apportion the defendant's profits and the patentee's damages between the patented feature and the unpatented features, and such evidence must be reliable and tangible, and not conjectural or speculative, or he must show by equally reliable and satisfactory evidence that the profits and damages are to be calculated on the whole machine, for the reason that the entire value of the whole machine as a marketable article is properly and legally attributable to the patented feature.

The plaintiff complied with neither part of this rule. He produced no evidence to apportion the profits or damages between the improvement constituting the patented feature and the other features of the mop. His evidence went only to show the cost of the whole mop and the price at which it was sold; and, of course, it could not be pretended that the entire value of the mop-head was attributable to the feature patented. So the whole case ended, the rule was not followed, and the decree is therefore affirmed.

The Official Gazette.

The OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of May 6, 1884.

DESIGNS.

14,987.—BURIAL-CASKET.—*Isaiah G. Hatcher*, Cleveland, Ohio. Application filed February 11, 1884. Term of patent 7 years.

14,988.—MOLDING.—*Isaiah G. Hatcher*, Cleveland, Ohio. Application filed February 12, 1884. Term of patent 7 years.

14,989.—COFFIN-TABLET.—*Oliver McCarthy*, Meriden, Conn., assignor to *The Meriden Britannia Company*, same place. Application filed February 23, 1884. Term of patent 14 years.

14,990.—CULTIVATOR-KNIFE.—*Inrank A. Packard*, Delphos, Kans. Application filed March 31, 1884. Term of patent 14 years.

14,991.—BACK OF A GAME-CARD.—*L. Lum Smith*, Philadelphia, Pa. Application filed March 24, 1884. Term of patent 3½ years.

14,992.—CHRISTMAS-CARD.—*Robert Sneider*, Brooklyn, N. Y. Application filed January 11, 1884. Term of patent 14 years.

14,993.—ENVELOPE.—*Robert Sneider*, Brooklyn, N. Y. Application filed January 11, 1884. Term of patent 14 years.

14,994.—STATIONERY-CASE.—*Joshua F. Tannatt*, Springfield, Mass. Application filed March 10, 1884. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

11,153.—SMOKING-TOBACCO.—*James G. Butler & Co.*, St. Louis, Mo. Application filed March 28, 1884.
"The words 'UNCLE NED.'"

11,154.—STEEL BARS AND PLATES.—*Detroit Steel and Spring Works*, Detroit, Mich. Application filed March 17, 1884.
"The letter 'D' inclosed within a triangle."

11,155.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed March 26, 1884.
"The word-symbol 'GRAPE SHOT.'"

11,156.—SMOKING AND CHEWING TOBACCO.—*G. W. Gail & Ax*, Baltimore, Md. Application filed March 26, 1884.
"The word-symbol 'BLUE BELL' and the pictorial representation of the flower bearing that name."

11,157.—APPARATUS FOR PRODUCING FAC-SIMILE COPIES OF WRITINGS, DRAWINGS, AND OTHER DELINEATIONS.—*W. F. B. Massey-Mainwaring*, 99 Shoe Lane, county of Middlesex, England. Application filed January 16, 1884.
"The representation of a toothed wheel and the word 'CYCLOSTYLE.'"

11,158.—CERTAIN PROPRIETARY MEDICINES.—*Adolph C. Meyer*, Baltimore, Md. Application filed March 11, 1884.
"A parallelogram of a bright-red color and the fac-simile of the registrant's firm-signature, 'A. C. MEYER & CO.'"

11,159.—BASE-BALL BATS, INDIAN CLUBS, &c.—*A. J. Reach & Co.*, Philadelphia, Pa. Application filed December 12, 1883.
"A red band encircling a base-ball bat, Indian club, or other article of sporting goods."

11,160.—BASE-BALL BATS, INDIAN CLUBS, &c.—*A. G. Spalding & Bros.*, Chicago, Ill. Application filed November 8, 1883.
"A broad black band encircling the bat about midway thereof."

11,161.—DYES.—*William M. Townley*, Newark, N. J. Application filed March 5, 1884.
"The words 'LIQUID MARBLE.'"

11,162.—PLUG, TWIST, AND SMOKING AND CHEWING TOBACCO, SNUFF, CIGARS, CIGARETTES, AND CHEROOTS.—*Charles W. Van Alstine*, Chelsea, Mass. Application filed March 26, 1884.
"The arbitrarily-selected words 'OUR JOKES OR TRIX, ARE BEST OF ALL.'"

11,163.—WATCHES.—*The Waterbury Watch Company*, Waterbury, Conn. Application filed July 21, 1883.
"The words 'THE WATERBURY.'"

11,164.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"The representation of a triangle within a circle and two letters with a horizontal line between them within the triangle."

11,165.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"The symbol of an anchor, the word 'ANCHOR,' the word 'CLARK'S,' and an arrangement of lines."

11,166.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.
"Two or more curved lines within a circle, the highest point of each line being its center, and its extremities abutting into the circle, and the gold and black color alternating between said lines themselves, and between said lines and the circle the word, sign, and letters 'J. CLARK & CO.' and 'C. S. I.'"

11,167.—ALL KINDS OF MANUFACTURED TOBACCO.—*F. W. Felgner & Son*, Baltimore, Md. Application filed March 29, 1884.
"The arbitrarily-selected word 'MINERS,' in connection with the word 'EXTRA.'"

11,168.—FELT USED FOR HAMMERS AND ACTION PARTS IN PIANOS AND ORGANS.—*Alfred Dolge*, New York, N. Y. Application filed February 21, 1884.
"A red line."

11,169.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"The arbitrary word 'IVY.'"

11,170.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"The arbitrary word 'LOBSTER.'"

11,171.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"The arbitrary word 'TOTO.'"

11,172.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"The arbitrary word 'EGLANTINE.'"

11,173.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"The arbitrary word 'SURPRISE.'"

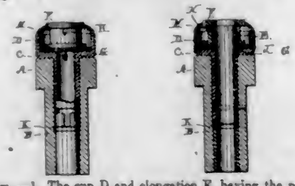
11,174.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.
"A series of ellipses."

LABELS.

4,112.—Title: 'CARPET-TACKS."—*American Tack Company*, Fairhaven, Mass. Application filed April 10, 1884.

4,113.—Title: "TINNED CARPET-TACKS."—*American Tack Company*, Fairhaven, Mass. Application filed April 10, 1884.

4,114.—Title: "ANDERSON'S ELECTRIC SALVE."—*William J. Anderson*, Boston Mass. Application filed April 14, 1884.

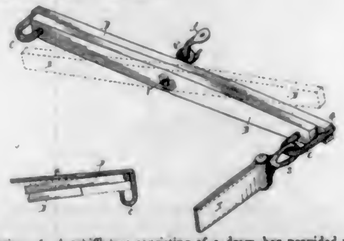


4,115.—Title: "POTTER'S CATARRH CURE, PREPARED BY N. PRENTISS POTTER, M. D. BRIDGTON, ME."—*N. Prentiss Potter*, Bridgeton, Me. Application filed April 10, 1884.

PATENTS

GRANTED MAY 6, 1884.

297,959. SPINDLE-BOLSTER FOR SPINNING-FRAMES. AARON ALDRICH, Taunton, Mass. Filed Sept. 15, 1883. (No model.)



Brief.—The bolster is provided at its upper end with an elongation projecting into the oil-chamber and screw-threaded on its exterior, upon which is fitted a sleeve screw-threaded on its interior. A packing is placed in the bottom of the oil-cup, and the adjustment of the sleeve upon the elongation regulates the flow of oil to the spindle through holes or ducts leading from the bottom of the oil-cup to the interior of the bolster. A packing is placed on a shoulder on the interior of the bolster-socket, below the end of the bolster, to prevent the flow of the oil below said packing.

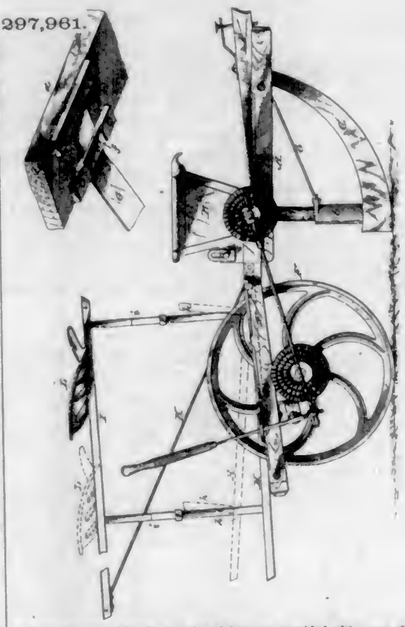
Claim.—1. The cup D and elongation E, having the passage G, reaching from the interior of the bolster to the cup, at the bottom thereof, and the screw-threaded exterior upper end, the adjustable sleeve F, and the packing J, resting between the bottom of the sleeve F and the cup D, substantially in the manner and for the purpose set forth.

2. The socket or bolder A, constructed with an interior shoulder B, and packing K, in combination with a bolster and spindle, as described.

297,960. WHIFFLETREE. EDWARD R. ANNABLE, Paw Paw, Mich. Filed Feb. 26, 1884. (No model.)

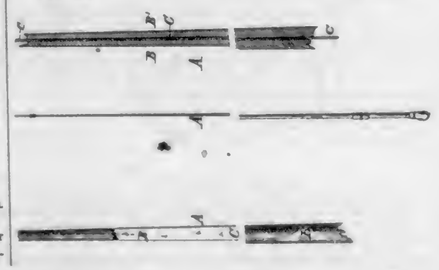
Claim.—1. A whiffletree consisting of a draw-bar provided with the end hooks, a spreader between said hooks, and a pivotally-connected lock-bar adapted to enter and fill the spaces between the ends of the hooks and the spreader, substantially as set forth.

2. The elastic draw-bar provided with the central loop and end hooks, in combination with a spreader between said hooks, and a lock-bar pivotally connected with said spreader, and adapted to operate substantially as set forth.



3. The combination, with the draw-bar having the end hooks, of the spreader provided with the central pivot and end notches, and a lock-bar adapted to operate as set forth, substantially as specified.

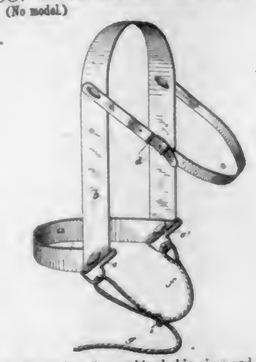
297,961. GRAIN-DRILL. JOHN I. ASHURST, Havana, Ill. Filed Jan. 11, 1884. (No model.)



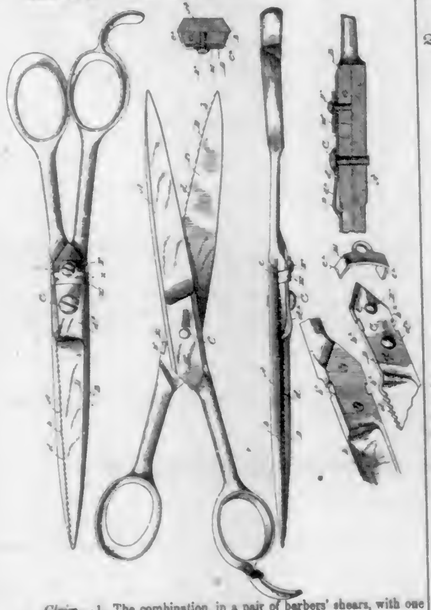
Claim.—1. In a grain-drill, the combination, with a front and rear frame hinged together, and carrying, respectively, the hopper and runners and the press-wheels, of a hinged foot-rest provided with a seat-slide and means for regulating its height by vertical adjustment, substantially as and for the purpose set forth.

2. In a grain-drill, the combination, with the runners thereof, provided with the usual shanks or boots, of spring connected thereto and to the cross-piece of the front frame by means substantially as shown and described, and for the purpose specified.

297,961.



297,962. WHIP. SAMUEL BAKER, Buffalo, N. Y. Filed Mar. 5, 1884. (No model.)



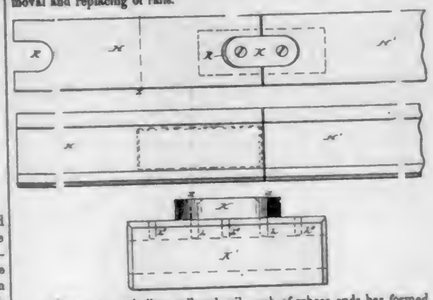
Claim.—As an improved article of manufacture, a whip, A, consisting of two semicircular strips, B B', and a central strip of prepared buckskin, C, the parts being united together, substantially in the manner, as and for the object specified.

297,963. HALTER. EDWARD BARNARD, Rome, N. Y. Filed Jan. 21, 1884. (No model.)

Claim.—In a halter, the combined chin-piece and lead-rope formed of a single piece of rope secured by a loop-connection at one end to one of the loop-castings on the headstall, passed thence through a tongue-buckle and through a second loop-casting at the opposite side of the headstall, and back through the tongue-buckle, which secures it, to form the chin-piece, the free end forming the lead-rope, substantially as specified.

297,964. GUARD FOR BARBERS' SHEARS. ENOCH BATEMAN, Rockford, Ill. Filed Jan. 13, 1884. (No model.)

Claim.—1. The combination, in a pair of barbers' shears, with one of the blades, of the plate secured closely against the outer face thereof, and provided with a serrated edge having the serrations projecting slightly from the cutting-edge of the blade, substantially as and for the purpose set forth.

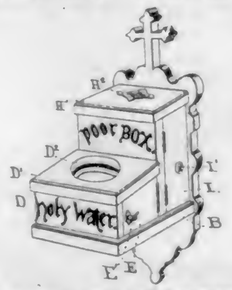


2. A pair of shears having a guard-plate secured in position against the face of one of the blades by means of the pivot pin or screw of the shears, substantially as set forth.

3. A pair of shears embodying the blades, a guard-plate disposed along the face of one of the blades, a plate arranged at the inner end of the guard-plate, and embracing the said guard-plate and blade, and a pin or screw securing this plate in position, substantially as set forth.

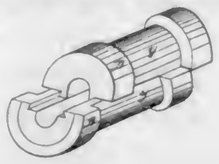
4. A pair of shears having a spring-plate secured against the outer face of one of its blades by means of the pivot pin or screw of the shears, the said plate being compressed by the pin and caused to exert its tension to secure an even movement of the cutting-edge of the blades, substantially as set forth.

297,965. RAILROAD-RAIL. THOMAS BREEN, Knowlton, Pa. Filed Dec. 13, 1883. (No model.)



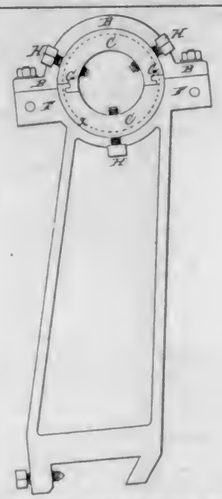
Brief.—The meeting ends of a hollow rail are recessed to receive the tread portion of a key which enters the hollow of each rail, said tread part being detachably connected with said key to admit of the removal and replacing of rails.

Claim.—1. A hollow railroad-rail, each of whose ends has formed in its tread a recess, R, combined with a key, K, between each pair of rails, and the key-bar K' being movably secured to key K, substantially as shown and described.



2. The combination of the rail-sections H and H', key-bar K', and key K, substantially as shown, and for the purpose described.

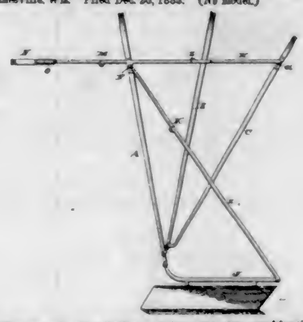
297,966. COMBINED HOLY-WATER FONT AND POOR-BOX. JAS. JOSEPH BRENNAN, Whippany, N. J. Filed Feb. 21, 1884. (No model.)



Claim.—The herein-described article of church-furniture, consisting of a combined poor-box and holy-water font separated by the partition C, the said poor-box being projected above the font and in the rear thereof, and provided with a slit or opening, H^2, and having a door, I, hinged at one edge and provided on its opposite edge with a suitable lock, and the holy-water font provided with a dip-opening, D^2, and a tank, F, and provided at one end with a door through which said tank may be removed, substantially as and for the purposes set forth.

297,967. LATHE-REST. SIMON H. BROWN, Ramapo, N. Y., assignor of one-half to William W. Snow, same place. Filed Aug. 28, 1883. (No model.)

297,967.

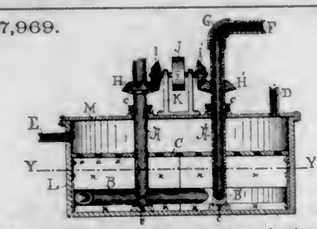


Claim.—1. The revolving sleeve or collar C, of two semi-cylindrical parts provided with longitudinal locking-grooves G, and proper centering devices, substantially as described.

2. The revolving sleeve or collar C, consisting of two semi-cylindrical parts provided with devices whereby they may be brought together and locked by a movement in the direction of their axis, and also with proper centering devices, substantially as described.

3. The combination of a revolving sleeve having a groove, *y*, in its middle, beads D D, and centering-screws H, with the journal-box in two parts, B F, fitting the groove *y*, substantially as described.

297,968. CARRIAGE-TOP. HERMAN BUCHHOLZ and WILLIAM MORRIS, Janesville, Wis. Filed Dec. 20, 1883. (No model.)



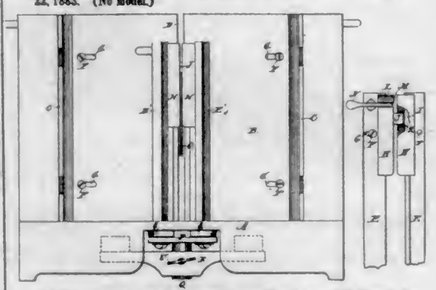
Claim.—1. In a folding carriage-top, the combination, with the bows, of the top-brace pivotally secured to the front and rear bows, and having knuckle-joints at either side of its front pivot, a forwardly-extending curved bow rigidly secured to the front ends of the top-brace, and the cover secured to the bows and the forward extension, substantially as and for the purpose set forth.

2. In a folding carriage-top, the combination, with the bows, of a jointed brace pivotally secured to the front and rear bows, and a top-prop pivotally secured to the carriage-frame, with its upper end pivotally secured to the front bow at the juncture where the brace is secured, substantially as and for the purpose set forth.

3. In a folding carriage-top, the combination, with the bows, of a top-brace secured to the front and rear bows, and provided with upwardly and downwardly working knuckle-joints, and a top-prop secured to the carriage-frame and front bow, and provided with an upwardly-working knuckle-joint, substantially as and for the purpose set forth.

297,969. CONDENSER FOR STEAM AND SMOKE. JAS. M. CARVER, Grand Rapids, Mich., assignor of one-half to Jeremiah W. Boynton, same place. Filed Sept. 7, 1883. (No model.)

297,969.



Claim.—1. In a steam and smoke condenser, the pipes A and A', having cross-pipes B and B', with mitered ends, and revolving in opposite directions, as shown and described.

2. In a steam and smoke condenser, the combination, with the revolving pipes A and A' and cross-pipes B and B', having mitered ends, of the perforated top plate C, resting upon the wings or flies *n n*, as shown, and for the purpose specified.

3. In a steam and smoke condenser, the combination, with the revolving pipes A and A' and cross-pipes B and B', having mitered ends, and the perforated top plate C, of the wings or flies *n n*, as shown and described, and for the purpose set forth.

297,970. MITER-BOX. JOS. CASHIN, Washington, D. C. Filed Dec. 22, 1883. (No model.)

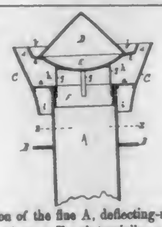
Claim.—1. The slides H, having plane faces from end to end, between which a saw may be placed, and provided with a connection by which they may be supported on the back of a saw, consisting of a projection, J, on the face of one slide, and an opening, K, in the face of the other, adapted to receive the end of said projection, substantially as shown and described.

2. The combination of the bars E, the connected slides H, one having the recess M and bevel L, and the catch N, supported in one of said bars, substantially as shown and described.

3. The combination of the revoluble guide-bars E', adapted to turn together, and the series of bars E, having slots C C D, with any one of which slots the slot in said bars E' may be made to register, substantially as shown and described, and for the purpose set forth.

4. The combination of the base A, the guide-bars E', having a common pintle at their lower ends, the supporting-bracket, and the set-screw bearing against the said pintle, substantially as shown and described.

297,971. MANUFACTURE OF ARTIFICIAL STONE AND MARBLE. HENRY ADOLPHUS DANIELS, Yonkers, N. Y. Filed Mar. 1, 1884. (Specimens.)



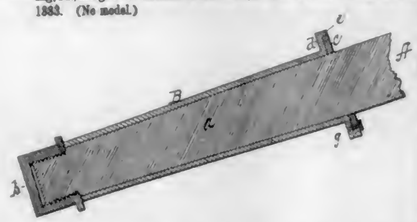
Claim.—1. An artificial stone or marble composed of lime of Tiel, lime, Keen's cement, Martin's or other cements, marble-dust, and calcined or other plaster, united and solidified by mixing therewith a chemical solution formed of starch, gum-arabic, caoutchouc, white vitriol, glue, muriate of soda, soluble glass, and pearlash, with or without nut-gall, substantially as and for the purposes set forth.

2. The herein-described liquid compound, consisting of starch, gum-arabic, caoutchouc, white vitriol, glue, muriate of soda, soluble glass, and pearlash, with or without nut-gall, substantially in the proportions named, for the purpose of producing the crystallization of the artificial stone and marble, as described.

297,972. VENTILATING-FLUE CAP. HENRY LAWRENCE DAY, Minneapolis, Minn. Filed Sept. 13, 1883. (No model.)

Claim.—1. The combination of the flue A, outwardly-flaring shield C, dome D, and convex bottom E, substantially as and for the purpose herein specified.

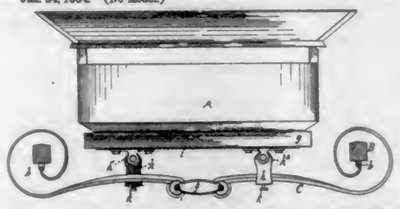
297,972.



2. The combination of the flue A, deflecting-ring B, flaring shield C, dome D, and convex bottom E, substantially as and for the purpose herein specified.

3. The combination of the flue A, shield C, and dome D, having the lower upturned edge, *b*, and convex bottom E, substantially as forth.

4. The combination of the flue A, shield C, dome D, standards *g*, and ring F, substantially as described.



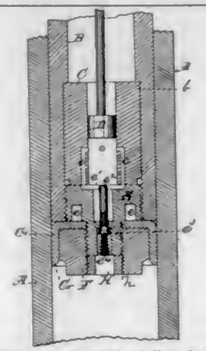
5. The combination of the flue A, deflecting-ring B, flaring shield C, dome D, having the upturned edge *b*, and the bottom E, substantially as and for the purpose herein specified.

297,973. AXLE FOR VEHICLES. JAMES J. DEVINE, Plymouth Meeting, Pa., assignor of one-half to Thomas Lynch, same place. Filed Oct. 31, 1883. (No model.)

Claim.—In combination, the axle A, formed with the extended core *a* and ring or collar *c*, and provided with a burr, *b*, the metal sleeve B, fitted to the core of the axle, and formed with the shoulder *d* and wall *e*, and the retaining-bolt *g*, substantially as and for the purpose set forth.

297,974. VEHICLE-SPRING. JOHN D. DORSEY, Greenville, Ill. Filed Jan. 24, 1884. (No model.)

Claim.—1. A vehicle-spring composed of half-springs joined by a link at one end, and having the other extremities attached to the side bars, around which they form a coiled spring, prior to being connected therewith, in combination with laterally-adjustable couplings or connections with the body of the vehicle, substantially as shown, and for the purpose hereinbefore set forth.

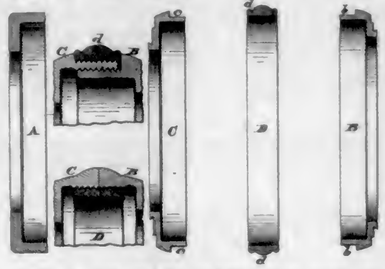


2. In combination with the body and springs of a vehicle, a coupling device connecting them susceptible of a swinging movement and lateral adjustment on both the body and springs of said vehicle, substantially as and for the purpose set forth.

3. A coupling device between the body and springs of a vehicle, by which the said body is supported on said springs, the said coupling device having a lateral adjustment, substantially as shown and described, and being provided with a set-screw or other suitable contrivance by means of which it is secured in position on the springs.

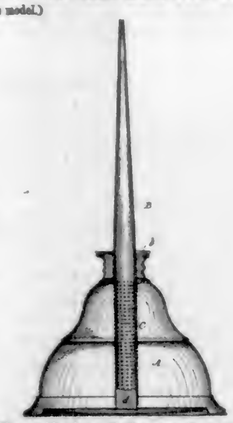
4. The combination of guide *i*, brackets A', couplings A, and the springs of a side-bar vehicle, with which said couplings A are adjustably connected, substantially as and for the purpose specified.

297,975. HYDRAULIC JACK. RICHD. H. DUDGEON, New York, N. Y., assignor to Richard Dudgeon, same place. Filed May 10, 1883. (No model.)



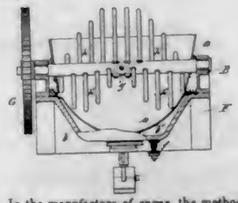
297,975.

Claim.—1. The combination, with a hollow piston, of a removable internal plunger-cylinder provided with internal fluid-passages and held in position by a valve block or plug formed with an extension adapted to hold and support a nut or binding-piece and packing in position, substantially as shown and described.



2. The combination, with the hollow piston B and independent cylinder C, provided with internal fluid passages, *c*, of the valve block or plug E, valve *c*³, and a packing, G, and nut or binding-piece F, substantially as shown and described.

297,976. WATCH-CASE CENTER. JOHN C. DUEBER, Newport, Ky. Filed Sept. 17, 1883. (No model.)



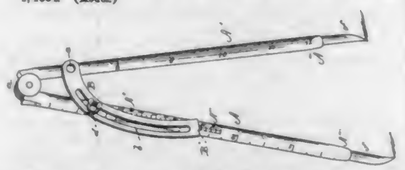
Claim.—A watch-case center consisting of a ring having a pair of halves screwed thereto and secured together by the pendant-bearing, substantially as herein described.

297,977. OIL-CAN. ROBERT ENGLISH, Austin, Tex. Filed Jan. 30, 1884. (No model.)

Claim.—The combination, with the can A, having a screw-threaded opening, of a spout provided upon its sides within the can A with a series of openings, and provided at its lower end with a plug, *d*, and an exteriorly-screw-threaded cap rigidly mounted on said spout, and adapted to engage the screw-threaded mouth of the can A, substantially as set forth.

297,978. METHOD OF AND APPARATUS FOR MASHING SUGAR AND SUGAR MASSES. ALBERT FESCA, Berlin, Germany. Filed Jan. 8, 1884. (No model.)

Claim.—1. In the manufacture of sugar, the method of preparing raw sugar or masse-cuite for treatment in the centrifugal machine, which consists in mixing the cold raw sugar or cold broken-up masse-cuite with sirup or a saccharine solution or water, to give it the required fluidity, and effecting the mixture under a gradually-increasing temperature while the mass is being agitated in a vessel having smooth interior surfaces, substantially as described, for the purpose specified.



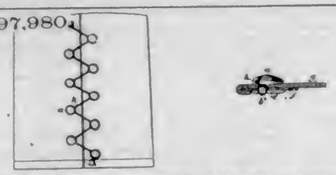
2. In the manufacture of sugar, the method of preparing raw sugar or masse-cuite for treatment in the centrifugal machine, which consists in mixing the cold raw sugar or cold broken-up masse-cuite with sirup or a saccharine solution or water, to give it the required fluidity, and effecting the mixture in a vessel having smooth interior surfaces and under a gradually-increasing temperature until the mass has attained the temperature or about the temperature set forth, as described, for the purpose specified.

3. The herein-described apparatus for preparing raw sugar or masse-cuite for the centrifugal machine, which consists of a receiver or vessel having smooth and preferably curvilinear interior walls, smooth-faced stirrers, or stirrers cylindrical in cross-section, for agitating the material therein, and means, substantially such as described, for applying steam heat to the receiver, as and for the purpose specified.

4. The herein-described apparatus, consisting of a receiver or vessel having smooth and preferably curvilinear interior walls or bottom, and means, substantially such as described, for heating the vessel with steam, in combination with smooth-faced stirrers arranged upon their shaft in groups on helicoidal lines, forming right and left handed screw threads or paths meeting at the longitudinal center of said shaft, substantially as described, for the purpose specified.

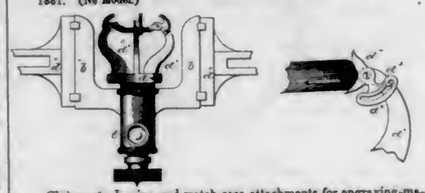
5. The herein-described apparatus, consisting of a receiver or vessel having smooth and preferably curvilinear interior walls or bottom, and means, substantially such as described, for heating the vessel with steam, in combination with stirrers arranged upon their shaft in groups on inverse helicoidal lines, forming right and left handed screw-threads, the threads of one group trending from opposite ends toward the center of the shaft, and those of the succeeding group from the center of the shaft toward its extremities, as described.

297,979. DIVIDERS. ROWLAND FOLGER, Milford, Mass. Filed Mar. 1, 1884. (Model.)



Claim.—1. In combination with the legs A and A' of a pair of dividers, the curved slotted retaining or adjusting bar B, pivoted at one end to the leg A' relatively near the joint, and adjustably secured by means of its slot to the leg A at a greater distance from the joint, substantially as and for the purpose set forth.

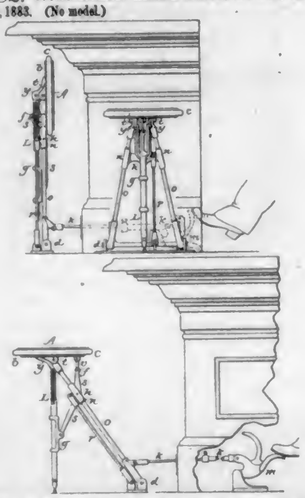
2. The combination of the leg A', the adjusting or retaining bar B, pivoted at *e* thereto, and the leg A, provided with the adjusting-screw *d* and the degree-scale A'', substantially as and for the purpose described.



297,980. GLOVE-FASTENING. WILLIAM F. FOSTER, New York, N. Y. Filed July 20, 1883. (No model.)

Claim.—In combination, the lacing-cord, the glove, the disk-like head *a*, arranged on one surface thereof, and the plate *c*, arranged on the other surface, in relation substantially as described, the eccentric neck provided with the flange *c*, and means of attachment, whereby, by the elasticity of the glove, the entrance to the hook is substantially closed to prevent the escape of the cord.

297,980.

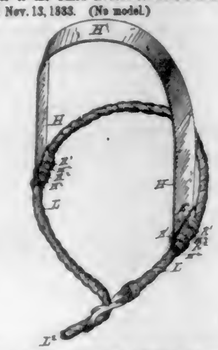


297,981. RING AND WATCH-CASE ATTACHMENT FOR ENGRAVING-MACHINES. ALLAN E. FRANCIS, Cleveland, Ohio. Filed Nov. 16, 1881. (No model.)

Claim.—1. In ring and watch-case attachments for engraving-machines, frame *b*, having body *c*, containing hollow shaft *c'*, provided with head *d*, carrying arms *d'*, and being operated by rod K, all made and combined substantially as and for the purposes herein described and set forth.

2. In ring and watch-case attachments for engraving-machines, the combination of arm *d* with jaw *d''*, having slide *d*³ and screw *d*³, made and arranged substantially as shown and described.

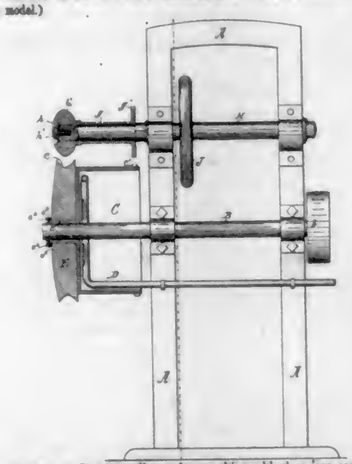
297,982. COUNTER-SEAT. ALLAN E. FRANCIS, Cleveland, Ohio. Filed May 5, 1883. (No model.)



Claim.—1. The combination, with the seat-top, of support L, hinged thereto, the supports *o o*, hinged to the seat-top, and provided at their lower end with means whereby they may be hinged to the floor, arm *s*, connected to the supports L and *o o*, substantially as described, and link *v*, connecting the upper end of arm *s* and the seat-top, as and for the purpose specified.

2. The combination, with the seat-top, of support L, hinged to the same, bracket *d*, supports *o o*, hinged to the seat-top and bracket *d*, arm *s*, connected to the supports L and *o o*, substantially as described, link *v*, connecting the upper end of arm *s* with the seat-top, and rod *r*, connected to arm *s*, as set forth, and pivoted to bracket *d*, as and for the purpose specified.

3. The combination, with the seat-top, of support L, hinged to the

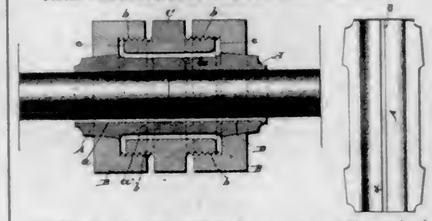


same, bracket *d*, supports *o o*, hinged to the seat-top and to bracket *d*, arm *s*, connected to supports L and *o o*, substantially as set forth, link *v*, connecting the upper end of arm *s* with the seat-top, rod *r*, connected, substantially as described, with arm *s*, and hinged to the bracket *d*, the treadle *m*, and rod *k*, connecting the same to supports *o o*, as and for the purpose specified.

297,983. HALTER-STRAP FASTENING. JOHN GIBBONS, West Troy, N. Y., assignor to the Union Hardware Manufacturing Company, same place. Filed Nov. 13, 1883. (No model.)

Claim.—The combination, with the strap and rope portion of a halter, of the coupling device, consisting of the parallel side bars, B' B², connected by ring-like straps or portions R' R², all applied to operate substantially as set forth.

297,984. HAT-ROLL-PRESSING MACHINE. CHARLES WILLIAM GILMAN and RAYMOND WHEELER, Medfield, Mass. Filed Feb. 27, 1884. (No model.)

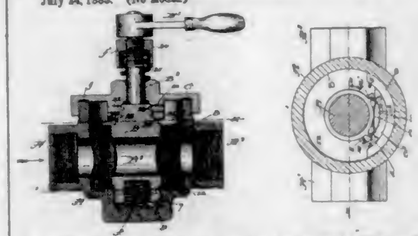


Claim.—1. In a hat-roll-pressing machine, a block or iron connected with a rotating shaft and having a peripheral groove, and a presser shaped at its edge to enter the concaved portion of the roll of a hat-brim, and adapted to hold the convexed or outer side or face of said roll down into the peripheral groove of the block or iron, in combination, as and for the purpose specified.

2. In a hat-roll-pressing machine, a heated block or iron connected with a rotating shaft and having a peripheral groove, and a presser shaped at its edge to enter the concaved portion of the roll of a hat-brim, and adapted to hold the outer surface or face of said roll down into the peripheral groove of the block or iron, combined and arranged as and for the purpose set forth.

3. The combination, with a block or iron connected with a rotating shaft and having a peripheral groove, of a presser connected with a shaft adapted to rise and fall, as set forth, said presser being arranged above the block or iron, and being shaped at its edge to enter the concaved portion of the roll of a hat-brim, and adapted, upon the downward movement of its shaft, to hold the convexed or outer side or face of said roll down into the peripheral groove of the iron or block, substantially as set forth.

4. The combination, with a block or iron connected with a rotating shaft and having a peripheral groove, of a presser connected with and free to be rotated upon a shaft adapted to rise and fall, as set forth, and provided with a sleeve encircling the presser-shafts, and having a toothed disk or gear, and suitable gear mechanism attached to or moved in unison with the block-shaft with which the toothed disk meshes upon the downward movement of the presser-shaft, all substantially as and for the purpose set forth.



297,985. SHAFT-COUPLING. THEODORE EARNEST GOLDEN and JOHN PORTER GOLDEN, Columbus, Ga. Filed Jan. 12, 1884. (No model.)

Claim.—1. In a shaft-coupling, the combination, with a sectional box for embracing adjacent ends of the sections of the shaft and having tapering ends, as shown, of two end collars resting on the tapering ends of the sleeve and provided with the internally-threaded projections, and a central collar having threaded extensions on the end collars, whereby both end collars are simultaneously moved by the central collar, substantially as set forth.

2. In a shaft-coupling, the combination, with a box, A, adapted to be keyed to a sectional shaft, of the end collars, B, having tapering bores and the internally-threaded projections, and the central collar provided with screw-threaded lateral extensions, which latter engage the threaded projections of the end collars, substantially as set forth.

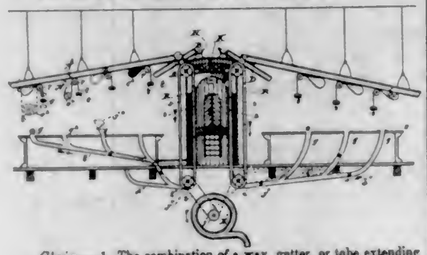
297,986. VALVE. J. MORTIMER GOLDSMITH, Boston, Mass. Filed July 14, 1883. (No model.)

Claim.—1. In a straight-way valve, a case or shell having a cylindrical seat, *b*, a valve-segment placed therein loosely, a head or valve-mover also in said shell, having a stem and a transverse fluidway or port, a spring interposed between said valve-segment and valve-mover, and projections on the two to engage such segment and its mover, all combined and arranged substantially as described.

2. The valve-case having the cylindrical seat *b*, a main valve-segment provided with a port, and an auxiliary valve-segment seated on the said main valve-segment, combined with the head or valve-mover provided with the transverse way B', and with means to move the said valve-segments in succession, as and for the purposes described.

3. The valve-case and valve-segment inserted therein loosely, and the head or valve-mover provided with a suitable way for the passage of the fluid, combined with a spring to keep the valve-segment against the valve-seat *b*, substantially as described.

4. The valve-case provided with the cylindrical seat *b* and recess 10, and valve-segment inserted therein loosely, combined with the head or valve-mover provided with the way B, and with a pin or projection, 6, and adapted to move the said valve-segment, substantially as described.



5. The valve-case and its cap provided with the hub 21, extended into the said shell, and having passages 22, combined with the head B, provided with the conical part 20, having grooves, and with a spring to keep the said part 20 into the conical seat in the said extended hub, substantially as described.

6. The valve-case and its cap provided with the hub 21, extended into the said shell, and having passages 22, combined with the head B, provided with the conical part 20, having grooves, and with a nut to

regulate the force of the said spring, substantially as described.

7. The valve-segment provided at its rear side with projections or shoulders, combined with a flat spring, *e*, having its ends abutted against the said shoulders, substantially as described.

297,987. AUTOMATIC STORE-SERVICE APPARATUS. JOHN H. GOODFELLOW, Troy, N. Y. Filed Feb. 12, 1884. (No model.)

Claim.—1. The combination of a way, gutter, or tube extending past a series of clerks' counters or stations, and below the counter or shelving, or both, and a rolling cash holder or box adapted to operate substantially as and for the purpose specified.

2. In a cash-carrying system for stores, the combination of a way adapted to and extending from the cashier's desk H to and over a counter, and a way, trough, or tube extending from the said counter or station and below the line of said counter, and a rolling cash holder or box, substantially as described.

3. In a cash-carrying system, a way adapted to the cashier's desk H and inclined downwardly from and extending over a store-counter, and a way, gutter, or tube extending from the said counters or stations and below the line of said counters, and a rolling cash-holder adapted to receive and carry cash on said ways, as and for the purpose specified.

4. The within-described system for store-service, consisting of the combination of a way or ways adapted to the cashier's desk and downwardly-inclined therefrom, and extending over a store-counter and along a series of stations, and a way, trough, or tube extending from the said counter and stations and below the upper line of said counter, said ways adapted to support and convey by gravity a hollow rolling carrier or ball to an elevator arranged and adapted to elevate said carrier for the cashier's manipulation, substantially as described.

5. The combination, in a cash-carrying system for store-services, of a way or ways adapted to the cashier's desk and inclined downwardly therefrom, and provided with distributing-stations arranged in said ways over the different salesmen's counters or stations, and a way, gutter, or tube extending from said stations or counters below the upper line thereof, adapted to receive, support, and convey by gravity cash-holders to an elevator passing the cashier's desk, for elevating or lowering the carriers thereat, substantially as described.

6. In a cash-carrying system, the combination of one or more chutes arranged below the top line of the counters or salesmen's stations and adapted to convey by gravity a rolling carrier therethrough, and one or more branch ways or tubes leading to the cashier's desk or to an elevator or side track, substantially as described.

7. In a cash-carrying system, a chute or chutes arranged below the top line of the counters or salesmen's stations, and leading thence to the cashier's desk or to an elevator thereat, adapted to convey thereto by gravity a rolling cash-carrier, substantially as described.

8. In a cash-carrying system, the combination of one or more counters or stations and one or more chutes adapted to direct rolling carriers upon or into a way, tube, or gutter, arranged to converge at their lower ends and discharge said carriers into or upon an elevator, whereby they may be raised or lowered to a side track for the operation of the cashier, substantially as described.

9. In a cash-carrying system for stores, the combination and arrangement of an incline way or ways, gutter, or tube longitudinally beneath the counter or shelving, provided with means, substantially as described, for receiving a hollow rolling ball or carrier adapted to carry cash on said ways, and the lower end of said ways adapted to discharge said ball or carrier into or upon an elevator, substantially as and for the purpose set forth.

10. In a cash-carrying system, the combination of a way, tube, or gutter, one or more counters or stations, and one or more inclined chutes connecting the stations or counters with the way, whereby a quick impetus is given the hollow rolling ball or carrier used therewith, when introduced therein, toward the cashier's desk or an elevator or side track thereat.

11. A cash-carrying system consisting of the combination, with one or more salesmen's counters or stations, of one or more chutes, ways, troughs, or tubes leading therefrom, and serving as a means of communication therewith to the cashier's desk, whereby cash-carriers may be sent to the cashier's desk, an elevator thereat by which the cashier may receive or distribute the cash-carriers, and a return distributing-track, the elevator being intermediate of the converging and diverging system of ways, troughs, or tubes, substantially as described.

12. In a cash-carrying system having chutes the bodies of which are arranged below the line of the counter or shelving at the salesmen's stations or counters, the combination, with the chute, of a cover adapted to close said chute when not in use, substantially as described.

13. The inclined chute *g*, arranged at the salesmen's counters or stations, and adapted as a source of indirect communication with a way, trough, or tube to the cashier's desk, whereby hollow rolling cash-carriers are sent by the clerk along said ways, in combination with an inclined return distributing-track, as set forth.

14. The chute *g*, arranged with its mouth extending above the counter, and furnished with a cover, in combination with a way, *b''*, substantially as described.

15. In a cash-carrying system, one or more chutes having their bodies arranged below the top line of the counters or salesmen's stations, but with mouths extending above the top line of the counters or stations, provided with suitable covers, substantially as described.

16. In a cash-carrying system, the combination, with the troughs, grooves, or ways, arranged and adapted to deliver the cash-carriers at the cashier's desk, of one or more grooves, troughs, or ways located at the cashier's desk, and adapted to receive and hold the cash-carriers for the cashier's operations, substantially as set forth.

17. In a cash-carrying system, the combination of troughs, grooves, or ways arranged and adapted to carry from the counters or salesmen's stations the cash-carriers, one or more troughs, grooves, or ways located at the cashier's desk, adapted to receive and hold for his operations the cash-carriers, and an elevator for receiving the cash-carriers from the troughs, grooves, or ways leading from the counters or stations and delivering them into the troughs, grooves, or ways receiving and holding them at the cashier's desk, substantially as described.

18. In a cash-carrying system, the combination, with one or more troughs, grooves, or ways located at the cashier's desk, and adapted to receive and hold thereat the cash-carriers, of an elevator for delivering the cash-carriers thereupon, substantially as described.

19. The combination, with a cashier's desk, H, of a store, and a series of outgoing distributing-tracks, of an elevator adapted to lift the ball from a converging station or stations to the cashier's desk, for his manipulation, substantially as described.

20. The elevator R, consisting of a suitable band provided with platforms adapted to raise a spherical carrier from a position near or below the floor or compartment beneath to an incline leading to the cashier's desk or the neighborhood thereof, for his manipulation, substantially as described.

21. The elevator R, consisting of a suitable band furnished with disks 3' and slot 3'', adapted to raise or lower a spherical carrier to or from the cashier's desk and a converging station, and provided with means for ejecting the carrier in either direction automatically, substantially as described.

22. In combination with a cash-carrying system and a cashier's desk, an elevator consisting of the sections 2 and 3, hand n^3, supporting and driving wheels J and J'', and hoop or disks or equivalents adapted to carry a ball in either direction, substantially as described.

23. The combination, with an elevator, R, for raising and lowering carriers from one floor to another, provided with means, as described, for receiving automatically such carriers into or upon the elevator from the incoming tracks or converging stations, of means, as described, for ejecting said carriers upon a track adapted to to serve clerks in various floors, and means, as described, as a motive power, substantially as described.

24. The combination of the water-motor E and elevator R, and a cash-carrying system adapted to rolling carriers, substantially as described.

25. The combination of the disk 3', slot 3'', and mouth 22, deflector 13, and case 2, adapted to operate as and for the purpose specified, and band n^2 and wheel J.

26. In a horizontal switch on the way of a carrying system, the combination, with a pivoted switch-tongue, of a yielding switch-guard attached to or engaging with the switch-tongue, and extending beyond its pivot into the branch to be kept normally closed, and self-adjusting to various sizes of carriers, adapted to close the switch-tongue upon a carrier passing out of the switch, and means, as described, for holding said tongue in such a position adapted to be released by a carrier to be switched, and a tongue adapted to move said switch-tongue in advance of the carrier, substantially as described.

27. In a horizontal switch on the ways of a carrier system, the combination of a switch-tongue, a latch to retain said tongue against the main rail with the branch closed, and means for moving said tongue by the action of various-size carriers to which it is adapted to yield, and means, as described, for raising said latch by the action of said carriers, and means for moving said tongue to the opposite side of the rail upon being released, whereby a carrier resets the switch upon passing through, substantially as described.

28. In a horizontal switch on ways of a carrying system, the combination of a pivoted switch-tongue provided with a spring or latch normally retaining the tongue in position against the spring, to close a branch way, means, as described, operated on by the carrier, for causing the latch to release the tongue and open the normally-closed branch, and a yielding switch-guard attached to or engaging with the switch-tongue and extending into said branch or way, and adapted to yield to various-sized carriers and again close the switch-tongue after leaving the main way or track and entering the branch way or track, substantially as described.

29. In a horizontal switch on the ways of a carrier system, the combination, with the pivoted switch-tongue provided with the yielding switch-guard V, extending back over the branch, of a latch, U, and a yielding guard, *m*, made in one piece, and adapted to trip the end of the tongue at 10 by the sideward or upward pressure of the carrier, substantially as described.

30. In a cash-carrying system, the combination, with a track or way provided with two vertical moving sections pivoted to the main track at their outer ends, and provided with means, as described, whereby they are connected, of means, as described, for retaining said gates or switches in a horizontal position, adapted to be operated by the carriers, substantially as described.

31. In cash-carrying systems, the combination, with a track or way provided with two vertical moving sections pivoted at their outer ends, and provided with means, as described, for retaining them in a horizontal position adapted to be operated by a carrier intended to pass through the switch, of means, as described, for closing them again by a following carrier, as set forth.

32. In a carrying system, the combination, with a track or way, means, as described, for discharging the carriers from such ways, and a receptacle for arresting the carriers as they drop from the trap, of means, as described, whereby the ball is lowered by counter-weight, substantially as described.

33. In a store system, the combination of a discharging device on the ways and a receptacle beneath the same for the carrier, adapted to automatically drop upon arrival of such carrier in said receptacle, substantially as described.

34. In a store system, the combination of a discharging device on the ways and a receptacle beneath, attached to a lever provided with a counter-weight which may be overbalanced by the arrival of said carrier in said receptacle, whereby said receptacle automatically returns to the track upon relieving the carrier, substantially as described.

35. In a store-service system, a three-rail track or way consisting of rails running parallel with each other and the outer ones higher than the center one, whereby a ball placed upon the track between the two right-hand rails will follow those rails, substantially as described.

36. In a cash-carrier system, the combination of inclined distributing ways A and the devices forming the means for sending a carrier toward the cashier's desk H from and below the counter of a store, and hollow rolling balls T, adapted to receive and carry cash on said ways, as and for the purpose specified.

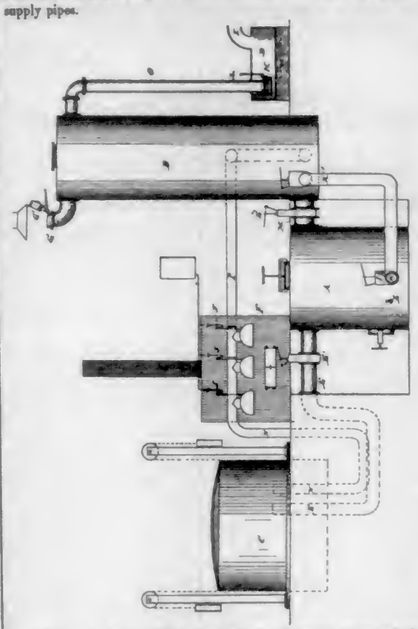
37. The combination, with the counter *f* and desk H and elevator R in a store, of the devices forming the means for connecting the same, substantially as described.

38. The combination of the box T and bung x'', provided with the devices forming the means for holding the bung in position, as and for the purpose set forth.

39. The combination of the box T, the bung x'', and spring x''' and a detent, x^4, as and for the purpose set forth.

40. The combination of the box T, adapted to roll, the bung x'', the detent x^4, spring x^5, and counter-weight x^3, as and for the purpose specified.

41. The combination of the box T, adapted to roll, the bung x'', the detent x^4, spring x''', counter-weight x^3, and spring x^5, adapted to hold and carry cash, substantially as described.



42. A rolling cash-carrier consisting of the combination of the box T, adapted to roll, and provided with a cover, and means, as described, for returning it to the box, and a weight and spring adapted to counterbalance coin, substantially as and for the purpose specified.

43. In a cash-carrying system, the combination, with a cashier's desk, of an independent groove or trough, *k*, adapted to receive and hold a series of rolling cash-carriers, and the devices forming the means for conveying said carriers thereto, substantially as described.

44. In a cash-carrying system, the combination, with the ways, troughs, or tubes forming the track for conveying the cash-carriers, and hangers for supporting or suspending the same, of wires or supports for the hangers arranged on either side of the center thereof alternately and at an angle thereto, whereby the ways are held steady and fixed throughout the length of the track, substantially as set forth.

297,988. APPARATUS FOR MANUFACTURING ILLUMINATING-GAS. ARTHUR O. GRANGER, Philadelphia, Pa., assignor to A. O. Granger & Co., same place. Filed June 25, 1883. (No model.)

Brief.—A body of coal in a furnace is heated by a blast of air, and the resulting products are burned in a fixing-chamber, whereby it is heated. Steam is then decomposed by passage through the heated coal, forming carbonic oxide and hydrogen, which are stored in a holder. They are thence passed to and carbureted in a separate auxiliary hydrocarbon-vaporizer, and the carbureted gas is fixed by passing it through said heated fixing-chamber. The hydrocarbon-vaporizer consists of retorts set in a furnace, and they have connected with them gas and oil supply pipes.

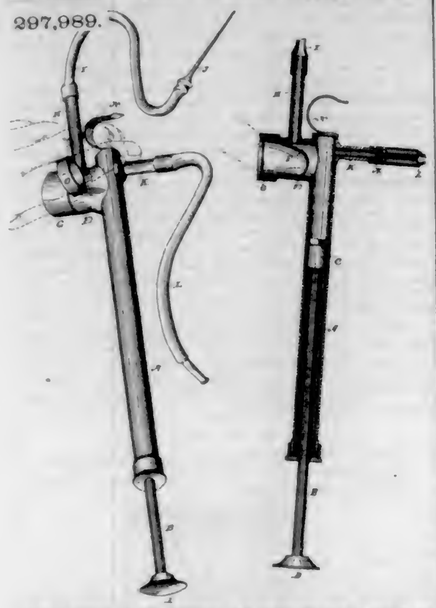
Claim.—1. The combination of generator A, having steam and air pipes, fixing-chamber B, having chimney-valve G, seal D, flues M and O, valved flue E, oil-vaporizer F, and flue P, substantially as and for the purpose specified.

2. The combination of generator A, having steam and air pipes, fixing-chamber B, having chimney-valve G, seal D, flues M and O, valved flue E, auxiliary holder C, pipe N, oil-vaporizer F, and flue P, substantially as and for the purpose specified.

3. The combination of generator A, having steam and air pipes, fixing-chamber B, having chimney-valve G, seal D, flues M and O, valve E', valved flue E, oil-vaporizer F, and flue P, substantially as and for the purpose specified.

4. The combination of a generator having air and steam pipes, a fixing-chamber, a valved chimney-flue and water-sealed gas-outlet from said fixing-chamber, a flue connecting said fixing-chamber with said generator, a carburetor or oil-vaporizer, and flues connecting said carburetor with said generator and said fixing-chamber, substantially as and for the purpose specified.

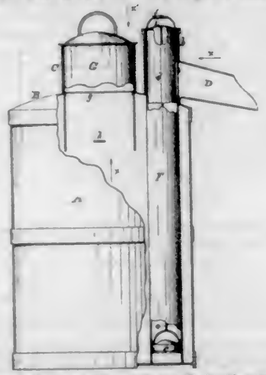
297,989. SURGICAL ASPIRATOR. CHARLES BUCKNER HARDIN, Independence, Mo., assignor of two-thirds to Jesse W. Clements and John W. Clements, both of same place. Filed Dec. 28, 1883. (No model.)



Claim.—1. In a surgical instrument, the combination, with the piston and cylinder, of receiving and conducting tubes connecting with the cylinder, and a rubber flexible safety-valve arranged within the cylinder and adapted to be operated by the hand to close the mouth or inner end of the receiving-tube, as and for the purpose set forth.

2. In a surgical instrument, the combination, with the piston and cylinder, of the conducting and receiving tubes attached to the cylinder, a pipe also attached to the cylinder adjacent to the receiving-tube, and a safety-valve secured within the pipe, and adapted to be operated by the thumb or finger of the operator to close the mouth or inner end of the receiving-tube, for the purpose set forth.

3. In a surgical instrument, a cylinder having a piston working therein, in combination with receiving and conducting tubes, a valve adapted to be operated by the thumb or finger of the operator to close the mouth or inner end of the receiving-tube, and a valve arranged in the conducting-tube and adapted to automatically open by the operation of the piston, as set forth.

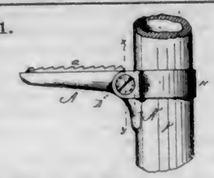


4. In a surgical instrument, the cylinder A, having piston B, carrying a plunger, C, in combination with conducting-tube L, pipe E, cap G, valve F, receiving-tube I, and hooks and rings N O, as set forth.

297,989.

297,990. CAN. WILLIAM HAFER, Rochester, N. Y. Filed Feb. 5, 1884. (No model.)

Brief.—A stopper for the spout is attached to the rod of a lift-pump. When the rod is lifted, the stopper is raised, opening the exit-port of the pump-barrel. When the rod is lowered, the stopper closes the port.



Claim.—A fluid or milk can, A, provided with a tube, *b*, in addition to the usual neck, C, rising above the top of the can at one side of the neck, and provided with a spout, D, in combination with a pump, F, extending down through the tube into the interior of the can, the said pump having an opening, *a*, opposite the spout D, and a thimble, *d*, to close the upper open end of the pump and the opening *a*, substantially as shown and described.

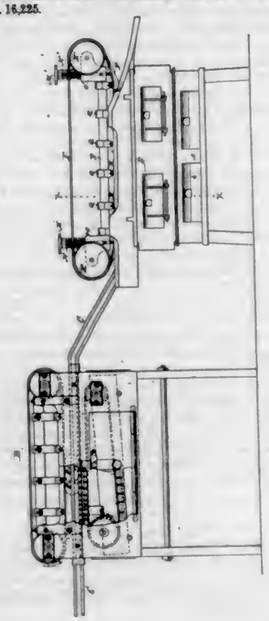
297,991. STEP FOR BICYCLES. GEORGE F. HARWOOD, Worcester, Mass. Filed Feb. 25, 1884. (No model.)

Claim.—1. In a step for bicycles and other velocipedes, the combination, with the band H, bolt D, and nut *d*, of the step A, the back plate, A', thereof being provided with the slot B, extending from a point near the lower end of said back plate to the surface of the step, substantially as and for the purpose set forth.

2. In a step for bicycles and other velocipedes, the combination, with the band H, bolt D, and nut *d*, of the step A, the back plate, A', thereof being provided with the slot B, extending from a point near the lower end of said back plate to the surface of the step and opening into the loop thereof, whereby the two portions of the back plate formed by the slot may be compressed, substantially as and for the purpose described.

297,991.

297,992. VESSEL FOR CONTAINING AERATED LIQUIDS. JOSIAH P. HASKINS, Saratoga Springs, N. Y. Filed Feb. 7, 1884. (No model.)

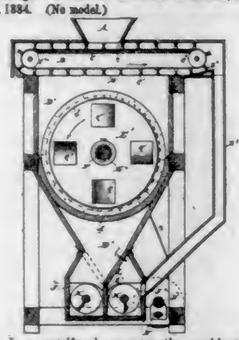


Claim.—1. A vessel for gaseous liquids, &c., having a top formed integrally with the sides and bottom, and provided with an orifice near one side, and a slide adapted to close said orifice, substantially as shown and described.

2. In combination with a vessel, A, having top B, provided with orifice C, and raised rib D at opposite sides of said orifice, grooved substantially as shown, slide E, adapted to enter said grooves and close the orifice.

3. In combination with vessel A, having top B, orifice C, and grooved rib D, slide E, provided with a yielding facing, F, substantially as and for the purpose set forth.

297,993. SOLDERING-MACHINE. BERNHARD HAUSHERR and JOHAN METZNERS, Chur, Switzerland, assignors to David S. Page, New York, N. Y. Filed Mar. 15, 1884. (No model.) Patented in Germany Feb. 19, 1881, No. 16,225.



Claim.—1. The combination, in a soldering-machine, of a solder bath, a track extending over such bath adapted to guide the articles to be soldered, and a soldering-tool arranged in the path of said articles for applying solder thereto.

2. The combination, in a soldering-machine, of a solder bath, a track extending over such bath adapted to support and guide the cans or other articles to be soldered, an endless band for impelling the cans along said track, and a soldering-tool arranged in the path of the cans or other articles for distributing the solder thereupon.

3. The combination, in a soldering-machine, of a solder bath, a guide or track for the cans extending over said bath, and a soldering-tool arranged to take the solder for soldering said cans from below the surface of said bath.

4. The combination, in a soldering-machine, of a solder bath, a track arranged over said bath to support the cans, a soldering-tool for applying the solder, and an adjustable guide for regulating the position of said cans with reference to said tools, substantially as described.

297,994. CENTRIFUGAL SEPARATOR. JUSTUS J. HENDRICKSON, Norristown, assignor of one-half to Charles K. Bullock, Philadelphia, Pa. Filed Jan. 8, 1884. (No model.)

Claim.—1. In a centrifugal separator, the combination of the reel having a solid head on its feeding end, said head being provided with apertures or slots, and hoods for said apertures, with a feed-box in which said hoods rotate to scoop up the flour, and means to feed the flour into said feed-box in a continuous shower the full width of the end of the reel, substantially as and for the purpose specified.

2. In a centrifugal separator, the combination of the reel having a solid head on its feeding end, said head being provided with apertures or slots, and hoods for said apertures, with a feed-box in which said hoods rotate to scoop up the flour, a screen covering the top of said feed-box, and a brush adapted to pass over said screen to feed the flour through said screen into said feed-box, substantially as and for the purpose specified.

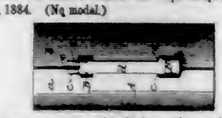
3. In a centrifugal separator, the combination of the reel having a solid head on its feeding end, said head being provided with apertures or slots, and hoods for said apertures, with a feed-box in which said hoods rotate to scoop up the flour, a screen covering the top of said feed-box, and a brush adapted to pass over said screen to feed the flour through said screen into said feed-box, and a discharge from one end of said screen, through which any lumps or impurities are discharged to prevent clogging of said screen, substantially as and for the purpose specified.

4. In a centrifugal separator, the combination of the reel having a solid head on its feeding end, said head being provided with apertures or slots, and hoods for said apertures, with a feed-box in which said hoods rotate to scoop up the flour, a screen covering the top of said feed-box, and a brush adapted to pass over said screen to feed the flour through said screen into said feed-box, a return-conveyer, and a discharge from one end of said screen, and connecting with the return-conveyer, through which any lumps or impurities are discharged to prevent clogging of said screen, substantially as and for the purpose specified.

5. In a centrifugal separator, the combination of the reel having a solid head on each end, said heads being provided with apertures or slots, and hoods for said apertures, to insure a positive feed and a positive discharge and prevent the overloading of the reel, with a feed-box in which said hoods rotate to scoop up the flour, a long flat screen covering the top of said feed-box, and a flat brush adapted to pass over said screen from one end to the other, to feed the flour through said screen in a continous shower into said feed-box, substantially as and for the purpose specified.

6. A reel having a closed head, in combination with a stationary perforated partition or ring-piece, in which said solid head works, the reel-shaft, and adjustable bearings, whereby said reel may be set true with respect to said stationary partition or ring and prevent wear and binding should the frame become warped or shaft-worn, substantially as and for the purpose specified.

7. The combination of the reel with an auxiliary feeding device, which consists of a long flat stationary screen, upon which the flour is brushed, a flat traveling brush moving over said screen, and means to feed the flour upon said screen, whereby the flour is caused to fall in a continuous shower, substantially as and for the purpose specified.



8. In a centrifugal separator, a reel-head provided with a positive feeding device, in combination with an auxiliary screening device consisting of a long flat stationary screen, upon which the flour is brushed, a flat traveling brush moving over said screen, and means to feed the flour upon said screen, whereby the flour is caused to fall in a continuous shower to first make a separation of the flour or middlings from lump impurities, &c., and then deliver said flour or middlings to said positive feeding device, substantially as and for the purpose specified.

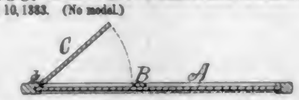
9. The auxiliary feed, consisting of chamber B, having hopper A and board B^2, in combination with band C, brushes C', screen B', pulleys C^2, and discharge B^3, substantially as and for the purpose specified.

10. The auxiliary feed, consisting of chamber B, having hopper A and board B^2, in combination with band C, brushes C', screen B', pulleys C^2, inclined board *c*, and discharge B, substantially as and for the purpose specified.

11. In a centrifugal separater, the combination of a reel, a beater, beater-shaft F, sprocket-wheel H', chain *n*, shaft N, supported in adjustable bearings N', sprocket-wheels N^4, conveyer sprocket-wheels M^2, sprocket-wheel M, sleeve E^2, and chain M', whereby said shaft N^2 and its wheels may be adjusted to tighten all of the working-chains, substantially as and for the purpose specified.

297,995. MOLD FOR DRAIN-TILES. CHARLES B. HEWITT, Racine, Wis., assignor to the Racine Cement and Pipe Company, of Wisconsin. Filed Feb. 13, 1884. (No model.)

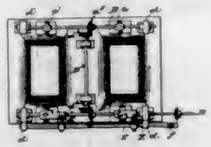
Claim.—1. In combination with flask-sections *a b*, having two or more pairs of lugs at the line of meeting, removable clamps B, connected by a strip or bar, substantially as shown, whereby the several clamps may be applied or removed simultaneously and by a single operation, and the mold-sections separated one from the other.



2. In combination with flask-sections *a b*, provided with two or more pairs of lugs, *c*, at the meeting line of the sections, clamp B, consisting of two or more clasps adapted to engage with or to be removed from the lugs at will, and connected by a bar, *d*, as shown.

3. In a flask, the combination of two sections, *a b*, completely separable from each other, each provided near their edges with one or more lugs, *c*, tapered in the direction of the length of the sections, and a clamp for each pair of said lugs, substantially as shown and described.

4. In combination with flask-sections *a b*, each provided with lugs *c*, having beveled front faces and undercut rear faces, clamps B, applied to said lugs, substantially as and for the purpose set forth.



5. The herein-described flask for use in the manufacture of cement pipe and like articles, consisting of sections *a b*, each provided with two or more lugs, *c*, at or near both edges, said lugs tapered longitudinally and beveled on their front faces, and clamps B, straddling and drawing together said lugs, as and for the purpose explained.

297,996. SCHOOL-SLATE. WILLIAM D. HEYER, Elizabeth, N. J. Filed Sept. 10, 1883. (No model.)

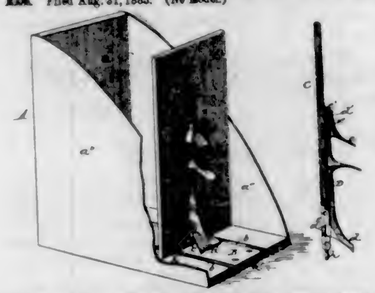
Claim.—A school-slate, in combination with a transparent slate hinged thereto, so as to cover or uncover a portion of the opaque slate, substantially as described.

297,997. VALVE-GEAR FOR STEAM-ENGINES. OLIVER P. HOWARD, Burlington, Iowa. Filed Mar. 5, 1883. (No model.)

Claim.—1. The combination of the induction-valves having their gearing on one side of the cylinder, the exhaust-valves having their gearing upon the opposite side of the cylinder, and a connecting-shaft passing under the cylinder for imparting motion from the induction to the exhaust gearing.

2. The combination of the cylinder, induction-valves on one side of the cylinder, the exhaust-valves upon the opposite side of the cylinder, shafts for operating the valves, one below the induction and the other below the exhaust valves, and a shaft passing under the cylinder and connecting the valve-operating shafts, substantially as described.

3. The combination of the induction-valves on one side of the cylinder, the exhaust-valves on the opposite side of the cylinder, shafts D and D', respectively, beneath the induction and exhaust valves, and each having cams for operating said valves and a miter-wheel, and a shaft, D^2, having miter-wheels for connecting said shafts D and D', substantially as described.



4. The combination of the induction-valves having their gearing on one side of the cylinder, the exhaust-valves having their gearing upon the opposite side of the cylinder, a connecting-shaft passing under the cylinder for imparting motion from the induction to the exhaust gearing, and a rod, F, connected with the induction-gearing and the governor, substantially as described.

297,998. GAGE FOR GORING SHOE-UPPERS. WILLIAM BRADFORD KINSLEY, Stoughton, Mass. Filed Feb. 25, 1884. (No model.)

Claim.—The gore-gage substantially as set forth, consisting of a board or plate provided with the three cells arranged in it, as represented, for the reception and gaging of the gore, and the two pieces of material to be adapted thereto, as specified.

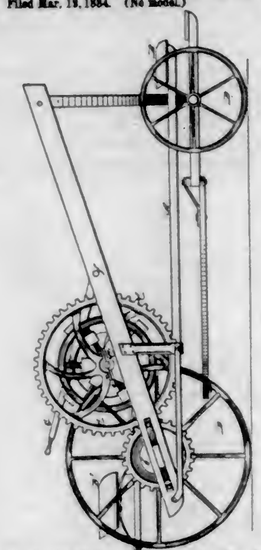
297,999. DEVICE FOR FILING PAPERS. JOHN C LANG, Boston, Mass. Filed Aug. 31, 1883. (No model.)

Claim.—1. In a paper-file, a follower-board combined with an elastic guide or base-board, and frictional clamping devices connecting the follower-board and guide, substantially as described.

2. In a paper-file, a guide or base-board combined with a follower-board having a sliding connection therewith, a vertically-movable brace applied to said board, and means, substantially as described, for locking said brace downward.

3. In a paper-file, the clamping device composed of a slotted follower-board having a sliding brace or rear support, the thumb-latch to lock said brace, and foot hooks or arms on the board, combined with a guide or support therefor.

4. In a paper-file, the combination, with a guide or support, of a clamping follower composed of a board having arms or hooks at the lower end, and a vertically-moving brace or support applied to the follower, the whole arranged, substantially as described, to lean backward at any point within the limits of the guide, substantially as and for the purpose set forth.



5. The combination, with the guide, of the follower-board slotted at its lower end, the vertically-sliding brace D, provided with the stud *d'''*, and means, substantially as described, for locking the brace in position.

6. In combination with the follower-board and brace, acting as described, the thumb-latch E, constructed, as described, to serve the two-fold purpose of guiding and locking the upper end of the brace.

298,000. PROCESS OF PREPARING MEDICAL COMPOUNDS. HENRY C. LAWRENCE, Chicago, Ill. Filed Nov. 30, 1883. (No specimens.)

Claim.—In a process for making a medical compound composed of spirits, balsam of tolu, sirup, and water, the method of retaining and blending a maximum amount of tolu by heating the alcohol, then adding the tolu and boiling water, and then clarifying the same with carbonate of lime or precipitate of chalk, as set forth.

298,001. SPRING AND WEIGHT MOTOR. ANDREW LEWIS, Naperville, Ill. Filed Mar. 19, 1884. (No model.)

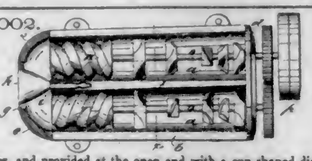
Claim.—1. In a spring-motor, a drum, upon which the actuating or main spring is wound, provided with a series of short springs interposed between the drum and main spring, substantially as and for the purpose set forth.

2. In a spring-motor, a main frame, a drum journaled thereon, and a main spring having one end secured to the frame and the other wound upon and secured to the drum, in combination with a series of short auxiliary springs upon the periphery of the drum, having one end secured thereto and the other free to press outward against the coils of the main spring, substantially as and for the purpose set forth.

3. In a spring-motor, a main spring made in two or more separate parts laid one upon the other, and wound upon a suitable driving-drum, substantially as and for the purpose set forth.

4. In a combined spring and weight motor, a main driving-shaft provided with a fixed clutch-disk and a loose spring-drum adapted to be engaged and disengaged therewith, in combination with a fly-wheel fixed on the main shaft, and having its spokes provided with weights free to slide in and out upon the same as the wheel revolves, substantially as and for the purpose set forth.

5. The wheel C', provided with the sliding weights D, formed with a removable portion, *d*, secured by bolt *d'*, substantially as and for the purpose set forth.



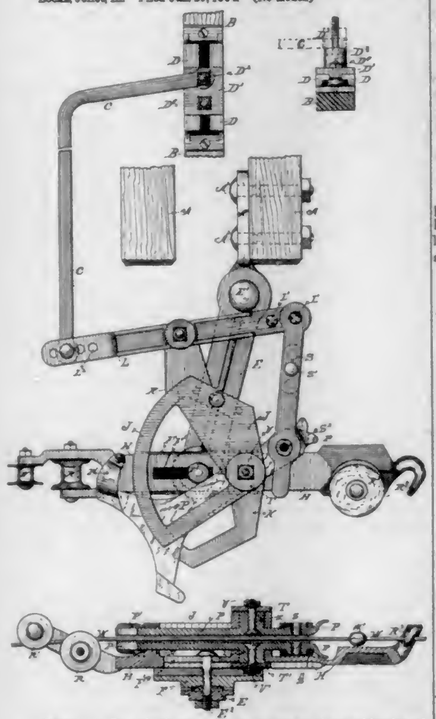
6. In a spring-operated vehicle or car, the main frame A, wheels B B, gearing *b* C, and driving-shafts C', provided with the clutch-disks E, in combination with the oppositely-operating spring-drums E' E^2, constructed as herein described, and the shifting-levers G G, substantially as and for the purpose set forth.

7. In a spring-motor, the main spring G', composed of two or more separate springs wound upon the drum E', and having one end secured thereto and the other to the main frame, in combination with the auxiliary springs G^2, interposed between the main spring and the drum on which it is wound, all constructed and arranged to operate substantially as and for the purpose set forth.

298,002. TILE-MACHINE. WARNER LEWIS, Stone Bluffs, Ind. Filed Aug. 11, 1883. (No model.)

Claim.—1. The combination, with two plungers, screws, or augers, of two cylinders, *a a*, divided by a partition closed at one end, open at

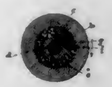
298,002.



the other, and provided at the open end with a cup-shaped die-plate, *e*, open at *g*, and a central conical core, *h*, as and for the purpose described.

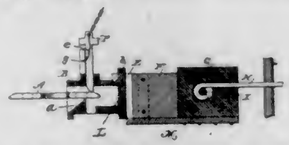
2. The cylinder of a tile-machine, having its internal diameter decreasing from the clay-inlet to its outlet, to condense the clay as it approaches the die, and thus make a strong shell for the tile.

3. The core *h*, having a central stem, *i*, oppositely notched at *j*, in combination with the two sections forming cylinders *a a*, and provided with an intermediate recess, half in each section, and adapted to fit over said stem, as and for the purpose specified.



298,003. CHECK-ROWER FOR CORN-PLANTERS. CHARLES S. LOCKE, Joliet, Ill. Filed Jan. 29, 1884. (No model.)

Claim.—1. In a check-rower for corn-planters, the combination of the frame H, having the slot F', seat-plate F, bracket-arm E, and plate A'', the several parts adjustably secured together, as and for the purpose set forth.



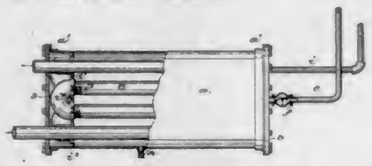
2. In a check-rower for corn-planters, the combination, with the frame H, of the seat F, bracket-arm E, and plates A'', the several parts being provided with the serrations described, and held adjustably together, as and for the purpose set forth.

298,004. CATCH FOR SHADE-ROLLERS. ALSON A. LOTHROP, Boston, Mass., assignor to Charles H. Cushman, same place. Filed June 27, 1883. (No model.)

Claim.—The combination of the clutch *f*, groove *g*, grooved disk *c*, and strip of felting *e*, when used for shade-rollers, as hereinbefore shown and described.

298,005. CAR-COUPLING. FERDINAND F. LUTZ, Louisville, Ky. Filed Feb. 14, 1884. (No model.)

Claim.—1. In a car-coupler, the combination, with the draw-head having the solid back provided with the lateral extensions *b*, of the side plates having slots to receive the said extensions, and the cushion-block F, substantially as specified.



2. In a car-coupler, the combination, with the draw-head constructed as described, having the lateral extensions *b*, of the side plates, J, having the slots *d*, the vertical strips D, and cushion-block L, substantially as specified.

3. The combination, with the draw-head constructed as described, of the block G, provided with the arm H, to receive the king-bolt, the base-plate M, side plates, J, having the forward loops, C, and slots *d*, the draw-head having the rear lateral extensions, *b*, the vertical strips D, elastic block F, and interspace E, substantially as specified.

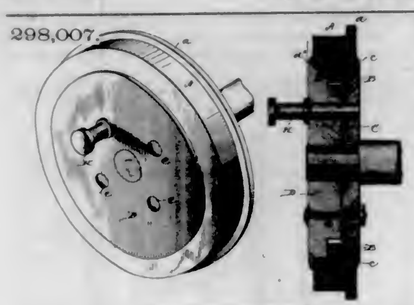
4. The combination, with the draw-head having the bossed pin-aperture, of the coupling-pin constructed as described, the pin-set, and coupling-link, substantially as specified.

5. The combination, with the draw-head having its inner walls tapering rearwardly, and provided with the incline *a*, of the coupling-link A, having its flat and edge walls beveled at their ends, the pin P, having its lower end beveled, and the pin-set connected to the pin, substantially as specified.

298,006. FEED-WATER HEATER. CHARLES H. MASCON, Muskegon, Mich. Filed Nov. 23, 1883. (No model.)

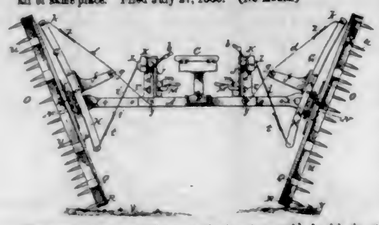
Claim.—1. The combination of the exhaust-pipes of a locomotive with a feed-water heater consisting of a case or chest and circulating-coil for the feed-water, and steam-inlet pipes leading from each of the exhaust-pipes of the locomotive to the said case, and check-valves within the said pipes opening toward the case, substantially as and for the purpose set forth.

2. In a feed-water heater, the combination of the chest or case to receive steam with the circulating-pipes for the feed-water, the said pipes being connected at the ends of the case by elbows resting in contact with one another and with the walls of the case for supporting the said circulating-pipes, substantially as described.



3. The combination of the exhaust-pipes of the locomotive with the heater-case and circulating-pipes for feed-water therein, the steam-inlet pipes *c c'*, leading from the exhaust-pipes to the case, and the outlet-pipe *i*, leading from the said case into the smoke-box of the engine, substantially as described.

4. The combination of the case *a*, circulating-pipes *c* therein, flanged elbows *i*, connecting the said pipes, and having their flanges in contact with one another, the said elbows being provided with lugs i^2, affording a support for the said pipes from the interior of the case, substantially as described.

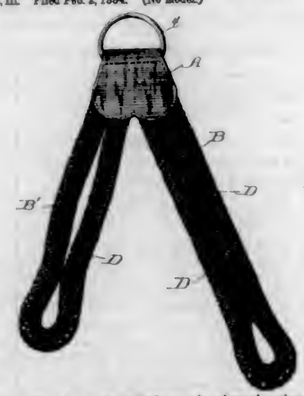


298,007. LOCOMOTIVE-WHEEL. JOHN H. MANN, Grafton, assignor of one-half to Newton J. Myers, Decatur, Tex. Filed Jan. 26, 1884. (No model.)

Claim.—The combination, with a rim, A, having the flange B, of a core, D, consisting of the portions *d d' d^2*, a plate, C, having a flange, *c*, said core and plate being secured to the rim by transverse bolts, and having a central opening for the axle, and being also provided with a hole or opening within which is seated a crank-pin, substantially as set forth.

298,007.

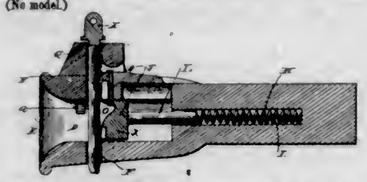
298,008. ROTARY HARROW. DAVID MANUEL, Hyde Park, Mass., assignor of seven-eighths to Benjamin E. Phillips, Lawrence A. Boylan, George Haigh, William H. Julian, John H. Monahan, and Herbert C. Somes, all of same place. Filed July 27, 1883. (No model.)



Claim.—1. In a rotary harrow, the bar A, provided with the standard J, having the arm K, the shaft L, provided with the pulleys *n n*, and crank *b*, the treadle M, provided with the chain *l*, and the chains *i d*, for raising, lowering, and securing the wheel O, substantially as described.

2. In a rotary harrow, the head-stock E, carrying the wheel O, and provided with arms G H, and upwardly-projecting arm *f*, in combination with the chains *i d*, and means for drawing and releasing the latter, the arm *f* acting as a lever, against the outer end of which the chain *d* operates in raising and lowering the wheel O, substantially as described.

3. The combination, substantially as set forth, of a bar, arms horizontally pivoted to the outer ends thereof, short axles attached to said arms, wheels on said axles provided with harrow-teeth, a winding mechanism, and elastic extensible cords connecting said arms with said winding mechanism.

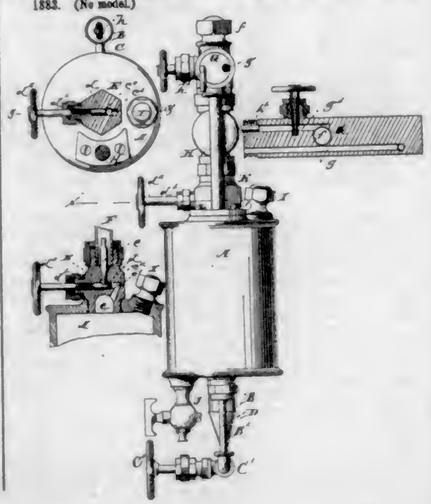


298,009. SUSPENDER-END. MORRIS MARCUS and HERMAN ANDES, Chicago, Ill. Filed Feb. 2, 1884. (No model.)

Claim.—1. In a suspender-end, the reaches formed each or both of two strips of material of unequal width, the wider strip of each reach being doubled to bring two of the edges adjacent to each other, and the narrower strip being superposed upon the wider and crossed, to form the button-hole, from one of the double parts of the wider strip to the other, substantially as described.

2. In a suspender-end, the reaches formed each or both of two strips of material of unequal width, the wider strip of each reach being doubled to bring two of the edges adjacent to each other, and the narrower strip being superposed upon the wider and crossed upon itself at one or more points upon the wider strip, and being secured longitudinally flatwise upon the same to maintain the inner edges of the doubled part of the said wider strip in contact with each other and to form the button-hole, substantially as described.

298,010. CAR-COUPLING. SAMUEL BROOKS MAYFIELD, Palestine, Tex., assignor to Mary L. Mayfield, same place. Filed Mar. 14, 1884. (No model.)

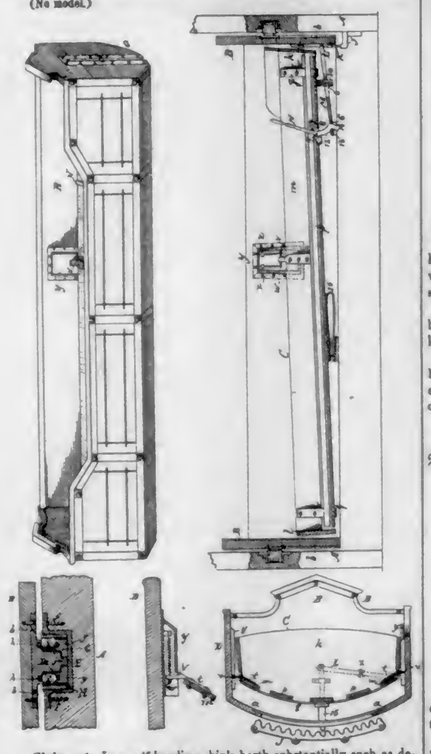


Claim.—1. In a car-coupling, the combination, with the draw-head having the guide and stop around the coupling-pin perforation on its top face, the stops on the inner faces of the vertical walls of the link-chamber in front of the pin-perforation, and the bore in its stem communicating with the link-chamber, of the pin-supporting slide having its head working in the link-chamber beneath the upper portion of the pin-perforation, and its stem or bar working against the spring in the bore of the stem of the draw-head, substantially as specified.

2. As an improvement in car-couplings, the combination of the draw-head having the longitudinally-disposed bore or recess H in its stem, the vertical coupling-pin perforation F, the longitudinal top groove, Q, extending to and opening into the pin-perforation F, and the longitudinal slot U, opening into the pin-perforation F at its front end, the spring I, fitting neatly into the bore H, and working against the front end of the spring I, and the supporting-plate S, sliding in the groove and over the pin-perforation, and provided with the downwardly-extending tongue T at its front end which works in the slot, and is secured to the top edge of the slide J at the front end of the latter, as set forth.

3. The combination, with the draw-head having the longitudinal groove in its top surface, and a longitudinal slot arranged centrally in the bottom of said groove, of a spring-actuated slide having its head provided with a straight front face, at the top of which is formed a projecting flange, and in the surface of which is provided a recess, from which extends a perforation up through the head, a slide-plate working in the groove and having a downwardly-projecting tongue at its front end, through which a perforation is provided, and a pin or bolt passing through the perforations to secure the slide and guide-plate together, as set forth.

298,011. LUBRICATOR. GEORGE MCNEIL, Chicago, Ill. Filed Oct. 23, 1883. (No model.)



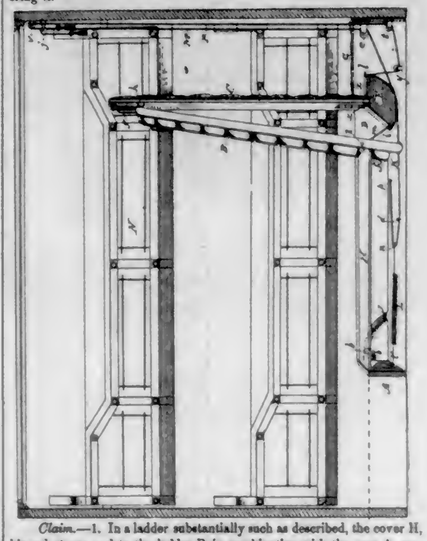
Claim.—1. The chamber G, having a passage, *g*, for steam and a passage, *g'*, for lubricant, in combination with a pipe, B, for the water of condensation, reservoir A, having communication with the pipe B, and oil-feed tube F, substantially as and for the purposes specified.

2. The chamber G, having a passage, *g*, for steam and a passage, *g'*, for oil, in combination with the pipe B, trap-pipe *h*, reservoir A, communicating with the pipe B, and feed-pipe F, substantially as and for the purposes specified.

3. The reservoir A and plug E, having an opening, *e*, and passages *e' e''*, in combination with the feed-tube F and feed-nozzle *e*, substantially as and for the purpose specified.

4. The reservoir A, pipe B, having the trap-pipe *h* located therein, and feed-pipes C D, in combination with the plug E, feed-pipe F, and chamber G, having the passages *g g'*, substantially as and for the purposes specified.

298,012. SHIP'S BERTH. CHARLES A. MILLIGAN, Somerville, and MICHAEL J. KILLION, Boston, Mass., assignors to the Excelsior Self-Leveling Berth and Automatic Ladder Company, Portland, Me. Filed Feb. 7, 1884. (No model.)



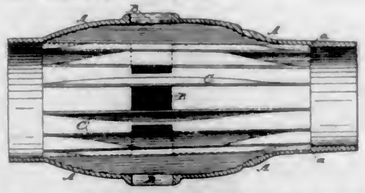
Claim.—1. In a self-leveling ship's berth substantially such as described, the lever N, pivoted to the side of the berth, and provided with the bend or cam 12, and headed stud 14, in combination with the pivoted lever M, and means for locking the berth, substantially as specified.

2. In a self-leveling ship's berth substantially such as described, the berth B, provided with the dovetail grooves *d*, for receiving the beveled or dovetailed flange on the journal D, substantially as specified.

3. The improved self-leveling ship's berth herein described, the same consisting of the berth B, provided with the sockets E, bushings H, grooves *d*, springs *x*, bar *w*, and rack J, the crib C, provided with side rails, *m*, studded bars *i*, slats *p*, bands *q*, levers L M N, bar K, flanged journal D, cap G, and rollers *i*, constructed, combined, and arranged to operate substantially as shown and described.

298,013. LADDER. CHARLES A. MILLIGAN, Somerville, and MICHAEL J. KILLION, Boston, Mass., assignors to the Excelsior Self-Leveling Berth and Automatic Ladder Company, Portland, Me. Filed Feb. 7, 1884. (No model.)

Brief.—The portable ladder is folded into a case or housing which is provided with tracks and covers and mechanism for raising and lowering it.



Claim.—1. In a ladder substantially such as described, the cover H, hinged at one end to the ladder B, in combination with the case A, provided with the tracks J, and means for raising and lowering the ladder, substantially as specified.

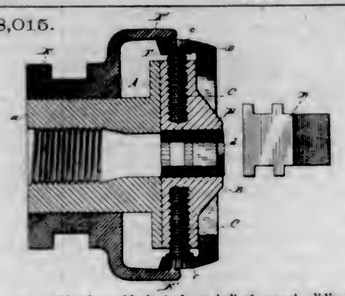
2. In a ladder substantially such as described, the cover H, in combination with the ladder B, cover C, case A, and means for raising and lowering the ladder, substantially as set forth.

3. In a ladder substantially such as described, the cover H, in combination with the ladder B, cover C, case A, means for raising and lowering the ladder, and means for elevating and supporting the outer end of the cover H when the ladder is erected, substantially as specified.

298,014. VEHICLE-HUB. JOHN MONK, Lynn, Mass. Filed Sept. 6, 1883. Renewed Oct. 9, 1883. (No model.)

Claim.—1. A hub having a shell provided with radial tapering ribs extending from the back band to the front band of the hub, in combination with a wooden core, substantially as set forth.

2. A hub having a shell provided with radial tapering ribs extending from the back band to the front band of the hub, in combination with a wooden core having a groove, into which the tenons of the spokes enter and form a solid base, substantially as described.

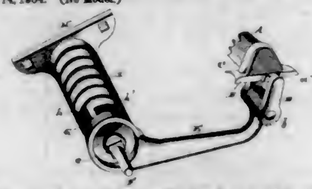


3. A hub having a shell made in one piece, and provided with radial ribs extending from the back band to the front band, and forming spaces *b*, into which the spokes expand, as and for the purpose set forth.

4. In a hub, the combination of a shell, A, provided with radial tapering ribs C, extending from the back band to the front band, in combination with a wooden core having radial groove D, in which the spokes are secured and form a solid base, substantially as specified.

298,015. LATHE-CHUCK. WILLIAM A. MONTGOMERY, Cleveland, Ohio. Filed July 21, 1883. (No model.)

Claim.—1. The combination, with the body or shell of a chuck, sliding jaws adjustably secured to screws, and springs yieldingly connecting the screws to the shell or casing, of devices for simultaneously forcing the jaws toward each other.

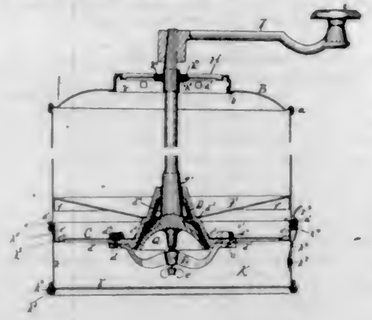


298,015.

2. The combination, with the body or shell of a chuck, sliding jaws adjustably secured to screws, pinions secured to the outer ends of the screws, and springs for yieldingly connecting the jaws to the body or shell, of the ring D, provided with teeth for engaging the pinions on the screws, and devices for simultaneously forcing the jaws toward each other.

3. The combination, with the body or shell of a chuck, the sliding jaws, screws, pinions, springs, and ring D, of the hub provided with the flange E', all of the above parts combined and adapted to operate as described.

298,016. SIDE-BAR VEHICLE. HOLLIS W. MOORE, Olean, N. Y. Filed Feb. 14, 1884. (No model.)



Claim.—1. The combination, with a bracket provided with a shell, and a second bracket or bearing, a shaft supported in said brackets, and a sleeve placed on said shaft, the said sleeve being provided with a serrated head, of an arm having a serrated portion adapted to engage the serrated portion of the sleeve, and a coiled spring, one end of which is secured to the bracket having the shell thereon, while the opposite end is secured to the sleeve.

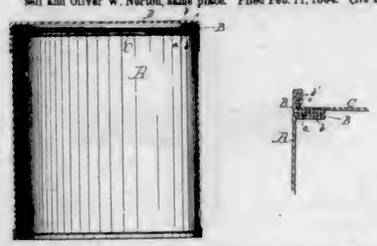
2. The combination, with a shaft suitably journaled to the under side of a vehicle-body, a sleeve placed on said shaft, and an arm secured to the sleeve, of a coiled spring, one end of which is indirectly connected to the vehicle-body, while the opposite end is secured to the sleeve.

3. The combination, with the shaft, the bracket provided with the shell, and a second bracket or bearing, of the sleeve, arm, clip, clip-tie, and stirrup, substantially as set forth.

4. The combination, with supporting-brackets, the sleeve, arm, and nut for securing the parts together, of a coiled spring, one end of which is indirectly connected to the vehicle-body, while the opposite end is secured to the sleeve, substantially as set forth.

298,017. COMBINED COFFEE CANISTER AND MILL. EDWIN NORTON, Chicago, Ill., assignor to himself and Oliver W. Norton, same place. Filed Oct. 20, 1883. (No model.)

Claim.—1. The combination, with a sheet-metal coffee-canister, of a removable box at the bottom of the same for the reception of the ground coffee, and a coffee-mill having a stationary grinder secured to the sheet-metal bottom of the canister, and projecting up through an opening in the same, and having its rotary grinder secured to a shaft which projects up through the canister, and is journaled at its upper end in the removable sheet-metal cover of the canister and at its lower end in the stationary grinder, said sheet-metal cover being provided with screw-coupling devices to secure the cover rigidly to the canister, and thus afford a fixed bearing for the shaft, substantially as specified.

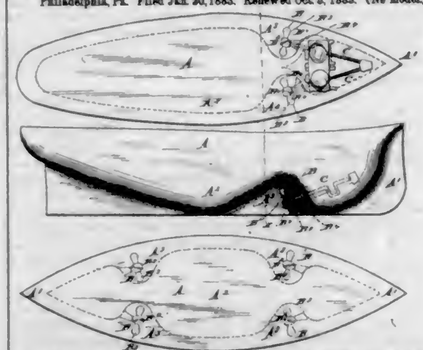


2. The combination, with the sheet-metal bottom C of the canister, of the stationary grinding cone or shell projecting up through an opening in said bottom, and secured thereto by screws passing through a flange on said cone and entering nuts soldered to said bottom, substantially as specified.

3. The combination, with sheet-metal canister-bottom C, of stationary grinding-cone D and bridge-piece E, secured to said bottom C by screws entering threaded nuts soldered to said bottom, substantially as specified.

4. The combination, with bottom C, of body A, having an exterior crimp, *a'*, and hinged box K, provided with a spring-clamp adapted to fit over said crimp to fasten said box to the canister, substantially as specified.

5. The combination, with canister-body A, of bottom C, secured thereto, and box K, provided with a wire at its top, and hinged to said bottom C by a strap folded over said wire and soldered to said bottom, substantially as specified.



298,018. PAINT-CAN. EDWIN NORTON, Chicago, Ill., assignor to himself and Oliver W. Norton, same place. Filed Feb. 11, 1884. (No model.)

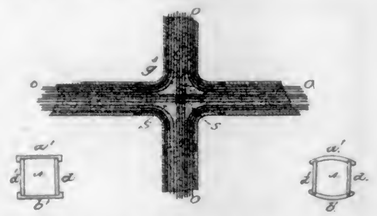
Claim.—1. The combination, with a can-body provided with an interior shoulder to support the seam while it is being formed, of a can-head secured thereto by a double seam folded inwardly and resting upon said shoulder, substantially as specified.

2. The combination of can-body A, provided with inturned flange *a*, with seamless ring B, folded over said flange, and can-head C, having upturned flange *c*, folded with said seamless ring inwardly into a double seam, substantially as specified.

298,019. SHIP'S HULL AND PROPELLER. ZACHARIAH ORAM, Philadelphia, Pa. Filed Jan. 30, 1883. Renewed Oct. 5, 1883. (No model.)

Claim.—1. The combination of a vessel having concavities forward of the midship section and below the water-line with two or more screw-propellers having an oblique downward and outward thrust, located wholly or partially in such concavities, and rotated separately and independently by motors having a driving-shaft in common with each propeller, substantially as and for the purpose set forth.

2. The combination of a vessel having concavities in the hull forward of the midship section and below the water-line, adapted to receive and guide the currents of water to and from screw-propellers located wholly or partially therein, with the screw-propellers having a downward and outward direction of thrust toward the stern of the vessel, and susceptible of independent rotation, substantially as and for the purpose set forth.



3. The combination of independent engines susceptible of varying and adjustable regulation of speed and direction of motion relatively to each other with propellers located in cavities of a vessel forward of the midship section, and having downward and outward rearward thrust, as and for the purpose set forth.

4. The combination, in a vessel adapted to sail in either direction of its length of keel, of two or more sets of screw-propellers having their axes inclined outwardly and downwardly toward the midship section of the vessel, located wholly or partially in concavities, substantially as and for the purpose set forth.

5. In a vessel having two or more hulls combined in parallel position, the combination of a series of two or more independent engines with screw-propellers having their axes inclined outwardly and downwardly toward the midship portion, such propellers located in or partially within cavities formed in said hulls aft of the bows and forward of the midship section.

6. In a vessel propelled by power internally applied, the combination of screw-propellers located forward of the midship section with projections in the form of zones or segments of prolate spheroids, surrounded by receding curved surfaces, substantially as shown and described.

298,020. LAYING UNDERGROUND ELECTRIC WIRES. JOEL H. PAGE, Philadelphia, Pa., assignor of one-half to Blanch Carrie King, same place. Filed Nov. 16, 1883. (No model.)

Claim.—1. In forming angles in and turning corners with systems of wires laid underground for telegraphic and other electrical purposes, the method of simultaneously laying, protecting, securing, and wholly insulating severally each wire, by arranging and holding in suspension in close proximity to each other to the point of divergence the desired number of wires, and pouring upon them simultaneously an insulating compound, until the whole are embedded to that point, and after the compound has set making the desired diversions, and repeating the operation in the new directions of the several wires, substantially as shown and described.

2. For laying systems of underground wires for telegraphic, telephonic, and other electrical purposes, an extensible jointed conduit-case consisting of removable parts longitudinally dovetailed to engage and secure and made interchangeable with each other, so that the conduit may be extended to any desired length, and be free from lateral joints, substantially as shown and described.

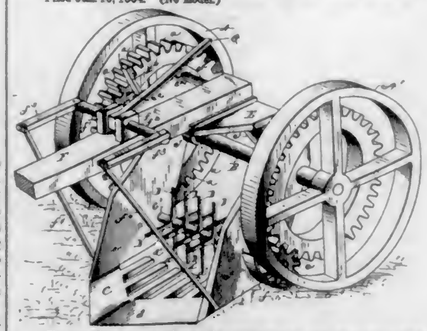
3. A longitudinal conduit-case consisting of top, bottom, and side pieces, quartered longitudinally, and dovetailed to adjust into and secure each other, the whole made continuous through intersecting joints, in combination with a system of underground wires for telegraphic and other electrical purposes, secured and insulated by being wholly embedded in an insulating compound, substantially as shown and described.

4. In systems for underground wires for telegraphic, telephonic, and other electrical purposes, the combination of longitudinal conduit A, angle-joint *g*, lateral and vertical ducts, and test-box *n*, the latter above the surface of the street, securing, protecting, and insulating compound *s*, and systems of wires *o*, substantially as shown, and for the purpose described.

5. In combination, systems of wires *o* for telegraphic, telephonic, and other electrical purposes, insulating and protecting compound *s*, conduit-case A, connecting-joints *h*, and man-holes *r*, for reaching, testing, and repairing defects, together with angle-joints *g*, lateral and vertical ducts, and test-box *n*, above the surface of the street, the whole constructed and arranged substantially as shown and described.

6. In systems of wires for electrical purposes laid underground in common conduits, the combination of the longitudinal casing A, comprising top, bottom, and side parts, and intersecting receiving connecting-sections, hollow intersecting angle-joints *g g' g² g³*, having openings at diverging angles to each other, insulating, securing, and protecting compound *s*, systems of wires *o*, embedded therein, man-holes *r*, for reaching the conduit, and laterally-arranged test-boxes *n*, rising above the surface of the street, substantially as shown and described.

7. Angle-conduits separable horizontally into top, bottom, and intervening side pieces, forming a simple hollow empty case, accessible from the top and side, provided with diverging outlets through branching arms, as shown, and designed and arranged for separating and diverging in various directions systems of wires laid underground for electrical purposes, substantially as and for the purpose described.



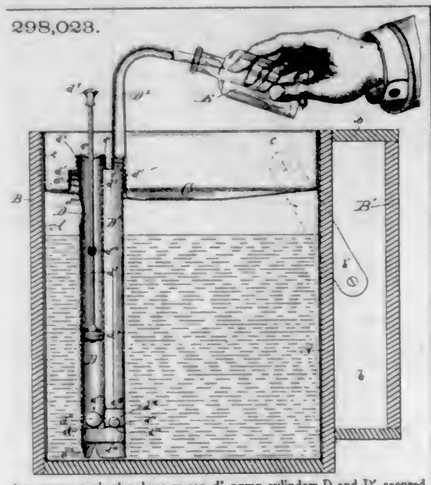
8. An angle-conduit consisting of a simple hollow horizontally-separable empty case, accessible from the top and sides, constructed of top, bottom, and intervening side pieces, and provided with diverging outlets through branching arms, and designed and arranged for separating and diverging in various directions systems of wires laid underground for telegraphic, telephonic, and other electrical purposes, in combination with an insulating compound, *s*, and systems of wires *o*, laid therein, substantially as shown and described.

298,021. SECURING CARRIAGE WINDOW-FRAMES TO CURTAINS. ARIJAH S. PARKER, Cincinnati, Ohio. Filed Dec. 12, 1882. (No model.)

Claim.—A window-frame for carriage-curtains, of leather, textile fabrics, or other material, composed of an outer glass-receiving frame, a second glass-retaining frame provided with tangs which project from the frame at a distance from the edge of the outer frame, and an inner frame against which the tangs are clinched, substantially as and for the purpose specified.

298,022. POTATO-DIGGER. FRANK A. PAUL, South Wales, N. Y. Filed Jan. 10, 1884. (No model.)

Claim.—In a potato-digger, the combination, with carrying-wheels mounted upon a suitable axle, and provided on their inner sides with a circumferential series of teeth, of a frame loosely mounted on the axle of said wheels, extending forwardly and terminating in a pointed end, and provided with rearwardly-extending arms, a shaft carrying pinions adapted to mesh with the teeth of the carrying-wheels, and journaled in the sides *c c'*, said shaft being also provided with arms or fingers D, guards *f*, arranged below the pinions, and a suitable lever for raising and lowering said frame, substantially as set forth.



298,023. COMBINED BOTTLING AND SHIPPING CAN. CHARLES R. PEASLEE, Louisville, Ky. Filed Feb. 25, 1884. (No model.)

Claim.—1. The combined transportation and filling can consisting of a can and its inclosing-jacket having a depressed head or tray furnished with a drip-nozzle and an oil-pump, and means for closing the openings in said head when the pump or its plunger is removed, said tray being adapted to contain the pump or its plunger when removed for transportation, substantially as specified.

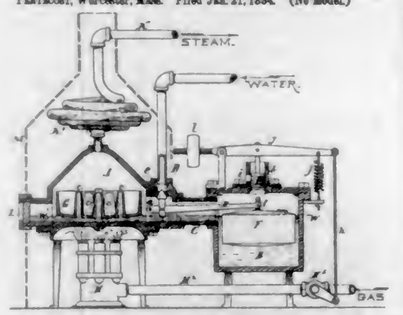
2. The combination, with the can A and its inclosing-jacket, of the depressed head or tray C, having its vertical flange or wall *c* secured to the top edge of the can-body, and being provided with a screw-nozzle for attachment of a removable pump, and adapted to store said pump during transportation, said vertical flange *c* serving to strengthen the wall of the can-body, and adapt the same to brace against the cover of the jacket and hold the can in position therein, substantially as specified.

3. The combination of the can A, jacket B, tray C, provided with downwardly-projecting drip-nozzle c^2 and cork c^3 and upwardly-project-

298,023.

ing screw-nozzle c^4 and screw-cap d', pump-cylinders D and D', secured to said cap d', screw-nozzles d^2 and d^3, also secured to said cap, and caps d^3 d^3, for closing said nozzles, substantially as specified.

4. The combination, with the can A, of the depressed head or tray C, provided with screw-nozzle c^4, of the cap d', adapted to fit on said screw-nozzle, and provided with screw-nozzles d^2 d^3, pump-cylinders and plunger, and the bottling-spout D^2, secured to said nozzle d^3, substantially as specified.



5. The combination, with the can A and its head C, provided with a screw-nozzle, c^4, of the pump-cylinder D and outer cylinder, D', provided with a screw-cap, d', having screw-nozzles d^2 and d^3 communicating with said cylinders D and D', respectively, substantially as specified.

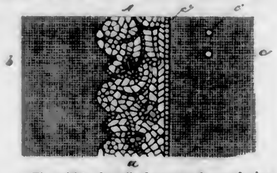
6. The combination, with can A, of protecting-jacket B and its cover B', provided with rim *b* and hinge-straps *b'*, pivoted at each end to said jacket and cover, substantially as described.

7. The combination, with can A, of protecting-jacket B, provided with rim *b*, hooks b^2, and staples b^3, secured to the lower edge of said rim *b*, substantially as specified.

8. The combination, with a transportation-can and its protecting-case having a receptacle at the top for an oil-pump or its plunger, of a pump provided with a screw-cap for securing it to the can, said cap being provided with a nozzle communicating with one chamber of the pump for attachment of a spout, and another screw-nozzle communicating with the pump-cylinder, so that the same may be closed by a cap, substantially as specified.

298,024. APPARATUS FOR GENERATING STEAM. WILLIAM A PENTECOST, Worcester, Mass. Filed Jan. 21, 1884. (No model.)

Claim.—1. The combination of the heating-chamber A, flat at its base, for containing a thin sheet of water, the auxiliary tank B, of greater depth, connected therewith by the conduit C, leading from the bottom level of said chamber to the upper part of said tank, the water-inlet having valve *s*, the valve-lever E, fulcrumed as at *a* and extending through said conduit, the float F, attached to said lever, the steam-delivery K, and burner H, said parts being constructed and relatively arranged for operation substantially as shown and hereinbefore described.



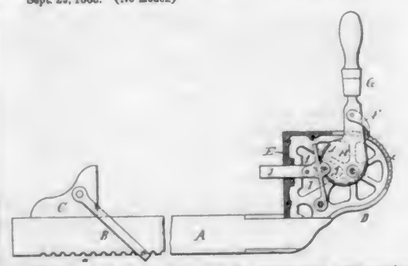
2. The combination, with the generating-chamber A, auxiliary tank B, valve-regulating float F, and valve *e*, of the circular pan or dish-shaped piece G, secured within said chamber, substantially as and for the purpose described.

3. The combination, with the generating-chamber A, having connected therewith the tank or regulating-chamber B, of the disk-shaped piece G, provided with tubes *c*, substantially as set forth.

4. The cylinder *b*, having the side opening, *i*, the piston I, the lever J, and adjustable weight *l*, and spring *j*, in combination with the boiler A, tank B, and burner H, the same being adapted for action as a safety-valve and for regulating the flame of the burner, substantially as set forth.

5. The combination, substantially as hereinbefore described, of the chamber or boiler A, the chamber or tank B, connected therewith, as at C, the water-supply pipe D, having valve *e*, the float F, lever E, the burner H, the coil K', and steam-delivery pipe K, for the purposes set forth.

298,025. EMBROIDERY. MORRIS H. PULASKI, Philadelphia, Pa. Filed Dec. 7, 1883. (No model.)



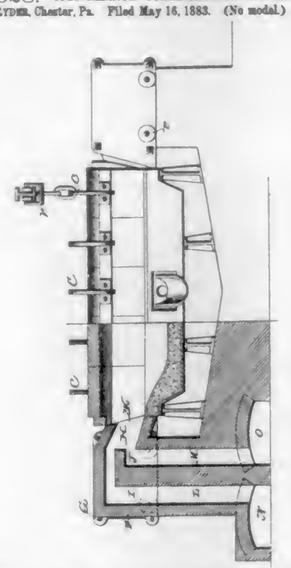
Claim.—1. The within-described process for producing embroidery-lace, which consists of the following steps: first, drawing aside in desired directions in an unbroken condition each and all of the strands of all of the meshes of a piece of textile fabric specially adapted for the purpose, and gathering said strands into groups to form open spaces therein of predetermined configurations, then covering over and concealing with embroidery-threads all of the strands so drawn aside, substantially as set forth and described.

2. As a new article of manufacture, embroidery-lace composed of a foundation of textile fabric specially adapted for the purpose, each and all the strands of all the meshes of which are drawn aside in desired directions in unbroken condition and gathered in groups to form openings of predetermined configurations, said strands being entirely covered over and concealed from view with overlapping embroidery-threads, substantially as described and shown.

298,026. METHOD OF MANUFACTURING ARTIFICIAL STONE. MICHAEL B. RANDLE and BENJAMIN E. TURNER, Statesborough, Ga. Filed Dec. 31, 1883. (No specimens.)

Claim.—The herein-described method of manufacturing artificial stone, consisting in subjecting a molded and partially-hardened mass of cement, sand, and lime to a rubbing operation of cement, lime, and water for filling the cavities or pores in the stone and giving it a smooth or polished surface, and finally saturating the stone with lime-water, substantially as herein set forth.

298,027. JOINER'S CLAMP. FRITZ RESTORFF, Chicago, Ill. Filed Sept. 29, 1883. (No model.)

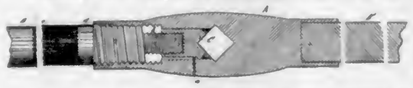


Claim.—1. In a joiner's clamp, the combination, with notched strip A and block C, adjustably mounted thereon, of lever G, provided with flanged cam-head H, rocker-bar I, connected to said cam-head by inwardly-projecting pins, and pusher-bar J, secured to said rocker-bar, said lever, rocker-bar, and pusher-bar mounted between plates D, secured to the end of strip A, as and for the purpose set forth.

2. In a joiner's clamp, the lever G, provided with flanged cam-head H, carrying pawl F, and mounted between notched plates D, in

combination with rocker-bar I, connected with said lever by inwardly-projecting pins, pusher-bar J, secured to said rocker-bar, and block O, said block adjustably mounted on notched strip A, to the end of which plates D are secured, as set forth.

298,028. OPEN-HEARTH STEEL-MELTING FURNACE. CHARLES M. RYDER, Chester, Pa. Filed May 16, 1883. (No model.)



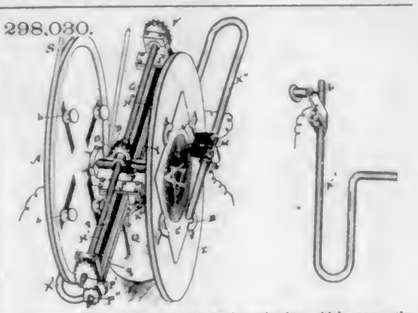
Claim.—1. An open-hearth steel-melting furnace having its sides composed of movable sections, and its roof composed of removable and interchangeable transverse sections, the ends of the roof-sections being supported by the removable side-wall sections, substantially as set forth.

2. An open-hearth steel-melting furnace having its sides and roof composed of removable and interchangeable sections of equal width, substantially as set forth.

3. An open-hearth steel-melting furnace having gas and air flues combined in a single structure, adapted to be moved toward and from the body of the furnace, substantially as set forth.

4. An open-hearth steel-melting furnace having gas and air flues combined in a single structure mounted on wheels, and adapted to be moved toward and away from the body of the furnace, substantially as set forth.

298,029. TAP-WRENCH. NELSON SAWYER, Hartford, Conn., assignor to Wallace A. Downes, Sing Sing, N. Y. Filed July 14, 1883. (No model.)



Claim.—The socketed wrench-head having the angular opening, the movable bit, the retaining-pin, and the handle having the oppositely-inclined threaded portions and plain part, all combined and arranged substantially as shown and described, and for the purposes set forth.

298,030. AUTOMATIC ELECTRIC COPYING AND ENGRAVING MACHINE. ALBERT SCHMID, Zurich, Switzerland. Filed Oct. 23, 1883. (No model.)

Claim.—1. In a copying or engraving machine, the combination of the revolving disks A and E, carried at opposite ends of the shaft D, the tracing-point L and drawing point or chisel N, and suitable automatic feed mechanism which moves the tracing-point and drawing point or chisel across the face of their respective disks, substantially as and for the purpose set forth.

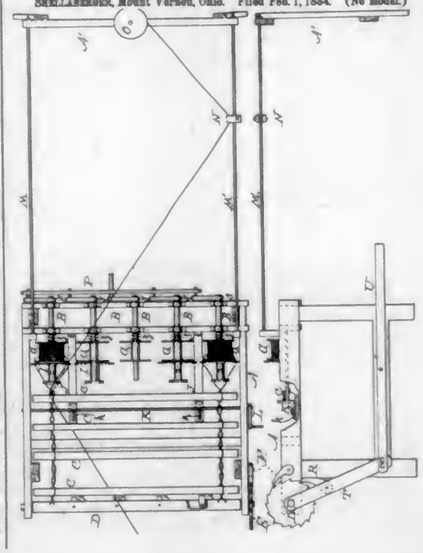
2. In a copying or engraving machine, the combination of the revolving disks A and E, carried at opposite ends of the shaft D, the tracing-point L and drawing point or chisel N, controlled by the armature

298,030.

of a magnet, M, suitable automatic feed mechanism which moves the tracing-point and drawing point or chisel across the face of their respective disks, and an electric circuit established through the tracing-point and its disk and the electro-magnet, substantially as and for the purpose set forth.

3. In a copying or engraving machine, the combination of the arms K' and K'', cross-heads J' and J'', feed-screws H' and H'', and suitable gearing connecting the feed-screws with the shaft D, constituting a feed mechanism for the tracing point and chisel, substantially as set forth.

298,031. CLASP FOR GARMENTS. CHRISTOPHER C. SHELBY, New York, N. Y. Filed Mar. 12, 1884. (No model.)

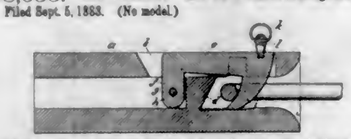


Claim.—1. The herein-described garment-holder constructed of tubular tapering form, and having a longitudinal tapering slot closed at the lower or smaller end, as set forth.

2. The holder consisting of the plate provided with the side wings turned so as to form a slotted tapering tube, and having also the third wing at the bottom of the slot, for closing the lower or smaller end of the slot and assisting in sustaining the side wings in position, substantially as described.

3. The holder consisting of the plate provided with the side wings turned so as to form a slotted tapering tube, and having the wing at the bottom of the slot, and means for attachment to the cord or webbing, substantially as described.

298,032. MACHINE FOR MANUFACTURING FENCES. GEORGE H. SHELLABERGER, Mount Vernon, Ohio. Filed Feb. 1, 1884. (No model.)



Claim.—1. The combination of the shafts B, frictional springs Z, spools G, and guides I with crank S and bar P, or equivalent mechanism for operating the same, substantially as set forth.

2. The combination of the spring-arm J, having a vertical projection above and a horizontal projection below, and the shaft K, with bearing-arms, as a device for holding and freeing the palings, substantially as set forth.

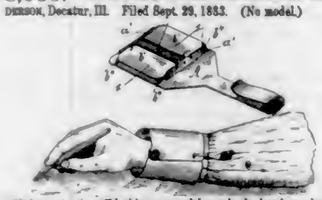
3. The combination of the wire-spool O, rods M M', and transferable guide N, for the purpose of directing a wire diagonally into position to be interlaced with the fencing-panels, substantially as set forth.

4. In a machine for the manufacture of fencing, the spool G, carrying two wires supported on a horizontal shaft, and with guides, as set forth, to direct the wires to the palings, substantially as described.

298,033. CAR-COUPLING. NEWTON J. SKAGGS, Montgomery, Ala. Filed Sept. 5, 1883. (No model.)

Claim.—The combination, with a draw-head provided with the vertical longitudinal recess *b* in its upper wall, of the abutment *d* midway of the opening in the draw-head, having its outer face inclined outwardly and upwardly, in combination with the coupling-bar *e*, having the vertical arm *f*, perforated laterally near its lower end at the rear end thereof, and the downwardly and rearwardly curved hook *i* near its front end, substantially as specified.

298,034. BAGGAGE-CHECK. CLARENCE C. SMITH, Camptown, Pa. Filed Feb. 11, 1884. (No model.)



Claim.—1. The combination, in a changeable baggage-check, of the slotted side plates, the circular name-disk having a notched or toothed periphery, the fixed teeth arranged between the side plates, and means for fixing the disk in its adjusted position by interlocking or engaging its toothed periphery with the fixed teeth, substantially as set forth.

2. The combination, in a changeable baggage-check, of the slotted side plates, the circular disk having a central circular aperture and a notched or toothed periphery, the fixed teeth arranged between the side plates, the cam or eccentric inserted through the center of the disk between the side plates, and the finger-buttons for adjusting the position of the cam or eccentric, substantially as set forth.

3. The combination, in a changeable baggage-check, of the slotted side plates, the circular disk having a central circular aperture, a notched or toothed periphery, and the names of stations arranged radially in curved lines on opposite sides of the disk, the names on one side alternating or breaking joints with the names on the opposite side, and means for fixing the disk between its side plates when it has been adjusted to its proper position, substantially as set forth.

298,035. CUFF-HOLDER. FRANK W. STAFFORD and GEORGE A. HENDERSON, Decatur, Ill. Filed Sept. 29, 1883. (No model.)

Claim.—1. A cuff-holder comprising a body having a hook or equivalent means for sustaining the cuff, and having a spring-clip arranged to clasp the shirt-sleeve in direction of the length of the sleeve, substantially as described.

2. A cuff-holder comprising the body A, the hook D, the jaws, and the spring C, substantially as described.

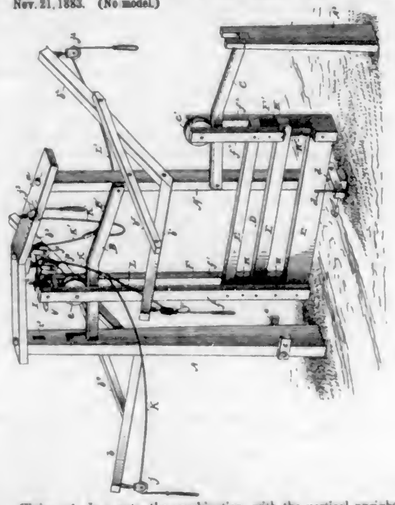
3. A cuff-holder having a body, A, provided at one end with means for attachment to the cuff, and having the flanges *a'* and the spring-jaws pivoted thereto, substantially as described.

4. A cuff-holder having the body A, with cut-away space *a*, the hook D, the flanges, and the pivoted spring-jaws, substantially as described.

5. A cuff-holder having the body A, the hook D, or its equivalent, and the clamping-jaws extending through said body, whereby said jaws may clamp the fabric on one side of said body and may be operated from the opposite side, substantially as described.

6. A cuff-holder having the body A, the hook D, the clamping-jaws extending through said body, and having flanges to elevate the parts *b'* of said jaws above the body, substantially as described.

298,036. SWITCH-OPERATING MECHANISM. JAS. D. STANWOOD, Boston, Mass. Filed Apr. 28, 1883. (No model.)

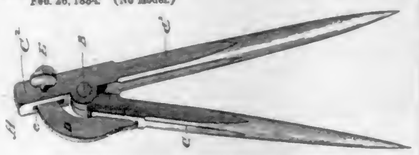


Brief.—Shifting device for a tramway-switch, to be operated by treadles carried by the car and controlled by the driver, embraces a horizontally-sliding bar placed beneath the surface crosswise of the track and connected to the switch; also, vertically-sliding pins connected to said bar by mechanism described in the second claim and arranged to be depressed by means of the treadles to actuate the bar and switch; also, a narrow casing embedded in the track, open at the bottom, containing the mechanism which connects pins and bar and provided with a top plate perforated for the pins.

Claim.—1. The narrow casing A, extending transversely from track to track, made open at the bottom for the escape of dirt and water, and having a top plate forming between the tracks a fixed part of the roadway, in combination with vertical pins D D, protruding through and above such top plate, to be alternately depressed by the treadles, and with a horizontally-sliding bar actuated by said pins and extending from the end of said casing to engage with and shift the switch-tongue, substantially as set forth.

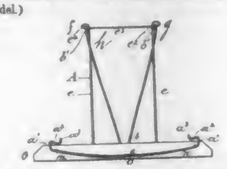
2. The elbow-levers E E, pivoted centrally to the case, at their outer ends to the vertical pins D D, and at their inner ends to the horizontal lever F, in combination with the vertical bar G, pivoted centrally to the lever F, and at its lower end to the case, and connected with the bar B by insertion between shoulders thereon, so as without binding to shift the switch to the right or to the left, according as the right or the left hand treadle is depressed, substantially as set forth.

298,037. GATE. ALONZO H. STARING, German Flats, N. Y. Filed Nov. 21, 1883. (No model.)



Claim.—1. In a gate, the combination, with the vertical uprights provided with tracks which are inclined or sloping from the center down to the end, of arms secured to the uprights A A' and having pulleys swiveled at their ends, a bar connecting said uprights and having pulleys swiveled on its under side, a gate carrying rollers adapted to travel on said tracks, and cords secured to the upper arm, and a bell-crank latch

pivoted to the upper end of the upright F, the lower or horizontal arm of which is provided with a hook or catch to engage a mortise in the adjacent gate-post, said cords passing through the pulleys on the under side of the bar *a*, and from thence through the pulleys on the ends of the arms *b b' b² b²*, as set forth.



2. The combination, with a sliding gate having an upright, F, of a latch pivoted to the upper end of said upright, and consisting of a bell-crank lever, the upper arm of which has a dog adapted to limit the movement of said latch by contact with the upper end of the upright F, and the lower arm of which has a catch engaging a mortise in the adjacent gate-post, and a cord connected to the upper arm of said latch for raising the same from engagement with the notch i^2, substantially as set forth.

298,038. COMPASSES. WILLIAM STROMBERG, St. Louis, Mo. Filed Feb. 26, 1884. (No model.)

Claim.—The compasses A, having the arc D extended from the leg C outward, upward, over the knuckle B, and engaging with the extension C^2 of the leg C', substantially as described.

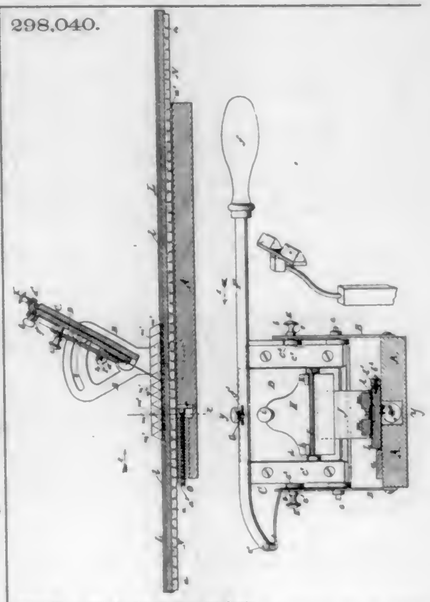
298,039. BOOK-RACK. JOEL SWARTZ, Gettysburg, Pa. Filed Jan. 24, 1882. (Model.)

Claim.—1. In a book-rack having a base and back, a spring-brace swinging between the legs of the back, and having end crooks, *g h*, loosely hinged to the back by loops *b' b'* engaging eyes outside the legs of said back, whereby it is adapted to be sprung in between the legs of the back to lock it (the said brace) in position for use in sustaining the rack, substantially as described.

2. The combination, with the base, of the back provided with eyes projecting outside its legs, and the brace hinged in said eyes swung between the legs of the back, and provided with the bends or crooks *g h* below the hinging-points, whereby it is adapted to be sprung in between the uprights of said back when swung back from said eyes, to thereby lock itself in position, substantially as described.

3. A book-rack composed of a supporting-base, a back having eyes outside of its legs, a brace hinged between said legs to said back by loops *b' b'* engaging its eyes, and having crooked or bent ends, substantially as described, so as to be sprung through the uprights thereof, and thereby be self-locking and adjustable, and spring-fingers made in one piece and moving with a curved shaft, substantially as shown and described.

4. In a book-rack having a support for the back and lower edge of a book, the wire *a*, secured to the support in a curved line, substantially as set forth, by staples *s s s*, to convert it into a spring, and having its ends bent to project over such support for holding the book in place thereon, all as and for the purpose described.



5. The wire *a*, curved as shown, and having the bends *a' a'* and fingers a^2 a^2, combined with a book-support, and means to secure the wire in its curved form thereto, whereby the fingers of said wire are retained in position to hold an open or other book in place upon the support, and also retained in a reverse position to free the book, substantially as set forth.

298,040. DEVICE FOR CUTTING DAMPER-FELT FOR PIANOS. JOHN SWENSON, New York, N. Y. Filed Aug. 13, 1883. (No model.)

Claim.—1. A piano-damper-felt-cutting machine consisting of a bed-plate and uprights, A B, a feed-plate, L, arranged to slide upon the said bed-plate, and provided with means for holding a felted strip, M, and a knife-holding slide, D, and means for moving said slide up and down at an angle to the said feed-plate L, substantially as and for the purpose set forth.

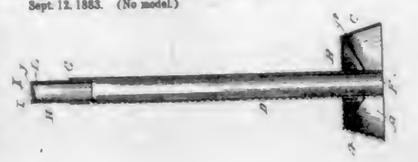
2. The combination of the bed-plate A, provided with the stop *o*, the feed-plate L, provided with the notched bar N, and with means for holding a felted strip, M, and the knife-holding slide D, and means for moving the same up and down at an angle to the said feed-plate L, substantially as and for the purpose set forth.

298,040.

3. The combination of the bed-plate A, provided with the adjustable stop O *o*, the feed-plate L, provided with the notched bar N, and with means, *l l' P*, substantially as described, for holding the felted strip M, the uprights B, provided with the slots *b*, the plate C, pivoted between the said uprights, and provided with guides *c'* and adjusting-screws E, the knife-holding slide D, movable in the said guides, and provided with the leg *d'* and adjusting-screw K, and the lever F, pivoted to the said plate and slide C D, substantially as and for the purpose hereinbefore set forth.

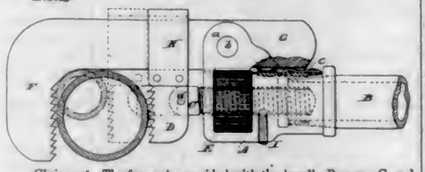
4. In a machine for cutting damper-felt for pianos, the feed-plate L, provided with a recess, *l*, suitable to receive the felted strip M, and having along one side an adjustable strip, *l'*, arranged to clamp the said strip edgewise, substantially as and for the purpose set forth.

298,041. BASE-BALL. THOMAS P. TAYLOR, Bridgeport, Conn. Filed Mar. 7, 1884. (No model.)



Claim.—1. In the manufacture of base-balls, forming a center by collecting a mass of loose materials, inclosing the mass in hemp combings or like fibrous material, then consolidating and baking under pressure, and then applying the external covering, substantially as set forth.

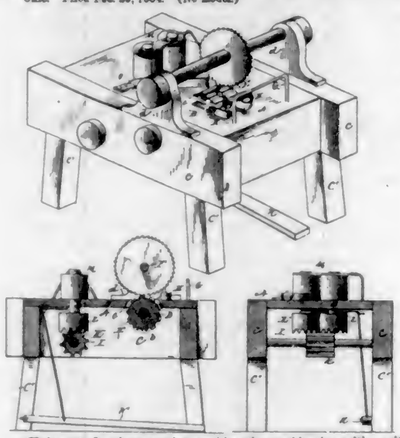
2. A base-ball consisting of a consolidated mass of loose waste materials inclosed in a wrapper of hemp combings or like material, and with an outer covering, as specified.



3. A base-ball in which the filling portion of loose materials is confined by an outer layer of hemp combings or other like material, substantially as described.

298,042. CHURN-DASHER. S. MINER TILSON, Rocklane, Ind. Filed Sept. 12, 1883. (No model.)

Claim.—An improved churn-dasher, consisting of a bottom cell or chamber comprising the imperforate top and side walls, a tubular cylindrical staff having the open top and bottom ends, the latter end extending down through the top of said chamber to the plane of the bottom edge of the side walls thereof, the transverse braces disposed above and below the top wall at the point of juncture of the said top wall and staff, and the top cap-piece fitted to the top end of the tubular staff, and having the flat spring carrying a valve at its free end, substantially as and for the purpose set forth.



298,043. WRENCH. NATHANIEL W. VANDERVRIFT, Bridgeport, Conn., assignor to Frank Armstrong, same place. Filed Nov. 5, 1883. (No model.)

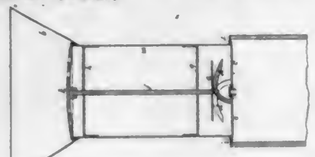
Claim.—1. The frame A, provided with the handle B, screw C, and adjusting-nut E, and having the cheeks or bearings *a*, in combination with a sliding jaw, D, secured to a movable yoke, H, and a rocking or lever jaw, F, having its tail G connected pivotally to the cheeks *a* of the frame, whereby, when the jaws are placed against the work, grip or releasement may be effected by the downward or upward movement, respectively, of the handle, as and for the purposes hereinbefore set forth.

2. In combination with the pivoted jaw F, sliding jaw D, frame A, and screw C, the yoke H, secured to the jaw D, and embracing the jaw F, in a manner described, with a space, *s*, to permit vibratory movement of said jaw and protect the work from a crushing strain, substantially as hereinbefore set forth.

298,044. HOOP-SPLITTING MACHINE. ISRAEL WALDEN, Fremont, Ohio. Filed Feb. 29, 1884. (No model.)

Claim.—1. In a hoop-sawing machine, the combination, with a suitable supporting-frame, the top of which is formed with an opening near the front end thereof, of a shaft carrying a corrugated disk located beneath said top and bearing in the sides of the supporting-frame, a shaft mounted in brackets on the top of said table, guides H, secured at their rear ends near the rear end of the corrugated disk, their other or free ends extending forwardly and then bent rearwardly to form a U shape, and blocks operated by set-screws for adjusting the same, substantially as set forth.

2. The combination, with a suitable supporting-frame, the top of which is provided with an opening near its front end, of a shaft carrying a pulley mounted in the sides thereof beneath said table, said shaft being also provided with a corrugated disk having a circumferential groove, a shaft carrying the saw, adjustable guides H, secured adjacent thereto, and a bracket, G, secured to the table near the front end thereof, substantially as set forth.

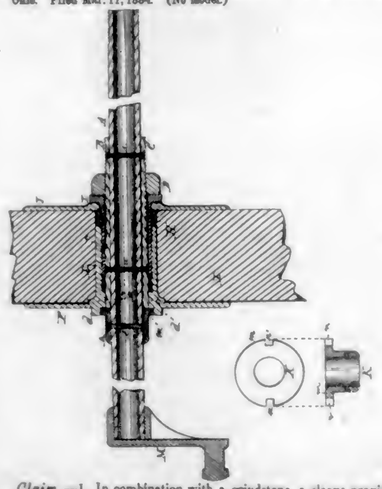


3. The combination, with a suitable frame or support of a shaft located in the sides thereof, and provided at about its center with a pinion-wheel, of vertical rollers the upper ends of which bear in a bracket secured upon the table, and having their lower ends geared to engage said pinion, and a rod secured to the top of the table, its front end extending forwardly adjacent to the saw, substantially as set forth.

4. The combination, with vertical rollers loosely mounted at their upper ends, and adapted to mesh with a pinion at their lower ends, of a lever, and a cord connecting said lever with one of said rollers, substantially as and for the purpose set forth.

5. The combination, with a suitable supporting-frame carrying a corrugated disk provided with a circumferential groove, and with a saw mounted upon a shaft suitably journaled, of vertical rollers loosely connected at their upper ends, and adapted to mesh with a pinion-wheel at their lower ends, and a lever connected with one of said rollers, substantially as set forth.

6. The combination, with a suitable supporting-frame carrying a corrugated disk provided with a circumferential groove, guides located adjacent to said disk, and a saw mounted upon a shaft above said disk, of vertical rollers located in rear of the saw, said rollers being loosely connected at their upper ends, and adapted to mesh with a pinion at their lower ends, a rope or chain connected to one of said rollers, a lever for operating the same, and a rod secured adjacent to said rollers at its rear end, its forward end being located adjacent to the corrugated disk and saw, substantially as set forth.



298,045. SEWER-TRAP. THOS. WATKINS, Portsmouth, N. H. Filed July 17, 1883. (No model.)

Claim.—1. In the described improved sewer-trap, the combination of each of its valves, arranged with and applied to the tubular body of the trap as specified, with a horn to extend upward from it, (the said valve,) and with a valve-closer resting upon such horn, and to operate with it, substantially as set forth.

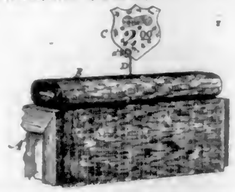
2. The combination of the valve-closer (consisting of the strainer or perforated cover or plate *d*, the rod *f*, and the disk *e*) with guide-spiders *g* and *h*, the tube *a*, the valves *c c*, and their horns *d d*, adapted and arranged, as set forth.

298,046. GRINDSTONE-SHAFT. ARTHUR F. WEAVER, Cleveland, Ohio. Filed Mar. 11, 1884. (No model.)

Claim.—1. In combination with a grindstone, a sleeve provided with a female screw, annular flange, follower J, and tubular screw adapted to engage the screw of the said sleeve for clamping the stone between the flange F and follower, substantially in the manner as described, and for the purpose specified.

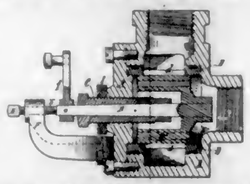
2. In combination with the sleeve E, having a flange, F, and pro-

jections or studs *d d*, follower and tubular screw constructed and adapted to each other, as described, the shaft A, provided with a threaded enlargement, and having secured thereon a collar, K, with peripheral notches registered to engage the studs of the said sleeve, and binding-nut D, substantially as described, and for the purpose specified.



3. In combination with a grindstone, the flanged sleeve E, provided with a female screw and studs, follower J, tubular screw and shaft having an enlargement provided with a threaded end, binding-nut, and notched collar K, constructed, arranged, and adapted to each other, substantially in the manner as described, and for the purpose set forth.

298,047. COCOANUT-SHELLER. JESSE G. WEBB, Boston, MASS. Filed Feb. 8, 1884. (No model.)



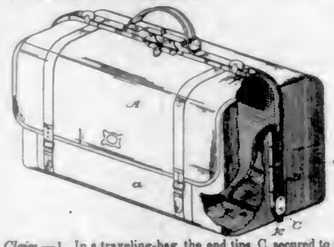
Claim.—The improved cocoanut-sheller herein described, the same consisting of the blade A, having the flat side *f*, and provided with the point *d*, bayonet-rib C, splitting-edge *t*, and handle B, constructed and arranged to operate substantially as shown and specified.

298,048. CARD OR TICKET HOLDER. HENRY WILLSON, Chicago, Ill. Filed Feb. 11, 1884. (No model.)

Claim.—As an improved article of manufacture, a card or ticket holder made of a continuous piece of wire, having a coiled head, *a'*, at one end thereof, and made pointed at the other end, substantially as shown and described, and for the purposes set forth.

298,049. ROTATING JOINT MECHANISM FOR STEAM APPARATUS. EDWD. WRIGHT, Worcester, Mass., assignor to the Wright Machine Company, same place. Filed Dec. 28, 1883. (No model.)

Claim.—1. A rotating joint for apparatus working steam or other fluids under pressure, consisting of a long slightly-tapered stem fitted within a correspondingly-tapered seat or sleeve in a manner to be longitudinally acted upon by the fluid-pressure for closing the tapered surfaces upon each other, and means for sustaining and adjusting said stem in a direction opposite to the action of the steam-pressure in the manner set forth.



2. A rotative joint mechanism for preventing the escape of steam, or for similar purpose, in which the stem or inner joining part is exposed to the steam-pressure in a direction tending to close the joint or force the adjacent moving surfaces together, and with a positive adjustable bearer adapted for counteracting or sustaining said part in opposition to the steam-pressure and regulating the position of the joint-surfaces in relation to each other, as hereinbefore set forth.

3. A rotating or movable joint on parts communicating from the exterior to the interior of steam apparatus, composed of a slightly-tapered stem, an internally-tapered sleeve or seat bushing surrounding said stem and adjustably secured to the body, shell, or steam-cylinder, and means for sustaining and adjusting said stem within said sleeve to prevent the tapered surfaces being forced together firmly by action of the steam-pressure, substantially as herein set forth.

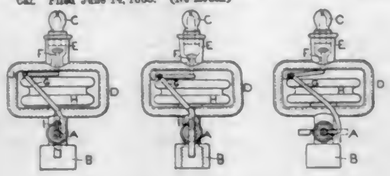
4. The combination, with the body, shell, or cylinder A surrounding the steam-space or pressure-chamber, of the stem or inner joint part, B, externally tapered in the manner shown and described, the seat-sleeve or outer joint part, C, fitting around said stem with a corresponding internal taper, and the screw or step E, mounted in an arm, F, or relatively fixed support and adapted for sustaining and adjusting said stem in opposition to the pressure from within said steam-chamber, as hereinbefore set forth.

5. The combination of the valve B', having the stem B tapered, as shown, the internally-tapered screw-threaded sleeve C, embracing said stem, the shell or case A, with an arm, F, the screw E, serving as a step for said stem, and an operating connection, *f*, for imparting rotative action to said stem, substantially as described.

298,050. TRAVELING-BAG. CHARLES A. ZINKAND, San Francisco, Cal. Filed Feb. 21, 1884. (No model.)

Claim.—1. In a traveling-bag, the end tips, C, secured to the frame of the bag, in combination with a bar secured to the bag outside and extending under its bottom along its longitudinal center, the ends of said bar bending upward on the outside and over the ends of the tips C, substantially as herein described.

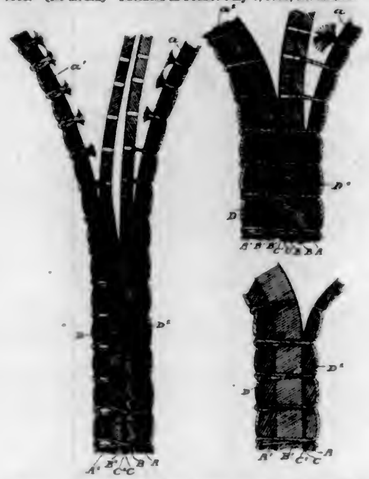
2. In a traveling-bag, the bar D, inside of the bag, and on which the ends of the frame of the bag are pivoted, in combination with the bar E, outside the bag, said bars being secured together at their ends by the bent portions of bar E, which pass up on the outside of the tips C, and to the bag, substantially as described.



3. In a traveling-bag, having the front *a* and back *a'*, with the encircling frame B, the end tips, C, on the outside of the ends of the frame, and the inside bar, D, on which the ends of the frame and the tips C are pivoted, in combination with the outside bar, E, passing beneath the tips and secured to the ends of the inside bar, and to its body through the bottom of the bag, substantially as herein described.

4. In a traveling-bag, the linings F of the front, back, and flap, in combination with the inside bar, D, and outside bar, E, between which said linings are fastened by the rivets *e*, substantially as described.

298,051. WIRE-COATING PREPARATORY TO DRAWING. BENJAMIN F. AKEN, Jr., Millbury, and CHARLES W. NEWHALL, Jr., and GEORGE W. B. ELLIS, Worcester, Mass. Filed July 13, 1883. (No specimens.)

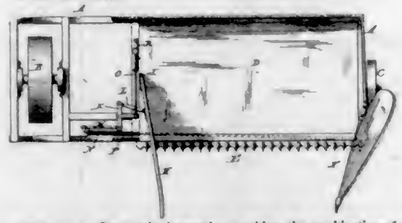


Claim.—The improved wire coating or bath consisting of a solution of dextrine and alum and flour or meal, as and for the purpose set forth.

298,052. CUT-OFF GAS-BURNER. ALVAN C. AUSTIN, San Francisco, Cal. Filed June 14, 1883. (No model.)

Claim.—The automatic gas cut-off herein described, consisting of the valve F, bell-crank G, expansion-drum H, and trip-pin I, arranged and operating in connection with the ordinary parts of a gas-burner, substantially as and for the purpose herein described.

298,053. VELVET AND PLUSH EMBROIDERY. EDUARD BALLY, Schönenward, and JOHANN HARTMANN, Suhr, Switzerland. Filed Oct. 13, 1883. (No model.) Patented in France July 7, 1883, No. 156,450.



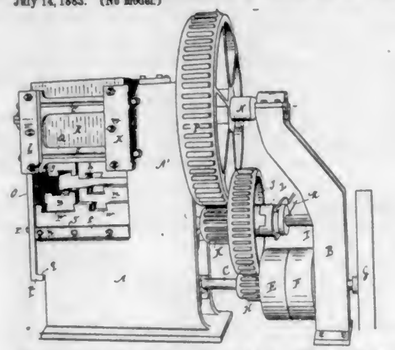
Claim.—1. The process of producing velvet or plush embroidery, which consists, first, in ornamentally sewing together surface sheets of leather or cloth with intermediate layers of the same or other suitable fabric, then cutting the stitches between the intermediate layers, and then removing the intermediate layers, so as to have the projecting cut threads constitute a shag on the leather and cloth, and forming the embroidery design on each of the surface sheets.

2. Plush embroidery, substantially as shown and described, consisting of a cloth or leather sheet, A, having a shag or plush projecting above its face side, and said shag being held in position by lock-stitches, which stitches form said shag with the interlocking threads D on the back side of the cloth or leather.

3. In a new article of manufacture, the combination consisting of a sheet of leather or cloth with threads projecting therefrom, the shag of the threads forming an ornamental design, and the single thread or threads thereof being held by an interlocking thread on the back side of the cloth or leather sheet, and by a coating of paste or glue, the whole being constructed substantially as herein described.

298,054. GRAIN-HARVESTING MACHINE. ELIAS BARNHARD and AARON F. THOMAS, Troy, Ohio. Filed Aug. 1, 1883. Renewed Mar. 27, 1884. (No model.)

Claim.—1. In a grain-harvesting machine, the combination of a cutter mechanism, substantially as described, and a divider or guard movable lengthwise over the end of the cutter to render a portion of the same inoperative, substantially as described and shown, whereby the width of the machine may be increased and diminished.

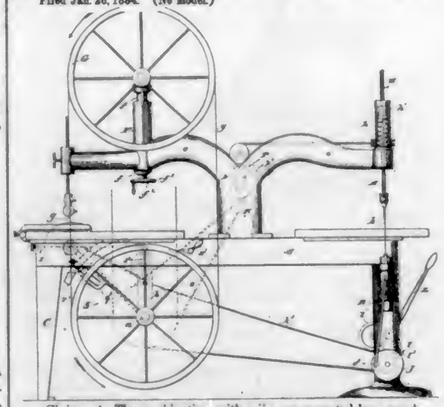


2. In a harvesting-machine, the combination, with an ordinary cutting mechanism such as shown, of a horizontal swinging divider, hinged in rear of the cutter and extended forward across the same to render a portion of the cutter inoperative, substantially as described.

3. In a harvesting-machine, the combination of a cutting mechanism, substantially as described, and two movable dividers or guards located at opposite ends of said cutting mechanism, and adjustable inward past the extremities of the same, substantially as described, whereby the extremities of the cutter may be rendered inoperative and the width of cut thereby reduced.

4. In a harvesting-machine, the combination of a cutting mechanism, substantially as described, a guard or divider movable over the end of the cutter to prevent the access of the grain thereto, and thereby render a portion of its length inoperative, and mechanism, substantially as described, to adjust said guard, extending thence to a point adjacent to the driver's seat, whereby the driver is enabled to vary the width of the cut at will while the machine is in action.

5. In combination with the cutting mechanism, the two movable dividers, and operating mechanism, substantially as described, connected with both dividers, whereby the two may be adjusted simultaneously.



298,055. FORGING-MACHINE. RALPH H. BEACH, Flint, Mich. Filed July 14, 1883. (No model.)

Claim.—1. In a forging-machine, and in combination with the plunging mandrel and main frame thereof, a detachable end plate forming an end bearing for the main shaft, and provided with an offset upon its lower end engaging upon an offset on the main frame, substantially as and for the purposes described.

2. In a forging-machine, the combination of the plunging mandrel R, frame A, and end plate, O, with the guide-plates Q, bolts *o*, and set-screws *m*, constructed and arranged substantially as and for the purposes described.

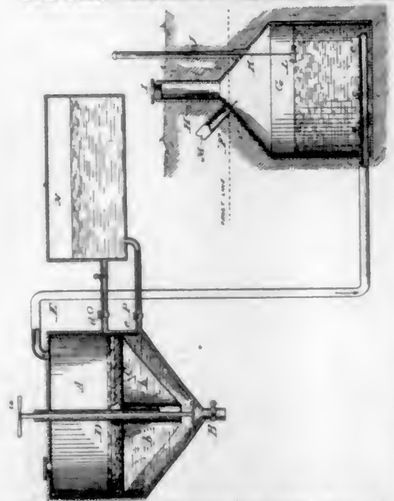
298,056. UNIVERSAL JOINER. AUGUSTUS BEAN, Concord, N. H. Filed Jan. 26, 1884. (No model.)

Claim.—1. The combination, with a jig-saw operated by a revolving shaft, a friction-wheel and a pulley secured to said shaft, and a belt, of a lever pivoted at its lower end provided with a cross-head, a friction-block secured to said cross-head and adapted to bear against the friction-wheel, and a belt-tightening wheel mounted at the opposite end of said cross-head and adapted to be forced against the belt, substantially as set forth.

2. In a universal joiner, the combination, with a circular saw mounted in a swinging frame, of a curved arm secured to the table-bed of the universal joiner, and devices for locking the swinging saw-frame to the curved arm in a limited rotary adjustment, substantially as set forth.

3. In a universal joiner, the combination, with a circular saw mounted in a swinging frame, and a curved arm secured to the supporting-frame of the universal joiner, of a clamp secured to the swinging frame and constructed to embrace the said curved arm, and thereby lock the swinging frame in a limited rotary adjustment, substantially as set forth.

4. In a universal joiner, the combination, with a circular saw adjustable in the arc of a circle, and operating mechanism, of a tilting table provided with a downwardly-extending slotted plate, and devices for moving and holding the table in a limited rotary adjustment, substantially as set forth.



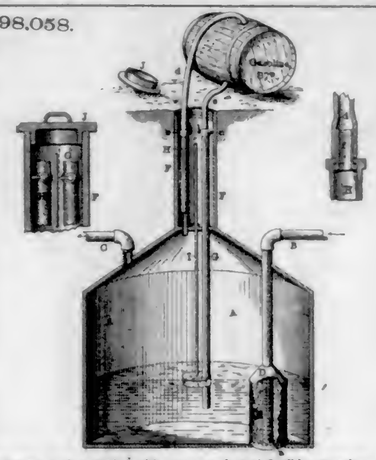
5. The combination, with a circular saw adjustable in the arc of a circle, and suitable operating mechanism, of a laterally-tilting and longitudinally-sliding table situated alongside of the saw, substantially as set forth.

6. The combination, with a circular saw adjustable in the arc of a circle, of a laterally-tilting and longitudinally-sliding table situated on one end of the saw, and a stationary table situated on the opposite side of the saw, substantially as set forth.

7. In a universal joiner, the combination, with a table supporting the main shaft, of a column or standard supported on the table and terminating in three horizontal branches, which latter support, respectively, a band-saw, a jig-saw, and a boring-tool, substantially as set forth.

8. The combination, with a table and a shaft journaled thereto, of the column E, having three horizontal branches, e, e', and e^3, which support, respectively, the band-saw, the jig-saw, and boring-tool, the said saws and boring-tool being operated by the shaft, substantially as set forth.

298,057. GAS-GENERATOR. LYMAN C. BEEBE, Villisca, assignor of one-half to Robert Truman, Afton, Iowa. Filed Oct. 11, 1883. (No model.)

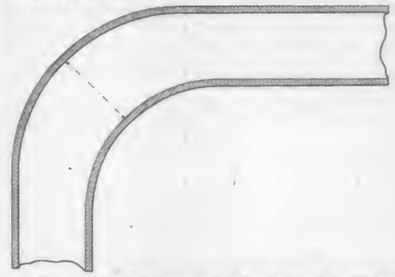


Claim.—A gas-generating apparatus consisting of a vessel, A, charged with acidulated water, a perforated basket, C, within said vessel, containing iron scraps or equivalent matter, acidulated-water reservoir N, pipes O P, connecting said reservoir with vessel A, and provided, respectively, with inwardly-opening check-valve d, and outwardly-opening check-valve e, a gasoline-tank, G, outside of vessel A and below the frost-line, and a pipe extending from generator A to tank G, entering the latter near its bottom, and perforated within said tank, all substantially as described and shown.

298,058. CARBURETOR. LYMAN C. BEEBE, Villisca, assignor of one-half to R. TRUMAN, Afton, Iowa. Filed Nov. 27, 1883. (No model.)

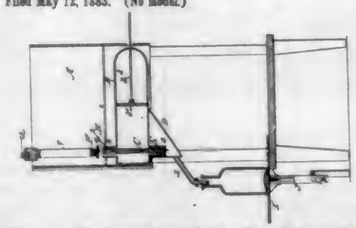
Claim.—1. The herein-described carburetor, consisting of a vessel, A, provided with inlet-pipe B, outlet-pipe C, and upright neck or pipe F, having cover J, filling-tube G, and vent-tube H, both located within pipe F, and each furnished with a stop-cock, and flexible extension provided with a plug adapted to enter the bung-hole of a cask, all substantially as shown and described.

2. In a carburetor, the combination of a tank for containing a hydrocarbon, provided with an inlet and an outlet pipe, a filling-tube and a



298,058.

vent-tube, each provided with a stop-cock, and flexible extensions connected with the filling and vent tubes, and each provided with a screw-plug adapted to be tightly screwed into the bung-hole of a cask, as and for the purpose set forth.



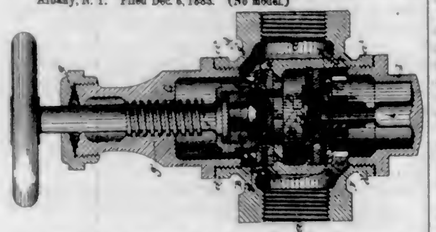
3. In combination with tank A, having inlet and outlet pipes B C, filling-tube G, and vent-tube H, each provided with a flexible extension and with a swiveled screw-plug at the end of said extension adapted to enter the bung-hole of a cask.

298,059. CURVED PIPE. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Sept. 24, 1883. (No model.)

Claim.—A pipe whose curvature amounts to a right angle, having an area at its middle point equal to twice that of the main pipe, and tapering in each direction from that point till the straight pipe is reached, the area at that point decreasing in proportion as the curvature is less than a right angle.

298,060. BOTTLING-MACHINE. JOHN C. BLAIR, Louisville, Miss. Filed May 12, 1883. (No model.)

Claim.—1. The combination, with the cylinder B, having the tubes b b' and piston b^3, of the tube C, valves c, and chamber D, substantially as shown and described.



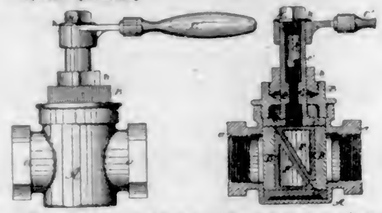
2. The combination, with the cylinder B, having tubes b b' and piston b^3, of the valve-rod E, threaded near its ends, adjustable valves c upon said rod, and means for operating the valve-rod, substantially as

shown and described.

3. The combination, with the tank A, having an orifice, s, in its bottom, of the cylinder B, provided with the tubes b b', the former, b, passing through the orifice s, graduated piston b^3, and tube C, having adjustable valves c on its valve-rod E, substantially as shown and described.

4. The combination, with the tank A, having an orifice, s, in its bottom, valve-bar F, connecting-bars g, and lever G, of the cylinder B, having tubes b b' and graduated piston b^3, tube C, valve-rod E, threaded near its ends, adjustable valves c upon said rod, platform I, and levers J, substantially as shown and described.

298,061. COMBINED CHECK AND STOP VALVE. JAS. H. BLESSING, Albany, N. Y. Filed Dec. 6, 1883. (No model.)



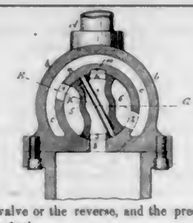
Claim.—1. In a combined check and stop valve, the combination, with a valve-casing containing an inner valve-chamber and a partition—formed between said casing and the wall of its inner valve-chamber—for separating the induction and eduction openings of said casing, the said inner valve-chamber being provided with two valve-seats arranged one above the other, as herein described, of two independent valves entirely disconnected from each other, and arranged as herein set forth, the lower of said valves being always free to operate as a check-valve, and the upper one being provided with means whereby it can be forcibly retained upon its valve-seat, as and for the purpose herein specified.

2. The combination, with a valve-casing, A, containing an inner valve-chamber, B, and a partition, C, formed as herein described, of the removable valve-seats D and caps G and I, constructed substantially as described, and adapted to secure the valve-seats D, as herein specified.

3. The combination, with a valve-casing, A, adapted to contain two independent valves, substantially as herein described, of the removable and interchangeable valve-seats D, each consisting of a flat annular flange provided with a cylindrical flange, d, as and for the purpose specified.

298,062. STOP-COCK. JAS. H. BLESSING, Albany, N. Y. Filed Dec. 18, 1883. (No model.)

Claim.—1. The combination, with a casing, A, provided with branches a, of a turn-plug consisting of a skeleton cage provided with expansible gibs D, angle-frames F, and a spring, E, substantially as and for the purpose herein specified.



2. The combination, with a casing, A, for a stop-cock, of a turn-plug consisting of a skeleton cage provided with expansible gibs D, mechanism for forcing said gibs outward, and a set-screw, G, as and for the purpose herein specified.

3. In a stop-cock, the combination, with a turn-plug consisting of a skeleton cage provided with a hollow stem, substantially as described, of the expansible gibs D, angle-frames F, and set-screw G, substantially as and for the purpose specified.

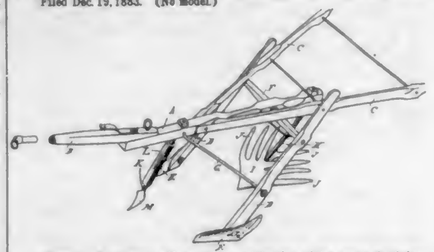
298,063. BALANCED ROTARY VALVE. JOHN L. BOGERT, Flushing, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—1. The valve-chest and hollow valve-case, with a steam-space between the two parts and with openings in the valve-case, in combination with a rotative valve within the case, with side depressions and ports and open ends, substantially as specified, whereby the steam is admitted by the side depressions, and the exhaust takes place through

298,063.

the center of the valve or the reverse, and the pressures are balanced, substantially as set forth.

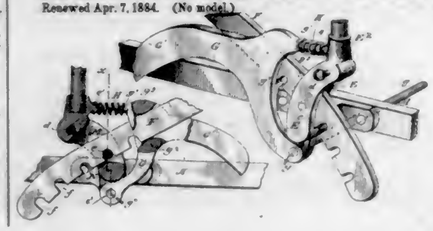
2. The hollow cylindrical valve having two sets of depressions in the sides and openings, forming ports, one set being in the position described to the other set, in combination with the valve-case having ports for the admission of steam, and two ports longitudinally in line with each other, one leading to each end of the cylinder, substantially as specified, whereby the one rotative valve is adapted to exhaust and to admit steam alternately to the two ends of the cylinder, as set forth.



3. The combination, with the cylindrical valve and its case, having the respective depressions and ports, of the pipe i, extending from one side of the valve which covers the port 8 to the opposite side, for the purposes and substantially as set forth.

4. The combination, with the valve-case and tapering valve with depressions and ports, of valve-stems—one at each end—affixed to and moving with the valve, to support such valve centrally within its case and prevent the weight of the valve resting upon the surfaces, and screws and nuts to adjust the valve endwise, substantially as specified.

5. The hollow cylindrical valve having ports or openings through it and depressions in opposite sides, forming passage-ways, in combination with a steam-chest having an internally-cylindrical case and ports through the same, and the recess 10, for the purposes and substantially as set forth.

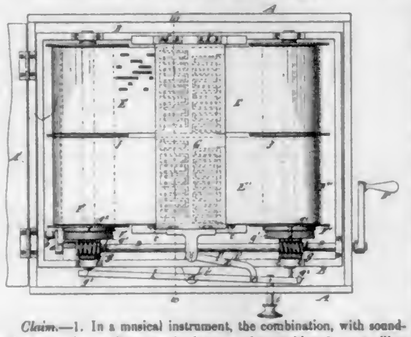


6. A rotative hollow cylindrical valve having two sets of ports and depressions in the sides thereof, in the relative positions described, in combination with a valve-chest and case having openings for the steam to pass to the valve, and four ports leading to opposite ends of two steam-cylinders, the ports being in pairs opposite to each other and in line longitudinally, substantially as set forth.

298,064. POTATO-DIGGER. STEPHEN D. BROWN, Farmington, Mich. Filed Dec. 19, 1883. (No model.)

Claim.—In a potato-digger, the combination of the center draft-bar, A, handle C, standards D, having their upper ends attached to said handles, and braced by the cross-bar F and braces G, both of which are connected to the center draft-bar, standard K, attached to said bar A, and carrying the cylinder L and tooth M, side plows, E, adjustable back and forth on the standards D, and the double-winged digger-shovel I, carried by the standard H, attached to the rear end of the bar A, all constructed and arranged substantially as herein shown and described.

298,065. FOLDING CHAIR. LEWIS BUSH, Jr., Chicago, Ill., assignor to the American Machinery Company, same place. Filed Jan. 12, 1883. Renewed Apr. 7, 1884. (No model.)



Claim.—1. In a folding chair, the combination, with the seat-frame, the back-frame pivoted thereto, and a notched supporting-arm pivoted to the back-frame, of a stud fixed to the seat-frame, and a hand-lever, G, substantially as and for the purpose set forth.

2. In a folding chair, the combination, with the seat-frame, the back-frame pivoted to said seat-frame, a notched supporting-arm, and a stud for engagement with said notched arm, attached to the seat-frame, of a pivoted hand-lever, G, and a spring, H, substantially as and for the purpose set forth.

3. The combination, with the frame A, pivoted back B, and the notched supporting-arm F, of a bracket, E, provided with a stud, *e*, and the lever G, pivoted to the said bracket, and having lugs g^1 g^2, arranged above and below said supporting-arm, substantially as and for the purpose set forth.

4. In a folding chair, the combination, with the seat-frame, studs *s*, secured thereto, the back-frame pivoted to said seat-frame, and notched supporting-arms pivoted to the back-frame and constructed to engage said studs, of hand-levers G, placed on both sides of the seat-frame, and a rod, *g*, connecting said levers, substantially as and for the purpose set forth.

298,066. MECHANICAL MUSICAL INSTRUMENT. GEO. H. CHINNOCK, Brooklyn, N. Y. Filed Nov. 29, 1882. (No model.)

Claim.—1. In a musical instrument, the combination, with sound-producing devices and two music sheets, cards, or tablets for controlling their operation, of rests for said sheets, cards, or tablets, means for moving the sheets, cards, or tablets simultaneously in either direction, and devices whereby either of the music sheets, cards, or tablets may be rendered inoperative, substantially as and for the purpose herein described.

2. In a musical instrument, the combination of two rests for traveling music sheets, cards, or tablets, sound-producing devices, ducts leading from said rests to conduct air to the sound-producing devices, and means for closing the ducts from either rest while the others remain open, substantially as and for the purpose herein described.

3. In a musical instrument, the combination of two rests for traveling music sheets, cards, or tablets, sound-producing devices, two sets of ducts leading from said rests to conduct air to the sound-producing devices, and devices for closing said sets of ducts, connected together so that either set may be closed and the other set simultaneously opened, substantially as and for the purpose herein described.

4. In a musical instrument, the combination of sound-producing devices, two music sheets, cards, or tablets, and rollers for moving the same to control the operation of the sound-producing devices, two rests for said sheets, cards, or tablets, and devices for simultaneously reversing the direction of rotation of said rollers and rendering either sheet, card, or tablet inoperative, substantially as and for the purpose herein described.

5. In a musical instrument, the combination of two rests for traveling music sheets, cards, or tablets, rollers for moving said sheets, cards, or tablets, sound-producing devices, ducts leading from said rests to conduct air to the sound-producing devices, and devices for simultaneously closing the ducts leading from either rest and for reversing the direction of rotation of the rollers, substantially as and for the purpose herein described.

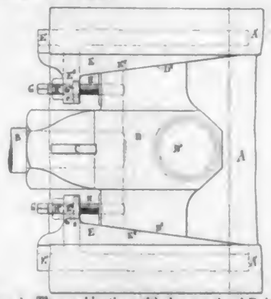
6. In a musical instrument, the combination of sound-producing devices, two rests for traveling music sheets, cards, or tablets, and air-ducts leading from said rests, two rollers—one upon each side of said rests—for moving the sheets, cards, or tablets, and devices for simultaneously reversing the direction of rotation of the rollers and closing the ducts leading from either rest, substantially as and for the purpose herein described.

7. In a musical instrument, the combination of two rests and air-ducts leading therefrom, rollers—one on each side of said rests—for moving two music sheets, cards, or tablets over the rests, a driving-shaft common to both rollers, and devices for simultaneously effecting the engagement of one roller with and the disengagement of the other roller from said shaft, and for closing one set of air-ducts and opening the other set, substantially as and for the purpose herein described.

8. In a musical instrument, the combination of two rollers, a driving-shaft provided with two screws or worms of reverse pitch, worm-wheels with which said screws engage, clutches connecting said worm-wheels with said rollers, and devices for simultaneously operating said clutches to release one roller from and connect the other roller with its worm-wheel, substantially as herein described.

9. In a musical instrument, the combination, with sound-producing devices, two music sheets, cards, or tablets, for controlling their operation, and two rests arranged side by side for said sheets, cards, or tablets, of means for moving said sheets, cards, or tablets simultaneously in either direction, and devices whereby either of them may be rendered inoperative, substantially as and for the purpose herein described.

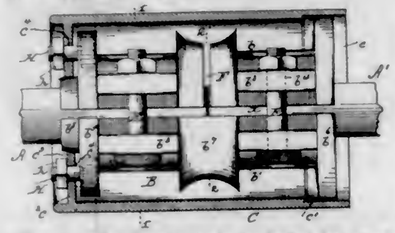
10. In a musical instrument, the combination of two rests arranged side by side, and air-ducts leading therefrom, rollers for operating two traveling music sheets, cards, or tablets, slides for closing said air-ducts, and devices for simultaneously reversing the direction of rotation of said rollers and moving said slides to open the ducts from one rest and close the ducts from the other rest, substantially as and for the purpose herein described.



298,067. COMBINED BREAST AND SKIRT SUPPORTER AND SHOULDER-BRACE. MORTIMER CLARKE, Washington, D. C. Filed July 25, 1883. (No model.)

Claim.—1. The combination, in a breast and skirt support and shoulder-brace, of a back V-shaped brace having a loop, *b*, near the terminal portion *a* of their union, a waistband, C, adapted to pass through said loop, and breast-pockets A A, secured to said waistband, and shoulder-straps D D, all constructed and adapted to operate substantially in the manner and for the purposes described.

2. The combination of the shoulder-straps D D, formed and adapted to serve as anterior and posterior suspenders, and provided with a loop, *b*, at their lower posterior ends, and the waistband C, attached anteriorly to the shoulder-straps, and adapted to pass through the loop in the posterior V-shaped portion of the shoulder-straps, and breast-supporting pockets A A, substantially as described.



298,068. CROSS-HEAD. GEORGE H. CORLISS, Providence, R. I. Filed Feb. 4, 1884. (No model.)

Claim.—1. The combination, with the cross-head D, having inclined faces D^2, of gibs E, having inclined faces E^2, and two or more independent adjusting-bolts, G G' and H H', exerting forces in opposite directions, all arranged for joint operation, to move and to resist the movement of the gibs relatively to the cross-head, substantially as herein specified.

2. The combination of a cross-head, D, having inclined faces D^2, with adjustable gibs E, having inclined faces E^2, and adapted to be operated in the direction of their length relatively to the cross-head by means of one or more adjusting-bolts, substantially as herein described.

298,069. SHAFT-COUPLING. WM. C. CRANDELL, Jr., Philadelphia, Pa. Filed Aug. 27, 1883. (No model.)

Claim.—1. A shaft-coupler having longitudinal slots extending from the bore to the periphery of the coupling, and a partial transverse slit, F, substantially as and for the purpose set forth.

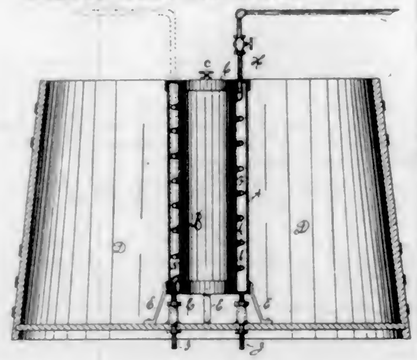
2. A shaft-coupling composed of longitudinal sections united by straps or bars embedded in the coupling during the process of casting, and provided with clamping-screws and a partial transverse slit, substantially as shown and described.

3. In combination with the coupling-sections *b* b^1 b^2, parted at *x*, the V or U shaped bars or straps D, and clamping-screws E, substantially as shown and described.

4. The coupling-sections *b*, b^1, and b^2, connecting-straps D, and clamping bolts or screws E, in combination with casing C, having tapered opening c^1, seating on the tapered hub b^2, formed on said sections, substantially as shown and described.

5. The coupling B, composed of longitudinally-parted sections having connecting-straps D, clamping screws or bolts E, enlarged ends, and middle part in which is formed a partial transverse slit, substantially as shown and described.

6. The coupling A, having end b^2, with tapered hub b^2, and embedded screws H, in combination with the casing C, having tapered opening c^2, and radial apertures c^4, and nuts *h*, substantially as shown and described.



7. A sectional clamp-coupling having partial transverse medium slit or slot, substantially as and for the purpose set forth.

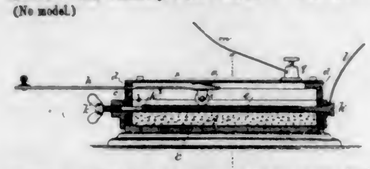
298,070. HOLDBACK-HOOK. CHAUNCY L. CROWELL, Peoria, Ill. Filed Feb. 13, 1884. (No model.)

Claim.—In a holdback-hook of that kind in which a plate, F, has a hook, E, projecting therefrom and pivoted thereto, a curved shank, A, provided with a rectangular eye, B, at the free end thereof, the combination, with such a plate, hook, shank, and eye, of the spring D, riveted or otherwise secured at one end to said shank, and adapted to so impress a strap held by the holdback-hook as to prevent rattling of the same, as set forth.

298,071. APPARATUS FOR COOLING BEER. HENRY E. DUCKBACH, Cincinnati, Ohio. Filed Feb. 12, 1884. (No model.)

Claim.—1. In combination with a beer-vat, the cooling device consisting of an outer cylinder, a cylinder arranged within said outer cylinder to form an annular space, annular heads securing the cylinders together, induction and eduction pipes leading to and from said annular space, and standards secured to the lower end of the device and resting upon the bottom of the vat, to support said lower end above said bottom, substantially as described.

2. In a device for cooling beer, the combination, substantially as specified, of the two cylinders A B, one within the other, and closed at both ends, forming the closed chamber F, with the coil G, located within said chamber, and induction and eduction pipes passing into said chamber and connected to the respective ends of said coil.



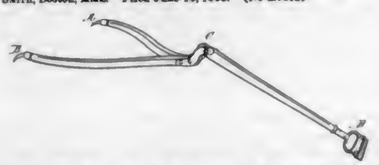
3. In a device for cooling beer, the combination, substantially as set forth, of cylinders A B, caps C, and coil G, with the two induction-pipes connecting, respectively, with coil G and chamber F, and two eduction-pipes leading one from the chamber and the other from the coil, for the purpose of cooling at the same time by means of the refrigerating-liquid and water.

298,072. INSULATING MATERIAL. DANIEL H. DORSETT, Chicago, Ill. Filed Aug. 27, 1883. (No specimens.)

Claim.—1. The herein-described insulating compound, composed of coal-tar, paraffine, silicious sand, and pulverized coal-ashes and cinders, in the proportions substantially as set forth, and for the purpose specified.

2. The above-described compound, composed of coal-tar, paraffine, silicious sand, pulverized coal-ashes and cinders, black oxide of manganese, and ammonia chloride, in the proportions substantially as set forth, and for the purpose described.

298,073. RHEOSTAT. JOHN DOYLE, Hoboken, N. J., assignor to himself and C. Coles Dusenbury, White Plains, N. Y. Filed Nov. 19, 1883. (No model.)

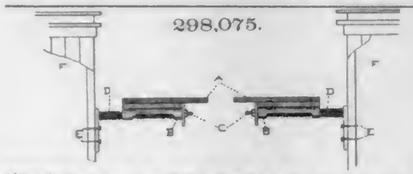


Claim.—1. The combination, with an insulating-holder having an opening therein, of a range of disks or pieces of metal placed together within such holder, a screw or other device to press the pieces together, a movable contact, and circuit-connections, substantially as set forth.

2. In a rheostat, a range of disks or pieces of metal having aluminium surfaces and a movable contact and circuit-connections, substantially as set forth.

3. The sliding contact formed of the plate A, roller *i*, and springs *o*, in combination with the plate *s*, the range of disks or pieces of metal, the holder for the same, and the circuit-connections, substantially as set forth.

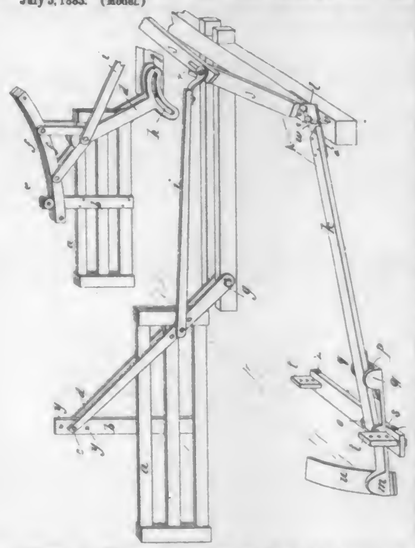
298,074. CARPET-STRETCHER. JAMES A. DUNNELL and AARON SMITH, Boston, Mass. Filed June 16, 1883. (No model.)



Claim.—The bent arms having points A B, in combination with toothed arm D, hinged at C, whereby two substantial points are given, between which a carpet may be stretched smooth and even at one motion the length or width of the room and be held firmly in place, substantially as set forth.

298,075. SAFETY-BRIDGE FOR RAILWAY-CARS. BENJAMIN L. FERRIS, Kansas City, Mo. Filed Jan. 18, 1884. (No model.)

Claim.—1. In a safety-bridge for freight-cars, the combination, with the wooden platform A, attached to the end of a car, through the medium of sliding blocks B, brackets C, and wood-bolts E, of the short springs D, substantially as shown and described.



2. A safety attachment for cars, having a narrow platform of wood, A, loosely connected to stationary supporting-brackets, in the manner

298,075.

substantially as shown and described, and for the purposes herein set forth.

298,076. GATE. MARK WILSON FOSTER, Minneapolis, Minn. Filed July 5, 1883. (Model.)

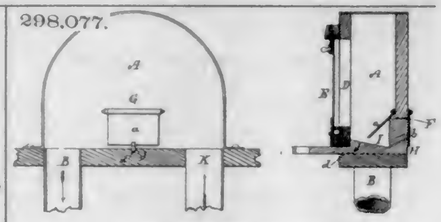
Claim.—1. The combination, with the levers *d* and gate *a*, suspended therefrom, of the angle-levers A, pivoted on the studs *v*, and connecting-rods *i*, substantially as shown and described.

2. The combination, with the levers A, connecting-rods *i*, levers *d*, and rails *f*, of the gate *a*, said gate being suspended from the rails *f*, and the said levers *d* and levers A being arranged to raise the gate and cause it to roll along the rails *f*, substantially as described.

3. The combination of the levers A, connecting-rods *i*, levers *d*, and rail *f*, with the gate *a*, said levers *d* being fitted by slots *h* to fulcrum-pins *g*, and said levers *d* and levers A being arranged to operate the gate, substantially as described.

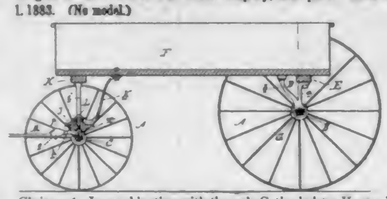
4. The combination, with the levers *d* and gate *a*, suspended therefrom, and the connecting-rod *i*, provided with a pivot, *x*, of the angle-lever A, composed of the arms *j* and *k*, rigidly secured at their ends by the plate *a'*, having angle-slot *w*, and pivots *v*, substantially as shown and described.

5. The combination, with the levers *d*, gate *a*, suspended therefrom, angle-levers A, pivoted on the studs *v*, and connecting-rod *i*, of the end pieces, *m*, pivoted to arms *k*, springs *p*, and ways *s*, substantially as shown and described.



6. The combination, with the levers *d*, gate *a*, suspended therefrom, angle-levers A, pivoted on the studs *v*, and connecting-rod *i*, of the end pieces, *m*, pivoted to arms *k*, springs *p*, way *s*, perforated adjustable uprights *t*, pins *z*, and way *u*, substantially as shown and described.

298,077. CASH-TRANSMITTER. HENRY GAZAILLE, Manchester, N. H. Filed Oct. 6, 1883. (No model.)



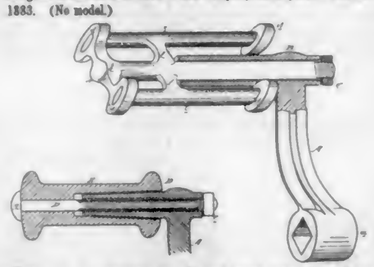
Claim.—1. The combination, with a case or receiver, the dispatch-tube, and an air-pump connecting with said case and tube, of a valve or valves for admitting entrance of air to the case and dispatch-tube, and for closing the opening by which such air enters when the direct stroke of the pump is being made, substantially as explained.

2. In combination, the case A, with its door E, the dispatch-tube B, air-supply tube K, and double valve *a b*, arranged and to operate substantially as explained.

298,077.

298,078. WAGON RUNNING-GEAR. PETER GENDRON, Toledo, Ohio, assignor to the Gendron Iron Wheel Company, same place. Filed Aug. 1, 1883. (No model.)

Claim.—1. In combination with the axle C, the bolster H, provided with a bearing-plate, A, having its ends recessed to fit the axles, and adapted to be secured thereto by means of studs engaging therewith, and to be held in place by ferrules, substantially as described.



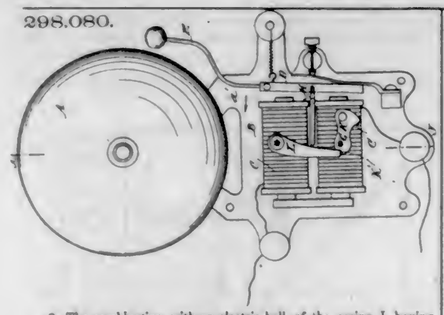
2. In a wagon, the combination of the axle C and bolster H, provided with the bearing-plate A and upwardly-projecting stud I, constructed substantially as described, with the plate J, having arms *i i k*, adapted to be secured to the body, the parts being connected together by a king-bolt, L, substantially as and for the purpose specified.

3. In a wagon, the combination of the axle C and bolster H, provided with the bearing-plate A and upwardly-projecting stud I, constructed substantially as described, with the plate J, having arms *i i k*, king-bolt L, and elastic washer, when constructed, arranged, and operating substantially in the manner and for the purposes set forth.

4. In combination with the ears *o*, forming an integral part of the bolster H, the hook shaft-iron M, substantially as and for the purposes described.

5. In a wagon, and in combination with the axle C, the bolster H, provided with bearing-plate A and stud I, and having cast integral therewith the ears *o*, pivots *r*, and caps *p*, substantially as described, and for the purpose specified.

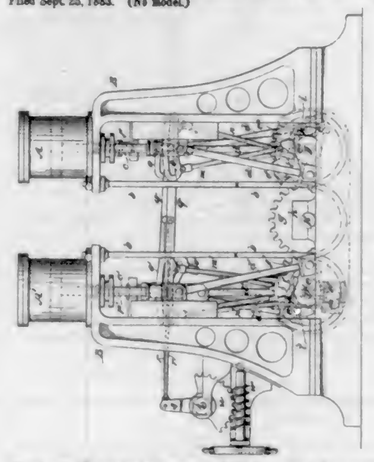
298,079. VELOCIPEDE-TREADLE. PETER GENDRON, Toledo, Ohio, assignor to the Gendron Iron Wheel Company, same place. Filed Nov. 3, 1883. (No model.)



Claim.—1. A velocipede treadle and crank, consisting of a crank cast with a thimble, and a pintle sleeved within said thimble and supporting the treadle, substantially as described.

2. In combination with a crank cast with a thimble, a treadle composed of the foot-bearings *c*, stops *d f*, head *b*, and pintle D, the parts being constructed, arranged, and operating substantially as specified.

298,080. ELECTRIC BELL AND ANNUNCIATOR. JOHN D. GILCHRIST, Ishpeming, Mich. Filed Jan. 15, 1884. (No model.)



Claim.—1. The combination, with an electric bell, of a pointer or hand, a weighted block connected with the hand, a lever for locking the weighted block and hand in place, and an arm projecting from the armature for the purpose of disengaging the locking-lever from the weighted block, substantially as herein shown and described.

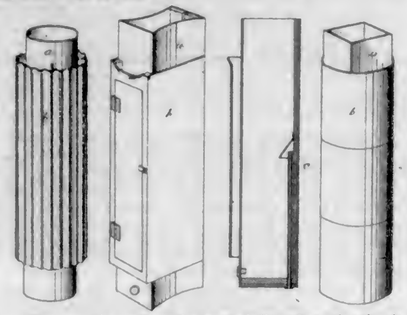
298,080.

2. The combination, with an electric bell, of the casing J, having a face-plate, H, the shaft G, held to turn in the face-plate, the hand F on the outer end of the shaft, the block K, secured on the inner end of the shaft G, and provided with a shoulder, K', the lever L, pivoted to the inner surface of the face-plate H, and of the arm M, secured to the armature D, substantially as herein shown and described.

298,081. STEAM-ENGINE. WILLIAM GOLDING, New Orleans, La. Filed Sept. 25, 1883. (No model.)

Claim.—1. In expansion-steam and other engines, the combination, with an intermediate driving-shaft, of a series of independent expansion reciprocating-piston engines, arranged in pairs on opposite sides of said shaft and geared or connected with it to rotate the same, the cranks in each pair of said engines being set at right angles with one another, and the cranks of the several engines being arranged progressively and uniformly, one in advance of the other, substantially as and for the purposes specified.

2. The combination, in the one expansion-engine, of the intermediate driving-shaft, E, the duplicate parallel crank-shafts D D' on opposite sides of said shaft, the gears *f f' g*, connecting the several shafts, a duplicate series, in pairs, of reciprocating-piston expansion-engines having their cranks arranged, as described, progressively and uniformly, one in advance of the other, and a valve mechanism common to all the engines for simultaneously and similarly controlling them, essentially as described.



298,082. BUTTON. NAPOLEON B. HALE, San Bernardino, Cal. Filed Nov. 12, 1883. (No model.)

Claim.—The combination, with a button provided with a shank secured to the said button by the parallel and bifurcated ends of said shank, and having a pin, C, and a slot, *b*, formed therein, of the slotted cross-head formed of one continuous piece of spring metal, and provided at its center with a depression, *l*, in which the pin C rests, all arranged to operate substantially as herein described.

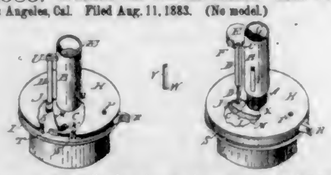
298,083. REFRIGERATING CAR AND CHAMBER. EDWARD HAMILTON, Boston, Mass. Filed Apr. 30, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 248,738, dated October 25, 1881, to same inventor.

Claim.—1. In a refrigerating-car or similar refrigerating-chamber, the tank *a*, adapted for holding a freezing-mixture, and the outer removable jacket or casing, *b*, provided with an opening at the top and bottom, and a circulating-air space between the said jacket and tank, all arranged and combined substantially as and for the purposes set forth.

2. In combination, the independent metal refrigerating-tank *a*, provided with the outer metal shell, *b*, the interposed perpendicular joists or stays *a²*, arranged to form perpendicular air-passages upon the outside of the tank *a*, said passages being open both at the top and bottom for the free circulation of air, and presenting independent metal condensing-surfaces all outside the tank *a*, and all adapted to operate in the chamber of a refrigerating-car or refrigerating-chamber, substantially as and for the purposes set forth.

298,084. STYLOGRAPHIC FOUNTAIN-PEN. JOHN C. HARING and CHARLES H. COURT, Jersey City, N. J. Filed Oct. 5, 1883. (No model.)



Claim.—1. In a stylographic fountain-pen, the combination of the case, the air-tube formed as described, to constitute a spring at its lower end, and the needle arranged within the case so as to have a bearing against said spring, whereby a vibratory or reciprocating movement is permitted to the needle, substantially as described.

2. In a stylographic fountain-pen, the case, the air-tube inclosed thereby, said tube being cut away as described, to form a spring, and being provided with a plug (as *g*) near its lower end, and the needle arranged in the casing to bear against said spring, all the parts in combination substantially as and for the purpose set forth.

3. In a stylographic fountain-pen, a case provided with a part internally screw-threaded, an air-tube having an external screw-thread to engage therewith, said air-tube being cut away in part at its lower end to form a spring, and a needle arranged, substantially as described, to bear against said spring, all in combination substantially as and for the purpose set forth.

298,085. CHARGER FOR POWDER-FLASKS. HENRY T. HAZARD, Los Angeles, Cal. Filed Aug. 11, 1883. (No model.)

Claim.—1. The following elements in combination, substantially as shown: the inner cut-off gate, C, pivoted at P, and having thumb-piece R, hook T, recess K, shoulder L, and discharge-opening N, the dog J, having opening Q for the reception and operation of the square part of the rod, the rod D being square at one end, and to the other end is rigidly affixed an outer cut-off gate, E, on which gate is mounted the hood F, the charge-tube A, mounted on the face-plate H, and projecting into the

charge-tube B, and having indentations X, the outer tube, B, movably attached to the tube A, through which is cut the slot G and hole for the catch W, on which tube is mounted the support U, in which the rod D rotates, the spring S, the face-plates H and I, the flask Z, and the spring V, having catch W.

2. The arm D, on which is mounted the cut-off gate E, and having apron F, in combination with the dog J, having the hole Q, the cut-off C, pivoted at P and being recessed at K, and having the arm T, shoulder L, and thumb-piece R, the spring S, the spring V, having catch W, and the charge-tubes A and B, substantially as and for the purpose shown.

3. The spring V, mounted on the tube B, and having rigidly affixed on its free end the catch W, which projects through a hole in the tube B into indentations X on the inner tube, A, holding thereby the tube B in proper position on the tube A, and being the means of properly regulating the charges, in combination with the tube B and the tube A, as shown.

4. The arm D, having rigidly affixed thereon the cut-off E, and being mounted on the side of the measuring-tube B, as shown, which arm D extends down into the flask through the hole Q in the dog J, the dog J having opening Q, in combination with the cut-off C, having the thumb-piece R and opening K, and being pivoted on the screw P, the spring S, the measuring-tubes A and B, and spring V, whereby upon the pressure upon the thumb-piece R the opening O will be first closed, separating an exact charge, and by the further movement of the thumb-piece the cut-off E will be opened, leaving the charge free to fall.

5. The charger for powder-flasks, consisting of the slotted charge-tube, the outer cut-off gate, E, mounted upon the connecting-rod D, the dog J, and lower cut-off gate, C, having arm T, curve M, recess K, and shoulder L, all in combination, substantially as shown, whereby the outer gate is operated by the rotation of the inner cut-off gate after the opening into the flask is completely closed.

6. The combination, in a powder-charger, of the following elements: the adjustable tube A B, having slot G and bearing U, the cut-off gate E, connecting-rod D, dog J, spring S, and inner cut-off gate, C, having shoulder L, curve M, recess K, and arm T, substantially as and for the purpose shown and described.

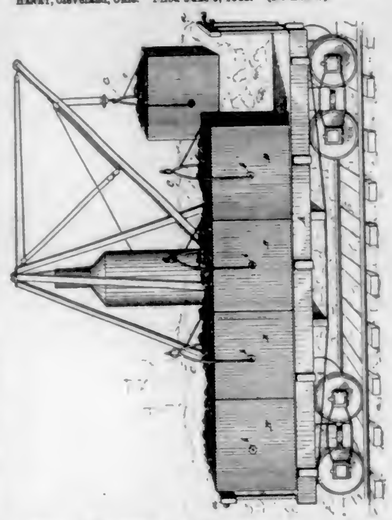
7. In a powder-charger, the rotary rod D, mounted longitudinally on the measuring-tube B, having an outer cut-off gate, E, rigidly affixed to its outer end, the inner and extending through the dog J, said dog being so arranged as to rotate by its engagement with the arm T on the gate C, whereby the outer gate, E, will be opened after the inner gate, C, has closed the channel into the flask.

8. In a powder-charger, the inner cut-off gate, C, having an irregular edge, substantially as shown, in combination with the dog J, operated thereby, and the rod D, supporting the outer rotary cut-off gate, E, whereby said outer gate, E, is operated by the movement of the inner cut-off.

9. In a powder-charger having an inner and an outer cut-off gate, the inner cut-off gate, C, having the discharge-opening L at such a point therein as to register with the passage into the flask when the charger is not being operated, and being connected with the outer cut-off gate by the rotary arm D and dog J, substantially as shown, whereby the measuring-tube will contain an exact charge while the operative parts are at rest.

10. A powder-charger having a measuring-tube, B, arm D, mounted longitudinally thereon, and adapted to operate by rotation by means shown, and an outer cut-off gate, which is rigidly affixed on said arm, which arm is rotated by its combination, as shown, with an inner cut-off gate, C, the inner gate in the first part of its movement closing the channel from the flask to the measuring-tube, after which, by its further movement, the arm D is caused to rotate, thereby opening the outer gate.

11. In a powder-charger, the combination of a measuring-tube, a cut-off gate at or near its outer end, a rotating rod carrying said outer cut-off gate, and provided at its inner end with a lateral arm, an inner cut-off gate provided with an orifice which normally registers with the measuring-tube and with a curved recess, K, and a spring serving to hold the inner cut-off gate normally open, the parts being constructed and arranged to operate substantially as described, whereby a movement of the inner gate is caused first to close the inner end of the tube, and then to open the outer end, substantially as explained.



12. In combination with tube B, having opening G in its side gate E, passing through said opening and limited in its inward movement by the tube, rod D, carrying gate E, and provided with dog S, and the inner cut-off gate, C, having curved face M, concentric with its pivot, and recess K, all substantially as shown, whereby the outer gate is locked shut until the slide C moves so far as to bring the recess K opposite the dog S, whereupon the latter is permitted to move laterally, thereby carrying the gate E out of the tube, as explained.

13. The combination, substantially as shown and described, of tube B, having opening G, gate E, rod D, provided with dog S, and inner gate, C, having curved face M, inclined shoulder L, and recess K, all substantially as and for the purpose set forth.

14. In combination with telescopic tube A B, gate E, and dog S, a polygonal rod, D, carrying said gate E, and passing freely through a polygonal opening in said dog, and cap-plates H I, or equivalent supports, one above and the other below the dog, whereby the tube may be lengthened and shortened without disconnecting the gate and the dog

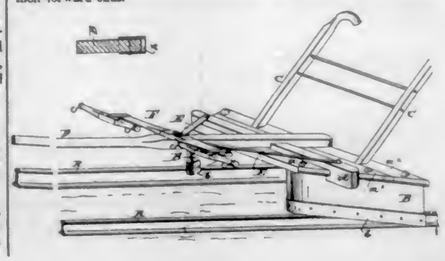
---

298,086. DETACHABLE COMPARTMENT FOR CARS. EDWIN S. HENRY, Cleveland, Ohio. Filed June 9, 1883. (No model.)

Claim.—1. The combination, with a series of movable flat-bottom rectangular freight-compartments constructed to extend the width of the car and cover the entire floor-space thereof, of a platform-car provided at its opposite ends with devices for holding the compartments thereon, substantially as set forth.

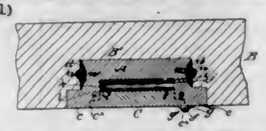
2. The combination of a platform-car provided at its end with upwardly-projecting frames having inwardly-projecting set-screws, and a series of removable flat-bottom rectangular freight-compartments constructed to extend the width of the car and cover the entire floor-space thereof and fit snugly one against the other, so that the entire series may be held by transverse pressure exerted by the set-screws upon the two end compartments of the series, substantially as set forth.

298,087. TOOTH-PICK DEVICE. JAMES HOFFMAN, Philadelphia, Pa. Filed Jan. 22, 1884. (No model.)



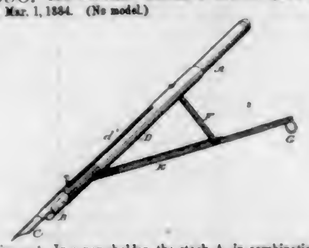
Claim.—1. The herein-described device for holding thread for cleaning teeth, consisting of the spindle or reel A, cylinder B, and jam-nuts C D, all substantially as and for the purposes set forth.

2. The herein-described device for covering the thread, consisting of the cylinder B, furnished with a slot, *c*, or its equivalent, said cylinder revolving on bearings *b b* on spindle A substantially as set forth.



298,088. CAR-TRACK CLEANER. JOHN GLIDDEN HOLDEN and JAMES EVERETT COX, Danville, Ill. Filed Feb. 6, 1884. (No model.)

Brief.—A track-cleaner in which the metal scraper-plates project below the wooden body of the scraper, and in which the scrapers are arranged diagonally across the track, leaving a broad space between their forward ends.

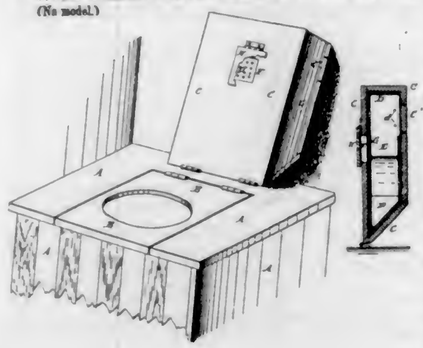


Claim.—The combination of the inward-inclined scrapers B B, separated at their forward ends by a wide space, and provided with plates *b b*, projecting below the scrapers and bent around the forward ends thereof, with the connecting-bars *a a'* a^2 and the bar *d* and tongue D, the bar a^2 being provided with handles C, substantially as set forth.

298,089. PICTURE-CASE FOR TOMBSTONES. HARVEY ALLEN HOLLOMAN and WILLIAM ROBERT GREEN, Kingston, Tex. Filed July 27, 1883. (No model.)

Claim.—The tombstone B, recessed at B', oppositely grooved at *a a*, and having at the lower end the sprue-holes *b*, in combination with the case A, provided with surrounding flanges *e e'*, of which the latter is cut away at *k*, and the grooved side surfaces, *a' a'*, whereby the case may be cemented in the stone, as described.

298,090. PEN-HOLDER. STEPHEN A. HOLMAN, Spencerville, Cal. Filed Mar. 1, 1884. (No model.)



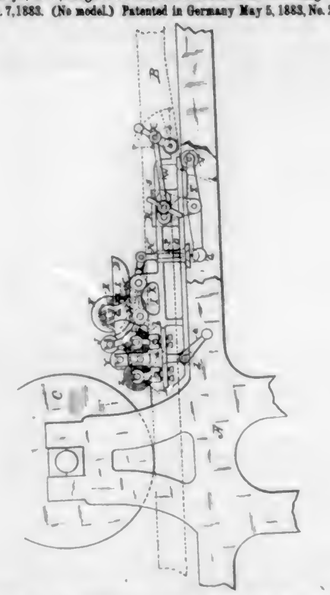
Claim.—1. In a pen-holder, the stock A, in combination with a bar or strip secured at its lower end to the stock, and extending backwardly and at an inclination, to serve as a support or rest for the thumb, substantially as described.

2. In a pen-holder, the slotted stock A, in combination with a bar or strip, the forward end of which projects through said stock and forms a rest for the index-finger, its rear end projecting backwardly and at an inclination, to serve as a support or rest for the thumb, and the brace F, substantially as described.

3. In a pen-holder, the slotted stock A, and the strip or bar E, pivoted at its forward end in the slot of the stock, in combination with the sliding slotted sleeve D, fitted over the pen-stock, and the link F, pivoted to the sliding sleeve and to the strip or bar E, substantially as herein described.

4. In a pen-holder, the slotted and grooved stock A, and the strip or bar E, the forward end of which is pivoted in and projects through the slot of the stock, forming a rest, *e*, in combination with the sliding slotted sleeve D, fitting on said stock, the link F, pivoted to the sliding sleeve and to the strip or bar E, and suitable means for confining or holding the bar E to its place when seated in the slotted stock, substantially as herein described.

298,091. DEODORIZING AND ANTISEPTIC WATER-CLOSET COVER. FREDERICK H. HUBBARD, Brooklyn, N.Y. Filed Jan. 14, 1884. (No model.)



Claim.—1. The combination, with a hinged water-closet cover made in box form, of a non-corrosive vessel arranged in said cover and provided with a number of fine perforations in its bottom, substantially as herein shown and described, and for the purpose set forth.

2. The combination, with the hinged hollow water-closet cover C, having an opening, F, in its lower surface, of the non-corrosive vessel D, arranged in said cover and provided with the fine perforations G in its bottom over the opening of the cover, substantially as herein shown and described.

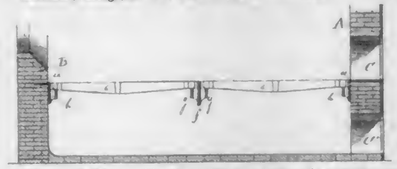
3. The combination, with the hinged hollow cover C, provided with the opening F in its lower surface, and the vessel D, arranged in said cover and provided with perforations G over the opening of the cover, of the flap H, hinged to the cover, near the forward edge of its opening, substantially as herein shown and described.

4. In a water-closet cover, the non-corrosive interior vessel, D, made substantially as herein shown and described, with its rear part closed at the top, and fine perforations in its bottom, whereby the liquid contents of the said vessel will be allowed to drip when the said cover is closed, and the dripping will be prevented and the said contents kept from being spilled when the cover is opened, as set forth.

298,092. LITHOGRAPHIC-PRINTING MACHINE. EMILE JAHN, Brooklyn, N. Y., assignor to John M. Fuchs and Julius C. F. Lang. Filed Aug. 7, 1883. (No model.) Patented in Germany May 5, 1883, No. 24,875.

Claim.—1. In a lithographic press, the bed having the cam-surface A, in combination with an adjustable lever which is actuated by the cam-surface during the movement of the bed to tilt, through a system of levers, the roller J against the trough-roller F, and to permit it to be relieved therefrom, substantially as set forth.

2. In a lithographic press, the levers T, I, and K and piece N, in combination with the bed B, having the cam A, adapted by its movement to tilt the roller J, carried by the lever I, against the trough-roller, and to permit it to be relieved therefrom, substantially in the manner and for the purposes set forth.

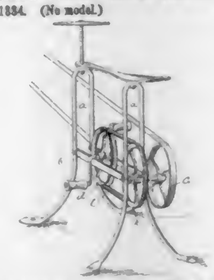


3. The lever T, secured to an adjustable carriage, in combination with the levers I K, piece N, and the bed B, having the cam A, which is adapted by its movement to tilt, through said levers, the roller J against the trough-roller, substantially in the manner and for the purpose set forth.

4. In a lithographic press, the combination of the lever I, carrying the roller J, the lever K, having in one end the screw L, and at its other being pivoted to the vertical slide N, and the rocking lever T, one end of which is below the piece N, and the other terminating in proper relation to be acted upon by the movement of the bed, substantially as set forth.

5. In a lithographic press, the rocking lever mounted in the carriage R, which is adjustable by a hand-lever or winch, X, and locking-screw S, in combination with the slide N, levers I K, and the bed B, having the cam A, which is adapted by its movement to actuate the mechan-

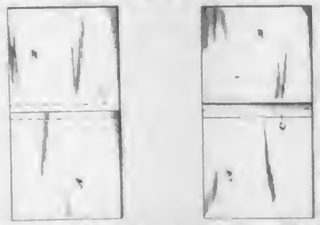
ism to tilt the roller J against the trough-roller and permit it to be relieved therefrom, substantially as set forth.



298,093. FURNACE-GRATE. OMAR H. JEWELL and WILLIAM M. MATHESEN, Chicago, Ill. Filed Nov. 27, 1883. (No model.)

Claim.—1. The combination, with grate-bars *e*, of supports secured to the front and bridge walls A B, and consisting of angle-irons *a*, bars *b*, and connecting-lugs *i* and provided with openings *d*, as described and shown.

2. A central support consisting of a center bar, *f*, side bars *g*, connected by lugs *i*, in combination with grate-bars *e* and the end supports described, said central and end supports adapted to support the ends of the grate-bars and provided with openings for the discharge of ashes, &c., as described and shown.

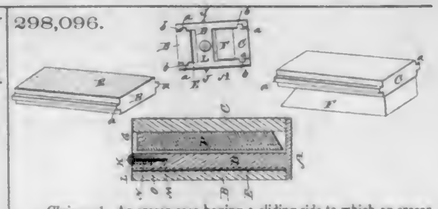


298,094. TREAD-POWER. EDWARD KILBOURN, Jamestown, Wis. Filed Mar. 21, 1884. (No model.)

Claim.—1. A tread-power consisting of the frame, a saddle and handle-bar upon said frame, a pulley having its bearings therein and provided with treadles, and means, substantially as described, for communicating power from said pulley to the driving-pulley, substantially as described.

2. A tread-power consisting of the frame having saddle and handle-bar, the pulley *d*, having its bearing in said frame and carrying treadles, the pulley *k*, mounted in rear of said pulley *d* and connected thereto by band, and the band-wheel G, mounted on the same shaft with pulley *k*, driven thereby, substantially as described.

298,095. METHOD OF JOINING RUBBER FABRICS. ISAAC B. KLEINERT, New York, N. Y. Filed Feb. 21, 1884. (No model.)



Claim.—1. The method of uniting pieces of rubbered fabric by applying a preparation of rubber to the edges to be joined, and then bringing the edges in contact without overlapping them, to allow the rubber to cohere, substantially as set forth.

2. A seam formed by the cohesion of rubber, said rubber having been applied to two edges of rubbered fabric, and a strengthening-strip cemented over the joined edges, substantially as set forth.

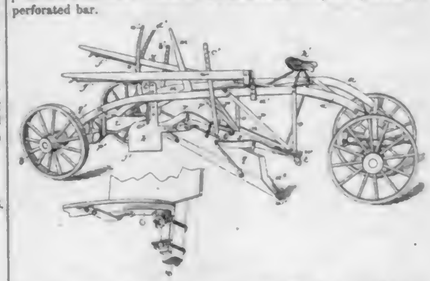
298,096. ERASER-CASE. LOUIS KROB, Zanesville, Ohio. Filed June 30, 1883. (No model.)

298,096.

Claim.—1. An eraser-case having a sliding side to which an eraser is attached, and a sliding cover for one end of the same, substantially as herein shown and described.

2. The combination, with a case, of a reversible slide having an eraser fastened thereto, substantially as herein shown and described.

3. The combination, with a case, of a reversible slide having an eraser fastened thereto, and of a slide provided with an abrading-surface, substantially as herein shown and described.



4. The combination, with a case, of a slide to which an eraser is fastened, a slide having an abrading-surface, and a sliding cover on one end of the case, substantially as herein shown and described.

5. The combination, with a case, of a slide to which an eraser is fastened, a slide having an abrading-surface, a sliding cover on one end of the case, and a spring-pintle for holding the cover in place, substantially as herein shown and described.

6. The combination, with the casing A, having a partition, D, of the slide C, to which the eraser F is fastened, the slide B, having an abrading-surface, the cover G, provided with a recess or cavity, K, in its under surface, and the spring-pintle M in the partition D, substantially as herein shown and described.

298,097. ROAD-SCRAPER. LEWIS LAMBORN, Hamorton, assignor to the Lamborn Road Machine Company, (Limited,) Media, Pa. Filed Dec. 11, 1883. (No model.)

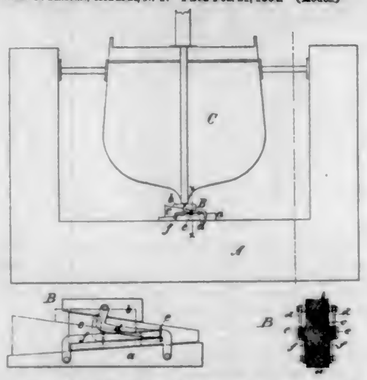
Brief.—An arched frame having a fifth-wheel bearing on its front axle and an auxiliary wheel on its rear axle, to ride while a main wheel is in a ditch, has a draw-bar, eyes on which interlink with forward and downward curved clevises on upward-curved draft-beams. A rudder flexibly connected by a pivoted arm to the scraper is adjusted by an elbow-lever connected to a perforated standard thereon, and braced by a hook-rod to a perforated plate on the frame. A landside connected by parallel rods socketed thereto to the main frame is adjustably held by a perforated bar.

Claim.—1. In a road-scraper, a supporting-frame which arches from end to end, in combination with a scraper-bar, substantially as set forth.

2. In a road-scraper, an arched frame supported at its rear end by the rear axle and at its front end through a fifth-wheel by the front axle, in combination with a scraper-bar, substantially as set forth.

3. In a road-scraper, the combination, with an arched frame supported at its rear end by the rear axle and its front end through the fifth-wheel by the front axle, of an auxiliary wheel arranged between the rear wheels of a four-wheeled machine, substantially as set forth.

4. As an improvement in adjustable blades forming the cutting-edge of the scraper-bar of a road-scraper, the combination, with said blades, of a binding-plate which permits the removal or adjustment of the blades by loosening without removing its fastenings, substantially as set forth.

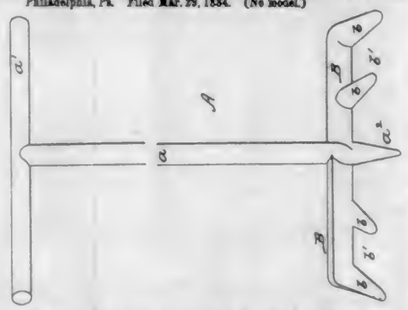


5. In a road-scraper, the combination, with the scraper-bar, of upwardly-curved draft-beams connected by clevises with the draft-bar, which is attached to the supporting-frame, substantially as set forth.

6. In a road-scraper, the combination, with the draft-bar and upwardly-curved draft-beams, of clevises *t* and *u*, constructed with downward and forward curves, and engaging eyes in the draft-bar, which is attached by hangers to the supporting-frame, substantially as set forth.

7. In a road-scraper, a rudder consisting of the blade *k'*, perforated shank *l'*, elbow-lever *m'*, flexible arm *n'*, and hooked rod *o'*, in combination with a scraper-bar and supporting-frame, substantially as set forth.

8. In a road-scraper, the landside consisting of a runner, the parallel rods *t'* and *u'*, the lower ends of which turn in sockets attached to the plate *r'*, and the upper ends of which are flexibly attached to a supporting-frame, and the perforated bar *v'*, adapted to engage a pin or hook or equivalent device on the frame, substantially as set forth.



298,098. ADJUSTABLE KEEL-BLOCK. FREDERICK C. LANG and JOHN F. TIETJEN, Rondout, N. Y. Filed Feb. 21, 1884. (Model.)

Claim.—1. The keel-block B, composed of the upper and lower inclined blocks, *a b*, connected together by pivoted S-shaped plates and interposed wedge *c*, connected to said plates by staples *e*, arranged to operate substantially as and for the purposes set forth.

2. The inclined upper and lower blocks, *a b*, connected by the S-shaped plates or rods *d*, the lower block being provided with the fenders *f*, in combination with the wedge *c*, interposed between the said inclined blocks and fenders and connected to the fenders *f* and connecting-plates *d* by the staples *e*, substantially as and for the purposes set forth.

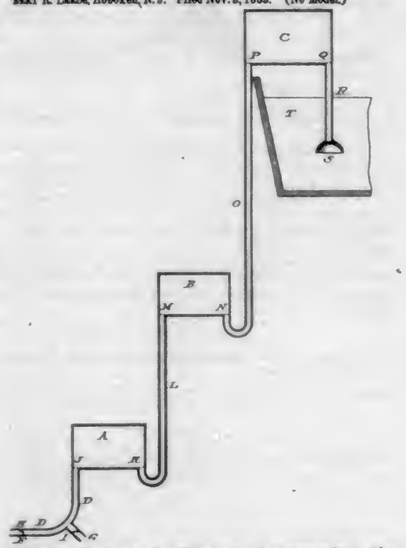
298,099. DEVICE FOR LOOSENING SUGAR, &c. JOHN S. LASH, Philadelphia, Pa. Filed Mar. 29, 1884. (No model.)

Claim.—1. The loosening and crushing tool A, comprising a stem, *a*, having tapering end a^2, and oppositely-inclining radial plates B B, provided with serrated edges *b' b'*, substantially as shown and described.

2. The tool A, having stem *a*, handle *a'*, tapering point a^2, and oppositely-inclining radial plates B B, having studs or fingers *b b*, substantially as shown, and for the purpose set forth.

298,100. JEWELRY-RING. EDWIN F. LEE, New York, N. Y. Filed Sept. 7, 1883. (No model.)

298,100.



Claim.—1. A ring having on its inner side emblems or figures in relief on the surrounding ground, substantially as herein described.

2. A ring having on the inner side emblems or figures in relief on a surrounding ground, and having the ground covered with enamel, substantially as herein described.

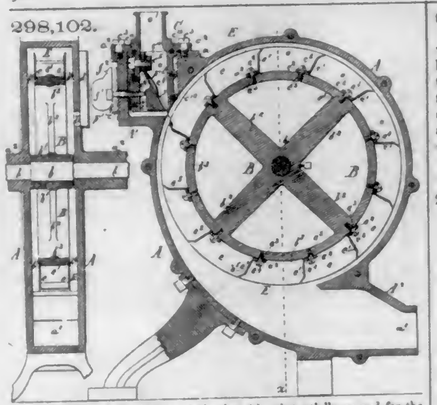
3. The method of forming an emblematic ring, consisting in rolling a strip of metal to produce emblems or figures on or in the surrounding ground, and in bending the strip into a circle, with the emblems or figures on the inner side, and in finally joining the ends of the strip, substantially as and for the purpose described.

298,101. PROCESS FOR THE PURIFICATION OF WATER. ALBERT R. LEEDS, Hoboken, N. J. Filed Nov. 3, 1883. (No model.)

Claim.—1. In the art of purifying water, the process of saturating water with oxygen or ozone, consisting in introducing into water while in motion, under pressure, compressed air also in motion, substantially as described.

2. In the art of purifying water, the process of saturating it with oxygen or ozone by causing the water to come in contact, while under artificial pressure and in motion, with compressed air in a system of pipes and air-chambers, permitting both air and water to enter under pressure, to move through said system while under pressure, and to be discharged into a suitable reservoir, substantially as described.

298,102. HYDRAULIC MOTOR. ROBT. LIGOWSKENING, New Bedford, Mass., assignor of one-half to Frederick B. Nesbett, same place. Filed Nov. 14, 1883. (No model.)



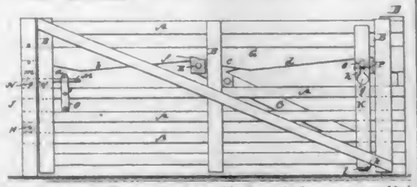
Claim.—1. The combination, with the water-wheel and its inclosing-case having a broad rectangular inlet, *a*, of the conduit C, closed on all sides, and provided with a flexible water-supply-regulating guide, c^4, having a broad surface, and a governing means, substantially as and for the purpose described.

2. The combination, with the water-wheel and its inclosing-case having a broad rectangular inlet, *a*, of the conduit C, closed on all sides, and provided with a rectangular chamber, and a flexible water-supply-regulating guide, c^4, having a broad face, the adjusting-screw *f*, pointer f^2, and dial F', substantially as and for the purpose described.

3. The combination, with the water-wheel and its inclosing-case, of the conduit C, closed on all sides, and having the broad surfaced adjustable guide c^4, which is made flexible at c^5, and provided with a spring, and adapted to be fastened within the rectangular chamber of the conduit by a screw-bolt, substantially as and for the purpose described.

4. The removable conduit C, provided with a coupling-head, c', a rectangular chamber, *c*, bolting-flanges c^3, screw-plates c^{10}, and a flexible removable water-supply-regulating guide, c^4, fitted within the cham-

298,102.



ber, in combination with the projection A', substantially as and for the purpose described.

5. The combination of the wheel B and the water-motor case A A' A^2, having a suitable conduit, C, and the air-supplying vent-hole D, covered by the tube *d*, substantially as and for the purpose described.

6. In a water-motor, the wheel B, having its periphery formed with circular rabbets b^1, and its buckets E, constructed separately with their face-plates *e'* and side portions, *e*, fitted to the rabbeted periphery, all substantially as described.

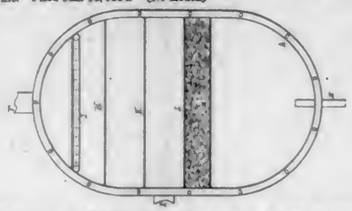
7. In a water-motor, the wheel B, having separately-constructed buckets E, provided with face-plate *e'*, side portions, *e*, flanged bolting portions e^2, and end portions, e^3, fitting the face-plate *e'*, substantially as described.

298,103. GATE. ADELBERT D. MACK, Franklin, Ohio. Filed July 30, 1883. (No model.)

Claim.—1. The combination, with the swinging crane provided with end rolls, and a guide plank or slat having a tenon on its lower end, of the gate provided with a track-plank having two short corresponding bevels and two long corresponding bevels, substantially as and for the purpose set forth.

2. The combination, with a gate and swinging crane on which the gate can slide, of the plank or slat K, having a slot, *k*, provided with an enlargement, *g*, of the loop *k* on the lower end post of the crane, and of the pintle *e*, on which the roller F is mounted, substantially as herein shown and described.

3. The combination, with a gate having a track-plank provided with two corresponding short bevels and two corresponding long bevels, of the crane provided with end rollers, and a guide plank or slat having a slot provided with an enlargement, and a loop on the hinge-post which receives a tenon on the lower end of said plank, substantially as and for the purpose set forth.



298,104. SWIVELING LOOP-IRON FOR HARNESS. KENNETH MACKAY and THADDEUS C. DUNN, Boston, Mass. Filed Mar. 14, 1884. (No model.)

Claim.—1. In a swiveling loop-iron for harnesses, a joint consisting of an annular boss or projection on one portion of the loop-iron, fitting within an annular recess in the other portion, in combination with a stud projecting from the center of said recess and fitting within the annular boss, whereby two separate and independent bearings are secured, and a fastening-screw adapted to enter the stud and bold the two portions of the loop-iron together, substantially as set forth.

2. In a loop-iron for harnesses, the stationary portion A, provided with an annular boss or projection, *e*, in combination with the swiveling loop portion B, provided with an annular recess, *f*, for the reception of the annular boss *e*, and having a stud, *g*, projecting from the center of the recess *f* into the central aperture, *h*, of the boss *e*, and the fastening-screw C, adapted to enter the stud *g* from the rear side of the portion A, and hold the two portions A B together, all constructed to operate substantially in the manner and for the purpose described.

298,105. FEED-WATER HEATER. THOMAS MARSHALL, Defiance, Ohio. Filed Jan. 16, 1884. (No model.)

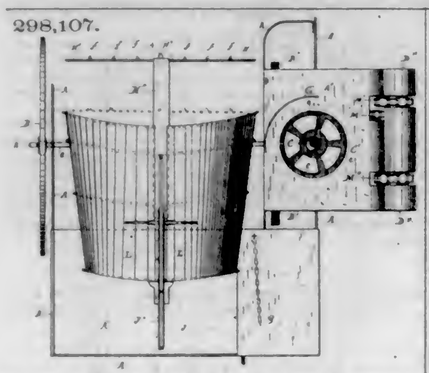
Claim.—1. A feed-water heater consisting of the case A, provided with steam-inlet E and steam-outlet B, the water-inlet G, terminating in perforated branches J, the imperforated plate I, the perforated plates H, K, L, and M, and the outlet water-pipe H', all constructed, arranged, and operating substantially as and for the purposes set forth.

2. A feed-water heater consisting of the case A, provided with steam-inlet E and steam-outlet B, the water-inlet G, terminating in perforated branches J, the imperforated plate I, the perforated plates H, K, L, and M, the outlet water-pipe H', water-gage C, and faucet D, the parts being constructed, arranged, and operating as and for the purposes set forth.

298,106. SASH-FASTENER. ROBERT MCCABE, Meadville, Pa. Filed Oct. 8, 1883. (Model.)

Claim.—The construction of the window-sash fastener, as described, consisting of the metal plate D D, the latch C, the rest H, and the lock-hook B, in combination with the screw-knobs 1 2 3 and the thumb-piece F, when the same are constructed as described in the aforesaid combination, for the purposes set forth.

298,107. SHEAF GATHERING AND SHOCKING MACHINE. SOLOMON CLEMENT MINEAR, Chillicothe, Ohio. Filed Aug. 22, 1883. (No model.)



Claim.—1. In a machine for shocking wheat, the combination of the frame, the carrying-wheels, a curved axle having one bearing in the frame and the other in one of the wheels, and a shocking-trough secured to said axle, as described, and for the purposes set forth.

2. In a machine for shocking wheat, in combination with a shocking-trough, a gate sliding in said trough, and means to lock the gate in different positions, as shown and described, and for the purposes set forth.

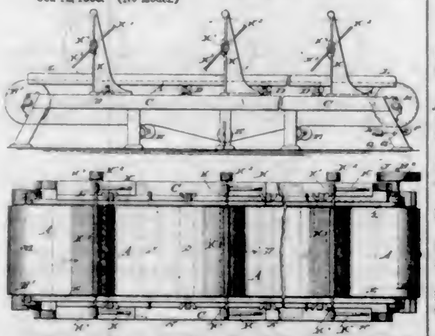
3. In a machine for shocking-wheat, a shocking-trough, L, in combination with the slide H'', curved piece H', and rods *f*, substantially as shown and described, and for the purposes set forth.

4. In a machine for shocking wheat, the shocking-trough L, the slide H'', having curved piece H', and rods *f*, in combination with compressing-arms H, lever J, handle J', links A, and lever K', substantially as described, and for the purposes set forth.

298,107.

5. In a machine for shocking wheat, the frame A, in combination with wheel B', axle C'', bevel-gears D'' D, shaft C, and wheel C', having pins *c*, as shown and described, and for the purposes set forth.

6. In a machine for shocking wheat, the combination of the frame A, wheel B', axle C'', bevel-gear D'', shaft C'', having bevel-gear D', sprocket-wheel F^{xx}, chain M, the shaft F', having sprocket-wheels F^{xx}, F, and F'', and the elevator-chains M' and M'', as described, and for the purposes set forth.



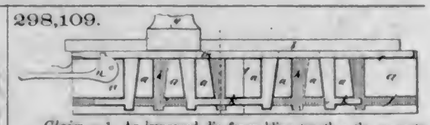
7. In a machine for shocking wheat, in combination with the frame A, the bars E, the pivoted bars E', the plate A''', and curved plate D^x, as described, and for the purposes set forth.

8. In a machine for shocking wheat, the combination of the trough L, plate N, the compressing-arms H, links A, and lever K', as described, and for the purposes set forth.

9. In a machine for shocking wheat, the trough L, the slide H'', the handle J', the lever J, having spring J'', and pin *j'*, the whole in combination as described, and for the purposes set forth.

10. In a machine for shocking wheat, in combination with the frame A, the table A'', the wheel 1^x, and beveled plate G, as described, and for the purposes set forth.

298,108. PAPER-STOCK SORTING AND CLEANING MACHINE. ROBERT O. MOORHOUSE and WALTER MOORHOUSE, Philadelphia, Pa. Filed Oct. 12, 1883. (No model.)



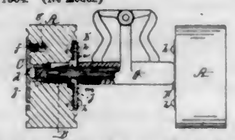
Claim.—1. In a machine for sorting and cleaning paper-stock, the combination of a progressively-moving screening-apron with a series of revolving vanes, arranged to operate substantially as set forth.

2. In a machine for sorting and cleaning paper-stock, the combination of an endless screening-apron with a driving-roller and a second roller pressed toward said driving-roller upon the apron, as and for the purpose set forth.

3. In a machine for sorting and cleaning paper-stock, the combination of revolving vanes having leather or other equivalent clothing upon the edges thereof, with a progressively-moving endless screening-apron, arranged to operate substantially as and for the purpose set forth.

298,109. LOCOMOTIVE-FRAME-FORGING DIE. THOMAS MORRIS, Dunkirk, N. Y. Filed Apr. 25, 1883. (No model.)

298,109.



Claim.—1. An improved die for welding together the separate sections of a wrought-metal locomotive-frame, consisting of plate *a*, with grooves *h j*, for the leg and brace forgings of the frame, and a ledge or table, *c*, for supporting the top connecting-bar of the frame that is to be welded to the leg and brace forgings, substantially as described.

2. In a die for welding together the separate sections of a wrought-metal locomotive-frame, the plate *a*, having grooves *h i j*, for the leg and brace forgings of the frame, and a ledge or table, *c*, for supporting the top connecting-bar of the frame that is to be welded to the leg and brace forgings, substantially as and for the purpose set forth.

3. The combination of the holding-lever *m* with the bed-die *a*, having face *c*, and leg-grooves *h*, substantially as described.

298,110. ROLLER-SKATE. CHARLES F. MORSE, Somerville, Mass. Filed Feb. 5, 1884. (No model.)

Claim.—1. An axle, D, having screw-threaded ends, journals *l*, capable of adjustment thereon, and a means of locking them thereto, in combination with a pair of rollers, A, having journal-boxes B, and a means of securing them therein, constructed to operate substantially as and for the purposes described.

2. An axle, D, having its ends provided with screw-threads *k* and notches *p*, in combination with notched journals *l*, adjustable thereon, and keys *r*, for locking them thereto, as set forth.

3. A roller, A, having a journal-box, B, and an outer face-plate, C, for retaining it therein, an axle, D, having screw-threaded ends, a journal capable of adjustment thereon, and an inner face-plate, E, for locking the roller upon the journal, as and for the purpose specified.

298,111. COMBINED BILLIARD-CUE AND WALKING-CANE. WM. G. MORSE, Plainfield, N. J. Filed Apr. 11, 1882. (No model.)

Claim.—1. The combination, with the sections in a walking-staff or billiard-cue, of the screw-cylinder *g*, screwed into one section, and the screw *f* in the adjoining section, substantially as set forth.

2. The sectional billiard-cue having screw-cylinders *g*, and screws *f*, to unite the respective sections, and the ferrule-section F, adapted to the end of the sections A B, when the two or more sections C D E have been removed, substantially as specified.

3. A billiard-cue having one or more axial weight-pockets, in combination with one or more movable or changeable weights for each pocket, substantially as set forth.

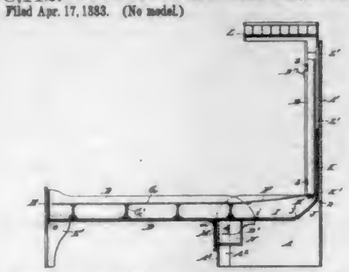
4. In a billiard-cue having weight-pockets, the combination of the heavy weights *h h* and the light weights *i i*, substantially as set forth.

5. A billiard-cue having one or more weight-pockets, in combination with the weight or weights and the screw-plug *k*, substantially as set forth.

6. The combination, with the billiard-cue and the elastic tip, of an intermediate bearing-plate having projections that bed themselves into the end of the cue-rod, substantially as set forth.

7. The combination, with the billiard-cue and flexible tip, of a bearing-plate, and a screw passing through a hole in the flexible material into the cue, there being an opening in the flexible material for the screw-driver, and the screw-head being below the surface of the elastic material.

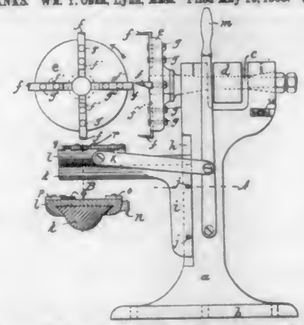
8. A flexible tip for billiard-cues, having a hole for the passage of the body of the attaching-screw, and an enlarged portion of said hole for the head of the screw, and a filling-plug over the head of the screw, substantially as set forth.



9. A tip for billiard-cues, made of two pieces of flexible material glued together, there being a hole in one for the body of the screw, and in the other for the head, in combination with the attaching-screw passing through the flexible material into the cue, substantially as set forth.

10. The bearing-plate having a central star-shaped opening, and the points bent toward the cue, in combination with the flexible tip and the attaching-screw, substantially as set forth.

11. The combination, with the billiard-cue and the cross-pin *r*, of the flexible tip and the attaching-screw, substantially as set forth.

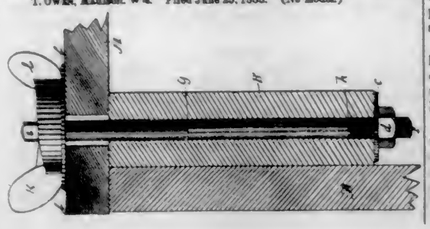


12. The combination, with the billiard-cue and the screw for attaching the flexible tip, of a tip having a plug, *t*, inserted into the hole above the screw-head, substantially as set forth.

298,112. WARDROBE-BEDSTEAD. EUGENE NASH, New York, N. Y. Filed Apr. 17, 1883. (No model.)

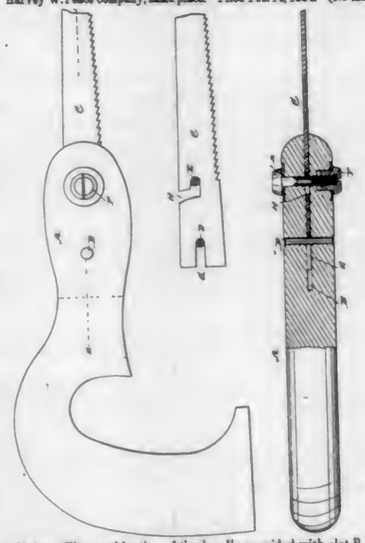
Claim.—In a wardrobe-bedstead, the box N, in combination with the stationary portion A, main folding part D, having arms D' and hinges *d*, and the cover M and hinge *m*, constructed as herein specified, for the purposes set forth.

298,113. MACHINE FOR CONCAVING BOOT AND SHOE HEEL BLANKS. WM. Y. OSER, Lynn, Mass. Filed May 19, 1883. (No model.)



Claim.—1. The combination of arm *i*, constructed and arranged to be vertically adjusted and locked upon standard *a*, and to receive and support the blank-carrying plate *l*, said plate being provided with blank-securing devices, lever *m* and link *n*, for reciprocating the plate, and rotary head *e*, carrying cutters *f*, formed to concave blank *t* in both its longitudinal and transverse sections, substantially as specified.

2. The combination, with devices, substantially as described, for holding the heel-blank and moving the same in a fixed path in the direction of its axis, of a rotary head whose axis is parallel with the line of movement of the blank, and which is provided with knives having a convex cutting-edge adapted and arranged to form a seat in the plane of the blank, and suitable driving mechanism, substantially as specified.



3. The cutter *f*, formed with a shank or bar, *f''*, for securing it to head *e*, and with a convex line adapted to impart the desired longitudinal concavity to the heel-blank, substantially as specified.

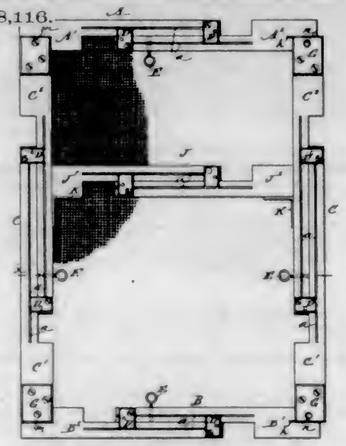
298,114. LOCKING DEVICE FOR CLOSETS, BOXES, &c. EDWARD T. OWEN, Madison, Wis. Filed June 23, 1883. (No model.)

Claim.—The combination of the handle provided with slot B, fixed pin D, and clamping-bolt E in front of said pin, with the blade provided with an open longitudinal slot, G, in its rear edge, as shown, and with an open L-shaped slot extending from the upper side downward to the plane of the slot D, and then toward the point of the blade, substantially as set forth.

298,115. SAW. HARVEY W. PEACE, Brooklyn, N. Y., assignor to the Harvey W. Peace Company, same place. Filed Feb. 14, 1884. (No model.)

Claim.—The combination of the handle provided with slot B, fixed pin D, and clamping-bolt E in front of said pin, with the blade provided with an open longitudinal slot, G, in its rear edge, as shown, and with an open L-shaped slot extending from the upper side downward to the plane of the slot D, and then toward the point of the blade, substantially as set forth.

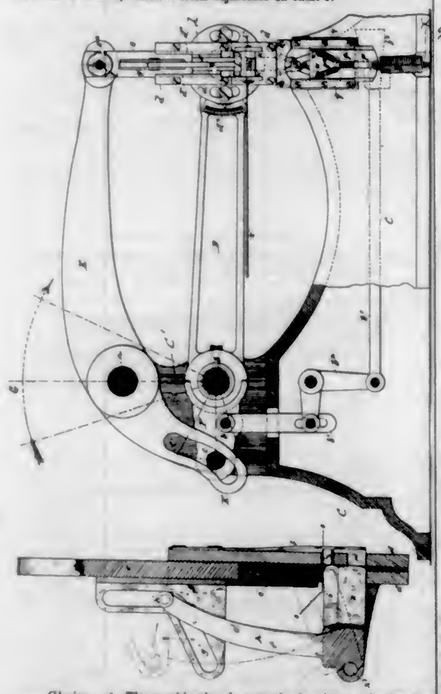
298,116. SCREEN-FRAME. GEORGE PHILLIPS, Tilford, Ill. Filed Jan. 3, 1884. (No model.)



Brief.—A screen-frame consisting of extensible bars having longitudinal recesses, longitudinal grooves in their surfaces, and clips fastened to the inner end of each section and running in the longitudinal grooves of the other, the ends of the side bars having secured clips that slide in the grooves of the end bars.

Claim.—1. A screen-frame having its bars formed of two sections having longitudinal recesses in the adjoining edges, and each section having longitudinal grooves in the side surfaces, and two clips or hook-plates, one being fastened to the inner end of each section, the hooks on the plates of one section passing into the longitudinal grooves in the other section, substantially as herein shown and described.

2. In a screen-frame, the combination, with the end bars having longitudinal grooves in the side surfaces, of side bars, and of hook-plates or clips secured on the ends of the side bars, the hooks of the said hook-plates or clips passing into the grooves in the end bars, substantially as herein shown and described.



3. In a screen-frame, the combination, with end bars having longitudinal grooves in the surfaces, of side bars, and of hook-plates or clips secured on the ends of side bars, the hooks of the said plates or clips passing into the grooves in the end bars, and the said hooks or plates being provided in the projecting ends with holes, through which screws can be passed, substantially as herein shown and described.

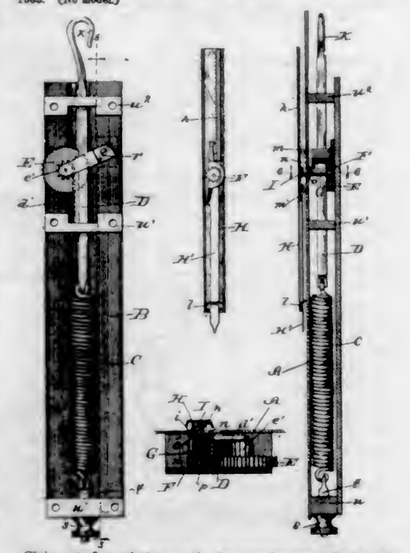
298,116.

298,117. MACHINE FOR STITCHING BOOKS WITH WIRE STAPLES. ERNST PFEIFFER, Plagwitz-Leipsic, Saxony, assignor to Gustav Hazhorst, Leipsic, Germany. Filed Apr. 28, 1883. (No model.)

Brief.—The pivoted cutter and former *k* cute off and bends the wire over the spring-seated anvil or shaping-block *m*, which is then forced from under the formed staple by the plate *i* (attached, like *k*, to lever *h*) acting upon the pins *n* on the anvil-spring *l*. Driver-bar *e'* then descends and drives the staple. For different thicknesses of work frame *d*, carrying the cutting, forming, and driving devices, is adjustable on the end of arm D, which is itself adjustable on shaft *b*.

Claim.—1. The combination, in a staple-forming mechanism for book-stapling machines, of a shaping block or mandrel, over which the wire is fed, hinged cutting and shaping jaws adapted to swing down on either side of said block, and means, substantially as described, for withdrawing said block from between the jaws after the staple is formed, substantially as described.

2. In a machine for stitching books with wire staples, the combination of the hand-lever G, shaft *b*, fixed arm D, having casing *d d'* at the outer end, crank-arm F, fulcrumed lever E, and slide-piece *e*, having push-piece *e'*, with means for cutting off and shaping the wire staple, and means whereby the staple ends are bent and closed after the same have been forced through the paper, substantially as set forth.



3. In a machine of the class described, the combination of casing *d*, vertical slide-piece *e*, push-piece *e'*, slotted bracket *g*, lever *h*, cutting and shaping pieces *k k*, plate *i*, pins *n n*, and shaping-block *m*, the latter two being applied to a strong band-spring, *l*, so as to release the bent staple for being forced into the paper, substantially as set forth.

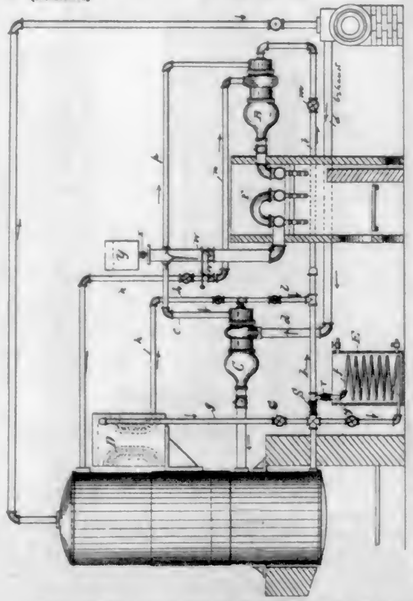
4. The combination, with the main shaft, of an intermittent feeding mechanism consisting of a slotted crank-arm on said shaft, an oscillating lever, a slotted link connecting said crank-arm and lever, means, substantially as described, for adjusting said slotted link on the crank-arm and lever for regulating the feed, a spring-pawl at the lower end of said lever for grasping the wire to feed it forward, a guide for the wire, and a spring-pawl for holding the wire during the backward movement of the lever, substantially as described.

5. The combination, in a staple-forming mechanism for book-stapling machines, of a frame, a spring attached thereto provided with a shaping-block and projecting pins, pivoted shaping-jaws adapted to bend the wire over said block, and curved faces movable with said jaws, adapted for contact with said pins for pushing back said spring to withdraw the block from between said jaws when a staple is formed, substantially as described.

6. The combination of a bed, a staple-clinching mechanism, substantially as described, a lever, E, a staple-driver, as *e*, pivoted to said lever, a pivoted arm, D, adjustable with reference to the bed to suit the thickness of the book, a frame, *d*, axially adjustable on said arm, and provided with ways in which the driver slides, and suitable actuating mechanism, substantially as described, said pivoted arm being provided with a graduated scale, and said adjustable frame being provided with a pointer, whereby the proper adjustment is indicated for the given thickness of a book to be stitched, substantially as described.

298,118. SCALE. EDWIN R. PUFFER, Riverside, Ill. Filed July 5, 1883. (No model.)

Claim.—1. In a platform-scale, the combination, with the scale-beam thereof, of a helical spring having its resistance regulated to measure the weights of the said platform-scale, a dial-plate having a graduated scale of numbers arranged on a spiral upon its face, an index-finger vibrating on the dial-plate and made in two parts, one of said parts sliding longitudinally upon the other, and mechanism actuated by the helical spring to cause the index-finger to lengthen and shorten, whereby in its vibrations it is caused to follow the line of the spiral, substantially as described.



2. In a device for measuring force or resistance, an indicator comprising, in combination, a dial-plate provided on its face with a spiral line having numbers at intervals, an index-finger pivoted at the center of the disk and made in two parts, one of said parts sliding longitudinally upon the other, mechanism for vibrating the said finger upon the dial-plate as the force or resistance increases or diminishes, and mechanism for lengthening the said index-finger when moving forward and shortening it when moving backward, whereby it indicates numbers on the several parallels of the spiral line, substantially as described.

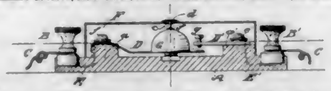
3. In a scale, the combination, with the helical spring for counterbalancing the object to be weighed, of a dial-plate provided with a spiral having numbers marked thereon, an index-finger made in two parts, one part sliding upon the other, mechanism operated by the action of the spring, for turning the said index-finger, and mechanism for lengthening the said finger when moving forward and shortening it when moving backward, substantially as described.

4. In a scale, the extensible index-finger H, caused to vibrate over the dial-plate A, having a graduated scale of numbers marked on a spiral formed on its face, said finger comprising a strip of material secured to the mechanism which causes it to vibrate, an auxiliary index-finger, H', secured to the said finger H and pointed at one end and made narrower toward its other end, where it is provided with teeth to form a rack, and the pinion I, rigidly secured to prevent its revolving, and having its circumference equal to the distance between the spaces in the spiral and kept in mesh with the teeth of the said rack, whereby as the index-finger is caused to revolve the auxiliary index-finger H' will have a longitudinal reciprocating motion, substantially as described.

5. In a scale, the combination of the following elements, to wit: a helical spring, C, rod *t*, to which the end of the said spring is secured, nut *s*, screwed upon the end of the rod *t* and abutting against the transverse bar *n* on the plate B, said bar having a guide for the said rod *t*, whereby the tension of the spring is regulated, rod D, to which the other end of the helical spring is secured, and which passes through guides formed in suitable transverse bars on the plate B, said rod D having a hook, K, and a rack, *d'*, to mesh with suitable gear, which operates when the said rod acts against or with the resistance of the helical spring, extensible finger H H', connected by means of upward-projecting arms with the gear mechanism, and dial-plate A, having a graduated scale of numbers marked on a spiral formed upon its face, all substantially as described.

298,119. UTILIZING THE EXHAUST OF ENGINES. DAVID RENSHAW, Braintree, Mass. Filed Feb. 21, 1883. Renewed Oct. 10, 1883. (No model.)

Claim.—1. The process herein described of utilizing the exhaust of engines by first injecting live steam with a small quantity of water into a superheater by means of the steam previously superheated in said superheater, thereby producing and maintaining a high pressure in the superheater, then injecting a portion of the boiler-water with the exhaust of the engine into the boiler by means of a subsidiary injector working under a superior pressure, as set forth.



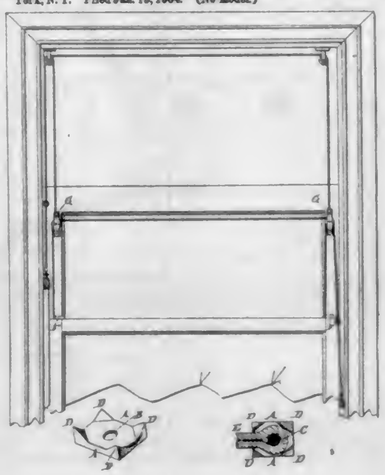
2. The combination of means for utilizing the exhaust of engines, consisting of the boiler, the superheater, the primary injector and the subsidiary injector, and the water-tank, with their intermediate connection, as described.

298,120. BELT-FASTENER. JAMES A. ROBERTS, Detroit, Mich., assignor of one-half to Wm. M. Dwight, same place. Filed Mar. 12, 1884. (No model.)

Claim.—A belt-fastener consisting of a bar, B, provided with an enlarged head, *a*, at one end, and a T-head, *c*, upon the opposite end, in combination with the washer C, when constructed, arranged, and operating substantially in the manner and for the purposes described.

298,121. AUTOMATIC ELECTRIC-CIRCUIT-CLOSING DEVICE. CHARLES T. ROSS, New York, N. Y. Filed Nov. 19, 1883. (No model.)

Claim.—1. The automatic circuit-closing device herein shown and described, consisting of two suitable contact-pieces placed in the circuit and held normally apart by a cap arranged to be released by heat, the contacts being arranged for closing the circuit when the cap is so released, as set forth.

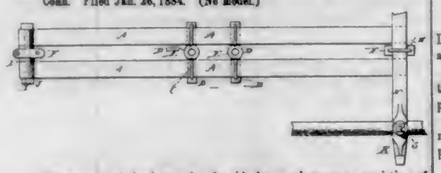


2. The combination, with the contact-pieces D D', of the cover F, having opening *e* and cap *d*, for holding the contacts apart, as and for the purposes set forth.

3. The combination, with the contact D, made of spring metal and provided with post *f*, of the contact D', cover F, and removable cap *d*, arranged to operate substantially as and for the purposes set forth.

4. The contact D, provided with the weight G and post *f*, in combination with contact D' and cover F, having removable cap *d*, substantially as and for the purposes set forth.

5. The circuit-closing device herein shown and described, consisting of the base A, of insulating material, binding-posts B B', contact-pieces D D', connected with the posts, respectively, cover F, and cap *d*, the contact D being made of spring metal, and the cap *d* adapted to be released at a low temperature, substantially as and for the purposes set forth.



298,122. SASH-CORD FASTENER. S. HOWLAND RUSSELL, New York, N. Y. Filed Jan. 15, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a cord-fastener consisting of the plate A, perforated to receive the fastening-screw, and provided with two or more points, D, having inclined inner sides, as set forth.

2. The combination, with the perforated plate A, having two or more points, D, with inclined inner sides, of the fastening-screw C and the cord E, substantially as herein shown and described, whereby the said cord will be compressed between the said points and around the said screw, as set forth.

298,123. SIDE-BAR VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed Jan. 26, 1884. (No model.)

Claim.—1. A duplex spring for side-bar road-wagons, consisting of two flexion members arranged parallel to each other in pairs under each end of the body, and having their outer ends connected to a single bearing suspended from the side bars on opposite sides, substantially as set forth.

2. A duplex spring for side-bar road-wagons, consisting of two flexion members arranged parallel to each other in pairs under each end of the body, their outer ends connected to a double pivotal bearing suspended from the side bars by a single clip, in combination with a single upper member, L, having its center position rigidly secured to the lower members, A A, midway between their ends, by cross-bars B B, clips C C, a shouldered bolt-pin, E, and nut E', and adapted to support the body at the sides, substantially as set forth.

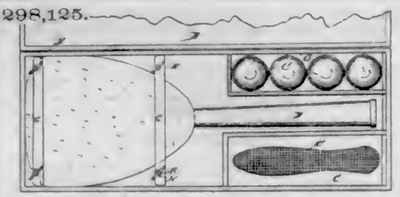
3. A duplex spring-support for vehicles, consisting of two flexion members arranged in pairs parallel to each other, their center portions, A', between the bearings B B, made straight, or nearly so, and connected to the member L by clips C C, shouldered pin-bolt E, and nut E', thence bent downwardly from said bearings, and their outer ends carved upwardly to connect with the frame of the running-gear at opposite sides by a double pivotal and single clip connection, substantially as set forth.

4. A duplex spring-support for vehicles, consisting of two flexion members arranged in pairs parallel to each other, and having their center portions connected together by cross-bars B B and clips or bolts E, base D, and upper member, L, all combined and arranged to operate substantially as set forth.

5. In a side-bar road-wagon, the combination, with the side bars and the bolster, of the standard P, provided with the pin S and shoulder S', the pin passing up through the side bar and secured in place by nut R, and terminating at its lower end in the clip T, which incloses and is secured to the bolster, substantially as specified

---

298,124. BLOTTING-PAD. EDWIN A. SCRIBNER, Ridgefield Park, N. J. Filed Dec. 29, 1883. (No model.)

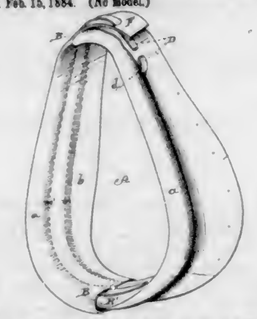


Claim.—1. The combination, with two wooden blocks or pieces, and means for clamping or binding the same together, of sheets of bibulous paper laid on and folded partly around one of said blocks, and plates or strips of metal laid on the paper sheets between the blocks, substantially as set forth.

2. The combination, with two blocks or pieces of wood, and means for clamping or binding the same together, of one or more sheets of bibulous paper laid on and folded upon one of said blocks, and plates or strips of metal bent longitudinally at right angles and laid on the edges of the paper sheets between the blocks, as set forth.

3. The combination, with the blocks A and C, screw B, and knob D, of the sheets of bibulous paper E, and metal strips F, bent at right angles and laid on the edges of the sheets between the blocks, as herein set forth.

298,125. CASE FOR LAWN-TENNIS IMPLEMENTS. GEORGE E. SHEPARD, Jersey City, N. J., assignor to Hall, Nicoll & Granberry, New York, N. Y. Filed Feb. 7, 1884. (No model.)



Claim.—1. The combination of the case A, the rods E, the boards I, F', and F, the metal pieces G, and the thumb-screws H, substantially as and for the purposes set forth.

2. The combination of the case A, the rods E, the boards F' and F, the metal pieces G, and the thumb-screws H, substantially as and for the purposes set forth.

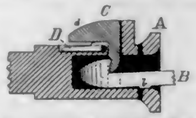
3. The combination of the case A, the rods E, the board F, the metal pieces G, and the thumb-screws H, substantially as and for the purposes set forth.

4. The combination of the case A, the rods E, the metal pieces G, and the thumb-screws H, substantially as and for the purposes set forth.

298,126. HORSE-COLLAR. CHARLES STAUFENBIEL, San Luis Obispo, Cal. Filed Feb. 15, 1884. (No model.)

Claim.—1. The two-part horse-collar A, joining at the throat and neck, the ends being unstuffed and flexible, an end of each fitting within a socket formed in the opposing end of the other, in combination with the straps D, secured to the entering end of each, passing through the opposing sockets and emerging therefrom at their bases, and a means for securing the free ends of said straps, substantially as and for the purpose herein described.

2. The two-part horse-collar A, joining at the throat and neck, the ends being unstuffed and flexible, an end of each fitting within a socket formed in the opposing end of the other, in combination with the straps D, secured to the entering end of each, passing through the opposing sockets and emerging therefrom at their bases, and the loose flaps F on the end of each part, provided with loop-holes *f*, through which the free ends of the straps fit and are secured, substantially as herein described.



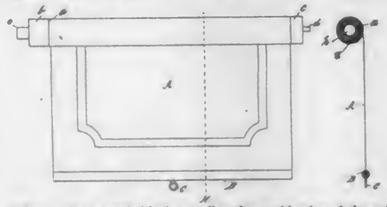
3. The two-part horse-collar A, joining at the throat and neck, each part having a point, B', at one end, and a socket, B, at the other, in relation to each other as described, said socket being formed of the ends of the leather covering the rim and that covering the back of the belly, in combination with the straps D and the overlapping flaps F, provided with loop-holes *f*, said flaps being made of the loose ends of the leather covering the front of the belly, substantially as herein described.

4. The two-part horse-collar A, joining at the throat and neck, each part having a point, B', at one end, and a socket, B, at the other, in combination with means for adjusting the diameter of the socket to regulate the entrance of the point, and a means for holding said point closely in the socket, substantially as herein described.

5. The two-part horse-collar A, joining at the throat and neck, each part having a point, B', at one end, and a socket, B, at the other, made of the ends of the leather covering the rim and that covering the back of the belly, in combination with the wire hook G, for contracting or expanding the socket, and the straps D, for drawing the points tightly into said sockets, substantially as herein described.

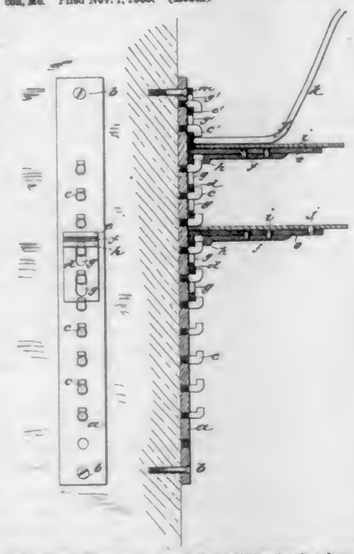
6. The two-part horse-collar A, joining at the throat and neck, each part having a point, B', at one end, and socket B at the other, a point of each being adapted to fit within a socket of the other, as described, in combination with a lining, H, containing the stuffing, and having its ends sewed down near the ends of the parts forming the collar, whereby the stuffing is confined, substantially as herein described.

298,127. CAR-COUPLING. LORENZO STEBBINS, Hinsdale, N. H., and GEORGE P. STEBBINS, Vernon, Vt. Filed Mar. 15, 1884. (No model.)



Claim.—1. The catch-bar B, provided with the projecting ribs *b*, as described, in combination with the head A, having a weight-piece, C, resting on the inner end of bar B and raising its outer end, substantially as and for the purposes above set forth and described.

2. In a car-coupler, the head A, the bar B, having a rib, *b*, as described, and the weight-piece C, provided with an arm, *d*, in combination with the rod E, provided with an arm, D, all constructed and operating substantially as and for the purposes set forth.

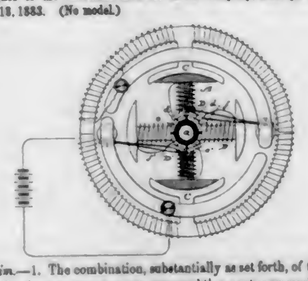


3. The coupling described, consisting of the head A, provided with grooves for the piece C, the bar B, having rib *b*, the piece C, and rod E, provided with arms connecting rod F and rods G and H on the car I, all constructed and operating substantially as described.

298,128. SHADE-FIXTURE. GEO. W. STERLE, Paterson, N. J. Filed Sept. 11, 1883. (No model.)

Claim.—In a curtain shade or roller, the combination of the rod *e* and pawl *h*, the pawl pivoted to the rod so as to keep the lower inner end of said pawl in constant engagement with the lugs *k k'* when said pawl is not occupying the notches *k'*, the upper inner end of the pawl arranged to impinge against the plate *b*, with the lock-plate *b'*, plug *p*, spring *m*, roller *a*, and pin *d*, substantially as set forth.

298,129. ADJUSTABLE SHELVING. HENRY FRANCIS STOCKING, Macon, Mo. Filed Nov. 1, 1883. (Model.)



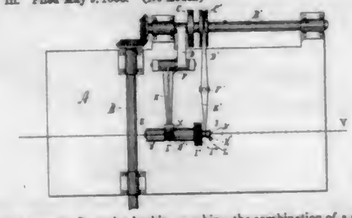
Claim.—1. The combination of the angle bracket-bar *d e*, provided with slots *g*, and a re-enforcing cleat, *f*, having a head, A, with the wall-bar *a* and hooks *c*, substantially as and for the purpose set forth.

2. In an adjustable bracket, the angular bracket *d e*, provided with apertures and connected to the wall-bar by stud-hooks *c*, in combination with a shelf, *i*, fitting closely between the said bracket and the next hook above the bracket, whereby the bracket is securely held in place on the wall-bar, substantially as set forth.

3. The combination of angular bracket *d e*, slotted at *g g*, brace *f*, provided with a head, A, and shelf *i*, with wall-bar *a*, provided with hooks *c*, said shelf fitting closely between the bracket and the next stud above said bracket, whereby the shelf serves as a lock to securely hold the bracket in place, substantially as shown and described.

4. The pole-crane consisting of bent rod *k*, having ring *l*, and slotted connecting-bar *m*, in combination with the inverted hooks *c'*, bracket *d e*, shelf *i*, and the wall-bar *a*, substantially as described.

298,130. ELECTRIC MOTOR. LEVI W. STOCKWELL, Cleveland, Ohio, assignor to the Cleveland Electric Motor Company, same place. Filed Dec. 19, 1883. (No model.)

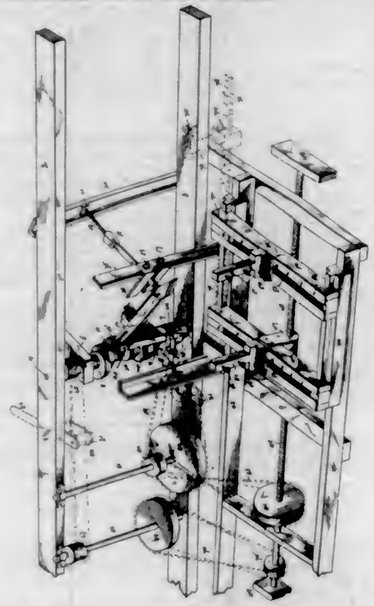


Claim.—1. The combination, substantially as set forth, of the armature-spindle, the armature-magnets arranged thereon transversely to each other, an independent coil on each half of each armature, the terminals of which coil are connected with adjoining commutator-plates, as shown, the commutator-ring, and brushes arranged to give an extended or double contact on each side of the ring, for the purpose set forth.

2. The combination, substantially as set forth, of the field-magnet poles having a uniform polarity on each side of the armature-spindle, the armature-spindle, the armature-magnets arranged thereon transversely to each other and in different vertical planes, the commutator-plates, the brushes arranged to give an extended or double contact on each side of the ring, and an independent coil on each half of the armature, the terminals of which coil are connected to adjoining commutator-plates, as set forth.

3. The combination, substantially as set forth, of the field-magnet poles, the armature, the commutator-ring, and the commutator-brushes arranged in pairs—one pair on each side of the ring—the brushes in each pair being arranged one above the other, as described.

298,131. WIRE-BARBING MACHINE. DANIEL C. STOVER, Freeport, Ill. Filed May 9, 1883. (No model.)



Claim.—1. In a wire-barbing machine, the combination of a spindle perforated longitudinally for the passage of the main wires, a sleeve rotating freely on said spindle, and a barb-wrapping hook attached to and rotating in unison with said sleeve, but having longitudinal motion independent thereof, whereby it is adapted to wrap one of the ends of a barb in a coil arranged next to the face of the sleeve and spindle, and the other end in a second coil continuous with the first, but arranged farther from said face.

2. In a wire-barbing machine, the combination of a spindle longitudinally perforated for the passage of the main wires, a sleeve rotating freely on said spindle, a collar encircling said sleeve and rotating therewith, but having longitudinal motion independent thereof, a barb-wrapping hook rigidly attached to said collar, and adapted to wrap one end of a barb in a coil arranged next to the face of the spindle, and the other end in a second coil continuous with the first, but arranged farther from the face of the spindle, and means for imparting reciprocal longitudinal motion to said collar.

3. The combination of the longitudinally-perforated spindle Q, the sleeve O, rotating thereon, the collar N, keyed to said sleeve and rotating therewith, but free to move longitudinally thereon, the hook K, rigidly attached to said collar, the forked lever E', engaging with the annular groove L in the collar N, and means for imparting reciprocal motion to said lever, whereby reciprocal longitudinal motion is imparted to said collar, substantially as shown and described, and for the purpose set forth.

298,182. STONE-DRESSING MACHINE. NELSON J. SWAYZE, Cottonwood Falls, Kans. Filed Feb. 14, 1884. (No model.)

Claim.—1. In a stone-dressing machine, a main operating-shaft provided with a series of eccentrics having arms 12, and pitmen 17, having one end pivoted to the cutter-arms, and the other end pivoted to the frame of the machine, substantially as and for the purpose set forth.

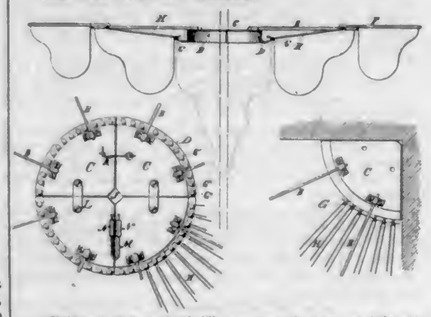
2. In a stone-dressing machine, a main operating-shaft provided with a series of eccentrics having cutting-arms 12, and pitmen 17, pivoted to the cutting-arms, and having adjustable screws 19, secured to a fixed part of the frame, as and for the purposes set forth.

3. The combination, with the shaft 4, eccentric 10, and cutter-arm 12, of the pitman 17, one end connected to the cutter-arms and the other to the frame, and having guards 36 on each side thereof, as and for the purpose set forth.

4. The combination, with the shaft 4, having eccentric 10, provided with a cutter-arm, 12, having removable bits 14, secured to the lower ends thereof, of the pitman 17, having one end pivoted to said arm, and the other to the girder 20, and provided with spring 38, as and for the purpose set forth.

5. The combination, with the shaft 4, and eccentric 10, and cutter-arm 12, having removable bits 14 secured thereto, of the pitman 17, one end of which is secured to said arm, and the other end to the adjusting-screw 19, mounted in the girder 20, and having the spring 38, removably secured to the lower end of said pitman, as and for the purposes set forth.

6. The combination, with the main shaft 4, having pulleys 58 65, and eccentric 10, rigidly secured thereto, of the cutter-arm 12, secured to said eccentric, and provided with pitman 17, its lower end connected to said arm, and its upper end to the adjusting-screw 19, secured to the frame.



298,133. LABELED WIRE-CLOTH. CHARLES SWINCOE, Cambridge, Mass. Filed Aug. 30, 1883. (No model.)

Claim.—The combination, with a roll of wire-cloth, of a label composed of flexible material inclosed between two layers of the roll and arranged in such position that it can be read through the meshes of the fabric, substantially as described.

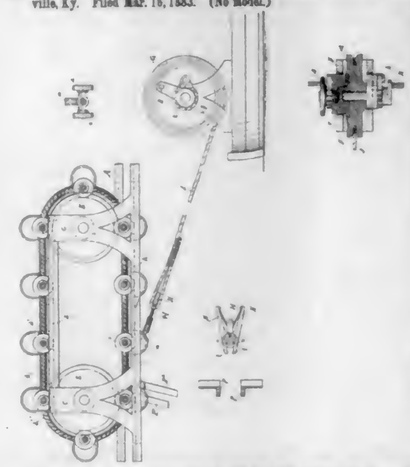
298,133.

298,134. HOLDER FOR ORNAMENTAL AND FLY PAPER. VURLIN G. TANSEY, Louisville, Nebr., assignor to himself and TRUMAN HALL, same place. Filed Feb. 19, 1884. (No model.)

Claim.—1. A frame for holding ornamental paper, consisting of a wire frame adapted to be held on the ceiling and adapted to hold ornamental or fly paper, substantially as herein shown and described.

2. The combination, with a frame for holding ornamental and fly paper, of swinging frames adapted to be projected over the edges of the frame to which they are hinged, which swinging frames are also adapted to hold fly-paper or ornamental paper, substantially as herein shown and described.

3. In a frame for holding ornamental and fly paper, the combination, with a curved wire or rod, A, of a plate, C, the rods B, uniting the wire or rod A and the plate C, and of swinging frames F, pivoted on laterally-projecting arms E of the rods B, substantially as herein shown and described.



4. In a frame for holding ornamental and fly paper, the combination, with a curved rod or wire, A, of the plate C, connected with the wire A by the rods B, and the cords H, extending from the edge of the plate C to the wire A, substantially as herein shown and described.

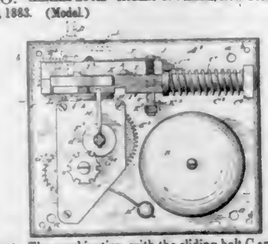
5. In a frame for holding ornamental and fly paper, the combination, with the curved rod or wire A, of the plate C, connected with the rod or wire A by the rods B, hooks, or other projections G, on the flange of the plate C, and the cords H, extending from the said hooks or projections to the curved wire or rod A, substantially as herein shown and described.

6. A frame for holding ornamental and fly paper, consisting of four quadrant-sections, each formed of a quadrant-wire held by arms on a quadrant-plate, the quadrant-plates being united with each other by means of clips, hooks, or other suitable devices, substantially as herein shown and described.

7. In a frame for holding ornamental and fly paper, the combination, with the four quadrant-plates united with each other, of four quadrant wires or rods connected by radial arms with the quadrant-plates, and of swinging frames held on the radial arms and adapted to be projected beyond the quadrant-wires, substantially as herein shown and described.

298,135. PROPELLING CANAL-BOATS. GEORGE R. TAYLOR, Louisville, Ky. Filed Mar. 16, 1883. (No model.)

Claim.—1. In an apparatus for towing canal-boats, the track A, provided with standard C, supporting cable-wheels E, in combination with an endless traveling cable provided with hitching-bars *a*, attached thereto, and having anti-friction wheels *c*, as and for the purposes described.



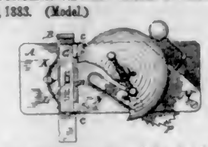
2. In an apparatus for towing canal-boats, the tracks A B, in combination with the standards C, carrying cable-wheels E E, and the endless driving-cable provided with metallic hitching-bars *a*, as and for the purposes specified.

3. In an apparatus for towing canal-boats, the lower track, A, provided with a free opening between its parallel rails, and having formed therewith downwardly-extending lugs or projections P P, adapted to receive the hitching and detaching device between them, as and for the purposes specified.

4. In an apparatus for propelling or towing canal-boats, the endless traveling cable provided with the hitching-bars, substantially as described, in combination with the pivoted hitching-levers N N, attached by means of the metallic bar *a* to the towing-cable *f*, and provided at the forward end with hooks *t t*, for engagement with the hitching-bars, substantially as described.

5. As a means for towing canal-boats, in combination with the hitching devices and towing-cable, substantially as described, the capstan-wheel G, provided with its flanged friction-disk *g*, hand-wheel, and clamp-screw *s*, for operation upon said disk, and the ratchet-wheel and pawl *k*, located upon the main shaft of the capstan, as and for the purposes specified.

298,136. ALARM-LOCK. ROBERT G. VARBAR, New York, N. Y. Filed May 18, 1883. (Model.)



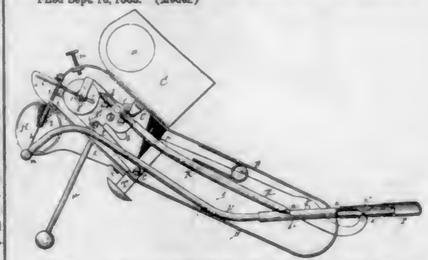
Claim.—1. The combination, with the sliding bolt C and its retracting-spring, of the automatic sliding catch for holding the bolt, and the rounded head or button E, for the catch, projecting through the casing and nearly flush with the outer surface of the casing, as and for the purpose described.

2. The combination, with the bolt and its retractor, of a detached operating-slide or thumb-piece arranged to engage with the bolt to throw it against the stress of its retractor, but not capable of catching upon it in the opposite direction, and an automatic catch for engaging with and holding the bolt against its spring, as and for the purpose described.

3. The combination of bolt C, spring C^3, sliding catch E^3, spring J, and rounded button E, having stem or spindle E^2, engaging with slide E^3, and means for projecting said bolt through the casing.

4. The combination of a horizontally and laterally movable bolt, C, springs C^3 K, detached operating thumb-piece, and stud D D^2, so arranged that it may be brought against the bolt for throwing it to lock the door, the automatic catch, and a detent for an alarm mechanism placed in the path of the bolt when moved laterally, as and for the purpose described.

298,137. BURGLAR-ALARM. ROBERT G. VARBAR, New York, N. Y. Filed Aug. 23, 1883. (Model.)



Claim.—1. The combination of the sliding bar B, the transversely-movable plate G, the detent-pin E, and the perforated wheel G^2 of an alarm-movement.

2. The combination of the catch-bar B, having two fulcrums upon the plate A, pin L, plate or support G, for the alarm-detent, and wheel G^2, controlled by said detent, as set forth.

3. The combination of the plate A, spring K, notched sliding bar B, adapted to work freely in a transverse direction on a pin, L, and an alarm controlled by a connection with the bar B at a portion thereof which moves upon pin L when the projecting end of the bar rises or falls above or below its normal plane.

4. The combination of the sliding bar working freely in a plane at right angles to its sliding movement, so that it may rock on either of two pivotal points on the same side of the bar, and an alarm controlled by connection with the bar at a portion thereof which moves in the same direction irrespective of the direction in which its projecting end moves when the bar rocks.

298,138. PAINT-DISTRIBUTER. LIBERTY WALKUP, Rockford, Ill. Filed Sept. 10, 1883. (Model.)

Claim.—1. In a paint-distributer, the herein-described case, consisting of a hand portion provided with a hinged or removable cover, and a forward end portion oblique to the hand portion, having a rearward inclination lengthwise and an upward lateral inclination from its front edge rearward, said inclined portion provided with a removable or hinged lid, substantially as and for the purpose set forth.

2. In a paint-distributer, the combination, with the case for containing the operative parts, of a support for said parts, mounted in the case in such manner as to permit an endwise movement thereof, substantially as and for the purpose set forth.

3. In a paint-distributer, the combination, with a wind-wheel support capable of an endwise movement relatively with its support, of a wind-wheel mounted upon the movable support and capable of revolving on pivotal bearings, substantially as and for the purpose set forth.

4. In a paint distributer, the combination, with a wind-wheel support capable of an endwise movement, and a wind-wheel mounted to revolve in bearing-supports thereon, of a walking-beam mounted to oscillate in bearing-supports on the wind-wheel support, and having a wrist-connection with the wind-wheel, substantially as and for the purpose set forth.

5. In a paint-distributer, the combination, with a walking-beam capable of an endwise movement, of a needle having a wrist-connection with the walking-beam, and capable of a reciprocating movement in the direction of its length of varying throws, substantially as and for the purpose set forth.

6. In a paint-distributer, the combination, with the case containing the operative parts, and with a walking-beam to impart motion to the needle, of a guard-plate to protect the projecting arm of the walking-beam, substantially as set forth.

7. In a paint-distributer, the combination, with a needle having a wrist-connection with the walking-beam, of a slotted guide to receive the depending wrist of the needle, substantially as and for the purpose set forth.

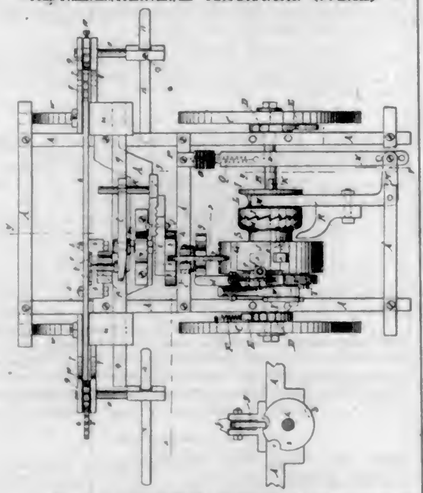
8. In a paint-distributer, the combination, with a needle supported to reciprocate in a pigment-receptacle, and having a wrist-connection with a walking-beam and with a guide-slot, of a guide-finger to engage the needle, said finger having a pivotal support to permit of a swinging movement in the vertical plane of the needle, substantially as and for the purpose set forth.

9. In a paint-distributer, the pigment-receptacle having a pivotal connection with the case, and a lip projecting from the inner edge of the receptacle to engage a corresponding indentation in the case, for holding the pigment-receptacle at a fixed point, substantially as and for the purpose set forth.

10. In a paint-distributer, the combination, with a wind-wheel and with its movable support, of an air-tube mounted upon the wind-wheel support, substantially as and for the purpose set forth.

11. In a paint-distributer, the combination, with the main air-tube and with the branch tube mounted upon the adjustable wind-wheel support, of a flexible tube to connect the branch with the main air-tube, substantially as and for the purpose set forth.

12. In a paint-distributer, the combination, with the spring-actuated valve-lever, of a thumb-lever having a pivotal connection with the free end of the valve-lever, substantially as and for the purpose set forth.



13. In a paint-distributer, the combination, with the wind-wheel support and with the adjustable thumb-lever, of a connecting-link having a pivotal connection with the wheel-support and with the thumb-lever, substantially as and for the purpose set forth.

14. In a paint-distributer, the combination, with the check-valve in the air-tube, mounted upon the wind-wheel support, and with a perforated arm having an adjustable support, of a lever fixed to the check-valve, and having its free end engage the perforated arm, substantially as and for the purpose set forth.

15. In a paint-distributer, the combination, with a reciprocating needle, a walking-beam, and a wind-wheel, of a thumb-lever and a link-connection with the thumb-lever and with the wind-wheel and walking-beam support, substantially as and for the purpose set forth.

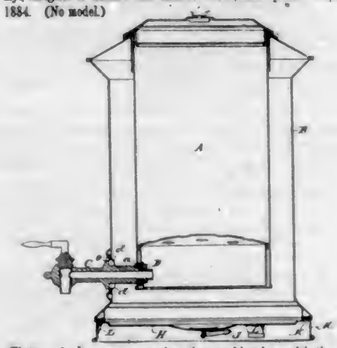
16. In a paint-distributer, the herein-described combination of a wind-wheel mounted on a movable support, a valve to control the flow of air through the main supply-tube, a thumb-lever, and a link connecting the valve-lever and movable support of the wheel, substantially as and for the purpose set forth.

298,139. CHECK-ROW CORN-PLANTER. VALENTINE WEBER and JOHN FRIEDMAN, Princeville, Ill. Filed Dec. 3, 1883. (No model.)

Claim.—1. In a corn-planter, the combination, with the wheels and axle C B and the seed-dropping slide *q*, of the trip-wheel G, having arms and rollers *e f*, the vibrating double cam *g*, shaft A, arm *i*, having crank-pin *k*, the slotted lever *l*, pivoted to the standard *n*, and having crank-pin *o*, and the slotted standard *p*, substantially as herein shown and described, whereby the said seed-dropping slide will be operated from the said wheels and axle, as set forth.

2. In a corn-planter, the combination of the seed-dropping slide, the trip-wheel G, having projections *x*, and the arms and rollers *e f*, the vibrating double cam *g*, shaft *h*, having arm *i*, provided with crank-pin *k*, the slotted lever *l*, having crank-pin *o*, slotted standard *p*, the spring-pawl *y*, and the recessed wheel 2, substantially as and for the purpose set forth.

3. In a corn-planter, the combination, with the trip-wheel G and the shaft A, carrying the vibrating cam *g* and the arm *i*, of the projections *x*, the locking-pawl *y*, the spring *z*, and the wheel 2, having recesses 1, substantially as herein shown and described, whereby the seed-dropping slide will be locked until released by the action of the trip-wheel, as set forth.

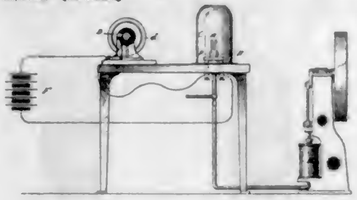


4. In a corn-planter, the combination, with the axle B and the trip-wheel G, of the fixed clutch-wheel H, the sliding clutch-wheel I, the forked elbow-lever M, the connecting-bar N, the foot-lever O, and the spring Q, substantially as herein shown and described, whereby the said trip-wheel can be readily thrown out of and into gear with the said axle, as set forth.

5. In a corn-planter, the combination, with the trip-wheel G, the fixed clutch-wheel H, having groove S and the forked clutch-lever M, of the brake-arm R, substantially as herein shown and described, whereby the outward movement of the said lever will stop the movement of the said trip-wheel, as set forth.

6. In a corn-planter, the combination, with the seed-dropping slide *q* and the grooved guides 7, of the cross-bar 6, the gear-wheels 9, the adjustable shafts 11, and the adjustable bars 12, substantially as herein shown and described.

7. In a corn-planter, the combination of the dropping-slide having the slotted standard *p*, the clamp 3, with its bolts *t* and 5, rack-bar 6, shafts 11, having pinions 9 and markers 12, the trip-wheel G, having arms and rollers *e f*, shaft *h*, carrying the vibrating double cam *g*, and arm *i*, having the crank-pin *k*, and slotted lever *l*, pivoted upon the standard *n*, and having a crank-pin, *o*, entering the slotted standard *p*, substantially as and for the purpose set forth.

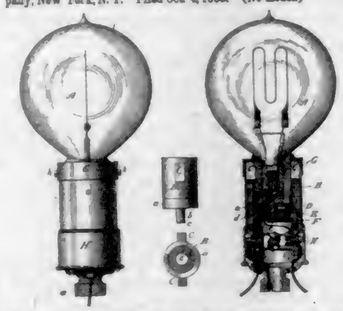


298,140. WATER-COOLER. JOHN EDWARD WELLING, Georgetown, Ky., assignor to himself and Justice Webb, same place. Filed Mar. 5, 1884. (No model.)

Claim.—1. In a water-cooler, the combination, with the casing B and the water-tank A, of the faucet C, having its inner end screw-threaded and extended into the water-tank, and provided with the shoulder *a*, resting against the outer surface of the tank, and the shoulder *b*, resting against the outer surface of the casing, and the nut D on the inner screw-threaded end of the faucet, substantially as herein shown and described.

2. In a water-cooler, the combination, with the shell or casing B and the water-tank A, of the faucet C, having the shoulders *a b*, and having lugs *d* on the shoulder *b*, which lugs fit in notches *g* in the edges of the aperture in the casing A, substantially as herein shown and described.

298,141. METHOD OF TESTING CARBON CONDUCTORS FOR INCANDESCENT LAMPS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Sept. 15, 1883. (No model.)



Claim.—1. The method of testing the carbon conductors for incandescent lamps by passing through them an intermittent or undulatory current, and heating or raising to incandescence their defective portions, as herein set forth.

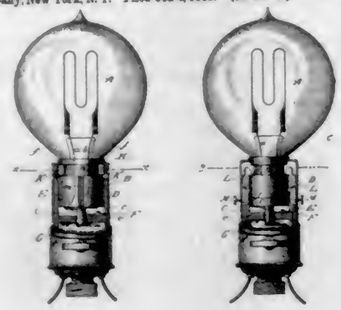
2. The method of testing carbon conductors for incandescent lamps, which consists in mounting the conductors in an exhaust-receiver, and passing through them an intermittent current of a nature to redden or raise to incandescence their defective portions only, as herein described.

3. In a carbon-testing apparatus, the combination of a receiver, means for exhausting the same of air, one or more holders for the carbons forming terminals of an electric circuit, and a device included in the circuit and adapted to close momentarily and at intervals the circuit, as and for the purpose specified

---

298,142. HOLDER FOR INCANDESCENT LAMPS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination, with an incandescent lamp and terminal plates secured to the same, of a holder or socket, means for locking or retaining the lamp therein, and spring-contacts in position to bear upon the terminals of the lamp, and arranged to exert a force tending to raise the lamp from the socket or holder, as set forth.



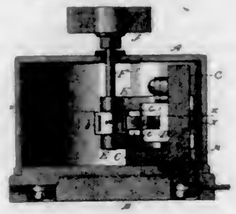
2. The combination, with an incandescent lamp and terminal plates secured to the same, of a holder or socket, spring-contacts therein, forming a seat for the lamp, and means, substantially as described, for locking or retaining the lamp in position against the springs and permitting it to be turned, as and for the purpose specified.

3. The combination, with an incandescent lamp having lugs or ears on the sides of its neck, of a socket or holder having a flanged rim with notches cut therein for admitting and retaining the neck of the lamp, and springs for forcing the lugs or ears against the flange when the lamp is in the holder, as set forth.

4. The combination, with an incandescent lamp having lugs or ears on the sides of its neck, of a socket or holder having a flanged rim with notches cut therein, and a perforated cap or cover with notches corresponding to those in the holder, these parts being constructed for use and operation in substantially the manner set forth.

5. The combination, with the lamp A and base B, having ears or lugs C, and contact-plates *a c*, of a holder or socket, D, having a flanged and notched rim *g*, and the spring-terminals E F, secured within said holder in a manner to bear upon the plates *a b* on the lamp when the latter is in position, as and for the purpose specified.

298,143. SOCKET FOR INCANDESCENT LAMPS. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)



Claim.—1. The combination, with an incandescent lamp and a cylindrical base containing a groove or grooves, as described, of a socket or holder having projections or their equivalents therein for entering the grooves in the lamp-base and retaining the same in position, as set forth.

2. The combination, with an incandescent lamp and a cylindrical base containing a groove or grooves, of a socket or holder, projections therein, or their equivalents, for entering the grooves in the lamp-base, and spring contact-plates forming a seat for the lamp, as herein set forth.

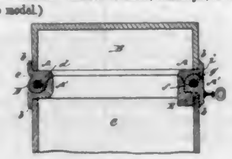
3. The combination, with an incandescent lamp, A, and base B, containing grooves *m m*, of a socket or holder, projections K, and spring-contacts F G, all as described.

298,144. ELECTRICAL CIRCUIT-BREAKER. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 10, 1883. (No model.)

Claim.—1. The combination, in a switch or circuit-breaker, of springs or plates, a spring-lever for completing the circuit by contact with said plates, and a spindle or key with lugs or equivalents for imparting movement to the lever, these parts being constructed and arranged in substantially the manner set forth.

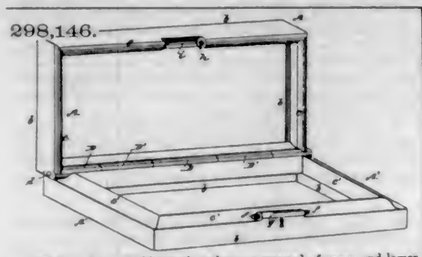
2. The combination, in a switch or circuit-breaker, of terminal springs or plates, a pivoted spring-lever having a raised portion with inclined sides, and arranged to close the circuit by contact with the springs or plates, and a spindle having lugs or their equivalents for imparting movement to the lever, these parts being constructed and arranged in substantially the manner set forth.

3. The combination, in a switch or circuit-breaker, of terminal springs or plates, a pivoted spring-lever formed with a raised and recessed portion, and carrying a pin for making contact between the terminal springs, a spindle journaled above the lever, and a plate secured thereto and adapted to impart movement to the lever by engaging with the raised portion thereof, all as set forth.



4. The combination of the springs H H, the pivoted spring-lever G, formed with the raised and recessed portion *e*, and carrying the pin A, the spindle F, and plate *a*, with rounded or equivalent ends, all as set forth.

298,145. METHOD OF ORNAMENTING GLASS ARTICLES. AUGUST WEYER, Long Island City, N. Y. Filed Aug. 9, 1883. (Model.)



Claim.—The method herein described of ornamenting articles of glass, which consists in transferring pieces of suitable glass enamel by transfer-sheets covered with adhesive substance to a glass body while in a soft state, then pressing said enamel into the soft body of the glass article, and finally fusing the enamel into said glass body, substantially as set forth.

298,146. TRUNK. EDWIN WILSON, Brooklyn, N. Y. Filed Dec. 31, 1883. (No model.)

298,146.

Claim.—1. A double trunk-valance composed of upper and lower rectangular sections or frames, hinged together in the rear by integral hinge-sections which are entirely under cover of the valances, and vertical flanges around said valance-section to receive the top and body of the trunk within them, substantially as specified.

2. The upper and lower trunk valances or frames, A A′, hinged together in the rear, and constructed with tongues and grooves *c c′*, arranged to enter one within the other, and the hinge connecting the valances being wholly under cover by them, essentially as described.

3. The upper and lower trunk valances or frames, A A′, having marginal outer vertical ribs or extensions, *b b*, arranged to receive the top and body of the trunk within them, and united in their rear by a single hinge, D D′, formed integral with the said valances and arranged to extend the whole length of the trunk, under cover of the valances and forming part of the same, substantially as specified.

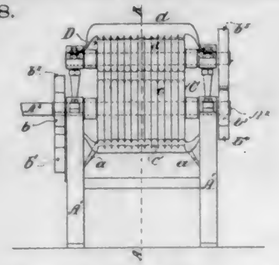
4. The upper and lower trunk valances or frames, A A′, constructed with rib *b b*, to form sockets for reception of the top and body of the trunk within them, and provided with tongues and grooves *c c′*, arranged to enter within each other, and with a hinge, D D′, and hinge-bolt *d* under cover of the valances, and arranged to extend the whole length of the trunk, essentially as described.

5. The combination, with the hinged upper and lower trunk-valances, A A′, constructed with tongues and grooves *c c′*, arranged to enter one within the other, of the bolt-guide *g*, arranged within the front groove, *c′*, in the lower valance, for operation in connection with a recess, *i*, in the front tongue, *c*, of the upper valance having a bolt hole or holes, *h*, in its end wall or walls, substantially as specified.

298,147. INKING MECHANISM FOR PRINTING-MACHINES. GEORGE ASHLEY WILSON, Liverpool, County of Lancaster, England. Filed Aug. 23, 1883. (No model.)

Claim.—1. In inking apparatus for rotary printing mechanism, the combination, with the ductor-shaft, of an eccentric loose upon the shaft and provided with a projecting pin or clutch-piece, a sliding hand-wheel splined to the shaft and provided with a pin or clutch-piece, a carrying-roller, and interposed mechanism, substantially as described, for actuating the carrying-roller from the eccentric of the ductor-shaft, substantially as and for the purposes specified.

2. In inking apparatus for rotary printing-machines, the combination, with the ductor-shaft, of an eccentric and devices, substantially as described, for causing the same to move with the shaft, an eccentric-strap having an arm provided with a pin, 21, an elbow-lever having its fulcrum at the angle and one arm slotted for the adjustment of the pin 21, and a carrying-roll journaled on the vertical arm of the elbow-lever, substantially as and for the purposes specified.

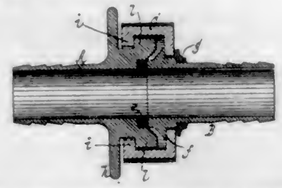


3. The combination of the shaft 4, driving-wheel 6, and disengaging mechanism with the hand-wheel 17 and clutch mechanism, and the eccentric 14 and carrying-roller and connections, substantially as set forth.

298,148. MACHINE FOR FORMING PILLS. AUGUST H. WIRZ, Philadelphia, Pa. Filed Jan. 21, 1884. (No model.)

Claim.—1. The herein-described pill-machine, consisting, essentially, of three grooved rollers arranged in triangular relation to each other, so as to serve the purpose of two sets of rollers, substantially as set forth.

2. The combination, with the grooved rollers, of the rakes or combs, substantially as described, constructed and arranged to rest in and clear the grooves in the rollers, substantially as set forth.

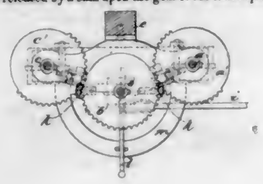


298,148.

298,149. PROCESS OF DISSOLVING METALS IN AMMONIACAL SOLUTIONS. CHARLES ROWLEY ALDER WRIGHT, 3 Castillain Road, Maida Vale, County of Middlesex, England. Filed Nov. 7, 1883. (No specimens.) Patented in England Feb. 9, 1883, No. 737; in France Aug. 8, 1883, No. 156,941, and in Belgium Oct. 27, 1883, No. 63,003.

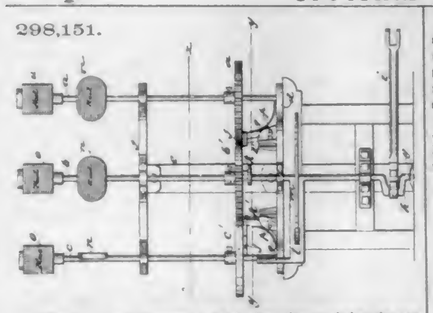
Claim.—The hereinbefore-described process of treating metals to produce solutions, which consists in subjecting fragments of copper, &c., to the action of water, ammonia, and a stream or streams of air, substantially as set forth.

298,150. HOSE-COUPLING. ALBERT ZOLLER, New York, N. Y. Filed Nov. 22, 1883. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, of the two hose-attaching pieces A and B, the former having the external lugs, *l l*, with the coupling-piece C, having the flange-sections *i i* and openings *k k*, and devices loosely confining the coupling-piece permanently in position on the attaching-piece B, but permitting its free rotation thereon, substantially as described.

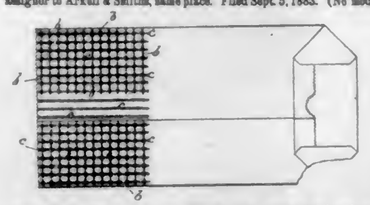
2. A hose-coupling consisting of the hose-attaching pieces A B, the former having the projecting lugs *l l*, and the other having the annular flange *f*, the coupling-piece C, having the internal flange-sections, *i i*, and openings *k k*, and means for permanently holding the coupling-piece against the said flange, but permitting it to be rotated on the attaching-piece carrying said flange, substantially as described.



3. A hose-coupling consisting of the following elements, to wit: the hose-attaching pieces A and B, the former having the external lugs, *l l*, and the other having the annular flange *f* and screw-nut *g*, and the coupling-piece C, having the internal flange-sections, *i i*, and openings *k k*, and loosely held between the flange and the nut, to permit its rotation on the hose-attaching piece B, substantially as described.

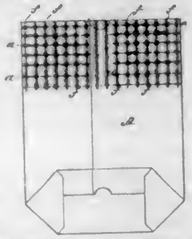
298,151. RAILWAY-SWITCH SIGNAL. JOSEPH W. ALEXANDER, Fraserville, Quebec, and MARSHALL WHEELHOUSE, Campbellton, New Brunswick, Canada. Filed Oct. 23, 1883. (No model.)

Brief.—The vertical signal-bearing switch-operating spindle of a three-throw switch is connected with two other signal-bearing spindles by mutilated gear, to operate the several signals correspondingly to the several tracks. Pivoted to the gear of each of the two last-named spindles is a latch, which, when its signal should stand at "danger," is engaged by a spring-catch hinged to the frame, and when the signal is to be turned to "safety" is released by a cam upon the gear of the main operating-shaft.



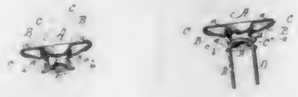
298,151.

Claim.—1. In a signal apparatus for three-throw switches, the combination, with the central crank-shaft, *b*, having the switch-rod i connected to it, also having the signal lamp and board, and also having a partly-toothed wheel, *b'*, and cams *k*, of the shafts *a c*, located on opposite sides of said central shaft, and each having a signal device, also a partly-toothed wheel, *a' c'*, and also a catch, *j*, and said catches provided with locking-catches *k'*, substantially as described.



2. A triple signal apparatus for a three-throw switch, consisting of three shafts, *a b c*, each having the proper lamp-and-board signal, and the shafts *a c* being geared with the lever and crank-shaft *b* by the partly-toothed wheels *a'*, *c'*, and *b'*, and having self-locking catches, in combination with the unlocking-cams *k* on the wheel *b'*, substantially as described.

298,152. SOFT-TIE PAPER BAG. JAMES ARKELL, Canajoharie, N. Y., assignor to Arkell & Smiths, same place. Filed Sept. 5, 1883. (No model.)



Claim.—A soft-tie paper sack having both longitudinal and transverse flutes or creasings, substantially as and for the purpose set forth.

298,153. METHOD OF MAKING SOFT-TIE PAPER BAGS. JAMES ARKELL, Canajoharie, N. Y., assignor to Arkell & Smiths, same place. Filed Sept. 5, 1883. (No model.)

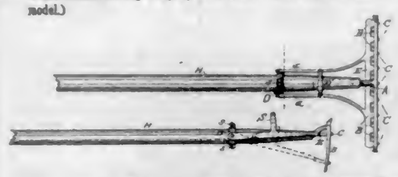
Claim.—As an improved process or method of manufacturing soft-tie paper sacks, subjecting the paper first to a crimping operation to produce a series of parallel flutes running in one direction, and subsequently fluting or crimping the stock transversely to the first-formed set of flutes or crimps, substantially as and for the purposes set forth.

298,154. BUTTON. JAMES F. ATWOOD, Boston, Mass. Filed Oct. 10, 1883. (No model.)

Claim.—1. The herein-described button, provided with a hollow shank whose bottom or outer end is pressed inwardly into convexo-concave shape, as shown and described, said shank being provided with a transverse passage or perforation, whereby a wire for fastening purposes may be drawn through the latter and over the said bottom or end, substantially as and for the purpose specified.

2. In a button, the combination of the outer tube, B, of the shank, provided with the opposite vertical slots, *b*, and the inner cup, C, provided with the coincident opposite openings, *c*, and convexo-concave bottom C', substantially as and for the purpose described.

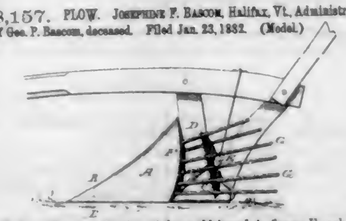
298,155. INSTRUMENT FOR SETTING BUTTONS. JAMES F. ATWOOD, Boston, Mass. Filed Oct. 27, 1883. (No model.)



Claim.—1. In a button-setting instrument, the combination of two jaws pivoted together, one of said jaws terminating in a needle adapted to be inserted in fabric and forced under a wire button-fastening therein or thereunder, and the other jaw adapted to grasp said fabric and wire fastening and hold them firmly against said needle, substantially as and for the purpose set forth.

2. In a button-setting instrument, the combination of two jaws pivoted together, one of said jaws being provided with the conical needle H and the other with a suitable former, I, substantially as and for the purpose specified.

3. In a button-setting instrument, the combination of the jaw A, provided with the conical needle H, and the jaw B, provided with the former I, having the notches I', substantially as and for the purpose described.

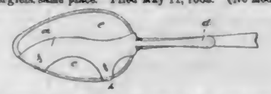


4. The combination, with the handle B, of the blade L, said blade being pivoted to and of the same general shape as said handle, and provided with the knife-edge *l*, and said handle being provided with the slot *n*, substantially as and for the purpose set forth.

298,156. RAKE. WILLIAM BARRY, Syracuse, N. Y., assignor to the Wales Manufacturing Company, same place. Filed Sept. 13, 1883. (No model.)

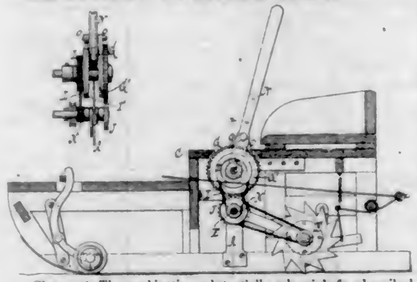
Claim.—The bar E, provided with tapering clearing-fingers C and rearwardly-projecting arms *a a*, and the yoke S, connected to said arms, in combination with the divided collar D, said collar having trunnions for the attachment of the arms *a a*, as and for the purpose specified.

298,157. PLOW. JOSEPHINE F. BASCOM, Halifax, Vt., Administratrix of Geo. F. Bascom, deceased. Filed Jan. 23, 1882. (Model.)



Claim.—The combination of the mold-board A, flange F, rods G G, secured at one end to the flange F, and free at their other end, arm C, and rocker D, as set forth.

298,158. POLICE CHAIN NIPPERS. EDWARD DAVIS BEAN, Chelsea, Mass. Filed Aug. 29, 1882. (No model.)



Claim.—In police-nippers, the T-shaped handle A, provided with the recess *a b*, in combination with the handle B, fitting within said recess, substantially as described.

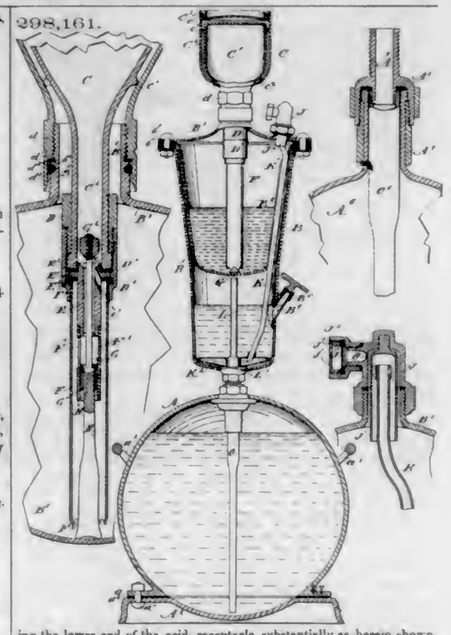
298,159. SPOON. JULIUS BERGFELS, Newark, N. J., assignor to William H. Bergfels, same place. Filed May 11, 1883. (No model.)

Claim.—Jointly with a spoon, as shown, the protecting-guard *b*, having the arms *f*, each of said arms provided with the spring-catch A, and the finger-piece *d*, formed integral with said plate, all substantially as described.

298,160. DEVICE FOR CONVERTING MOTION. CHARLES BERNHARD, New York, N. Y. Filed Mar. 25, 1884. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, with the driving-shaft and the main shaft, of a fixed cog-wheel on both shafts, one gearing with the other, a loose chain-wheel on the driving-shaft, a fixed chain-wheel on the main shaft connecting with the chain-wheel of the driving-shaft, a ratchet-wheel secured to both the cog-wheel and the chain-wheel of the driving-shaft on the opposite sides of such wheels, and one in a reverse position to the other, an oscillating lever intermediate of the ratchet-wheels on the driving-shaft, and pawls on the oscillating lever adapted to engage the ratchet-wheels, respectively.

2. The combination, substantially as hereinbefore described, with the driving-shaft and the main shaft, of fixed cog-wheels on both shafts—one at each end thereof—gearing with each other, loose chain-wheels on the driving-shaft—one adjacent to each of the cog-wheels thereof—fixed chain-wheels on the main shaft connecting with the chain-wheels of the driving-shaft, ratchet-wheels secured to adjacent cog-wheels and chain-wheels of the driving-shaft on the opposed sides of such wheels and in reverse positions, oscillating levers, one intermediate of each two adjacent ratchet-wheels on the driving-shaft, and pawls on each of the levers adapted to engage the ratchet-wheels, respectively.



298,161. SODA-WATER APPARATUS. ACHILLE BERTELLI, San Francisco, Cal. Filed Aug. 30, 1883. (No model.)

Claim.—1. The combination of the generator B, consisting of the outer vessel, B', inner vessel, B², and cover B³, securely held to the upper edges of said vessels, with the acid-box C, consisting of an outer vessel, C², secured to said top, and an inner vessel communicating with vessel B², and a suitable cover to said acid-box, substantially as set forth.

2. In a carbonic-acid-gas generator, the combination, with the vessel B', of the vessel B² therein, and the acid-box C, held on the cover of the generator, and provided with a tube extending to near the bottom of the vessel B², substantially as herein shown and described.

3. In a carbonic-acid-gas generator, the combination, with the vessel B', of the vessel B² therein, the acid-box C, and the tube F, extending to near the bottom of the vessel B², and provided with a valve for closing the lower end of the acid-receptacle, substantially as herein shown and described.

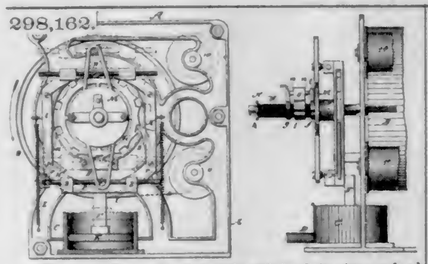
298,161.

4. In a carbonic-acid-gas generator, the combination, with the vessel B', of the vessel B², the acid-box C, the leaden bottle C', the valve-tube E, and a valve-plug attached to a rod extending down through a tube extending nearly to the bottom of the vessel B², substantially as herein shown and described.

5. In a carbonic-acid-gas generator, the combination, with the vessel B', the vessel B², and the acid-box C, of the leaden bottle C', the valve-tube E, the rod G, the leaden ball G², the tube F, the sleeve F', the rod H, the sleeve F², soldered to the lower end of the tube E, and the screw-cap G', in which the rod G is held, substantially as herein shown and described.

6. In a carbonic-acid-gas generator, the combination, with the vessels B' B² and the acid-box C, of the tube F, the valve-tube E, provided with an annular ridge E', the sleeve F², the rod G, the leaden ball G², the screw-cap G', and the rod H, held in the screw-cap G, substantially as herein shown and described.

7. In a carbonic-acid-gas generator, the combination, with the vessels B' B² and the leaden acid-bottle C', of the tube F, the screw-cap J, and the pipe K, extending from the same through a perforated tin box, K², on the bottom of the vessel B', substantially as herein shown and described.



8. In a carbonic-acid-gas generator, the combination, with the vessels B' B² and the leaden acid-bottle C', of the tube F, connecting with the same, the screw-cap J, carrying the safety-valve J', the cup J' in the cap J, and the pipe K, extending from the cap J down to a perforated tin block, K², in the bottom of the vessel B', substantially as herein shown and described.

9. In a carbonic-acid-gas generator, the combination, with the vessels B' B² and the leaden acid-bottle C', of the tube F, connected with the same, the screw-cap J, carrying the safety-valve J', the cup J' in the cap J, the pipe K, extending from the cap J down to a perforated tin block, K², in the bottom of the vessel B', and of the tube L, projecting upward from the bottom of the vessel B', and connected with an internally-threaded neck projecting from the bottom of the said vessel, substantially as herein shown and described.

10. The combination, with a carbonic-acid-gas generator, of a ring surrounding it and connected with the generator, and of a series of tubes for conducting the carbonic-acid gas from the generator into the fountain, substantially as herein shown and described.

298,162. STATION-INDICATOR. HENRI E. BISSELL, Hartford, Conn., assignor to the Bissell Railway Station Indicator Company, same place. Filed Feb. 26, 1883. (Model.)

298,162.

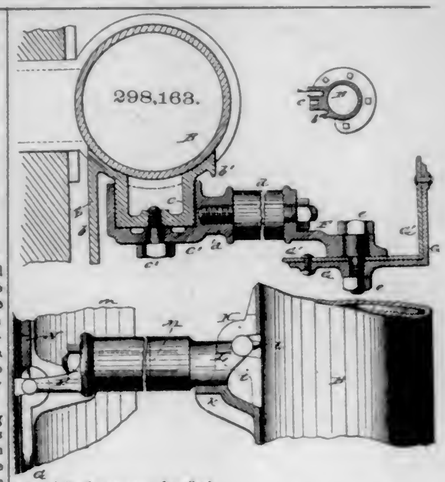
Claim.—1. The combination of the cylinder C, its piston and rod carrying the frame I K, the pawls *a b*, hung, respectively, in opposite sides of the frame, the ratchet G, in connection with the roller B, a slide arranged to be moved at right angles to the axis of the piston and in connection with the said pawls, and mechanism, substantially such as described, between the shaft and slide, whereby at predetermined times a longitudinal movement will be automatically imparted to said slide to engage one pawl with the ratchet and throw out the other, substantially as described.

2. The combination of the cylinder C, its piston and rod carrying the frame I K, the pawls *a b*, arranged, respectively, in opposite sides of said frame, the ratchet G, in connection with the roller B, and with which said pawls will engage, two slides arranged at right angles to the axis of the piston—the one above and the other below the ratchet—the said pawls made interchangeable in the frame, to be engaged with either of said slides, as the case may be, substantially as described.

3. The combination of the cylinder C, its piston and rod carrying the frame I K, the pawls *a b*, arranged, respectively, in opposite sides of said frame, the ratchet G, in connection with the roller B, and with which said pawls will engage, two slides arranged at right angles to the axis of the piston—the one above and the other below the ratchet—the said pawls made interchangeable in the frame, to be engaged with either of said slides, as the case may be, and mechanism, substantially such as described, between the shaft and the said slides, whereby at predetermined times a movement may be imparted to said slides to engage the one pawl with the ratchet and disengage the other, substantially as described.

4. The combination of the cylinder C, its piston and rod carrying the frame I K, the pawls *a b*, arranged, respectively, in opposite sides of said frame, the ratchet G, in connection with the roller B, and with which said pawls will engage, a slide arranged at right angles to the axis of the pistons and engaged with the said two pawls, the disk M, provided with the V-shaped arm, within which a stud on the slide works, a nut, *e*, arranged on a correspondingly-screw-threaded portion of the shaft and in connection with said disk, stops *f g* on said screw-threaded portion of the shaft, arranged to engage said nut at predetermined times and impart to said disk and V-shaped arm a rotary movement, and thereby impart to said slide a movement to reverse the pawls, substantially as described.

5. The combination of the cylinder C, its piston and rod carrying the frame I K, the pawls *a b*, arranged, respectively, in opposite sides of said frame, the ratchet G, in connection with the roller B, the two slides P T, arranged at right angles to the axis of the piston—the one above and the other below—the pawls interchangeable, to be engaged with either of said slides, the disk M on the shaft provided with the V-shaped arm S below, and corresponding arm, U, above, with a stud projecting from the respective slides into said arms, and so as to work therein, the nut *e*, arranged to travel on a screw-threaded portion of the shaft, and in connection with said disk, with stops *f g*, fixed on said screw-threaded portion of the shaft, to engage said nut at predetermined times and turn it with the disk, substantially as described, and for the purpose of converting the apparatus from compressed air as a motor to vacuum, or vice versa, substantially as described.



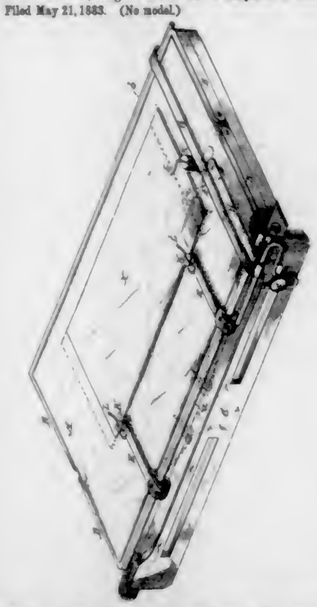
6. In a station-indicator, the combination of the roller by which the slip is moved, two rolls to which the ends of the slip are respectively attached, mechanism, substantially such as described, to impart intermittent rotation to said moving roller, a drum in connection with each of said rolls, the surface of said drums' frustum of cone shape, their bases in opposite directions, and a cord running from one of said drums onto the other, substantially as and for the purpose described.

298,163. FIRE-ESCAPE AND WATER-CONDUCTOR. VIRGIL W. BLANCHARD, New York, N. Y. Filed Jan. 18, 1883. (No model.)

Brief.—A stand-pipe composes the stationary upright of the folding ladder, and the rungs are pivoted to an angular bracket thereon and to the angular movable upright.

Claim.—1. A fire-escape ladder constructed with a stationary tubular upright, in combination with the folding upright G and the rungs jointed to the uprights, and adapted to operate substantially in the manner and for the purposes described.

298,163.



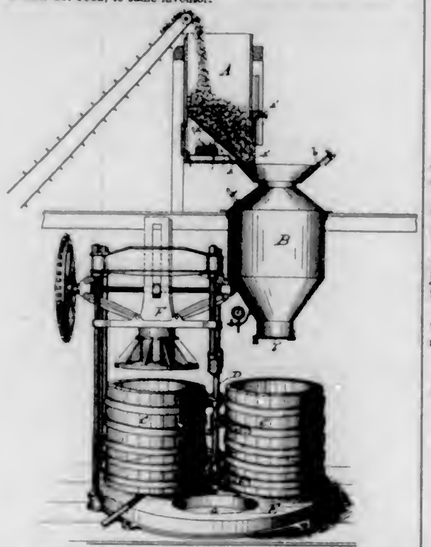
2. In a fire-escape ladder, the combination of a stationary upright, B, an angular bracket, E, having flange *b*, lip *b'*, and swivel-studs *c*, the folding angular upright G, and the rungs pivotally connecting the said uprights, substantially as set forth.

3. In a fire-escape ladder, the combination of a fixed upright, an angular bracket having swivel-studs *c*, the folding angular upright G, the swiveled cap *c'*, pivoted angular end piece, F, and the rungs connecting the same, substantially as set forth.

4. In a fire-escape ladder, the combination, with the folding angular upright G and pivoted end piece, F, of the angular stiffening-strap G', substantially as set forth.

298,164. FEED-GUIDE FOR PRINTING-PRESSES. JOHN BLOCHER, Franklin Grove, assignor of one-half to Benjamin F. Shaw, Dixon, Ill. Filed May 21, 1883. (No model.)

Claim.—1. The combination, with a platen of a printing-press, of a side guide adapted to move on the face of the platen toward the center and side thereof, and connected to the gripping-finger bar of the press by mechanism substantially as described, whereby said movement of the guide is rendered automatic, substantially as and for the purpose set forth.



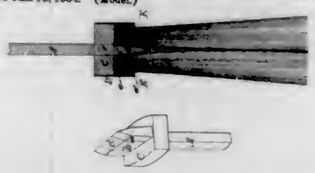
2. The combination, with the platen of a printing-press, of a pivoted side guide and a bar pivoted to the arm of said guide, and also connected to the gripping-finger bar of the press, by means substantially as described, and for the purpose specified.

3. The combination, with a pivoted side guide and a bar pivoted to the arm thereof, and connected to the gripping-finger bar of the press, of bottom guides the arms of which are pivoted to spring-clamps adjustable upon a rod on the lower band of the platen, substantially as and for the purpose described.

4. The side and bottom guides for a printing-press, provided with adjustable gage-heads carrying suitable tongues pivoted thereto, substantially as and for the purpose set forth.

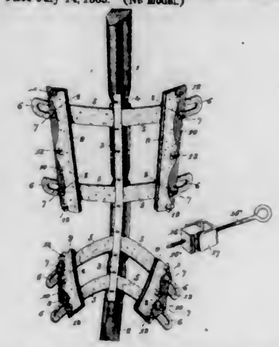
298,165. APPARATUS FOR EXTRACTING CANE-JUICE. GEORGE B. BOOMER, Mount Pleasant, Westchester County, N. Y. Filed Feb. 8, 1884. (No model.)

Brief.—Improvement on Letters Patent No. 269,628, dated December 26, 1882, to same inventor.



Claim.—1. The process of extracting the juice from sugar-cane by first cutting the cane into short lengths and submitting it to the fumes of burning sulphur, then steaming in a closed tank until the cellular tissues are broken and the condensed saccharine matter is rendered liquid, then submitting it to pressure.

2. A receiver or vessel for the cut cane, having its bottom inclining downward, and at its lowest part a discharge-orifice, with a chamber under such bottom to receive a vessel of burning brimstone, said bottom being perforated or slotted to allow the sulphurous fumes to pass upward through the cut material, substantially as and for the purpose set forth.

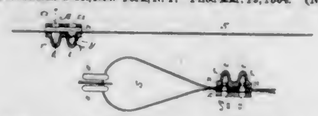


3. In combination with the tank B and the press F, the two hoops C C, revolving about the standard D, and the platform E, having an opening through which the bagasse is discharged, substantially as and for the purpose described.

298,166. PAINT-BRUSH. JOHN FRANCIS BOWDITCH, Revere, Mass. Filed Jan. 18, 1884. (Model.)

Claim.—The handle and cap provided with the wedge-pointed tongue and the mass of bristles, in combination with the ferrule and the wedges E, the latter being placed within the sides of the ferrule at the bottom alongside of the bristles, with their thin edges next to the butts of the bristles, substantially as described.

298,167. BOOT-CRIMP. FRANCIS MARION BRATTON, Hamden Junction, Ohio. Filed July 14, 1883. (No model.)



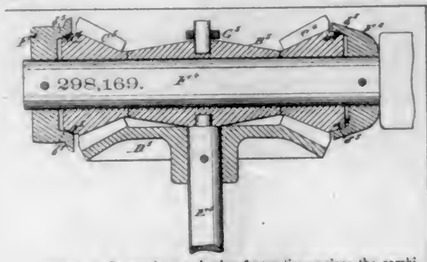
Claim.—1. A boot and shoe crimp consisting of a body forming the leg and foot pieces provided with hinged arms which carry adjustable clamping-jaws, as and for the purpose explained.

2. A boot and shoe crimp and stretcher consisting of a body, 1 2, braced or secured together by strip or bar 3, provided with plates 5, carrying jaws 9 10, as and for the purpose set forth.

3. A boot and shoe crimp consisting of a body forming the leg and foot pieces provided with hinged arms which carry adjustable clamping-jaws, the lower member of said jaws being provided with a lug, and having a nut, 13, and hand-screw 15, as and for the purpose described.

4. The clamping-jaws 9 10, provided with lug 11, in combination with a nut, 13, and hand-screw 15, substantially as and for the purpose set forth.

298,168. SEAL. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Mar. 19, 1884. (No model.)



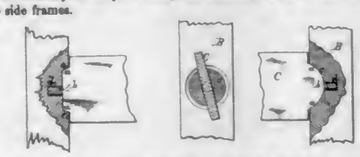
Claim.—1. An improved seal composed of a seal-disk of hard and rigid or substantially rigid material, and a flexible shackle of sheet metal, said seal-disk having a threading-hole adapted to receive one or both ends of said shackle, a recess or recesses behind said threading-hole to receive a burr of the sheet metal and render the same inaccessible, and in front of each recess an aperture adapted to admit a sharp-pointed punch for punching the shackle and throwing said burr into said recess to fasten the seal, substantially as herein specified, for the purposes set forth.

2. A seal-disk of hard and rigid or substantially rigid material, having a threading-hole, a recess or recesses behind said threading-hole, an aperture or apertures in its face opposite or in line with said recesses, and a teat or teats on its back to accomodate said recesses within them, substantially as shown, for the purposes set forth.

3. A seal-disk of hard or rigid or substantially rigid material, having a threading-hole, a recess or recesses behind said threading-hole, and an aperture or apertures opposite or in line with said recesses, and provided with permanent distinguishing-marks formed in or of the material of the seal-disk, as herein described, for the purpose set forth.

4. In combination with a seal-disk of hard or rigid or substantially rigid material, having a threading-hole, a recess or recesses behind said threading-hole, and an aperture or apertures opposite or in line with said recesses, a shackle of sheet metal, preliminarily united with said seal-disk, at or near one end of the shackle, by a burr formed thereon within one of said recesses, substantially as shown, for the purposes set forth.

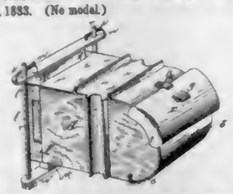
298,169. STEERING-GEAR FOR TRACTION-ENGINES. ALBERT P. BROOMELL, York, Pa., assignor to Arthur B. Farquhar, same place. Filed Feb. 18, 1884. (No model.)



Claim.—1. In steering mechanism for traction-engines, the combination, with the main or motor shaft F^4, and with the shaft E^2, by which motion is communicated, when required, in reverse directions to the steering devices, of the sliding hub B^2, the loose bevel-pinions C^3 C^4, having smooth conical driving-surfaces a^3 a^4 on their backs, and the fast conically-dished drivers F^3 F^4, all arranged upon the main shaft F^4, and the bevel-wheel D^2, fast on the shaft E^2, and in gear, on opposite sides of its axis, with the pinions C^3 C^4, essentially as and for the purposes specified.

2. In steering mechanism for traction-engines, the combination, with the main or motor shaft F^4, and the devices arranged thereon, consisting of the sliding hub B^2, the loose bevel-pinions C^3 C^4, having friction-driving conical backs a^3 a^4, and the fast conically-faced drivers F^3 F^4, of the bevel-wheel D^2, in gear with said pinions on opposite sides of its axis, and the shaft E^2, having said wheel D^2 secured to it, and supported at its upper end in the hub B^2, whereby the spring of said shaft E^2 is made available in controlling the release of the pinions from the friction-drivers, substantially as specified.

298,170. WINDOW-BLIND. HUGH BROTHERTON, New York, N. Y. Filed Feb. 15, 1884. (No model.)



Brief.—A window-blind consisting of a frame having circular seats formed in its sides, and slats having bearings or projections, in addition to the ordinary dowel-pins, fitting and operating in the circular seats in the side frames.

Claim.—1. In a blind, the slats C, having at their ends the bearings *a*, and a dowel, *b*, in combination with a conforming seat in the sides of the frame, substantially as set forth.

2. In a blind, the slats C, having upon their ends the bearings *a* and dowel *b*, in combination with the frame having in its sides the circular seats *c* and *d*, respectively, to receive the bearing and dowel, substantially as specified.

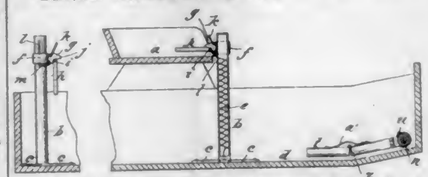
298,171. CAR-AXLE BOX. JAMES WILLSON CARR, Richmond, Va. Filed Sept. 6, 1883. (No model.)

Claim.—1. The combination, in a car-axle box, of the suitably-supported sliding gates having side-extending ears, said gates being adapted to embrace the axle-journal, and bolted together to permit them to move in unison, substantially as set forth.

2. The combination, in a car-axle box, of the suitably-supported sliding gates adapted to embrace the axle-journal, and provided with perforated ears extending beyond the sides of the box, and rods connecting the same, substantially as set forth.

3. The combination, in a car-axle box, of the suitably-supported sliding gates adapted to embrace the axle-journal, and provided on their outer edges with perforated ears, by means of which they may be bolted together, as described, and a loose sliding wicket, P, provided with a recess to embrace the upper side of the said axle-journal, substantially as set forth.

4. The combination, in a car-axle box, of upper and lower gates provided with connecting-rods, which pass through perforated ears which extend beyond the sides of the box, and springs *t t*, attached to the gates, so as to bear against the lips of the gate-guides, substantially as described, and for the purpose set forth.



298,172. FALSE BOTTOM FOR MASH-TUNS. GEO. GORDON CAVE, Fenny Stratford, County of Bucks, England. Filed June 25, 1883. Renewed Apr. 10, 1884. (No model.) Patented in England Oct. 17, 1881, No. 4,411.

Claim.—1. The improved false bottom for mash-tuns, hop-backs, or other vessels for the purpose of drainage, constructed of plates, in the piercings or perforations of which plates caps or cylinders A, with heads *a* having fine holes therein, are fitted, substantially as hereinbefore described.

2. In a false bottom for straining or draining purposes, the piercings or holes in the plate B, formed with countersink *b* and recess *b'*, for receiving the cylinders or caps A, formed of corresponding shape, and provided with heads *a*, with perforations *a'*, constructed and operating as and for the purpose herein set forth, and shown by the drawings.

298,173. ROBE-HOLDER FOR VEHICLES. GEORGE HENRY CHAPPELL, Huron, Dak. Filed Oct. 4, 1883. (No model.)

Claim.—1. The combination of presser-arms with the seat of a vehicle, said arms being adapted to hold a lap-robe thereon, substantially as described.

2. The combination of presser-arms with the bottom or foot board of a vehicle, said arms being adapted to hold a lap-robe thereon, substantially as described.

3. The combination of the arm-supporting tubes *b*, springs *c*, collars *f*, and presser-arms *h*, with the seat of a vehicle, the springs being connected with said arms through slots in the supporting-tubes, substantially as described.

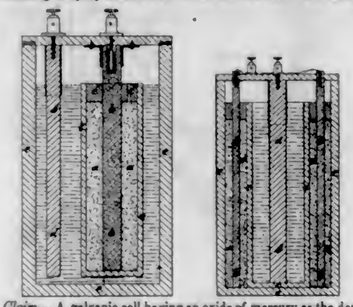
4. The collar *f*, having jointed arm *h* and stop-stud *i*, in combination with supporting-tube *b*, and spring *c*, said tube having slot *l m*, and the collar fitted to slide and turn on the tube, substantially as described.

5. The combination of the supporting-rod *n*, and spring-pressed arms thereon, with the body of a vehicle, said rod and arms being located near the bottom and foot board, and arranged to press and hold the lap-robe, substantially as described.

6. The extensible rod *n*, having spring-pressed arms adapted to press and hold the lap-robe, in combination with the vehicle-body, said rod being arranged to be secured between the sides of the body by the right-and-left adjusting-screw, substantially as described.

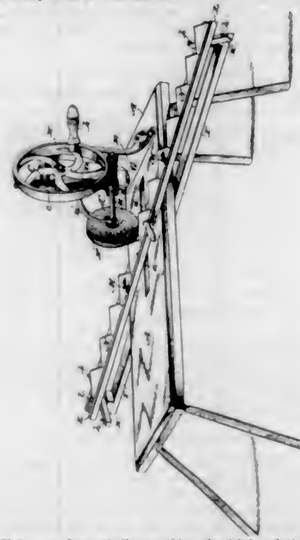
7. The combination of holding-arms, a rod for holding said arms, and springs for pressing said arms on the bottom or foot board of the body, said arms being pivoted to the holding-rod, and arranged to be raised upright and be secured by studs *w* and *x*, and their holding-down springs *u*, substantially as described.

8. The arms for holding the lap-robe down on the vehicle-bottom, connected to the supporting-rod *n* by turning collars *v*, and pivoted to said collars to fold down along the supporting-rod, substantially as described.



9. The combination, with a vehicle-bottom having irregular shape, of spring-pressed lap-robe-holding arms, having a joint, *z*, and presser-spring *a'*, to conform to said irregular shape, substantially as described.

298,174. HOLDER FOR USE IN CARVING MEAT. LOUIS CHEVALIER and LEON GRAILLOT, Paris, France. Filed Mar. 14, 1884. (No model.)

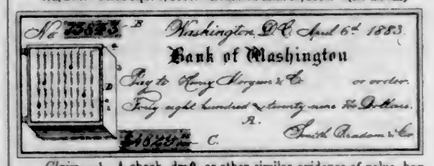


Claim.—A cutlet-holder composed of the sheath *h*, fixed into any suitable handle, the jaws *a*, grooved on their inner faces, and the blades *b*, acting as springs, in combination with the rack *d*, or its equivalent, engaging into the inner projection, *k*, on the pawl *j* of the sheath *h*, the whole constructed and operating as hereinbefore specified, and for the purposes set forth.

298,175. GALVANIC BATTERY. CHARLES L. CLARKE, Manchester, County of Lancaster, England, assignor to the Domestic Electrical Manufacturing Company, Boston, Mass. Filed Nov. 16, 1883. (No model.)

Claim.—A galvanic cell having an oxide of mercury as the depolarizing agent and a solution of potassic or sodic hydrate as the exciting-fluid, substantially as set forth.

298,176. SICKLE-GRINDER. COLIN W. CLAYBOURNE, Quincy, Ill. Filed July 30, 1883. (No model.)

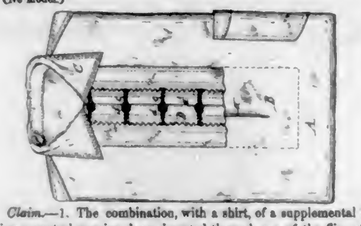


Claim.—1. In a grinding-machine, the driving-shaft of the abrading-wheel, provided with a fixed collar and an adjustable nut and washer, the elastic cylinder on the shaft between the collar and washer, and the wheel provided with a smooth face parallel to the shaft, and adapted to rotate in contact with the elastic material on the shaft, substantially as and for the purpose described.

2. In a grinding-machine, the combination of an abrading-wheel supported within suitable bearings, means for rotating the wheel and for adjusting the same to any desired angle and height with relation to the base of the machine, a bar for holding the article to be ground supported at each end upon supports at the ends of a pivoted bar, upon which it can also slide, and provided with a pin engaging a longitudinal slot in the base, substantially as shown and described.

3. In combination with grinding mechanism substantially as described, the knife-rest composed of the bar I, pivoted centrally upon the table A, the cross-bars K, pivoted upon the ends of the same, and provided with the studs *k*, the bar I, having the longitudinal groove *l*, pivoted stud *l'*, and handle *l''*, and the clamps M, all constructed and combined to operate substantially as set forth.

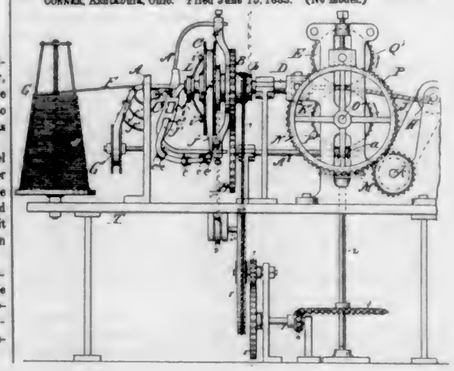
4. In combination with the grinding mechanism, the knife-rest consisting of a bar pivoted to the under side of the table, and provided at its ends with pivoted cross-bars, the upper faces of which are on a plane above the top of the table, and are provided with stop-pins at their ends, and the grooved bar for holding the knife resting on the cross-bars, and provided with a pin on its lower side engaging a groove in the table, substantially as and for the purpose described.



298,177. BANK CHECK AND DRAFT. JAMES K. CLEARY, Washington, D. C. Filed Apr. 6, 1883. Renewed Mar. 27, 1884. (No model.)

Claim.—1. A check, draft, or other similar evidence of value, having imprinted upon it at any convenient locality a series of vertical columns of figures, the first arranged from top to bottom from one to nine, indicating units, and the successive columns to the left of said unit-column representing multiples of one another by ten, in the usual order of enumeration, while each column increases vertically in serial order, substantially as shown and described, whereby a given amount may be expressed and read from left to right in the usual manner, as hereinbefore set forth.

2. A check, draft, or other similar evidence of value, having imprinted upon it a series of figures in vertical columns, and arranged horizontally in the order of usual enumeration, in combination with indicators and arresters, substantially as and for the purposes set forth.

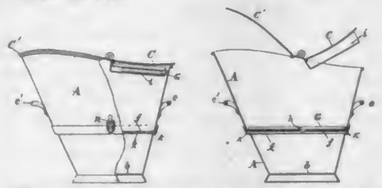


298,178. SHIRT. SWITS CONDÉ, Oswego, N. Y. Filed Dec. 7, 1883. (No model.)

Claim.—1. The combination, with a shirt, of a supplemental front having a central opening, loops inserted through one of the flies of the supplemental front, and secured between said fly and underlying fabric, and buttons or other suitable fastening devices secured to the other fly of the supplemental front, substantially as described and shown.

2. The combination, with a shirt, of a supplemental front provided with a central opening, loops inserted through one of the flies of the supplemental front, and secured between said fly and underlying fabric, and a binding across the exterior of the portion of the fly pierced by the loops, substantially as set forth and shown.

298,179. WIRE WRAPPING OR COVERING MACHINE. CHARLES CONNER, Ashtabula, Ohio. Filed June 15, 1883. (No model.)



Claim.—1. The combination of the sleeve D, cog-wheel B, arms *d*, and bow A' and its plate C' with the wheel B', worm-shaft A^3, worm *a*, yielding drawing-rollers E E', drum H, and suitable gearing for connecting said rollers and drum with said worm-shaft, substantially as set forth.

2. The wheel B, provided with arms *d*, and bow A', in combination with plates C', provided with the series of guide-plates *c c*, rollers *c'*, and slots c^3 c^3, and suitable mechanism for revolving the said wheel and devices secured thereto, all arranged substantially as herein shown and described.

3. The combination of the gear-wheel B, sleeve D, arms *d*, bow A' plate C', provided with the series of guide-plates *c c*, rollers *c'*, and slotted at c^3 c^3, with the reel C, friction device L, and adjusting-collar *i*, also mounted on sleeve D, and suitable mechanism for operating the wheel B, substantially as set forth.

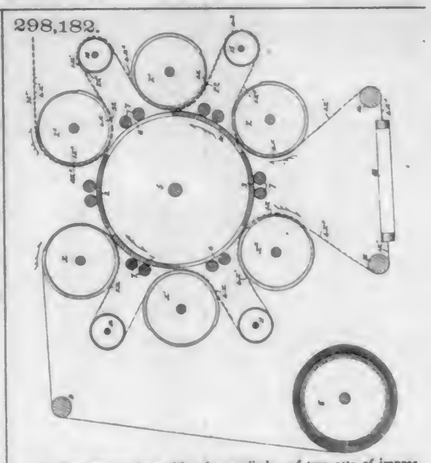
298,180. COAL-BUCKET. CHRISTIAN COOK, Baltimore, Md. Filed Feb. 19, 1884. (No model.)

Claim.—A coal-bucket having a cover provided with means by which to attach an ash-screen when the latter is not in use, an inturned flange to support an ash-screen intermediate of the cover and bottom, a removable ash-screen, and means, substantially as described, by which to remove ashes from the bottom of the bucket while the ash-screen is on the said flange, as set forth.

298,181. DRAWERS. JOSEPH M. COX, Richmond, Va. Filed Sept. 19, 1883. (No model.)

Claim.—1. A pair of drawers the sections of which are each formed with a front re-enforcing crotch-lap, C, having inclined or biased ends, whereby when the sections are joined the said laps will lie one within the garment and one without, and in such position relative to the body of the fabric as to insure a crossing of the weft of the two thicknesses of material, as described.

2. A pair of drawers made of counterpart sections, each of which is formed with a semi-elliptical rear lap, B, and a front lap, C, the ends of the latter being biased, whereby the weft of each lap C will be at an angle to the weft of the body of the fabric, to form a re-enforce of three thicknesses of material just below the fly of the garment, substantially as set forth.

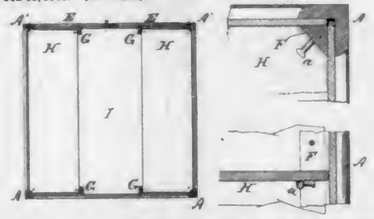


298,182. WEB-PRINTING MACHINE. LUTHER C. CROWELL, Brooklyn, assignor to R. Hoe & Co., New York, N. Y. Filed Dec. 2, 1882. (No model.)

Claim.—1. The combination, with a form-cylinder, of a plurality of impression-cylinders, and means for causing said impression-cylinders to come into printing contact with certain of the forms upon said form-cylinder, and to keep from printing contact with the remaining forms, whereby one side of a web may be printed from one set of forms upon said form-cylinder and avoid the remaining forms thereon, all substantially as described.

2. The combination, with a form-cylinder, of two sets of impression-cylinders and a web-turner, and means for causing each of said sets of impression-cylinders to come into printing contact with certain of the forms upon the form-cylinder and to keep out of printing contact with the remaining forms, all substantially as described.

3. The combination, with a form-cylinder, of a plurality of impression-cylinders and a register roll or rolls, said impression-cylinders having portions of their peripheries depressed or cut away, substantially as described.



298,182.

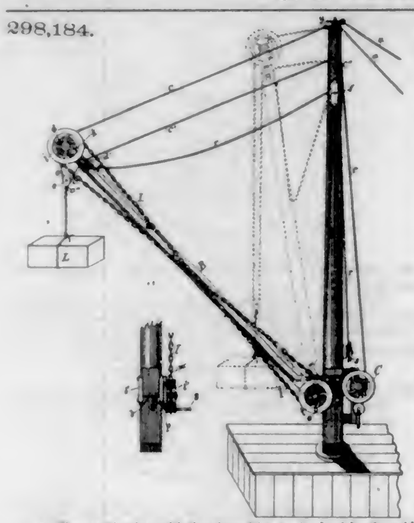
4. The combination, with a form-cylinder, of two sets of impression-cylinders and register-rolls, said impression-cylinders having portions of their peripheries depressed or cut away, and a web-turner, substantially as described.

5. The combination, with a form-cylinder, of a plurality of impression-cylinders and a register roll or rolls, said impression-cylinders having portions of their peripheries depressed or cut away, and a series of leading-rolls, as 18, substantially as described.

298,183. SHOW-CASE. TERENCE F. CURLEY, Brooklyn, N. Y. Filed Oct. 15, 1883. (No model.)

Claim.—In combination with a show-case, the perforated triangular corner-pieces F, the perforated vertical strips G, and the perforated corner-pieces A', said perforated pieces being adapted to receive adjustable pins *a*, for holding shelves H on each side of the space I, as shown and described, and for the purpose set forth.

298,184. DERRICK. CHARLES T. DAY, Newark, N. J., assignor of one-half to Thomas J. Gray, same place. Filed Mar. 19, 1884. (No model.)



Claim.—1. The combination, with the pivoted boom of a derrick, of a cable for suspending the load from said boom, said cable being fastened to a fixed support and passing over a pulley on the boom, whereby the raising and lowering of the boom will cause said pulley to travel over said cable and the load to be shifted sidewise, substantially as herein set forth.

2. The combination, with the pivoted boom of a derrick, of a cable for suspending the load from said boom, said cable being fastened to a fixed support and passing over a pulley on the boom, and an auxiliary chain or cable for raising or lowering said boom, thereby causing said pulley to travel over the first-named cable, substantially as herein set forth.

3. The combination, with the pivoted boom of a derrick, of a cable for suspending the load from said boom, said cable being fastened to a fixed support and passing over a pulley on the boom, and an endless chain or cable passing over pulleys, one of which rotates correlatively with the first-named pulley, substantially as herein set forth.

4. The combination, with the pivoted boom of a derrick, of a cable fastened at one end to a fixed support and passing over a pulley on the boom to form a traveling connection therewith, and formed into a loop having a bight below said pulley, from which bight the load is suspended, said cable being connected at its opposite end to the hoisting-windlass, substantially as herein set forth.

298,184.

5. The combination, with the pivoted boom of a derrick, of a cable fastened at one end to a fixed support and passing over a pulley on the boom to form a traveling connection therewith, and formed into a loop having a bight below said pulley, from which bight the load is suspended, said cable being connected at its opposite end to the hoisting-windlass, and an endless chain or cable passing over pulleys, one of which rotates correlatively with said pulley on the boom over which the first-named cable passes, substantially as herein set forth.

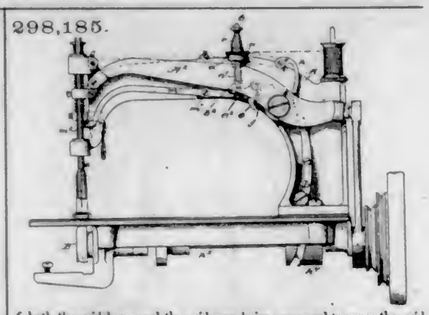
6. The combination, with the boom of a derrick, of a cable fastened to a fixed support and passing over and wound around a pulley on the boom and depending below said pulley to suspend the load, whereby the boom will be stayed by the weight of the load, but may be raised and lowered by causing its said pulley to travel over said cable, and the suspended load thereby be shifted, substantially as herein set forth.

7. The combination, with the boom of a derrick, of a cable fastened at one end to a fixed support and passing over and wound around a pulley on the boom, and formed into a loop having a bight below said pulley, from which bight the load is suspended, said cable being connected at its opposite end to the hoisting-windlass, substantially as herein set forth.

8. The combination of the mast, the boom, the cable formed into a loop, from the bight of which the load is suspended, said cable having one of its ends fastened to the mast and its other end connected to the hoisting-windlass, and the two pulleys on the boom, over which the two sections of said cable respectively pass, substantially as herein set forth.

9. The combination of the mast, the boom, the cable formed into a loop, from the bight of which the load is suspended, one section of which cable is fastened to the mast and the other connected to the hoisting-windlass, the pulley *d* upon the boom and around which the first-mentioned section of the cable is wound, the pulley *d'* on the boom, over which the other section of said cable passes, the chain-pulley fixed to the axis of the pulley *d*, the chain pulley-wheel *i'*, and the endless chain passing over said chain-pulleys, substantially as herein set forth.

10. The combination of the boom, the cable by which the load is suspended therefrom, the endless chain, the chain-pulleys, the ratchet fixed to one of said chain-pulleys, and a pawl or pawls engaging with said ratchet, substantially as herein set forth.

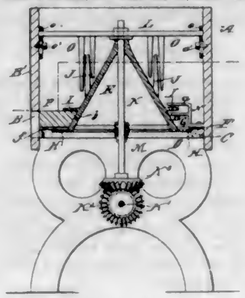


11. The combination of the boom, the cable by which the load is suspended, the pulley *d* on the boom, over which said cable passes, the chain-pulley *i*, mounted upon the same spindle with said pulley *d*, the chain-pulley *i'*, and the endless chain I, passing over said chain-pulleys, substantially as herein set forth.

298,185. TENSION MECHANISM FOR SEWING-MACHINES. GEORGE H. DEMOND and WILBUR F. DIAL, Bridgeport, Conn., assignors to the Wheeler & Wilson Manufacturing Company, same place. Filed Dec. 14, 1883. (No model.)

Brief.—A tension intermittently varied during the operation of stitching is entirely released upon lifting the presser-foot. A spring-actuated stop holds the tension in its released condition until the stitching is renewed.

Claim.—1. The spindle, one or more tension disks or plates, the spring *c'*, and the spindle mover or lever, combined with the lever *m*, having its long arm extended to the head of the machine, and the cam *f*, both the said lever and the said cam being arranged to move the said elbow-lever and spindle, substantially as described.



298,185.

2. The spindle, one or more tension disks or plates, the spring *c'*, the spindle mover or lever *e*, the lever *m*, and presser-bar-lifting lever to move it, combined with a spring-actuated catch or locking device adapted to operate upon the lever *e*, and serving to lock the same, as described, against backward movement when lifted by the lever *m*, substantially as set forth.

3. The spindle, one or more tension disks or plates, the spring *c'*, the spindle-moving lever *e*, and the cam *f*, provided with the side notch or incline, and adapted to move the lever *e*, combined with the spring-pressed catch or locking device, the cam *f* being adapted to disengage the said locking device from the elbow-lever, as and for the purpose set forth.

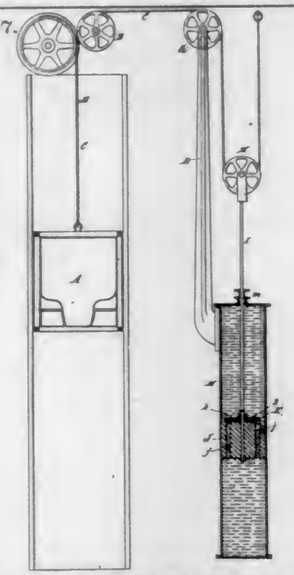
298,186. FERTILIZER PULVERIZER AND DISTRIBUTER. CHAS. FREDERICK DIMELE, Carlisle, Pa. Filed Jan. 21, 1884. (No model.)

Claim.—1. In a device for pulverizing fertilizers, the vertically-revolving cone E, formed with the flange H, which partially closes the hopper A, substantially as described.

2. The vertically-revolving cone E, formed or provided with the horizontal arms I and vertical arms J, substantially as described.

3. The vertically-revolving cone E, having horizontal projections I and vertical projections or arms J, in combination with the horizontal stationary breakers N, and the pendent arms O, arranged to operate substantially as described.

4. The combination, with the cone E, provided with arms I J, of the stationary breakers N, and pendent arms O, arranged to operate substantially as described.

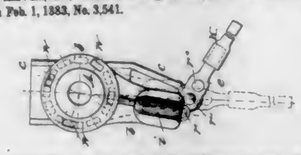


5. The combination, with the cone E, of the adjustable scraper P, with an inner beveled face resting against the side of the cone, near its base, arranged to operate substantially as described.

6. The cross-piece L, provided with the adjusting-arms *o o'* and pendent arms O, in combination with the cone E, having the vertical and horizontal arms I J, and the stationary breakers N, substantially as and for the purpose set forth.

7. The combination, with the vertically-revolving cone E, having vertical and horizontal agitating and crushing arms I J, and formed with flange H, of the hopper A, having pendent arms O, and horizontal breakers or crushers N, and the plate F, having circular opening G and side opening, *f*, and arranged to overlap the flange H of the cone, substantially as shown and described.

298,187. ELEVATOR. WM. J. M. DOBSON, New York, N. Y. Filed Aug. 13, 1883. (No model.)



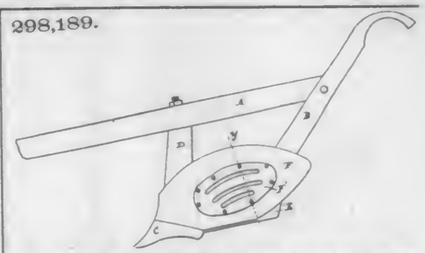
298,187.

Claim.—1. The piston J, having liberal apertures *j*, and valve K, having apertures *k*, of less capacity, the valve fitting closely to the piston by its periphery, and having an open chamber under it communicating between the apertures *j* and *k*, in combination with the piston-rod I, rope C, and a suitable pulley or pulleys arranged for joint operation, as herein specified.

2. In a device for elevators, the compound pulleys G H and rigid brace L, in combination with each other and with the elevating-car A, ropes B and C, cylinder M, piston J *j*, and valve K *k*, arranged for giving operation, as herein specified.

298,188. DIFFERENTIAL-LEVER PRESS. ANDRE DOCHSCHER, PIERRE DOCHSCHER, and MATHIAS G. SPOO, Luxemburg, Luxemburg, Germany. Filed Apr. 1, 1884. (No model.) Patented in Germany Dec. 10, 1881, No. 19,050; in Luxemburg Feb. 18, 1882, No. 135; in France Apr. 22, 1882, No. 148,508; in Belgium July 25, 1882, No. 58,580; in Italy Aug. 3, 1882, XXVIII, 490; in Austria-Hungary Aug. 12, 1882, No. 14,733, and in Spain Feb. 1, 1883, No. 3,541.

Claim.—1. The combination of the differential lever, the flanged nut connected to this lever by drop-pins, the pressure-base connected to said nut, and the operating-lever connected loosely to the differential lever, all constructed and adapted to operate substantially in the manner and for the purposes described.



2. The combination of the screw-shaft, the power-nut applied thereon, the lever *b*, connected to the nut by drop-pins, the lever *e*, provided with openings, a fulcrum-pin, *d*, on the base *c*, and a loose connection with the differential lever, all constructed and adapted to operate substantially in the manner and for the purposes described.

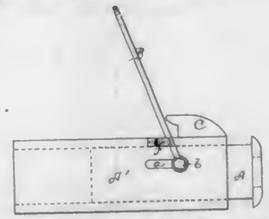
3. The combination of the screw-shaft, the flanged nut thereon, the differential lever connected by pins to the said nut, the lever *e*, for actuating the differential lever, the base *c*, and the angular irons, connecting the flanged nut to this base, all constructed and adapted to operate substantially in the manner and for the purposes described.

298,189. MOLD-BOARD. OLIA A. ENOS, Canton, Ohio. Filed Jan. 9, 1884. (No model.)

Claim.—1. In a plow, a mold-board constructed with an aperture, the mold-board surrounding said aperture being integral throughout, in combination with a detachable plate adapted to be situated in said aperture and have its wearing-face flush with that of the surrounding mold-

298,189.

board, and means for clamping the detachable plate in place, substantially as set forth.



2. In a plow, a mold-board having an aperture, the mold-board surrounding the aperture being integral throughout, in combination with a detachable wearing-plate provided with slots, substantially as and for the purposes set forth.

298,190. NECK-WEAR TIP. WERNER FICHTENBERG, New York, N. Y., assignor to William H. Hart, Jr., Philadelphia, Pa. Filed Jan. 12, 1884. (No model.)

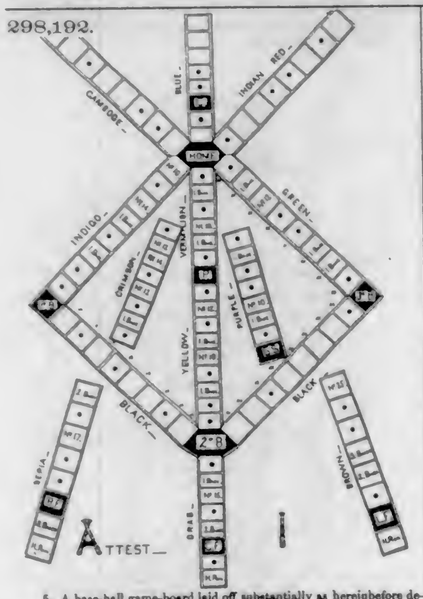
Claim.—The metal neck-wear tip A, having the sides *b b* and ends *c c*, curled or bent over, substantially as and for the purpose set forth.

298,191. CAR-COUPLING. ASA B. FREE, Lyndonville, assignor of one-half to John D. Warren, Medina, N. Y. Filed Feb. 25, 1884. (No model.)

Claim.—1. The combination of the draw-head A and draw-bar or frame A', the latter having the oblong side slots, *a a*, the rectangular link B, attached to a bolt, *b*, which goes through the slots *a a*, and also through the draw-bar A, and the horn C on top of bar A', all arranged and operating substantially as and for the purpose specified.

2. The combination of the draw-head A, slotted draw-bar A' *a a*, link B, and the side stops, *f f*, as and for the purpose specified.

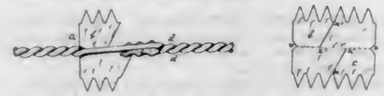
298,192. GAME. ROBERT B. B. FOOTE, Cincinnati, Ohio. Filed July 16, 1883. (Model.)



Claim.—1. A base-ball game-board consisting of a number of appropriate rows or sets of differently-colored squares arranged to represent a base-ball diamond, substantially as and for the purposes described.

2. A base-ball game-board consisting of a number of appropriate rows or sets of differently-colored squares arranged to represent a base-ball diamond and different field positions of a base-ball game, substantially as and for the purposes described.

3. A base-ball game consisting of a board composed of variously-colored sets of squares arranged to represent a base-ball diamond and various field positions, in combination with an indicator provided with a circle consisting of the colors employed on the board, and appropriate pointers to designate one of the colors on said indicator, substantially as and for the purposes described.



4. The herein-described base-ball game-board, consisting of a number of variously-colored sets of squares arranged to represent a base-ball diamond and the various field positions, a portion of said squares being provided with numbers and characters, substantially as described, in combination with an indicator having a circle composed of the various colors employed on the board, and another circle consisting of a number of blocks or spaces, each block or space being provided with a number, and two pointers—one light and the other dark—arranged to be turned on a central pivot and designate a certain color and number, substantially as and for the purposes described.

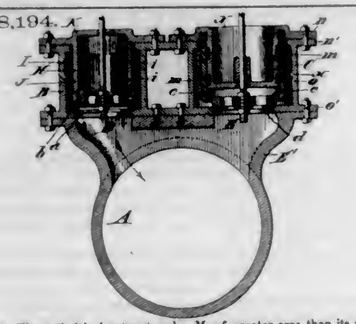
298,192.

5. A base-ball game-board laid off substantially as hereinbefore described, in combination with an indicator having a circle composed of the various colors employed by the board, and another circle consisting of a number of spaces, each space being provided with a number or designating character, and two pointers, designated from each other in a suitable manner, arranged to turn on a central pivot, and designate, respectively, a certain color or character, as the case may be, substantially as and for the purposes described.

298,193. WARNING-PLATE FOR WIRE FENCES. SAMUEL FORRESTER, Allegheny City, Pa. Filed Jan. 21, 1884. (No model.)

Claim.—1. A warning-plate consisting of a quadrilateral plate or blank having two cuts or slits extending from opposite sides to the line *x x'*, which intersects the plate normally to its other opposite sides, the parts thus formed being bent at an angle to each other on said line *x x'*, substantially as and for the purposes described.

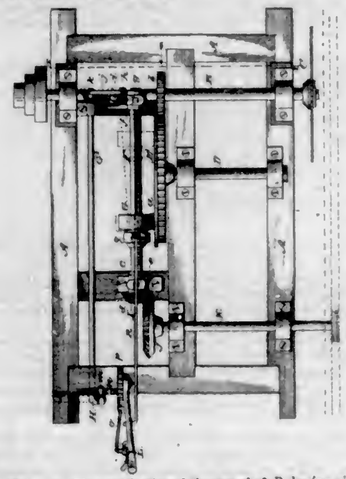
2. A warning-plate consisting of a flat plate notched on two of its edges for the reception of the strand-wires of a fence, and divided by two cuts extending from its other opposite sides partially across the plate, the parts thus formed being bent at an angle to each other on the line connecting the inner extremities of the cuts, substantially as and for the purpose described.



298,194. PUPPET-VALVE. HAMLIN F. FRENCH, Cincinnati, Ohio. Filed Dec. 18, 1883. (No model.)

Claim.—1. In combination with the cylinder A, the cylindrical valve H, provided with an annulus, *b*, and the cylindrical valve M, provided with the annulus *c*, adapted to operate as supply and exhaust valves, communicating directly with the cylinder A, substantially as herein set forth.

2. In combination with the cylinder A, the ports D E, communicating at one side with an inside valve, H, and annulus *b*, and on the other side an outside valve, M, provided with the inside annulus, *c*, whereby the valves are adapted to act as supply and exhaust valves, to be held in the seats by steam-pressure, substantially as herein set forth.

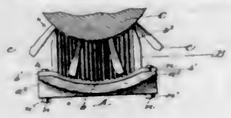


3. The outside annular cylindrical valve, M, in combination with the inside cylindrical cap, N, and provided with an inside annulus, *c*, of greater area than the annulus inside of the annular seat *d*, and adapted to act as an exhaust-valve and to be held in its seat by steam-pressure, substantially as described.

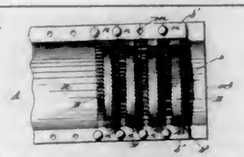
298,194.

4. The cylindrical exhaust-valve M, of greater area than its port, and provided with projecting flanges *c* on its inside, so as to hold the valve to its seat by steam-pressure, substantially as herein set forth.

298,195. SAW-MILL FEED MECHANISM. EDWIN T. GARDNER, Rocky Mount, N. C., assignor of one-half to James H. Odom, same place. Filed Mar. 15, 1884. (No model.)



Claim.—1. The combination of the saw-shaft B, having pinion *b*, the short shaft D, arranged parallel with the saw-shaft and having a toothed friction-disk, E, and the laterally-adjustable shaft F, arranged at right angles to shafts B and D, and bearing a friction-wheel, G, arranged to slide longitudinally on said shaft, but revolve rigidly with it, substantially as shown and described.

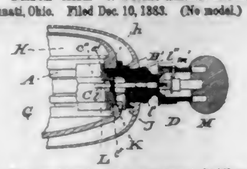


2. The combination, with the friction-disk E, of the laterally-adjustable shaft F, arranged at right angles to the axis of said disk, the feathered and sliding friction-wheel G, the pivoted bearing *c* and frame *e*, the pivoted bearing *f*, the sliding frame *h*, guide-plate *i*, and means for moving this end of the shaft, substantially as shown and described.

3. The combination, with the laterally-adjustable shaft F, of a parallel rock-shaft, G^2, having a crank and connecting-link at one end and a hand-lever and locking-bar at the other, and the feathered and sliding friction-wheel G, the connecting-rod R and hand-lever L, with locking-bar, and the double and right-angular notched plate *n p*, for bringing both hand-levers under the simultaneous control of the workman, as set forth.

298,196. CLOVER-HULLING ATTACHMENT FOR THRASHING-MACHINES. ALFRED L. GATES, Surrey, Wis. Filed Dec. 28, 1883. (No model.)

298,196.



Claim.—1. In a clover-hulling attachment for thrashing-machines, the combination, with the thrashing-cylinder, of the plano-concave provided with teeth-sections, constructed as described, extending from front to rear of the concave, and having vertical front and rear edges and top and bottom edges concentric with the thrashing-cylinder, substantially as herein described.

2. In a clover-hulling attachment for thrashing-machines, the combination, with the thrashing-cylinder, of the plano-concave provided with teeth-sections having their top edges concentric with the cylinder, said sections extending from front to rear of the concave, and having vertical front and rear edges, and provided at their base with laterally-projecting flanges having indentations and fastening-bolts, substantially as described.

3. In a clover-hulling attachment for thrashing-machines, the combination of the plano-concave provided with teeth-sections having vertical front and rear edges, and provided at their base with laterally-extending side flanges that abut together, said flanges provided at their side edges with V-shaped indentations and fastening-bolts, the heads of each of said bolts bearing upon two adjacent sections, substantially as described, with the thrashing-cylinder, as and for the purpose set forth.

298,197. WATCH-CASE. C. WESLEY HARMAN and HORACE G. SKIDMORE, Cincinnati, Ohio. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination of a movement-holding ring, a case-center, bezel, and inner back, the movement-holding ring adapted to be held from movement in the case-center, and the bezel and inner back being seated upon the movement-holding ring, and secured to the case-center by a turn-joint similar to a screw or bayonet-joint connection, as set forth.

2. The combination of a movement-holding ring, a case-center, bezel, and inner back, the movement-holding ring adapted to be held from movement in the case-center, and the bezel and inner back occupying seats on the movement-holding ring and case-center, and secured to the case-center by being turned into the latter, as by a screw or bayonet-joint connection, as set forth.

3. The combination of a case-center having flanges B B', movement-holding ring having seats d' e^x, the bezel, and the inner back, the movement-holding ring being held from movement in the case-center, and the bezel and inner back both being seated against their respective seats and flanges, and connected to the case-center by being turned in, as by a screw or bayonet-joint, as set forth.

4. In a dust-proof stem-winding-watch case, the slotted push and winder piece M, which contains a sliding key-pin, L, having a screw-threaded plug, K, in combination with the screw-threaded and counter-bored orifice e'' e''' in the movement-containing ring, substantially as and for the purpose set forth.

298,198. BUTTON-HOLE. EDNAH G. HARRIS, Boston, MASS. Filed Dec. 13, 1883. (No model.)

Claim.—A button-hole having its edges re-enforced by a wire, cord, string, or strip of any suitable material inserted between the thicknesses of material in which the button-hole is made, and secured thereto by overstitches, whereby said re-enforce is held between said thicknesses of material by said overstitches on all sides of said re-enforce, substantially as described.

298,199. DEVICE FOR OVERCOMING DEAD-CENTERS AND FOR CONVERTING MOTION. IRVING LEWIS HAWKINS, Windsor, N. Y. Filed Feb. 20, 1884. (No model.)

Claim.—1. The combination, with one or more cam-wheels, of a piston having pins arranged upon opposite sides for engaging the cams, and elongated slots for the passage of the journals, substantially as and for the purposes specified.

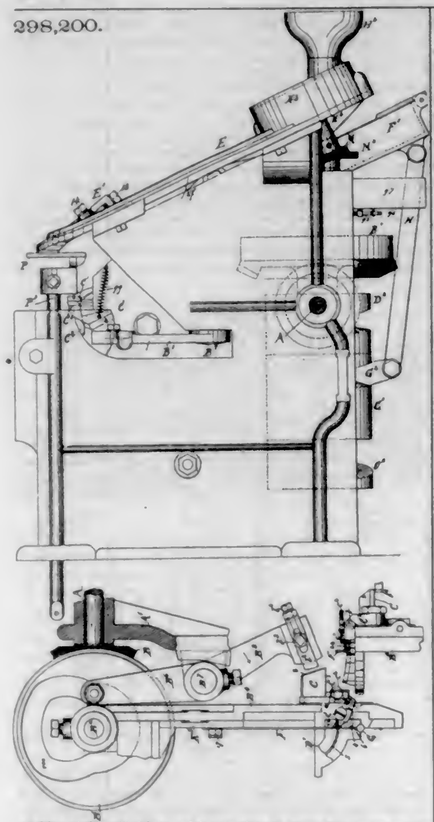
2. The combination, with two or more cam-wheels having laterally-projecting journals, of a piston having pins for engaging the cams, so arranged as to overcome the dead-center, and drive two or more wheels in opposite directions, substantially as specified.

298,200. BUTTON-SETTING MACHINE. LORENZO D. HAWKINS, Stoneham, and ERASTUS WOODWARD, Somerville, MASS., assignors to Joseph Davis, Benj. F. Spinney, and Charles A. Coffin, all of Lynn, MASS. Filed May 15, 1883. (No model.)

Claim.—1. In a machine for setting buttons, an independent anvil and a rest to hold the button in position with relation thereto, combined with an independent driver, and a centering device to direct the tack with relation to the anvil and eye of the button, substantially as described.

2. In a machine for setting buttons, a grooved button conductor or chute, down which the buttons are free to roll, the said conductor having an edge, 32, to enter the angle between the back of the button and the junction of the shank therewith, substantially as described.

3. The button conductor or chute, anvil against which to clinch the fastener, a fastener conductor or chute, and an upwardly-moved driver, combined with a transferrer to transfer a fastener into position above the driver, with its point uppermost, and with a centering device for the fastener, to operate substantially as described.



4. The button conductor or chute composed of the under plate provided with a groove and the top plate also provided with a groove, the under plate being of diminishing width outside the groove therein toward the delivery end of the said chute and to then arrive in position at the thin edge 32 of the eye of the button in position to be entered by the fastener, substantially as described.

5. The button conductor or chute and the anvil, and means to carry it, combined with the presser-foot, to clamp the material while the button is being set, substantially as described.

6. The button conductor or chute and the anvil provided with a prong to engage the shank of the button, combined with a driver to direct the fastener, and with means to change the position of the anvil and driver with relation to the end of the button conductor or chute to enable the button to be removed from the button-conducting chute, substantially as described.

7. The button conductor or chute, and an anvil on which to clinch or curl the point of the fastener, combined with a driver to drive the fastener and with means to operate the same and change the relative

298,200.

position of the said driver and button-chute horizontally, to remove the button from the chute holding it, substantially as described.

8. The fastener conductor or chute, and transferrer to carry a fastener to the driver, and a driver and support for the face of the material, and an anvil having a clinching-face, combined with a centering device or throat adapted to direct the point of the fastener to the anvil to clinch the said point about the shank of the button, substantially as described.

9. In a button-setting machine, a rest for the button and an adjacent anvil, a driver to drive a fastener, and an interposed device adapted to receive the point of the fastener and present it to the material, and yield to the passage of the fastener between it as the latter is driven by the driver, substantially as described.

10. In a machine for setting buttons, an anvil having a clinching-surface, combined with a driver and means to automatically vary its stroke or movement, according to the thickness of the material, substantially as described.

11. In a machine for setting buttons, an anvil and a driver and a centering device or throat to control the presentation of the point of the fastener to the said anvil, and with a lever having a movable fulcrum and adapted to operate the driver, substantially as described.

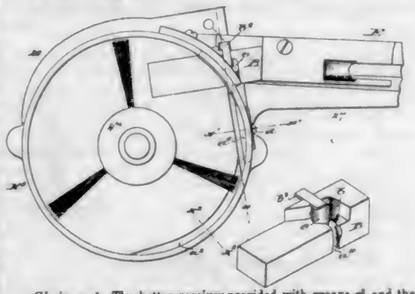
12. In a machine for setting buttons, a fastener conductor or chute, a transferrer, and an anvil, combined with a button conductor or chute, a driver, and a feeding-lever, and with means, substantially as described, actuated by the fastener, to determine when the material shall be fed, whereby should the presentation of a fastener be omitted the material will not be fed, substantially as described.

13. A swinging frame and a fastener conductor or chute, an anvil, and a driver carried thereby, combined with a button conductor or chute, a feeding-lever, and a presser-foot supported in another part of the frame-work, and with relation to which the said swinging frame and its parts are made movable a greater or less distance, according to the distance to be preserved between adjacent buttons, substantially as described.

14. In a machine for setting buttons upon boots and shoes and other material, a fastener conductor or chute, a reciprocating driver, opposite the end of which is placed the fastener to be driven, and a centering device or throat for the point of the fastener, combined with a button conductor or chute, a stop to arrest the undermost button in position opposite the said anvil, substantially as described.

15. The fastener-receiver, fastener conductor or chute, driver-bar, and driver, combined with a lever connected with the said receiver and driver-bar, and with a movable fulcrum-pin for the said lever, substantially as described.

16. In a machine for setting buttons, a fastener conductor or chute, grooved to receive the heads and shanks of the fasteners and set at an inclination to enable the said fasteners to descend therein by gravity while resting on their heads, and with their points directed upward, and a transferrer, and driver, and anvil, combined with a button conductor or chute to conduct buttons into position opposite the driver and fastener, the said button conductor or chute being curved and shaped, substantially as described, to cause the shank of the button to be turned to present the open eye in the path of movement of the point of the fastener before it meets the said eye, for the purposes set forth.



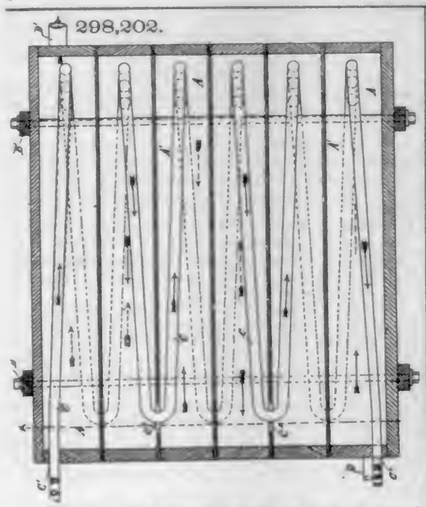
17. The swinging frame and its driver and fastener conductor or chute and anvil and transferrer and the button conductor or chute, combined with means to enable the material to be fed only after a fastener has been driven, and with a counting mechanism to indicate the number of feeding movements, and consequently of the fasteners which are driven, substantially as described.

18. The button-receiver and button raceway therein, grooved to receive the heads of the buttons when standing on edge, and an agitator to place the buttons in the said raceway, combined with the conductor or chute into which the buttons are discharged from the raceway, the latter at its lower portion having a knife-edged rest for the shank, substantially as described.

19. In a button-setting machine, a presser-foot and supporting-surface to hold the material, and a driver and anvil to drive a fastener and clinch it about the shank of the button, combined with means, substantially as described, to change the relative position of the anvil and driver horizontally with relation to the presser-foot, substantially as described.

20. In a button-setting machine, a presser-foot and supporting-surface to hold the material, and a driver and anvil to drive a fastener and clinch it about the shank of the button, combined with means, substantially as described, to change the relative position of the anvil and driver horizontally with relation to the presser-foot, and with a counter to indicate the number of horizontal movements of the said driver, substantially as described.

298,201. BUTTON-FEEDING APPARATUS. LORENZO D. HAWKINS, Stoneham, and ERASTUS WOODWARD, Somerville, MASS., assignors to Joseph Davis, Benj. F. Spinney, and Chas. A. Coffin, all of Lynn, MASS. Filed Nov. 26, 1883. (No model.)

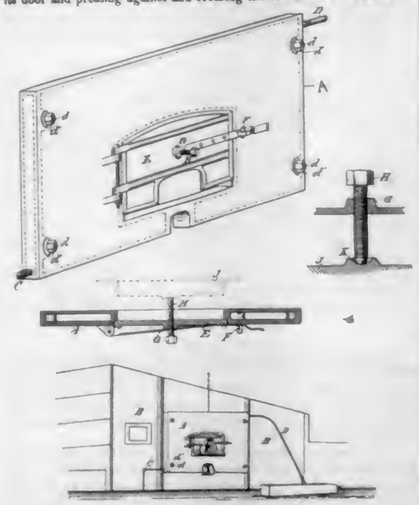


Claim.—1. The button-receiver provided with groove a^2, and the chute or conductor, combined with the block, having a throat for the entrance of the shanks of the buttons, a shoulder, and a passage, e, in communication with the groove in the said chute, the buttons falling edgewise from the said shoulder and dropping on their edges into the chute to roll down the same, substantially as described.

2. The button-receiver having a groove in its bottom, and the shelf or projection located along one side of the same to support part of the button-head, as shown, combined with an agitator or brush to move the buttons, along with their shanks, below the said shelf, and with a block having a throat, substantially as described, adapted to turn the button over upon its edge and effect its entrance edgewise into the groove of the chute, as set forth.

3. In a button-feeding apparatus, the block B, provided with a throat and shoulder and passage e, combined with a slide or projection, b^2, to more or less cover the passage e, substantially as shown and described.

298,202. APPARATUS FOR COOLING MASH, &c. TIMOTHY HAYES, Anderson's Ferry, Ohio. Filed Nov. 17, 1883. (No model.)

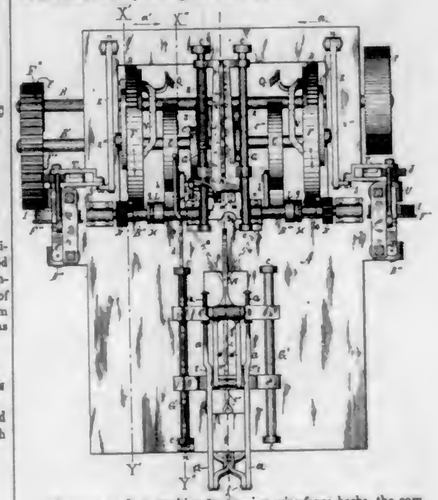


298,202.

Claim.—The cooler consisting, essentially, of a series of communicating chambers, A, arranged one above the other, and each provided with a longitudinal partition, A', dividing each chamber into two compartments communicating at one end, in combination with a coil, C, of a constant descending pitch, passing through the series of chambers from top to bottom and around the partition in each chamber, substantially as described.

298,203. COOLING-SHIELD FOR PUDDLING-FURNACES. EDWIN W. HEKMAN, Bay View, Wis. Filed Aug. 11, 1883. (No model.)

Brief.—A shield, hollow for circulation of cold air or water, and secured to the furnace by bolts and nuts, has a screw-bolt passing through its door and pressing against and securing the furnace-door in place.



Claim.—1. In a hollow shield for furnaces, a door provided with a screw-bolt for screwing the furnace-door to its seat when closed, substantially as described.

2. The shield-door and mechanism for securing it when closed, in combination with a screw-bolt, H, and furnace-door, as set forth.

3. A hollow shield adapted for containing air or water in circulation, and having a door for giving access to the furnace-door, in combination with a brace for pressing the furnace-door tightly in place when the shield-door is closed, as set forth.

298,204. WIRE-BARBING MACHINE. PETER P. HILL, Lee, Ill., assignor to the Washburn & Moen Manufacturing Company, Worcester, Mass., and Isaac L. Ellwood, De Kalb, Ill. Filed Nov. 30, 1883. (No model.)

Brief.—Two main wires are fed through the machine and are held one above the other. Two barb-wires are fed between the main wires from opposite sides. Their free ends are bent aside by reciprocating binders, and each is then wrapped around the other barb-wire by reciprocating and rotating wrapping-spindles, through which the barb-wires pass as they are fed into the machine, the wraps so formed being on opposite sides of the main wires. The barb-wires are severed by knives—one movable, the other stationary—carried by a sliding head, which brings them into operating position after the ends of the barbs are wrapped. Holding-jaws are closed upon the main wires over and under the barb-wires while the barbs are being formed. These jaws draw along the main wires with the formed barbs between them. The wires are afterward twisted, thereby holding the barbs in place.

Claim.—1. In a machine for forming wire-fence barbs, the combination of means for supporting two barb-wires whose free ends lie in opposite directions, means for intermittingly feeding said wires into a position in which their ends overlap each other and lie side by side, means for wrapping the end of each of said wires about the other, leaving the points projecting, and means for severing said wires at suitable distances from the wraps so formed.

2. In a machine for forming wire-fence barbs, the combination of means for supporting and intermittingly feeding from opposite directions two barb-wires whose free ends at the close of each feed overlap each other and lie side by side, means for grasping said overlapping ends midway between their respective points, means for wrapping the end of each wire about the other wire, the wraps so formed being on opposite sides of said grasping device, and means for severing said wires at suitable distances from the wraps.

3. In a machine for forming wire-fence barbs, the combination of means for supporting and intermittingly feeding from opposite sides of the machine two barb-wires whose ends at the close of each feed overlap each other and lie side by side, means for grasping said overlapping wires at a point midway between their ends, means for bending in opposite directions the ends of said wires, which project on opposite sides of said grasping device, means for wrapping the bent end of each of said wires about the other wire, and means for severing said wires at suitable distances from the wraps formed thereon.

4. In a machine for forming wire-fence barbs, the combination of two hollow spindles lying on opposite sides of the machine and in the same straight line, and journaled in suitable bearings, in which they have longitudinal and rotary motion, means for intermittingly feeding barb-wires through said spindles toward the center of the machine, whereby the inner ends of said wires at the close of each feed overlap each other and lie side by side, means for grasping said wires at a point midway between their ends, means for bending upward and downward, respectively, the projecting ends of said wires, which lie on the opposite sides of said grasping device, means for sliding said spindles inward toward the center of the machine until they engage the bent ends of said wires, means for rotating said spindles and wrapping the end of each wire about the other wire, means for sliding said spindles outward in their bearings, and thereby releasing the ends so wrapped, and means for severing said wires at suitable distances from said wraps.

5. The combination of the hollow spindles B'' B''', journaled in suitable bearings, the pinions N, and cam-faces O, rigidly mounted on said spindles, the flange and segment wheels F, co-operating with said pinions and cam-faces to produce intermittent rotary motion of said spindles, and suitable means for imparting reciprocal longitudinal motion to said spindles, substantially as and for the purpose set forth.

6. The combination of the hollow spindles B'' B''', journaled in suitable bearings, suitable means for imparting intermittent rotary motion to said spindles, the grooved collars L, mounted on said spindles, the swinging levers f'', whose forked ends g play in the grooves in said collars, the rollers x'', mounted on said levers, the cam-wheels F, and the cam-flanges V Q, rigidly attached to said wheels and co-operating with said rollers x'', whereby reciprocal longitudinal motion of said spindles is effected, substantially as shown and described, and for the purpose set forth.

7. The combination, with means for feeding and means for supporting two barb-wires, substantially as set forth, of the two benders K K', above and below the ends of the wires, respectively, the shaft B', journaled in suitable bearings, the cranks s' s'', mounted on said shaft and connected with said benders K K', respectively, and means, substantially as described, for partly rotating said shaft, whereby the benders K K' bend the ends of the barb-wires downward and upward, respectively, substantially as and for the purpose set forth.

8. The combination of the hollow spindles B'' B''', means, substantially as shown and described, for imparting rotary and longitudinal motion thereto, means for intermittingly feeding a barb-wire through each of said spindles, the benders K K' above and below the ends of said wires, respectively, means for thrusting said benders downward and upward, respectively, against the respective ends of said wires, and means for severing said wires after the wrapping of their ends, substantially as shown and described, and for the purpose set forth.

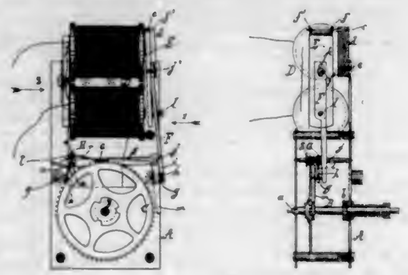
9. The combination of the guides G G and head H, sliding thereon, the two pairs of knives m'' m' and m m''', attached thereto, substantially as described, cam C''', and spring R, adapted to impart reciprocal longitudinal motion to said head, and cams C'' C'', adapted to operate said knives, respectively, substantially as shown and described, and for the purpose set forth.

10. In a wire-barbing machine, the combination of means for supporting two main wires, means for intermittingly feeding forward said main wires, means for feeding two barb-wires across and between the main wires from opposite sides thereof, means for wrapping the end of each barb-wire about the other barb-wire, the two wraps so formed being on opposite sides of said main wires, and means for severing said barb-wires at suitable distances on either side of the main wires.

11. In a wire-barbing machine, the combination of means for supporting two main wires, means for intermittingly feeding said main wires, means for feeding two barb-wires across and between the main wires from opposite sides, means for grasping the main and barb wires at their point of crossing, means for bending downward and upward, respectively, the projecting ends of said barb-wires, means for wrapping the bent end of each of said barb-wires about the other barb-wire, the two wraps so formed being on opposite sides of the main wires, and means for cutting said barb-wires at suitable distances on either side of said main wires.

12. In an automatic wire-barbing machine, the combination of suitable means for supporting two main wires, suitable means for feeding two barb-wires across and between said main wires from opposite sides, two reciprocally-sliding clamping-jaws adapted to grasp the main and barb wires at their point of crossing and hold them stationary during the formation of the barb, and to recede and carry with them the main wires at the completion of the barb, means for wrapping the projecting end of each barb-wire about the other barb-wire while said jaws are stationary, and means for cutting said barb-wires at suitable distances on either side of said clamping-jaws.

13. In a wire-barbing machine, the combination of two reciprocally-sliding jaws adapted to open and close, means for supporting two main wires in the line of and between said clamping jaws, means for feeding two barb-wires across and between said main wires from opposite sides thereof, means for operating said jaws, whereby they are made to advance while open, to close upon said main and barb wires at their crossing, to hold said wires stationary during the formation of a barb, to recede, still grasping said wires, thereby feeding forward the main wires, and to open at the end of said retrograde movement and release said wires, means for bending upward and downward, respectively, the projecting ends of said barb-wires, means for wrapping the bent end of each barb-wire about the other barb-wire, and means for cutting said barb-wires at suitable distances on either side of said clamping-jaws.



14. The combination of the guides G' G', blocks b b', sliding thereon, jaw W', rigidly attached to said blocks, jaw W, pivoted to the block b, toggle-levers r r', connecting the rear ends of said jaws, rods a, passing through the block b and pivoted to the toggle-levers r r' at their intersections, suitable stops on the rods a, in front of and behind the block b, and means for imparting reciprocal longitudinal motion to the rods a, whereby the jaws W W' are caused to slide forward and back on the guides G' G' and to alternately open and close, substantially as shown and described, and for the purpose set forth.

15. The combination of the jaws W W', rods a, lever f, pitman e, lever f', supporting the end of said pitman, roller x'', pivoted to the end of said pitman, and a suitable cam for imparting reciprocal motion to said pitman, substantially as shown and described, and for the purpose set forth.

16. The combination, with means for supporting the main and barbed wires, substantially as shown and described, of the jaws W W', longitudinally grooved for the reception of the main wires and transversely notched for the reception of the barb-wires, substantially as and for the purpose set forth.

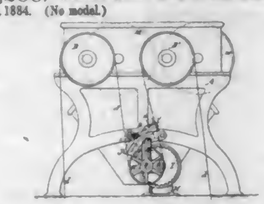
17. The combination, with the jaws W W', and means, substantially as set forth, for imparting to them a reciprocal longitudinal motion, of the ratchet-bar d, adapted to engage said jaws when at their forward limit of motion and hold them stationary while in such engagement, and the cam C, adapted to raise said ratchet-bar and release said jaws, substantially as shown and described, and for the purpose set forth.

298,205. SECONDARY ELECTRIC CLOCK. IDA C. HIMMER and WILLIAM F. WIEGERER, New York, N. Y., assignors to said Ida C. Himmer. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination, substantially as hereinbefore described, of a cog-wheel, C, an electro-magnet, D, a pivoted armature, E, a lever, F, connected with the armature, a pivoted lever, G, and a gravitating pawl, H, pivoted to one end of the pivoted lever, and provided with a stop-finger, r, and propelling-finger q, said pivoted lever, by its gravity and that of the pawl, serving to retract the armature, and the propelling and stop fingers being thrown into engagement with the cog-wheel by the gravity of the propelling-finger, all substantially as set forth.

2. The combination, substantially as hereinbefore described, of the electro-magnet, the armature, the cog-wheel mounted on or geared together with the center arbor of a clock, the rock-shaft j, the slotted lever mounted on said rock-shaft, the arm extending from the armature and engaging with the slotted lever, the pawl m, and the lever G, mounted on the rock-shaft, and the propelling-pawl attached to the lever G.

3. The combination, substantially as hereinbefore described, of the electro-magnet, the armature, the cog-wheel mounted on or geared together with the center arbor of a clock, the lever G, which is connected with the armature, so as to be actuated by the same, and which serves to retract the armature, the lug s, ajustably secured to the lever G, and the gravitating pawl H, pivoted to this lug, and provided with a propelling-finger and with a stop-finger, which are thrown in gear with the cog-wheel by the gravity of the propelling-finger.



4. The combination, substantially as hereinbefore described, of the electro-magnet, the armature, the cog-wheel mounted on or geared together with the center arbor of a clock, the rock-shaft j, the arm extending from the armature and geared together with the rock-shaft, the screws j'' and l, for adjusting the position of said arm, the pawl m, and lever G, mounted on the rock-shaft, and the propelling-pawl attached to the lever G.

5. The combination, substantially as hereinbefore described, of the electro-magnet, the armature, the adjusting-screw on which the armature swings, the adjustable arm d, the levers F and G, and the gravitating pawl for propelling the wheel, mounted upon or geared together with the center arbor of a clock.

6. The combination, substantially as hereinbefore described, of the electro-magnet, the armature, the pawl m, the stop-pawl s, loosely mounted on the rock-shaft, the gravitating pawl H, the adjusting-screw on which said pawl is mounted, and the wheel mounted on the center arbor of a clock.

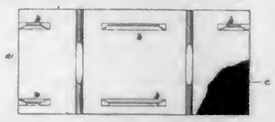
7. The combination, substantially as described, of the electro-magnet, the armature mounted on the adjusting-screw c, the adjustable arm d, the arm F, extending from said armature, the lever G, the pawl H, and the wheel C, mounted on the arbor B.

298,206. ROLLER-MILL. NOAH W. HOLT, Buffalo, N.Y. Filed Jan. 21, 1884. (No model.)

Claim.—1. The combination, with two pairs of rollers, B B and B' B', of pulleys D D' and M M', secured to the roller-shafts on opposite sides of the machine, a counter-shaft, A, carrying a wheel, I, and pulleys N N, an adjustable pulley, E, mechanism whereby motion is transmitted from the pulley E to the wheel I, and endless driving-belts *d*, *m*, and *n*, substantially as set forth.

2. The combination, with the fast rollers B B and the slow rollers B' B', of the counter-shaft A, supported in fixed bearings, a tightener-pulley, E, a belt, *d*, driving said tightener-pulley and the fast rollers, mechanism whereby power is transmitted from said tightener-pulley to said counter-shaft, and a belt driving mechanism provided with a tightening device, and connecting the counter-shaft with the slow rollers, substantially as set forth.

3. The combination, with the rollers B B and B' B', of the pulleys D D' and M M', counter-shaft A, tightener-pulley E, made adjustable concentric with said counter-shaft, mechanism whereby motion is transmitted from the tightener-pulley E to said counter-shaft, and mechanism whereby the counter-shaft is connected with the pulleys M M', substantially as set forth.



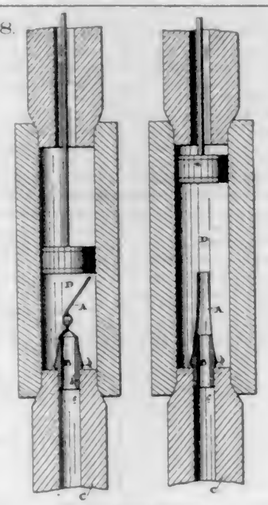
4. In a roller-mill, the combination, with the counter-shaft A, provided with a wheel, I, of the pulley E, shaft *e*, and pinion *i*, a frame, G, pivoted concentric with the shaft A, and means whereby the frame G can be secured in position, substantially as set forth.

5. In a roller-mill, the combination, with the pulleys M M', shaft A, pulleys N N, and belts *m n*, of a tightener-pulley, O, operating against both belts, substantially as set forth.

6. In a roller-mill, the combination, with the counter-shaft A, provided with a wheel, E, of a frame, G, pivoted concentric with said shaft, and provided with a shaft, *e*, and pinion *i*, a gear-segment, *j*, formed on said frame, and a worm-wheel, *k*, substantially as set forth.

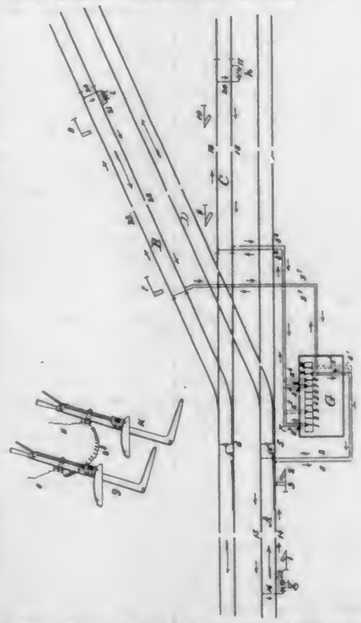
7. In a roller-mill, the combination, with the frame A and counter-shaft A, of a frame, G, pivoted concentric with the counter-shaft, and provided with a dovetail segment, *j*, a bearing-piece, J, secured to the frame A, and having a curved dovetail groove, *j'*, a shaft, *e*, supported in the frame G, and means whereby the frame G is adjusted and secured in position, substantially as set forth.

298,207. BEARING FOR SHAFTS, SPINDLES, &c. SILAS J. HOWELL, Boston, assignor of one-half to Daniel W. Gooch, Melrose, Mass. Filed Dec. 14, 1883. (No model.)



Claim.—1. A bearing composed of a Getchell metal or hardened copper shell or lining, and an adhering baser metal body, the baser metal body and the back of the shell or lining being amalgamated or incorporated one with the other, substantially as described.

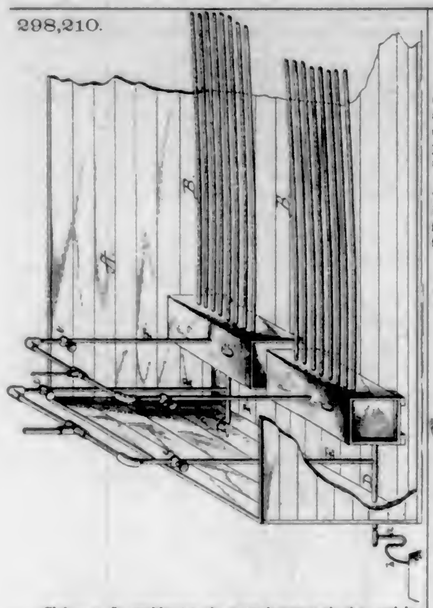
2. That improvement in the art or method of producing bearings which consists in coating a metal shell or lining with a metal fluxing coating, and then pouring upon the same in a mold a baser metal body fusible at a lower heat than the shell or lining, and capable of fusing the said metal fluxing coating, thereby amalgamating the opposed surfaces of the said lining and baser metal body, substantially as described.



298,208. PUMP. JOHN G. IRVING, Markdale, Ontario, Canada. Filed May 19, 1883. (No model.)

Claim.—The thimble B, having one end constructed to enter the suction-tube of a pump, the other end tapered to receive a flexible tube, and provided with a projecting flange, *b*, adapted to prevent the thimble being forced entirely into the suction-tube, in combination with the flexible rubber tube A, held on said thimble by the flange *b*, substantially as and for the purpose specified.

298,208.



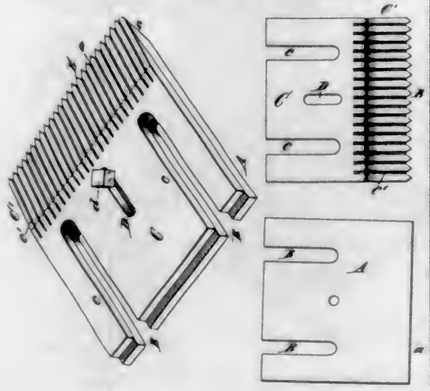
298,209. RAILWAY SIGNALING APPARATUS. CALEB H. JACKSON, Allegheny, Pa. Filed Feb. 15, 1883. (No model.)

Claim.—The combination of a signal governing the movements of trains on one of two intersecting lines of track, an operating-lever for moving said signal, a track-circuit on the other line of track, an electro-magnet included in said circuit, and an electric lock connected with the signal-lever and with the electro-magnet, and adapted to lock said lever by the demagnetization of said electro-magnet, these members being combined for joint operation to automatically lock at "danger" the signal of one line of track by the movement of a train on the other line, substantially as set forth.

298,210. APPARATUS FOR DISTILLING PETROLEUM. EDWARD KELLS, Cleveland, Ohio. Filed Nov. 26, 1883. (No model.)

298,210.

Claim.—1. In combination, the water box or tank, the receiving box or boxes immersed therein, the condensing-pipes opening into the receiving-boxes, and the discharge-pipe provided with a bent tube, *a*, fixed to its under side, substantially as and for the purpose set forth.



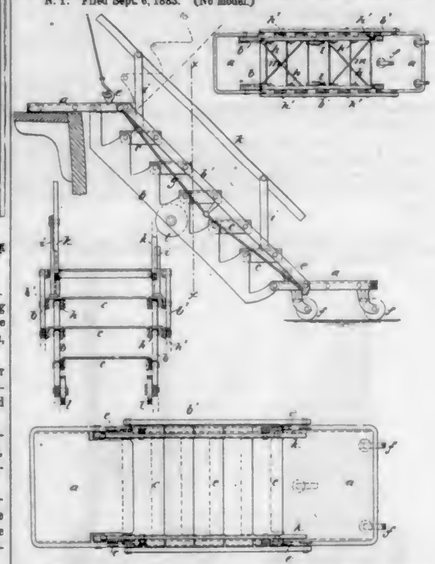
2. In combination, the water tank or box, the receiving box or boxes immersed therein, the condensing-pipes opening into the receiving-boxes, the flushing or pumping pipe let into the receiving-boxes, and the discharge-pipe, substantially as described.

3. In combination, the water tank or box, the receiving-boxes immersed therein, the condensing-pipes opening into the receiving-boxes, the flushing or pumping pipes let into the receiving-boxes, the discharge-pipe, and the vapor-conducting pipe, substantially as described.

4. In combination with the water tank or box and the receiving-box immersed therein, one or more condensing-pipes opening into the receiving-box, said condensing-pipes being laid in a descending curve from the end of the tank to their entrance in the receiving-box, substantially as and for the purpose set forth.

5. In combination with the discharge-pipe of a receiving-box, the bent tube *a*, fixed to the under side of the discharge-pipe, substantially as and for the purpose set forth.

298,211. CUTTER-KNIFE FOR EXCELSIOR-MACHINES. CHARLES L. KNIGHT, Cincinnati, Ohio. Filed Mar. 6, 1884. (No model.)



298,211.

Claim.—1. A cutter-knife for an excelsior-machine having a bevsled-edge cutter-blade, A, in combination with a blade, C, provided with a toothed and channeled sticker-edge, both blades being secured together so that the points of the toothed edge of one will project slightly beyond the cutting-edge of the other, substantially as and for the purpose specified.

2. In an excelsior-machine, the sticker-blade C, having sharp-pointed teeth E, which enter the wood to separate and guide fibers of it to the cutter-blade A, and a series of grooves, *c'*, along its beveled face C', to determine the grade of material cut, and to serve as guides for properly sharpening the teeth, substantially as herein set forth.

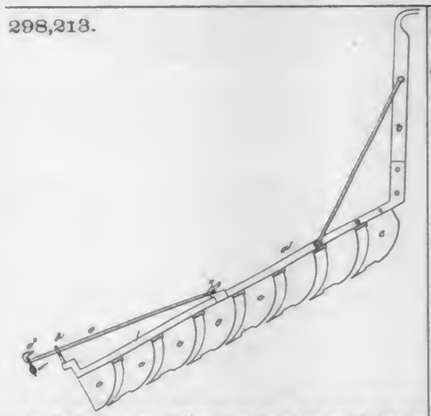
298,212. GANGWAY FOR SHIPS. THOMAS I. KNIGHT, New York N.Y. Filed Sept. 6, 1883. (No model.)

Claim.—1. An adjustable or folding step-ladder or stairs formed with two series of parallel side bars placed in different planes, in combination with steps jointed to the respective bars, forming a jointed reversible step-ladder capable of assuming opposite inclinations, substantially as herein set forth.

2. In a folding step-ladder, the combination, with parallel side bars and steps hinged thereto at the respective corners, of the overhanging platforms *a a*, hinged at each end of said side bars parallel with said steps, substantially as herein shown and described.

3. A reversible folding or adjustable ladder formed with the outer side bars, *b'*, and inner side bars, *b*, having a notched or stepped form, with steps *c c*, having hinging-ears at different planes on their respective corners jointed to the respective bars, substantially as and for the purpose set forth.

4. A folding step-ladder having parallel side bars with parallel steps jointed thereto, the said steps being formed of sheet metal, with their ends bent at right angles, forming hinging-lugs, which are jointed to said bars, substantially as herein set forth.

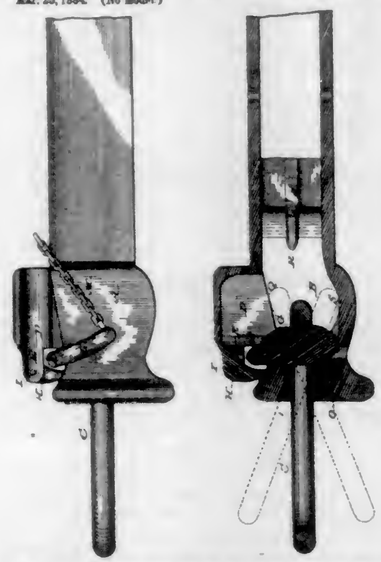


5. The combination, in a folding step-ladder, with parallel side bars and a parallel series of steps jointed thereto, of the suspending-eyes *e e*, fixed in the final steps connecting the side bars, and midway between the said bars, substantially as and for the purpose set forth.

6. In a folding step-ladder substantially such as described, the posts *i i*, arising from the steps, with the banister rail or rails *k k* jointed thereto, substantially as and for the purpose set forth.

298,213. ICE-PLOW. JACOB H. KNOWLES, LAWRENCE, MASS. Filed Jan. 14, 1884. (No model.)

Claim.—1. In an ice-plow, the beam, handles, and blade, combined with a horizontally-swinging link attached loosely to the plow-beam back of its front end, substantially as shown and described, the said link being

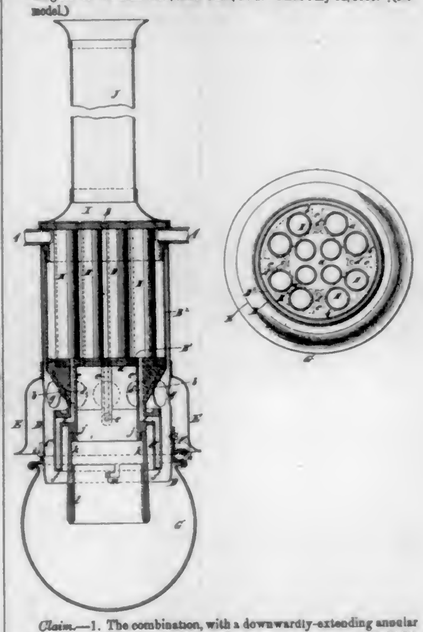


298,213.

adapted to hold the usual whiffletrees, and to operate as and for the purpose set forth.

2. In an ice-plow, the beam and the guide *d* at its front end, combined with the connecting-link *e*, attached to the plow back of the front end of the beam, the said link being extended through the said guide and adapted to hold the whiffletree, substantially as and for the purpose described.

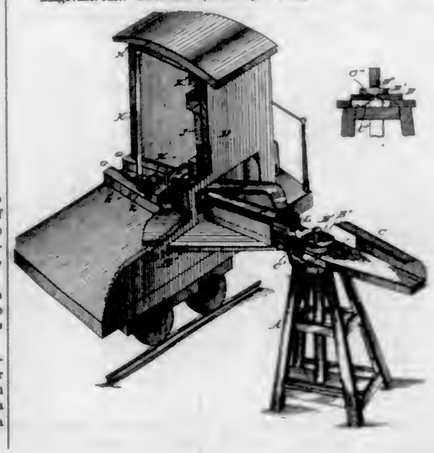
298,214. CAR-COUPLING. JOHN P. LANCASTER, Goshen, Ind. Filed Mar. 25, 1884. (No model.)



Claim.—1. The combination of the draw-head forming a transverse bearing upon its upper side, and having the inner side of the lower lip of its recess inclined, with the T-shaped coupling-pin rocking with its yoke in the bearing upon the upper side, and bearing with its obliquely-cut-off lower forward corner against the inclined inner side of the lower lip of the recess, as and for the purpose shown and set forth.

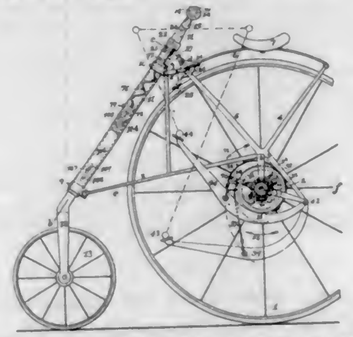
2. The draw-head having the roof of its recess inclined toward the forward end, having a transverse lip in its rear end slightly above the middle of the mouth of the recess, and having its bottom concaved, as and for the purpose shown and set forth.

3. The combination of the draw-head forming the transverse bearing at its upper forward corner, having the upper lips forming a circular recess or bore between them, the T-shaped coupling-pin rocking with its yoke in the bearing, and the angular fastening-plate secured upon a pin between the lips of the bearing, and having its inner end forming a circular enlargement fitting into the circular recess between the lips of the bearing, as and for the purpose shown and set forth.



298,215. GAS-BURNER. ANDREW B. LIPSEY, West Hoboken, N. J., assignor to William Bell, New York, N. Y. Filed July 11, 1883. (No model.)

Claim.—1. The combination, with a downwardly-extending annular burner-tip or a circular series of burner-tips, of a gas-chamber, B B' B², pipes extending through the same, and communicating at one end with shells which extend below the burner tip or tips, and at the other end with a chimney, substantially as specified.



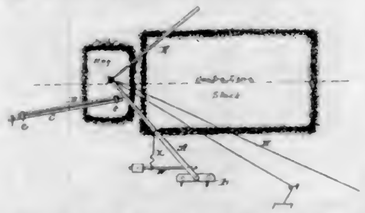
2. The combination, with a downwardly-extending annular burner-tip or a circular series of burner-tips and means for conveying gas thereto, of a shell, D, forming an air-flue and deflector for turning air inward toward the flame, and the shells *k l*, forming part of a flue for the waste products of combustion, and forming a deflector for turning air outward toward the flame, substantially as specified.

298,216. MAIL-BAG CATCHER. WILLIAM HENRY LOCKWOOD, North Kingsville, Ohio. Filed Mar. 6, 1884. (No model.)

Claim.—As an improvement in mail-bag catchers, the combination, with a swinging platform or shelf pivotally secured upon a suitable frame at the side of the railway-track, and having each of its projecting ends beveled or cut away upon one side and provided on the other with a curved wind-shield, of a swinging catch-shelf pivotally secured by one of its ends in a mail-car of ordinary construction, provided at its rear edge with a curved shield, and having at its outer free end a bumper adapted to strike against the beveled edge of the centrally-pivoted platform or shelf as the catch-shelf passes immediately beneath the same, and a sliding car-door adapted to be automatically closed by the swinging in of the catch-shelf after the latter has received the mail-bag, all constructed and arranged to operate substantially in the manner and for the purpose shown and described.

298,217. VELOCIPEDE. WILLIAM A. LORENZ, Hartford, Conn. Filed Sept. 1, 1883. (No model.)

Claim.—1. The combination of the handle-bar 14, the brake-handle 18, and the brake-lever 23, all combined and operating together substantially as described.



2. The combination of two disks, 30 and 31, having or not having spiral-shaped projections 35 and 36, the straps 37 and 38, the shaft 49, the bevel-gears 50 and 52, and bevel-pinion 51, all operating together, substantially as described, so that the downward motion of a treadle attached to the end of the strap 37 or 38 will operate to give an upward motion to a corresponding treadle or stirrup attached to the end of the other strap, and also vice versa.

3. The combination of the step 70, the disk 31, having or not having spiral-shaped projection 36, and the pawl 32, all operating together so that the rider, when placing his foot upon the step to mount the machine, will cause the wheel 1 to revolve, and thus propel the machine.

4. The combination of the spring 76, the bracket 77, and the holder 78, all combined and operating together substantially as described.

5. The combination of the shaft 106, the spiral spring 104, the key 107, and the steering-bar 11, all combined and operating together substantially as described.

298,218. HAY-STACKER. WILLIAM LOUDEN, Fairfield, Iowa. Filed Jan. 23, 1884. (No model.)

Claim.—1. The combination of the stacking-pole A with means for supporting it in any inclined position, so that its base will be at one side of the stack, and its upper end will be moved along the central line of the stack, substantially as shown and described.

2. The combination of the stacking-pole with supporting-braces which are provided with a sliding or flexible connection, whereby the pole will be moved back and forth over the stack, substantially as set forth.

3. The combination of the stacking-pole, with supports therefor, a hoisting-tackle for elevating the hay, and a suitable locking or holding device, which is adapted to catch and hold the hoisting-tackle and prevent it from dropping down while the pole is being moved over the stack, substantially as specified.

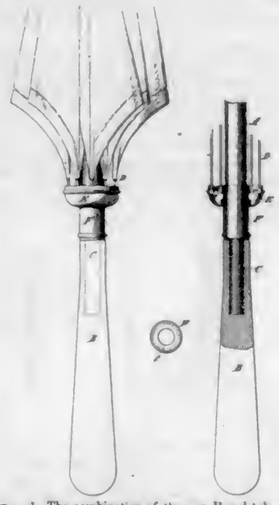
4. The combination of the stacking-pole, with supports therefor, a hoisting-tackle for elevating the hay, a locking device for holding the hay at any desired elevation, and a guy-rope, G, which is connected to said locking device at one end and to the ground at the other, so as to automatically operate the lock, substantially as shown and described.

5. The combination and arrangement of the pole A, pulley F, rope H, dog L, and guy-rope G, substantially as and for the purpose set forth.

6. The combination and arrangement of the pole A, hoisting-rope H, braces C D, and the sleeves *e e*, substantially as and for the purpose set forth.

7. A stacking-pole or hay-elevating mast composed of a number of boards which are secured together at an angle to each other, substantially as shown and described.

8. A stacking-pole or hay-elevating mast composed of a number of boards secured together at an angle to each other, and the solid pole Q, the whole being secured together substantially as shown and described.



9. The stacking-pole composed of the boards M N O P and the brace R, the whole being secured together substantially as shown.

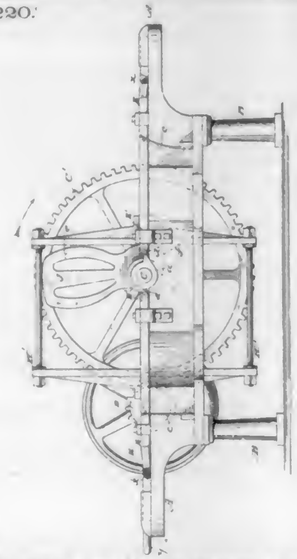
10. The combination of the stacking-pole with a weighted rod, W, or spring K, for the purpose of regulating the motion of the pole, substantially as set forth.

11. The combination of the stacking-pole with a collar, K, provided with a series of eyes or hooks, for the purpose of making attachments thereto, substantially as described.

12. The combination of the stacking-pole with the collar K, having hooks or eyes for making attachments thereto, and having the ribs *i i*, to prevent it from turning on the pole, substantially as set forth.

298,219. UMBRELLA TIP-CUP. JOHN MATTENBACHER, New York, N. Y., assignor of one-half to Levi L. Gans, same place. Filed Jan. 4, 1884. (No model.)

Claim.—1. The combination of the cup E and tube F, provided with a flange, G, substantially as described.

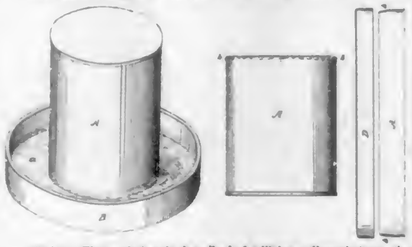


2. The combination of the umbrella-stick A, having a tenon, C, the cup E, and tube F, provided with a flange, G, and the mortised handle, substantially as described.

3. In an umbrella, a cup-supporting tube having a projecting portion clamped in place between the handle and the stick.

298,220. MACHINE FOR MAKING CHAIN-LINK BLANKS. LUTHER MCGILVRAY, Greenville, Pa. Filed Dec. 20, 1883. (No model.)

Claim.—1. The combination, with the cutting mechanism, the sheaves, and the reciprocating driver, of the driver-actuating mechanism, arranged and operating substantially as hereinbefore described, to cause said driver to clamp or hold the bar against the sheaves during the cutting operation, to push the severed bar-length through between the sheaves, and to then return to its original position, substantially as hereinbefore set forth.

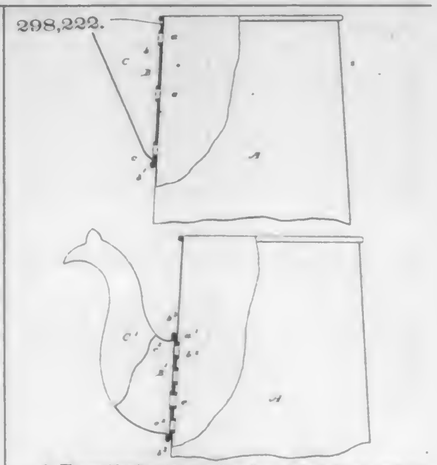


298,220.

2. The combination, with the cutting mechanism and the sheaves, of the reciprocating driver, the cam yoke or frame, and the rotary leaf cam formed with the parts *e f*, as and for the purposes hereinbefore set forth.

3. The combination, with the two sets of knives or cutters, drivers, sheaves, and gages, of the cam-yoke H' and the rotating cam-shaft C, provided with the knife-cam, and the leaf-cam, arranged to operate both sets of instrumentalities in the manner and for the purposes hereinbefore set forth.

298,221. PROCESS OF UTILIZING TIN CANS. BENJAMIN F. MECHLING, Philadelphia, Pa. Filed Mar. 17, 1884. (No model.)

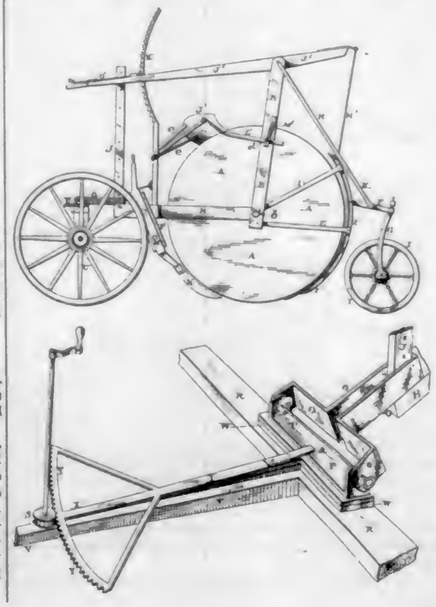


Claim.—The mode herein described of utilizing a discarded can, the said mode consisting in first detaching from the body whatever remains of the opened head of the can, then removing superfluous solder from and smoothing the exterior of the body at and near its edge *b*, and finally bending inward and truing the said edge *b* for the reception of a flanged cover, all substantially as set forth.

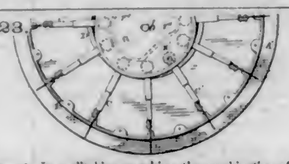
298,222. ATTACHMENT OF LIPS AND SPOUTS TO VESSELS. JOHN C. MILLIGAN, Brooklyn, and EMILE MOUHOT, Wood Haven, assignors to the Lalance & Grosjean Manufacturing Company, New York, N. Y. Filed Oct. 16, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, with the body of a vessel, of a lip or spout and an intervening flanged plate, whereby said vessel and lip or spout are united, the body and plate being perforated, so as to serve as a strainer, the projecting edges of the perforations being the means whereby the plate and the vessel are united.

2. The combination, substantially as hereinbefore set forth, of a vessel having a series of perforations formed in its side, a plate similarly perforated, the projecting edges of said perforations being the means whereby said vessel and plate are united, and a spout or lip secured to said vessel by flanges upon said plate and upon said spout or lip.



298,222.



3. The combination, substantially as hereinbefore set forth, with the body of a vessel, of a spout or lip and an intervening flanged plate, a series of holes being formed through said vessel and said plate, by the projecting edges of which said plate and vessel are united.

298,223. DITCHING-MACHINE. MOSES MILNER, Leesburg, Ohio. Filed Dec. 10, 1883. (No model.)

Brief.—A bar pivoted on a truck and having means for turning it extends rearward in a clevis-like device through which passes a perforated vertical standard of a frame carrying an excavator-wheel having spades protruded and retracted by a cam having an angular side so placed that the spades may give when they strike an obstruction. A plow-frame swung by rods pivoted, respectively, above and below the cutter-wheel axle carries at rear a wheel, and has a stay-rod so pivoted that a tilting (through a lever and connecting-rod) of the plow-frame on this pivot simultaneously raises and depresses or depresses and raises the plow and wheel, respectively.

298,223.

Claim.—1. In a ditching-machine, the combination of the wheel A, frame B, plow-frame I', rods D E, pivoted on opposite sides of the center of wheel A, and the wheel I, for supporting the plow-frame, substantially as shown.

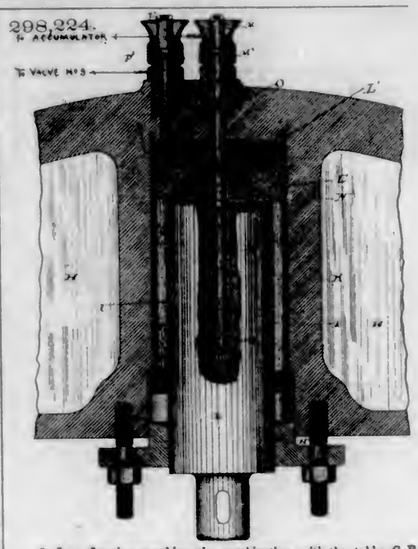
2. The combination of the ditching-wheel, the plow-frame I', rods D E, and wheel I, with the rods H N', frame B, and lever J', substantially as described.

3. The combination of the truck, the ditching-wheel, the plow-frame, the caster-wheel, which is loosely attached to the plow-frame, an operating-lever, J', and a supporting-rod for the caster-wheel, whereby the plow-frame and the caster wheel can be adjusted at the same time, substantially as specified.

4. The combination of the ditching-wheel, the cam F', having the angular side H', the spades C', and the friction-rollers G', the angular side of the cam being arranged in such relation to the spades that they can give inward when they strike an obstruction, substantially as specified.

5. The combination of the truck and tongue with the pivoted lever X and a means for moving it, the clevis O, and the standard J, substantially as set forth.

298,224. FLANGING-MACHINE. THOMAS R. MORGAN, Sr., Alliance, Ohio. Filed Oct. 29, 1883. (No model.)



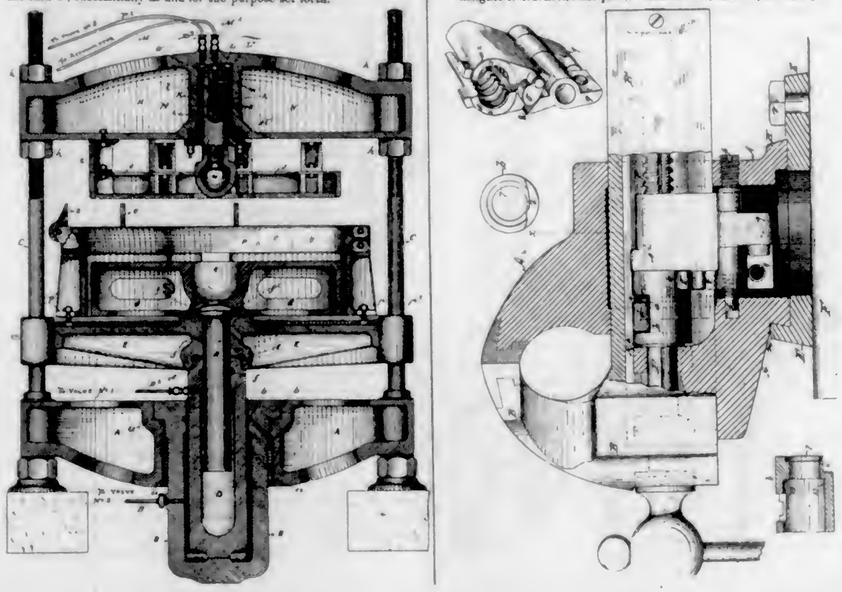
Claim.—1. In a flanging-machine, the combination, with a ram, and a table connected to the ram and provided with a matrix, of a holding-up table adapted to be operated within the matrix, having an independent ram connected therewith, substantially as set forth.

2. In a flanging-machine, the combination, with a ram, and a table connected therewith and provided with a matrix, of a holding-up table provided with an independent ram, and a stationary forming-die located above said matrix, substantially as set forth.

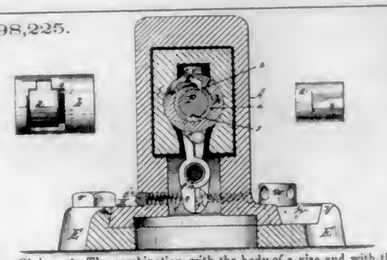
3. In a flanging-machine, the combination, with a matrix, a holding-up table, and independent rams for operating the matrix, and a forming-die located above the matrix, said parts constructed and adapted to flange the outer edge of the plate, of an independent ram, forming-die, and matrix for flanging an aperture in the plate, substantially as set forth.

4. In a flanging-machine, the combination, with a stationary forming-die, J, table E, matrix P, and ram D, of the holding-up table O, adapted to rest upon the table E, and ram F, arranged to operate within the ram D, substantially as and for the purpose set forth.

298,224.



5. In a flanging-machine, the combination, with the tables G E, rams F D, forming-die J, and matrix P, of the strippers Q, substantially as and for the purpose set forth.



6. In a flanging-machine, the combination, with the cylinder K, of the ram L, provided with a piston at its upper end, and a chamber having a passage communicating with an annular space around the ram, and a tube inserted within the chamber in the ram for supplying water under pressure thereto, substantially as and for the purpose set forth.

7. In a flanging-machine, the combination, with the matrix R, of the forming-die M, ram L, the latter provided with a piston at its upper end, and devices, substantially as described, for supplying water under pressure to the opposite sides of said piston, substantially as and for the purpose set forth.

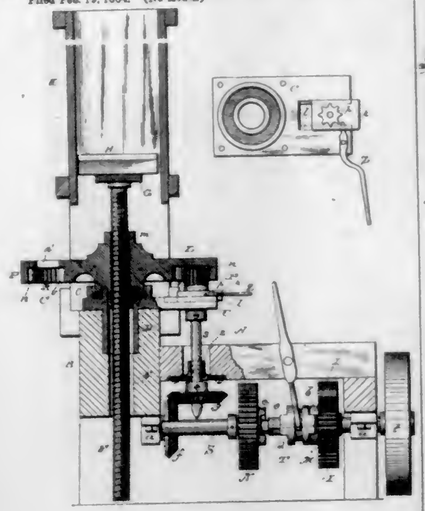
298,225. BENCH-VISE. WILLIAM H. NORTHALL, Bridgeport, Conn., assignor to C. S. Leet, same place. Filed Oct. 10, 1883. (No model.)

298,225.

Claim.—1. The combination, with the body of a vise and with the screw for operating the movable jaw thereof, of two nut-sections pivoted in said body, and arranged to swing against and from said screw, and mechanism, substantially as described, operated by said screw for swinging the nut-sections upon their pivot, substantially as described.

2. The combination, with the body of a vise and with the screw for operating the movable jaw thereof, of two nut-sections pivoted in said body, and movable therein by mechanism, substantially as described, in the direction of the length of said screw, and mechanism, substantially as described, for locking said nut-sections against the screw, substantially as set forth.

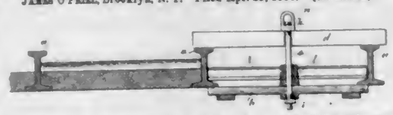
3. The combination, with the movable jaw-screw of a vise, of a vise-body having therein an abutment through which said screw passes, of two nut-sections, substantially as described, pivoted in said body, of a sleeve provided with a pawl-socket, and having a spline-connection with the jaw-screw, of a sleeve fitted over the above-named sleeve having a pawl therein to engage in said pawl-socket, and means, substantially as described, for swinging said nut-sections toward and from the jaw-screw by oscillating said pawl-carrying sleeve, substantially as set forth.



4. The combination, with the nut-sections e e^2, of the cam o, the sleeve b, springs i, and means, substantially as described, for imparting to said sleeve an oscillating movement, substantially as set forth.

5. The combination, with the nut-sections e e^2, having the ring z thereon, of the sleeve b, having the chamber 7, and means, substantially as described, for engaging said nut-sections with the said chamber in the end of said sleeve, substantially as set forth.

6. In combination, the body A, having the abutment K therein, the screw f, spring 10, the nut-sections e e^2, and the sleeves b and a, having springs interposed between them to give the former an endwise movement on the latter, substantially as set forth.

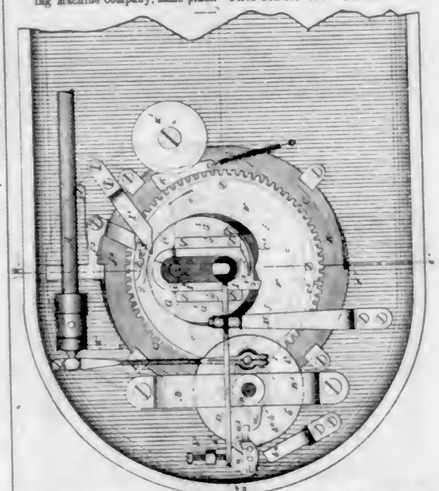


7. The combination, with the body of a vise having a circular bevel-edged foot thereon, substantially as described, of a base having a circular lip thereon to encircle a portion of said foot, and an abutment thereon opposite said lip, and a clamp-block adapted to be secured between said abutment and the edge of said foot, substantially as set forth.

298,226. COTTON-PRESS. JOSIAH DIAL O'DANIEL, Flatonia, Tex. Filed Feb. 19, 1884. (No model.)

Claim.—In a cotton-press, the combination, with a main follower-screw, and a crown-wheel engaging the same and having two series of teeth, of a pinion, p, its shaft, operating slide and lever, and rocking bearing, the main shaft carrying loose cog-wheels of different diameter having clutch-faces, the shifting-clutch, and the counter-shaft, carrying rigid cog-wheels of different diameter, and a bevel-wheel engaging the bevel-wheel at the lower end of the pinion-shaft, substantially as specified.

298,227. FIRE-PROOF FLOOR AND CEILING FOR BUILDINGS. JAMES O'FRIEL, Brooklyn, N. Y. Filed Apr. 23, 1883. (No model.)



Claim.—1. The combination, with the beams and table, of the cross-bearer, the bolt, nuts, eye, and thimble, substantially as set forth.

2. The method herein specified of making slabs of artificial stone between iron beams, consisting in drawing up to the under side of the beams tables and clamping them by means of bolts and bearers, filling in the space between the beams by a cement resting upon the tables, and forming holes through the cement by thimbles around the bolts, and then lowering the tables, after the cement has hardened, by ropes connected to the bolts and passing through the holes in the cement, substantially as set forth.

3. In the formation of slabs of artificial stone between iron beams, the combination, with the cement, of thwarts resting at their ends upon the iron beams and incased in the cement, substantially as and for the purposes set forth.

4. In combination with the tables b and the bolts c, the nuts upon such bolts, and eyes at their upper ends for ropes to be connected to, and the notched cross-bearers resting upon the beams, substantially as set forth.

298,228. BUTTON-HOLE SEWING-MACHINE. JOHN H. PALMER, Philadelphia, Pa., assignor to American Buttonhole Overseaming and Sewing Machine Company, same place. Filed Oct. 15, 1883. (Model.)

Claim.—1. The combination, substantially as set forth, in a sewing-machine, of the geared ring, its bearing and supporting blocks, the disk E, cloth-carrying devices actuated by the rotation of the ring, and mechanism for actuating the ring.

2. The combination, substantially as set forth, of the rotating ring or wheel, mechanism for rotating it, the camway carried thereby, the disk or plate which travels in and is actuated by said cam, and the cloth-carrying plate connected with said actuating-disk.

3. The combination, substantially as set forth, of the geared ring, its bearing, the face-plate F, the open cam C′, formed in the face-plate, the disk or plate actuated by the cam-face C′, and cloth-carrying devices actuated by said disk.

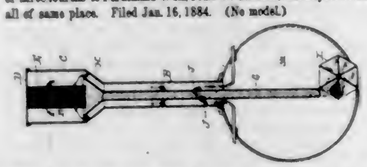
4. The combination, substantially as set forth, of the wheel C, mechanism for rotating it, the cam C′, the disk or plate acted on by the cam, the slotted plate E, the cloth-plate, and the connections between the disk G and the cloth-plate.

5. The combination, substantially as set forth, of the rotating wheel or ring C, mechanism for actuating it, a cam carried by said wheel or ring, the disk or plate acted on by the cam, the pivoted stop-lever, a cam way or track which travels against one end of said lever, and a stop on the actuating mechanism which works against the other end of the lever.

6. The combination, substantially as set forth, of the bed-plate, the friction-clutch-driving mechanism, the rocking arm d', a stop carried thereby, the pivoted lever arranged entirely beneath the bed-plate of the machine, the cam way or track on which one end of said lever works, also arranged entirely beneath the bed-plate of the machine, and the clutch carrying and actuating mechanism, the arrangement being such that the material being stitched may be handled freely without interfering with the pivoted lever or its controlling cam.

7. The combination, substantially as set forth, of the rotating ring or wheel, mechanism for actuating it, the cam carried thereby, the disk or plate acted on by the cam, cloth-carrying mechanism actuated by said disk, the sliding latch on said plate which engages with a notch on the ring, and means for throwing the latch out of engagement with the notch at intervals.

8. The combination, substantially as set forth, of the geared ring, the cam carried thereby, the disk acted on by the cam, cloth-carrying mechanism actuated by said disk, the sliding latch on the disk, the cam-track on said latch, the pivoted stop-lever, the mechanism for actuating the geared ring, and means for controlling the speed of said mechanism by the position of the pivoted lever.



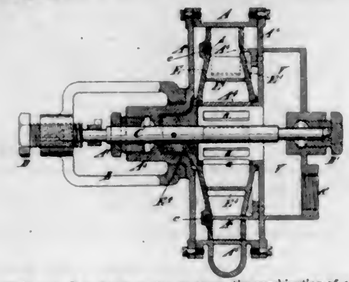
9. The combination, substantially as set forth, of the geared ring, mechanism for actuating it, the cam carried thereby, the plate acted on by the cam and rigidly connected with the cloth-carrying plate, the sliding latch on said plate, the slotted disk E, the catch f^3, which controls the disk E, and the devices for tripping said catch and the sliding latch, as described.

10. The combination, substantially as set forth, in a button-hole sewing-machine, of the ring or wheel C, cloth-carrying devices actuated by the ring, the pulley K, the wedge-block, and the spring which normally draws the wedge-block between the ring and pulley.

11. The combination, substantially as set forth, of the ring C, mechanism for actuating it, the cam carried by the ring, the disk G, actuated by said cam, the slotted plate E, the cloth-plate, which is connected with the disk G by the posts which pass through the slots in the disk E, a cam-track carried on the disk G, a pivoted stop-lever, one end of which bears against said cam-track, and mechanism for controlling the speed of the actuating mechanism by the position of the pivoted stop-lever.

12. The combination of the bed-plate, cloth-carrying devices located on the upper face of the bed-plate, mechanism for actuating the cloth-carrying devices to bring the material into proper position for stitching, a pivoted lever horizontally disposed below and being entirely beneath the bed-plate of the machine, mechanism, substantially such as described, by which the motion of the cloth-carrying devices is increased or decreased according to the position of the lever, and a horizontal cam face or track, also arranged entirely beneath the bed-plate of the machine, by which the position of said lever is changed, for the purpose set forth, whereby the horizontal pivoted lever and its controlling-cam are removed from any possible interference with the material being stitched.

298,229. SPARK-ARRESTER. JOHN S. PARK, Rockport, Ind., assignor of three-fourths to Ferdinand Weil, John W. Graham, and Taylor C. Barrs, all of same place. Filed Jan. 16, 1884. (No model.)

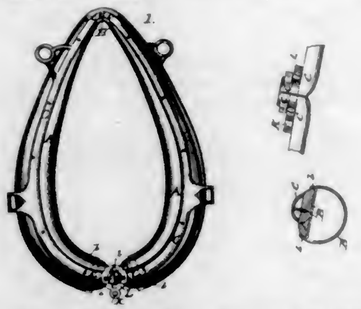


Claim.—1. In a spark-arrester, the combination of the boiler, the stack, the wire screen placed in the upper portion of the stack, the cinder-pipe having its upper end so shaped as to catch the sparks as they fall from the side of the screen, and a revolving cylinder placed at the lower end of the cinder-pipe, substantially as shown.

2. The combination of the boiler, the stack, the wire screen located in the upper portion of the stack, the cinder-pipe located below the screen for catching the cinders, the revolving cylinder or drum for discharging the cinders, the bent pipes which pass through the sides of the cinder-pipes, and the exhaust-nozzles, substantially as described.

3. In a spark-arrester, the combination of the wire screen for arresting the sparks, a cinder-pipe placed below the screen to catch the cinders, and a revolving drum or cylinder provided with a series of compartments, the drum or cylinder being made to revolve only by the weight of the cinders which have fallen into one of the compartments, substantially as set forth.

298,230. ROTARY METER. JOHN A. PEER, Grass Valley, Cal., assignor of one-half to John J. Berger, Brooklyn, N. Y. Filed Sept. 1, 1883. (No model.)

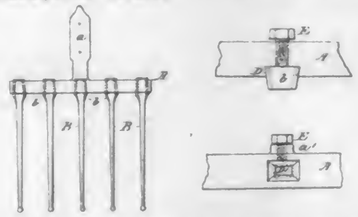


Claim.—1. In a meter, motor, or pump, the combination of a case, a wheel adapted to rotate within the same, and having two sets of buckets, a cylindric shell extending between the two sets of buckets of the wheel, and having an opening through which fluid may pass from the outer set of buckets to the inner set of buckets, and an outlet from that portion of the case which is surrounded by the inner set of buckets, substantially as specified.

2. In a meter, motor, or pump, the combination of a case, a wheel adapted to rotate within the same, and having two sets of buckets, a cylindric shell extending between the two sets of buckets of the wheel, and having an opening through which fluid may pass from the outer set of buckets to the inner set of buckets, and a shell extending into the central part of the case and serving to convey away fluid therefrom, substantially as specified.

3. In a meter, motor, or pump, the combination of a case having a tangential inlet tube or passage communicating with the lower portion, a wheel adapted to rotate within the case, and having two sets of buckets, a cylindric shell extending between the outer set of buckets and the inner set of buckets of the wheel, and having an opening through which fluid may pass from the outer set of buckets to the inner set of buckets, and an outlet from that portion of the case which is surrounded by the inner set of buckets, substantially as specified.

298,231. HORSE-COLLAR. CHAS. A. PETTIS, Brooklyn, N. Y. Filed Nov. 1, 1883. (No model.)

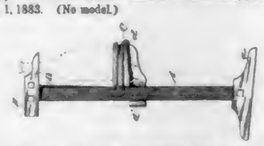


Claim.—1. In a harness-collar, the combination of the hollow pad B, constructed substantially as described, the frame or solid part A, and the hames C, hinged together at the top, and having a fastening, C′, at the bottom, substantially as and for the purposes described.

2. In a harness-collar, the combination of the hollow pad B, constructed substantially as described, and the frame A, hinged together at the top and having a fastening at the bottom, as and for the purposes described.

3. The combination, with the hollow pad B and the frame A and hames C, attached together, of the fastening consisting of the projections C′, the lugs c, and the ring L, substantially as described, and for the purposes set forth.

298,232. FORK. GUSTAV PICKHARDT, Hagen, Westphalia, Germany. Filed May 8, 1883. (No model.)

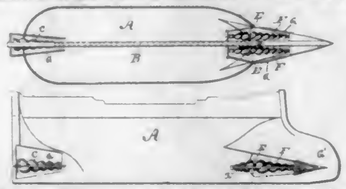


Claim.—1. In a fork, a head, A, having tapering grooves and a corresponding number of bosses, *a'*, in combination with tines having enlarged tapering shanks and set-screws arranged to work in said bosses, as described, for the purposes specified.

2. In a fork, a tine having an enlarged tapering shank, the lateral edges of which are beveled, in combination with a fork-head having dovetailed tapering grooves or slots for the reception of said tine-shank, substantially as shown and described.

3. In a fork, a tine having a tapering enlarged shank, the lateral edges of which are beveled, and a head, A, having a dovetailed groove or slot of the same taper as the tine-shank, in combination with a set-screw, substantially as shown and described.

298,233. BOTTLE-HOLDER. ERNEST R. RICHARDS, Sheboygan, Wis. Filed Dec. 1, 1883. (No model.)

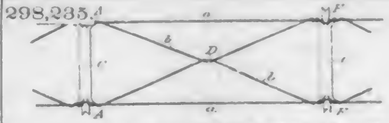


Claim.—1. In a bottle-holder, the standard having the foot and the bifurcated or slotted head-piece, in combination with the spring-actuated receptacle, substantially as and for the purpose set forth.

2. In a bottle-holder, the standard having a longitudinal slot, and the slotted or bifurcated head-piece, in combination with the spring-actuated receptacle or follower, substantially as and for the purpose set forth.

3. In a bottle-holder, the slotted standard having the slotted or bifurcated head-piece, in combination with the receptacle or follower connected to the edgewise-disposed bracket, adapted to have movement in the standard, and the spring connected to said receptacle or follower and the standard, substantially as and for the purpose specified.

4. In a bottle-holder, the slotted standard having the foot and slotted head-piece and disposed in an inclined position, in combination with the spring-actuated follower or receptacle, substantially as and for the purpose stated.



298,234. PROPELLING APPARATUS FOR VESSELS. ALONSO CARDOSO DE LOS RIOS, New Orleans, La. Filed Oct. 13, 1883. (No model.)

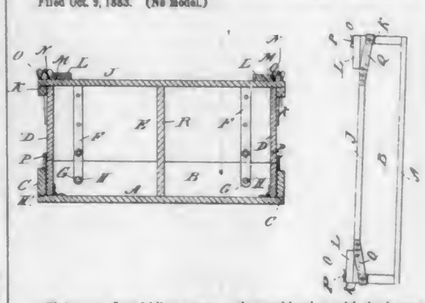
Claim.—The combination of the driving-shaft B, the conical screw-propeller C, arranged with its larger end hindmost and attached to the rear end of said shaft, the two parallel propellers F F, made smaller at the ends than at the center, and having pinions E, and the pinion D, secured to the forward end of the shaft and geared with pinions E, substantially as specified.

298,235. METALLIC FENCE. DAVID A. ROACH, Crawfordsville, assignor of one-half to Lewis N. Roach, Eugene, Ind. Filed Jan. 4, 1883. (No model.)

Claim.—In a metallic fence, the combination of the strands *a a*, the diagonal strands *b b*, crossing each other at intervals in the space

between the strands *a a*, and wrapped about the same at opposite points, and the barbed cross-slat C, secured between strands *a a* and *b b* at their points of contact, as shown and described.

298,236. SEPARABLE BUTTON. HAROLD C. ROBINSON and LOUIS J. LALLEMENT, St. Louis, Mo. Filed Sept. 19, 1883. (No model.)



Claim.—1. In a separable button, the combination of a body having an inner wall formed with an opening and a lip projecting across the opening, a lever hinged to the wall in the same plane as the lip, to turn on the wall, and extending through an opening in the side of the body, and a shank recessed to receive the lip and lever, as set forth.

2. In a separable button, the combination of a body having an inner wall formed with an opening to receive a shank, and a lip to fit a recess in the shank, a lever hinged to the wall extending through the body, to form a handle and to fit a recess in the shank opposite to the lip-recess, and a spring to insert the lever in its recess, as set forth.

3. In a separable button, the combination of a body, A, having an opening to receive a shank, an inner wall, J, having a lip, U, and opening to receive the inner end of the shank, a lever, O, hinged to the wall, having its end projecting through the body, a spring, V, to press the lever inward, and a shank, C, having recesses to fit the lip and lever, as set forth.

298,237. FOLDING EGG-CASE. WILLIAM G. RUGE, Washington, Mo. Filed Oct. 9, 1883. (No model.)

Claim.—1. In a folding egg-case, the combination, with the bottom section, from the ends of which screw-pins project, of hinged ends, removable sides, and a cover having holes for the screw-pins, which hinged ends have screw-pins projecting from their upper edges, substantially as herein shown and described, and for the purpose set forth.

2. In a folding egg-case, the combination, with the bottom A, the side boards, B, and the end boards, C, of the sides E, having hook-bars F, and the studs or pins H on the inner surface of the side boards, B, of the ends D, and the cover J, substantially as herein shown and described, and for the purpose set forth.

3. In a folding egg-case, the combination, with the bottom A, the side boards, B, and the end boards, C, of the screw-pins P, projecting from the end boards, C, removable sides E, having hook-bars F, the studs H, projecting from the inner surface of the side boards, B, the hinged ends D, provided with projecting screw-pins N, the apertured cover J, and the winged nuts O, substantially as herein shown and described, and for the purpose set forth.

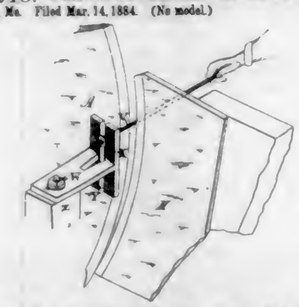
4. The combination, with the box, of the cover J, the cleats K, and the inclined braces Q, secured to the side edges of the cover at the ends, and secured to the ends of the cleats, substantially as herein shown and described, and for the purpose set forth.

298,238. MACHINE-BELT HOLDER. WM. R. SANTLEY, Wellington, Ohio. Filed Oct. 5, 1883. (No model.)

Claim.—1. A machine belt holder consisting of a combination of

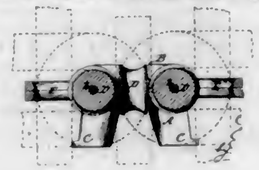
298,238.

the rim A, having a differential peripheral curve, and transversely in the face thereof a series of slots, rollers journaled in said slots in suitable bearings at each end thereof, and so adjusted that the face of the rollers may be above the surface of the rim, and one or more re-enforcing plates or braces within the rim, substantially as herein set forth.



2. In combination with a series of rollers, C, arranged within slots of the rim A, one or more braces or plates secured to the inner face of said rim, substantially as and for the purpose set forth.

298,239. OVERSHOE. EMMETT A. SAUNDERS, Naugatuck, Conn., assignor to Goodyear's Metallic Rubber Shoe Company, same place. Filed Mar. 11, 1884. (No model.)

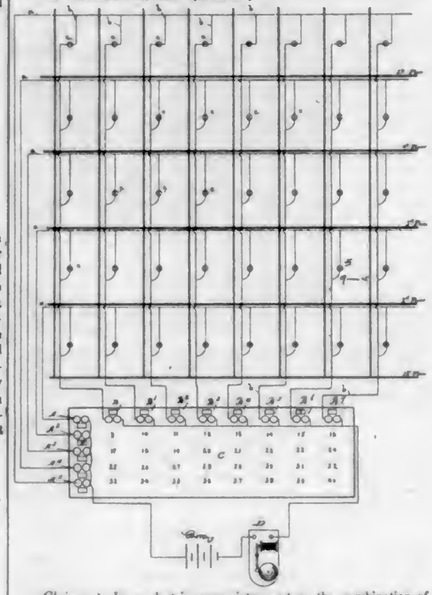


Claim.—In combination with those portions of the shoe which are to be coupled together and held in the proper relative position over the foot of the wearer, a strap-like device, E, projecting from one of said portions, and a spring-tongue fastening device properly secured to the other of said portions, the combination being such, as described, that when the parts shall be coupled together as shown the tongue of the metallic fastening device shall not only engage with one of the perforations of the strap-like device, but shall also operate to hold down the said strap-like device for some distance beyond said perforation, so that in uncoupling the parts of the fastening contrivance the spring-tongue *m* may be elevated or thrown up into a position for ready disengagement from the perforation of the strap-like device by simply taking hold of the protruding end of the latter and pulling it upwardly, as hereinbefore set forth.

298,240. WIRE-CUTTING MACHINE. WINSLOW H. SAVAGE, Bingham, Me. Filed Mar. 14, 1884. (No model.)

Claim.—In a machine for cutting calks, the gage W X, containing slot Y, behind which is a recess sufficient to admit the end of the calk, substantially as described and shown.

298,241. PULLEY BRACKET AND BLOCK. CHAS. SCHNEIDER and CHAS. PFANNE, Washington, D. C. Filed Mar. 19, 1884. (No model.)



Claim.—1. The pulley-bracket herein described, consisting of a bracket and a nest of grooved pulleys arranged therein to form a circular central eye of rolling surfaces for the rope or cord, substantially as herein set forth.

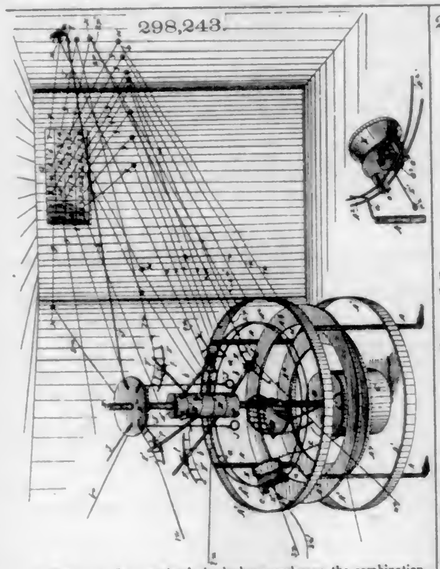
2. A circular pulley-eye formed of a nest of grooved pulleys, combined with a bracket consisting of an attaching base part and a confining cap part, each having open arms arranged at right angles to each other, and grooved to receive the axis-pins of pulleys arranged in the opening of each arm, substantially as shown and described.

3. A pulley-bracket consisting of a bracket and a nest of grooved pulleys arranged therein to form a circular central eye, and a supplemental eye for one or more of the nest of pulleys, substantially as shown and described.

298,242. ELECTRIC ANNUNCIATOR. PAUL SEILER, San Francisco, Cal. Filed Nov. 16, 1883. (No model.)

Claim.—1. In an electric annunciator system, the combination of a floor or section indicator or set of indicators and a set of room-indicators, each of which marks a corresponding room on all the floors or sections, and means for operating any floor or section indicator and any room-indicator together, whereby the floor or section and the room therein will be indicated.

2. In an electric annunciator system, the combination of battery-wires *a a*, &c., and having connection with battery through a set of indicating annunciators, a series of room or division wires connecting corresponding rooms or divisions on the several floors with a separate room-indicating annuciator, and connections in each room for complete circuit from battery-wire to room-wire and return-wires to the battery, as set forth.



3. The combination of the battery-wires *a*, battery D, indicators A, section-wires *b*, indicators B, and a signal-bell, E.

4. In a system for electrically-connecting rooms or stations with a common receiving station or office, the combination of a battery-wire connecting each room on a floor with an indicator, with section-wires connecting corresponding rooms throughout the several floors with a common indicator, and a battery-wire connecting each room with the section-wires, as set forth.

5. An annunciator consisting of a set of floor or section indicators, a series of room-indicators, and the blanks or room-numbers, arranged with relation to the two sets of indicators, as described, in rows from each floor or section indicator and from each room-indicator, crossing each other, so that the number will be indicated at the intersection.

298,243. MECHANICAL TELEPHONE EXCHANGE. GEO. F. SHAVER, Erie, Pa., assignor to the Consolidated Telephone Company, of New Jersey. Filed Nov. 23, 1882. (No model.)

298,243.

Claim.—1. In a mechanical telephone exchange, the combination, with the acoustic lines, of an electric annunciator and branch wires *g*, for affording electric communication between the same, substantially as and for the purposes mentioned.

2. In a mechanical telephone exchange, the ends of the lines *x*, provided with auxiliary or branch lines *x'*, substantially as shown, whereby the operator may keep in acoustic communication with two lines when they are in communication through the office.

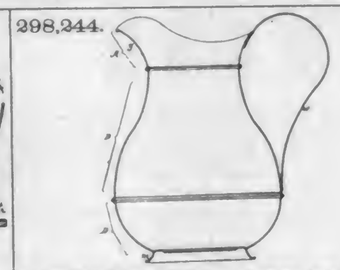
3. In a mechanical telephone exchange, the combination, substantially as shown, of the following elements: acoustic lines converging to an exchange-frame, to which they connect detachably, angle-hangers adjustably arranged in proximity to said frame, and, finally, means, substantially as shown, for connecting said acoustic lines one with another through said angle-hanger.

4. In a mechanical telephone exchange, the combination, substantially as shown, of the following elements: acoustic lines converging to a centrally-located circular exchange-frame, to which they are detachably connected, angle-hangers adjustably arranged upon a centrally-located support, and, finally, means, substantially as shown, for connecting said acoustic lines one with another through said angle-hangers.

5. In a mechanical telephone exchange, the combination, substantially as shown, of the following elements: acoustic lines converging to a frame to which they connect, a telephone-supporting rack arranged substantially as shown with relation to said supported wires, and, finally, a traveling telephone adapted to be supported by said rack and connected with said wires at pleasure, substantially as set forth.

6. In a mechanical telephone exchange, the combination, with the acoustic lines, of a post, B, arms B' *b*, and angle-hangers F, with clips *f*, supported on said arms, substantially as shown.

7. In a mechanical telephone exchange, the combination, with the converging acoustic lines and a telephone-supporting rack, of a telephone, E, having connected therewith a line-stretching device, which bears upon said rack and pushes the telephone away from it, substantially as and for the purposes mentioned.



8. In a mechanical telephone exchange, substantially as shown, an exchange rack or frame with wire-sustaining rail A', telephone-support A^2, and a traveling telephone supported thereon, in combination with the post B, having arms B' *b*, and the adjustable angle-line hangers F, mounted on said arms.

9. In a mechanical telephone exchange, the combination, substantially as shown, of the circular wire-supporting frame, circular telephone-supporting rack, central post, B, with arms supporting angle-hangers, the stand C, and chair D.

298,244. SHEET-METAL JUG. ROBERT SHAW, Philadelphia, Pa. Filed Mar. 10, 1884. (No model.)

Claim.—A sheet-metal jug composed of the seamed and die-formed upper section, A, the seamed and die-formed intermediate section, B, and

298,244.

the lower dished section, D, the several sections being combined and united, all substantially as set forth.

298,245. SPRING-BOARD WAGON. HENRY L. SHERWOOD, North Hoosick, N. Y. Filed Dec. 1, 1883. (No model.)

Claim.—1. A wagon box or seat supporting spring, consisting of an elastic board or bar of wood, a metallic leaf-spring beneath the same, having its ends curved upwardly to receive a rubber cushion and the abutting ends of said wooden board or bar, and provided with ears to secure said spring to the head-block at the front end and the stock of the axle at the rear, as shown and described.

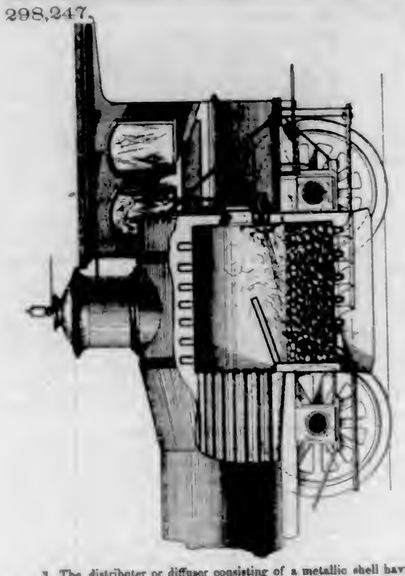
2. A wagon box or seat supporting spring, consisting of a crowned elastic board or bar of wood, a metallic leaf-spring beneath the latter and in surface contact with it, with the ends of said metallic spring curved upwardly and inwardly to receive a rubber cushion and the abutting ends of said board or wooden bar, a slot formed in each end of the latter, and a guide-pin in said slot, with its lower end secured to said metallic spring, and the latter constructed to be attached to the head-block at the front and the stock of the axle at the rear, as shown and described.

3. The combination, in a carriage-spring, of a grooved, crowned, elastic wooden board or bar, provided with a slot at each end, and a metallic leaf-spring beneath and partially or wholly inclosed by said wooden bar, provided with projecting guide-pins to work in the slots in the wooden bar, substantially as shown and described.

4. The combination of a grooved and slotted elastic wooden bar and a metallic leaf-spring having projecting guide-pins, and constructed to be attached to the head-block and stock of the axle, as described.

298,246. HARNESS-PAD. THOMAS A. SIMMONS, Wooster, Ohio, assignor of two-thirds to Wells A. Underwood and Duncan McMillan, both of same place. Filed Nov. 12, 1883. (Model.)

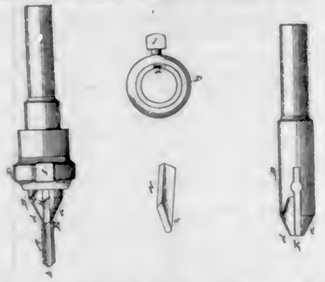
Claim.—1. A metallic coach-pad plate or tree formed with the downwardly-projecting flanges, whose lower edges are curved substantially as shown, to conform to the shape of the horse's back.



2. The combination, with a metallic pad-plate having downwardly-projecting side flanges for giving shape to the saddle, of a pad provided with a metallic or other hard center plate adapted to bridge over the space between the said flanges, as and for the purpose set forth.

298,247. LOCOMOTIVE-FURNACE. BYRON SLOPER, New York, N. Y. Filed Feb. 15, 1884. (No model.)

Claim.—1. A distributer for distributing hot air and steam for the purpose of surface combustion, consisting of a bell-shaped or concavo-convex shell having a perforated diaphragm and an opening through which the steam and air may be injected into the furnace, substantially as specified.



2. The distributer or diffuser consisting of a bell-shaped or concavo-convex shell having a perforated diaphragm and a series of perforations at its lower edge, whereby the induced cold air is heated by an induced current or currents taken directly from the furnace, substantially as and for the purpose specified.

298,247.

3. The distributer or diffuser consisting of a metallic shell having an elongated opening in front and a perforated diaphragm dividing the casing into two chambers, in which the air and heated products of combustion are induced, diffused, and commingled previous to coming into contact with the steam, substantially as and for the purpose specified.

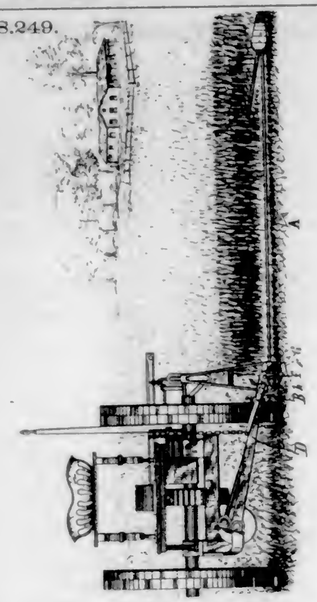
298,248. COMBINED DRILL AND COUNTERSINK. ALBERT J. SMART, Greenfield, Mass., assignor to the Wiley & Russell Manufacturing Company, of Massachusetts. Filed Dec. 31, 1883. (No model.)

Claim.—1. The cutter, the ring or collar, having a depression for the reception of the edge of the cutter, the drill, the stock, and the set-screw, all combined, as and for the purposes described.

2. The combination of the drill, the detachable cutter, the edge of which rests within the groove or fluting of the drill, the ring or collar, the stock, and the set-screw, as and for the purposes described.

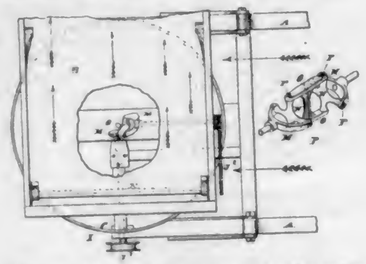
298,249. MOWING-MACHINE. EPHRAIM SMITH, Pittsburg, Pa. Filed Oct. 26, 1883. (No model.)

Claim.—1. In a mowing and reaping machine, the finger-bar formed with a downward middle curvature, substantially as and for the purpose herein specified.



2. A curved finger-bar, in combination with means for sustaining the outer end of the finger-bar from the inner end of the same.

3. A curved finger-bar, A, in combination with a counterbalancing-lever, B, substantially as and for the purpose herein specified.



4. The combination of the coupling-arm, the balance-lever, and the adjustable clamp mounted on the coupling-arm, and provided with the fulcrum-pin C, for the purpose specified.

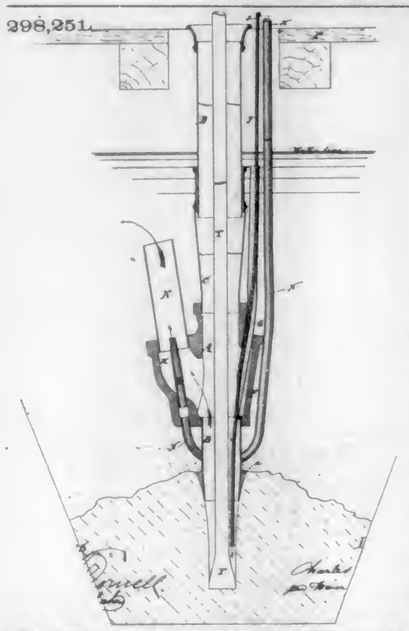
5. The pivot-clamp consisting of the three sides *a* and a separate side, *c*, secured thereto, substantially as specified.

298,249.

298,250. STRAW-STACKER FOR THRASHING-MACHINES. DUDLEY D. SPRAGUE, California, and PEARLEY J. SPRAGUE, Higbee, Mo. Filed Jan. 9, 1884. (No model.)

Claim.—1. In a stacker for thrashing-machines, the combination of a stacker-frame, a carrier-belt shaft on the stacker-frame, an intermediate frame supporting the stacker-frame, driving-shafts, and double universal joint connecting the driving-shafts in the vertical pivotal line of the carrier-frame, as set forth.

2. In combination with a thrashing-machine frame, a stacker-frame, and a laterally-movable carrier-frame supporting the stacker-frame, a carrier-belt shaft on the stacker-frame, two driving-shafts, and a coupling consisting of two tumblers, to which the adjacent ends of the shafts are secured by suitable yokes or arms, and a block connecting the tumblers, substantially as and for the purpose set forth.



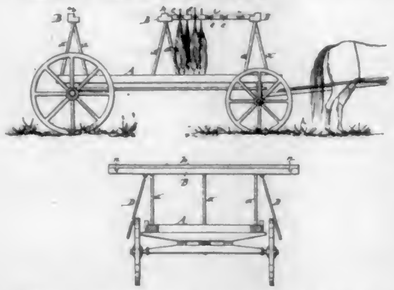
298,251. PIPE-CASING FOR SUBMARINE ROCK-DRILLS. CHAS. A. STERLING, New York, N. Y. Filed Jan. 26, 1882. (No model.)

Claim.—1. In combination with a rock-drill for submarine drilling, the herein-described pipe-casing, in combination with an ejector branch, H K, pipe L N, and movable pipe J, said pipes N and J being connected to suitable force-pumps, or their equivalents, the whole being arranged to operate in the manner and for the purpose substantially as specified.

2. The combination, substantially as hereinbefore set forth, of a rock-drill, tubular inclosing-case, and an independent tube extending longitudinally within said inclosing-case, whereby the fluid under pressure is discharged upon the débris in the neighborhood of the bit of said drill.

3. The combination, substantially as hereinbefore set forth, of a rock-drill, a tubular inclosing-case, an independent tube extending longi-

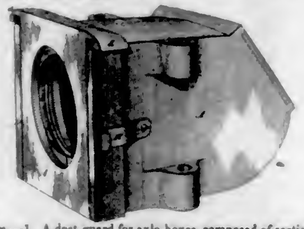
298,251.



tudinally within said inclosing-case and terminating in proximity to the bit of said drill for discharging a stream of fluid under pressure upon the débris surrounding said bit, and a discharge-opening formed in the side of said inclosing-case.

4. The combination, substantially as hereinbefore set forth, of a rock-drill, a cylindrical inclosing-case, and an ejector consisting of a pipe extending from the upper extremity of said inclosing-case and terminating within a discharge-tube leading from the lower portion of said case.

5. The combination, substantially as hereinbefore set forth, of a rock-drill, an inclosing-case consisting of two or more telescoping cylindrical sections surrounding the upper portion of said drill, a tubular extension of less diameter surrounding the lower portion of said drill, an intervening conically-tapering section, and a discharge opening or tube branching from said tapering section.



298,252. TOBACCO-TRANSPORTING RACK. WILLIAM STERNBERG, Cleora, N. Y. Filed Feb. 9, 1884. (No model.)

Claim.—1. The combination, with a wagon-rack, of parallel horizontal skids carried elevated and transversely on the rack and projecting over the sides thereof, longitudinal guides on the skids, locking devices on the ends of the skids, for retaining one of the tobacco-carrying bars, and bars adapted to ride on the skids and provided with fastening devices for attaching thereto the tobacco-plants, substantially as described and shown.

2. In combination with the wagon and tobacco-rack mounted thereon, the apron D, suspended from the rack and hanging over the outside of the wheels, substantially in the manner specified and shown.

298,253. CAR-AXLE BOX. DAVID S. STIMSON, Concord, N. H. Filed Oct. 13, 1883. (No model.)

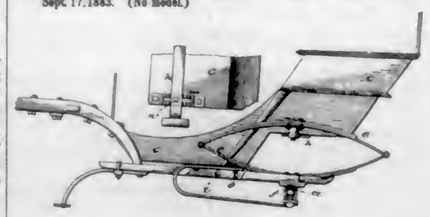
Claim.—1. A dust-guard for axle-boxes, composed of sections separable in a horizontal direction, the inner ends of which are provided with semicircular or concave recesses adapted to fit around the axle, and the vertical outer ends with flanges adapted to shut over slots in the sides of the axle-box when the dust-guard is in position, substantially as set forth.

2. A dust-guard for axle-boxes, composed of sections separable in a horizontal direction, the inner ends of which are provided with semicircular or concave recesses adapted to fit around the axle, and the vertical outer ends with flanges adapted to shut over slots in the sides of the axle-box, said flanges having suitable packing, substantially as set forth.

3. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, a dust-guard composed of sections separable in a horizontal direction and adapted for insertion and removal through said side slots, said sections being provided with flanges at their outer ends, adapted to shut over said side slots, and means for retaining said dust-guard in position in the axle-box.

4. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, a dust-guard composed of sections separable in a horizontal direction and adapted for insertion and removal through said side slots, said sections being provided with packed flanges at their outer ends, adapted to shut over said side slots, and means for retaining said dust-guard in position in the axle-box.

5. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, a dust-guard composed of sections separable in a horizontal direction, and provided with flanges at their outer ends, adapted to shut over said side slots, and spring fastening devices at the sides of said axle-box for holding said dust-guard in place.



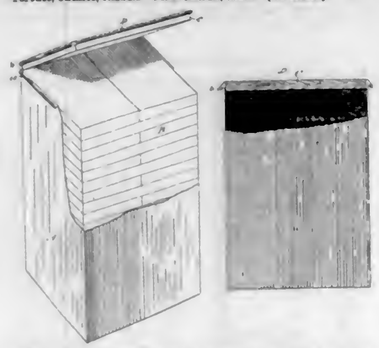
6. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, a dust-guard composed of sections separable in a horizontal direction and adapted for insertion and removal through said side slots, said sections being provided with packed flanges at their outer ends, adapted to shut over said side slots, and spring fastening devices at the sides of said axle-box for holding said dust-guard in position.

7. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, and with laterally-projecting lips above said slots, and a sectional dust-guard having flanges adapted to shut over said slots and under said lips.

8. The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, and with laterally-projecting lips above said slots, and a sectional dust-guard having flanges adapted to shut over said slots and under said lips, said lips being recessed to receive the upper ends of said flanges.

9 The combination, substantially as set forth, of an axle-box provided with slots in its vertical sides opening into the dust-guard chamber, and with laterally-projecting lips above said slots, a sectional dust-guard having flanges adapted to shut over said slots and under said lips, and fastening devices at the sides of the box for holding said dust-guard in place.

298,254. ROAD-CART. CLARENCE H. STRAIGHT, Bryan, Ohio. Filed Sept. 17, 1883. (No model.)



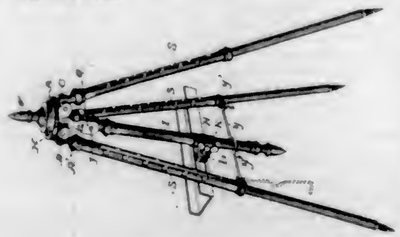
Claim.—1. In a road-cart, the combination, with the clips having recesses for the elliptical springs, the axle, and spring-braces, of the axle, elliptical springs, braces, and side bars, substantially as specified.

2. In a road-cart, the combination, with the body having the recessed body-sills covered with slotted corrugated plates carrying nut-bolts, of the cone-oval shaped body-supports, having holes for the passage of the bolts, and a rounded upper face to fit the corrugations in the plates, substantially as specified.

3. In a road-cart, the combination, with the axle, side bars, and body of the vehicle, of the clips *f*, constructed as described, the elliptic springs, U-form springs *i*, and the side braces, *g*, all constructed and adapted to operate substantially as specified.

298,255. SHEET-METAL TOBACCO-CADDY. EDMUND H. STRIKER Toronto, Ontario, Canada. Filed Jan. 15, 1884. (No model.)

Claim.—1. A sheet-metal caddy or case, A, provided with retaining-lips *a*, formed outwardly at its mouth, in combination with the sheet-metal cover D, having flanges *b*, with upwardly-turned lips on the lower edge of each flange, substantially as and for the purpose specified.



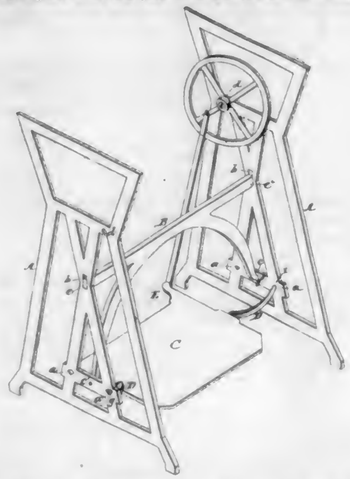
2. A sheet-metal cover, D, having flanges *b*, with upwardly-turned lips on the lower edge of each flange, a wooden block, C, applied as specified, in combination with a caddy or case, A, having retaining-lips *a*, formed outwardly at its mouth, substantially as and for the purpose specified.

298,256. PROCESS OF OBTAINING SODA. JOSEPH TOWNSEND, Glasgow, County of Lanark, Scotland. Filed Sept. 5, 1882. (No specimens.) Patented in England Apr. 30, 1879, No. 1,703, and in Germany Oct. 18, 1879, No. 10,541.

Claim.—1. The process described of treating kainit, consisting in mixing the substance with silica or silica and alumina, heating the mixture, passing air or steam through or over it, whereby chlorine or hydrochloric acid is evolved, reducing the sulphates in the residue to sulphides, and treating the sulphides with carbonic acid to form carbonates of soda and potash, substantially as set forth.

2. The process described of treating kainit, said process consisting in mixing the substance with silica or silica and alumina, then heating the mixture and passing steam or air through or over it, then mixing carbonaceous material with the residue, heating this to convert the sulphates into sulphides, lixiviating the sulphides, and finally treating this solution with carbonic acid to form carbonates, all substantially as set forth.

298,257. EASEL. THOMAS C. VAIL, Topeka, Kans. Filed Feb. 16, 1884. (No model.)



298,257.

Claim.—1. An easel provided with telescopic legs that are all adapted to be adjusted and secured at any desired point, and which are further provided with detachable reversible points at the lower end, said points having one end sharpened and the opposite end rounded, as substantially shown and described.

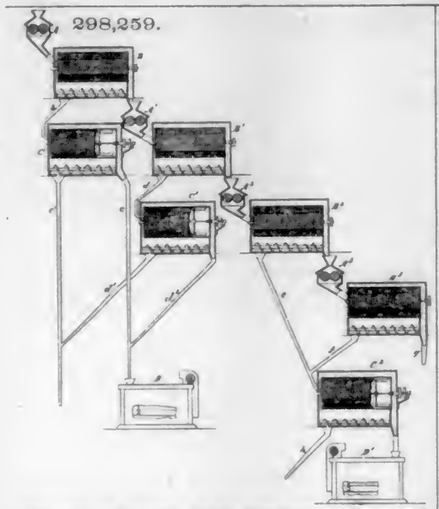
2. The combination of the cap A, telescopic legs S, depending link G, rod I, pivoted thereto, clamp K, adjustable vertically on said rod, shelf O, adjustable laterally on said clamp, and wire Y, having a bend, Y^3, said wire being adapted to secure the lower ends of two of the legs in position, all combined and arranged to operate substantially as shown and described.

298,258. TREADLE AND STAND FOR SEWING-MACHINES. FRANCIS MARION WEAVER, Springfield, Ohio, assignor of one-half to William Augustus Hance, same place. Filed Mar. 20, 1884. (No model.)

Claim.—1. The combination, with the stand-frames having bearing-openings *a a* and a suitable brace for said frame, of the treadle having bearing-arms adapted to fit and work directly in the stand-bearing openings, substantially as described.

2. The combination, with the stand-frames having bearing-openings *a a* and openings *b b*, the latter having inclines *c'*, and a treadle having bearing-arms adapted to fit and work directly in the stand-bearing openings, of a cross-brace having hook-shouldered ends *e e³*, adapted to fit the inclines of said openings *b b*, and perforated ends *f f*, bolted to the said stand-frames, substantially as described.

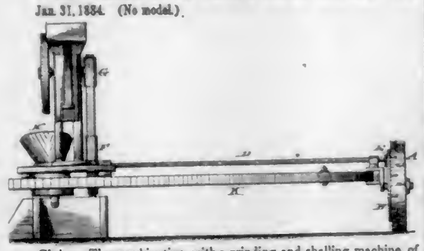
3. The stand-frames A A, having the V-shaped bearing-openings *a a*, the openings *b b*, having inclines *c'*, and the openings *c d*, arranged substantially as shown and described, combined with a treadle having bearing-arms terminating in shouldered knife-edge bearings *g i*, and a cross-brace, B, having shouldered hook ends *e e³* and perforated ends *f f*, all constructed substantially as set forth.



4. The treadle having the bearing-arms D D, and the pitman-rod connection E, formed integrally, in combination with stand-frames having bearing-openings adapted to receive the bearing ends of said arms, and means, as described, for securing and bracing said stand-frame to confine the treadle in its bearings, substantially as herein set forth.

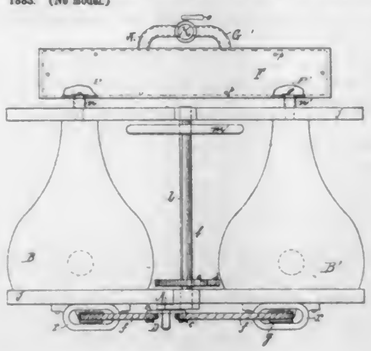
5. The combination of a treadle having bearing-arms, arranged as described, with the stand-frames A A, each having two bearing-openings, *a a*, arranged on the same horizontal plane and in coincident lines with each other, and an opening, *d*, at one side, not opposite but on the same horizontal plane, and a suitable cross-brace, substantially as herein set forth, for the purpose specified.

298,259. ART OF MANUFACTURING FLOUR. JOHN R. WHEATLEY, Detroit, Mich., assignor of one-half to August Heine, Silver Creek, N. Y. Filed July 3, 1883. (No model.)



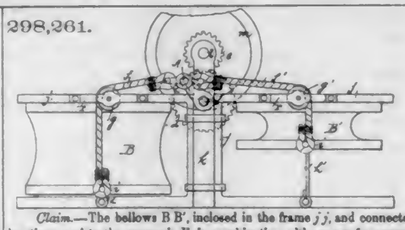
Claim.—The herein-described improvement in the art of manufacturing flour by the gradual reduction of grain, which consists in reducing the grain by successive breaks, separating the products of each reduction into flour and coarse fragments by bolting or sifting, separating the flour

298,259.



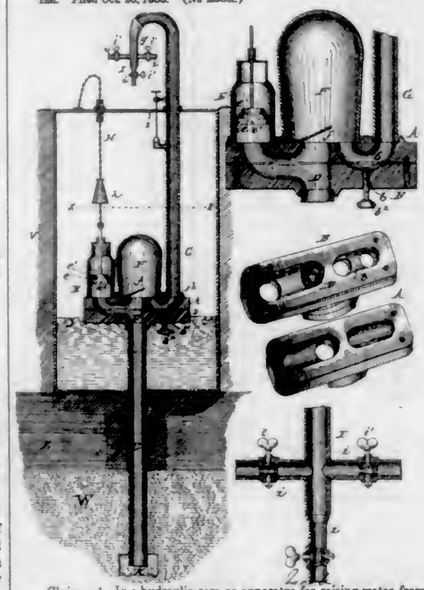
derived from each separation from the accompanying impurities and grits by beating and sifting, and purifying the tailings of this separation by sifting and air-currents, substantially as set forth.

298,260. SHELLING AND GRINDING MACHINE. EDWARD M. WILCOX, Whitewater, Wis., and WILLIAM E. BOTSFORD, Omaha, Nebr. Filed Jan. 31, 1884. (No model.)



Claim.—The combination, with a grinding and shelling machine, of the sweep K, having the drive-wheel A, provided with a spur-gear, B, and the shaft D, journaled upon said sweep, provided at its outer end with a pinion to mesh with the spur-gear, and at its inner end with a pulley to operate a belt connecting with the pulley G to operate the machine, substantially as specified.

298,261. BELLOWS. JOHN S. WILLIAMS, Chicago, Ill. Filed Aug. 4, 1883. (No model.)



298,261.

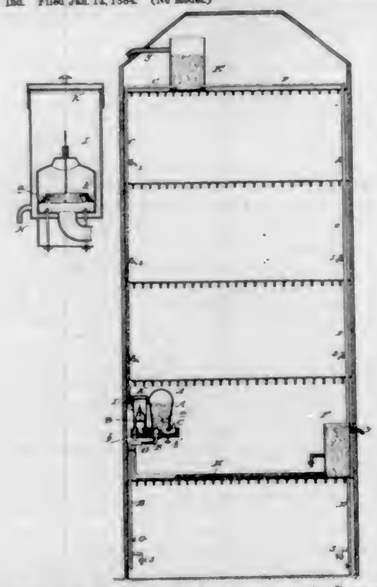
Claim.—The bellows B B', inclosed in the frame *j j*, and connected by pipes *n n'* to the reservoir F, in combination with means for operating the bellows, said means consisting of the elastic strips A A', cords *f f'*, pulleys *g g'*, link *c*, and crank A, all arranged and operating substantially as shown and described.

298,262. HYDRAULIC RAM. JACOB BLOOM YEAGLEY, Indianapolis, Ind. Filed Oct. 20, 1883. (No model.)

Claim.—1. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination, with an influx fountain-pipe, C, of the two-part castings A B, having a pipe, D, groove *b*, efflux valved chamber E, and valved air-chamber F, said parts adapted to connect two water-bearing strata of different hydrostatic levels, substantially as and for the purposes herein shown and described.

2. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination, with an influx fountain-pipe, C, of the parts A and B, having a pipe, D, the efflux valved chamber E, valved air-chamber F, and supply-pipe G, adapted to communicate with air-chamber, and all arranged to connect two water-bearing strata of different hydrostatic levels, substantially as and for the purposes herein shown and described.

3. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination, with an efflux-chamber, E, an air-chamber adapted to connect pipes C D, and the supply-pipe G, of the parts A and B, provided with groove *b*, opening *b'*, and plug or stop-cock attachment *b²*, substantially as and for the purposes herein shown and described.



4. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination, with a valved air-chamber and influx and efflux pipes, of the efflux-chamber E, having an inverted saucer-shaped valve, *e*, having the two series of openings *e e²*, substantially as and for the purposes herein shown and described.

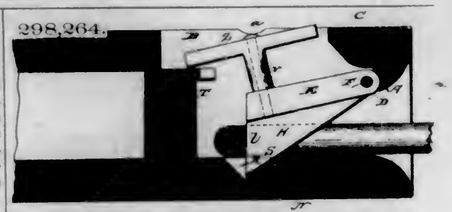
5. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination, with a valved air-chamber and influx and efflux pipes, of the efflux-chamber E, having a valve, *e*, and connecting rope or chain H, having a weight, A, substantially as and for the purposes herein shown and described.

6. In a hydraulic ram or apparatus for raising water from wells having water-bearing strata of different hydrostatic levels, the combination of an influx fountain-pipe, an efflux fountain-pipe, said two pipes adapted to connect two (2) water-bearing strata of different hydrostatic levels, intermediate valved air-chamber, efflux valved chamber, supply-pipe, and drainer 2 2, and a water-distributer having a series of pipes controlled by stop-cocks, substantially as and for the purposes herein shown and described.

7. The combination of an Artesian-fountain pipe, an efflux fountain-pipe with an efflux valved chamber, intermediate valved air-chamber adapted to connect efflux fountain-pipe and Artesian-fountain pipe, and the supply-pipe G and parts A and B, provided with groove *b* and plug or stop-cock attachment *b²*, substantially as and for the purposes herein specified.

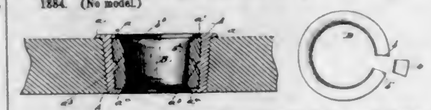
298,263. HYDRAULIC RAM. JACOB BLOOM YEAGLEY, Indianapolis, Ind. Filed Jan. 12, 1884. (No model.)

Claim.—1. The combination of the water-works pipe B, supply-pipe C, tank E, supply D, tank F, waste-water receiver I, pipe H, and apparatus A, consisting of the efflux-cylinder *i*, valved air-chamber A', and connecting cross-pipe *b*, substantially as and for the purpose herein shown and described.



2. The combination of the water-works supply-pipe B with main connection, supply-pipe C, apparatus A, consisting of the efflux valved cylinder *i*, valved air-chamber A', and connecting cross-pipe *b*, the waste-water receiver I, pipe H, and tank F, substantially as and for the purpose herein shown and described.

3. The combination of the water-works supply-pipe B with main connection, supply-pipe C, intermediate apparatus, A, consisting of the efflux valved cylinder *i*, valved air-chamber A', cross-pipe *b*, and waste-water receiver I, having double perforated top K, with alternating openings, substantially as and for the purpose herein shown and described.

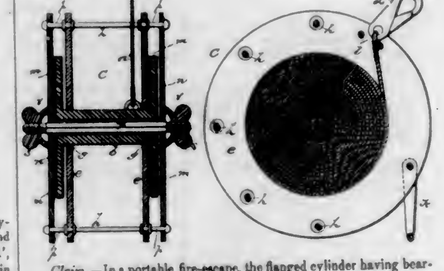


4. The combination of the water-works supply-pipe B, communicating with main pipe apparatus A, constructed substantially as described, supply-pipe C, tank E, supply-pipe D, tank F, and supply-pipe D', substantially as and for the purpose herein shown and described.

298,264. CAR-COUPLING. SAMUEL R. ZIMMERMAN, Hudson, Mich. Filed Mar. 13, 1884. (No model.)

Claim.—In a car-coupling, the draw-head having the elongated aperture B in its top and slot or recess in its bottom, the broad drop-catch plate pivoted to the draw-bar by a transverse pivot-pin, and having an under-catch projection, H, and a pivoted handle, Z, of proper length to engage the aperture B by the ends when turned transversely, and to pass down through said aperture when turned lengthwise, substantially as specified.

298,265. BUNG. ANTON G. ANDERSON, Chicago, Ill. Filed Jan. 11, 1884. (No model.)



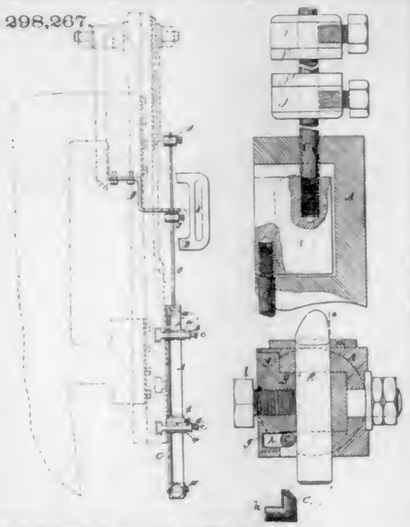
Claim.—1. In a bung-bushing, the combination of the metallic bushing A, provided with flanges *a a' a³*, and a ridge, *a²*, with a lining formed of wood, or compressed wood, paper-pulp, or other suitable material, having an external groove surrounding said lining, and means, substantially as described, whereby said lining may be inserted into the bushing, as set forth.

2. In a bung-bushing, the split lining B, having the groove *b²*, in combination with a wedge, *b*, and the metallic bushing A, having ridge *a²*, substantially as described.

298,266. FIRE-ESCAPE. CHARLES BINGLEY ANDERSON, Maysville, Ky. Filed Apr. 23, 1883. (No model.)

Brief.—By turning the nuts upon the ends of the rod the disk-rubbers are pressed against the flanges of the rope-cylinder, preventing its too rapid turning.

Claim.—In a portable fire-escape, the flanged cylinder having bearings in parallel case-disks, which are rigidly connected, the sliding disk-rubbers connected to the case-disks, and having the central right and left threaded brake-rod, and the manipulating nuts engaging the brake-rod, and operating to press the disk-rubbers against the flanges of the cylinder, substantially as specified.



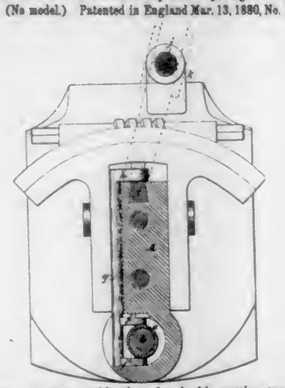
298,267. TOOL-OSCILLATING DEVICE FOR SLOTTING-MACHINES. JOSEPH ANGUS, South Lambeth, County of Surrey, England. Filed Oct. 1, 1881. (No model.) Patented in England Mar. 13, 1880, No. 1,091.

Claim.—1. In a slotting-machine, the combination of a vertically-reciprocating tool-bar adjustable on a vertical axis, a tool-holder mounted in the tool-bar and rocking on an axis at right angles to the axis of the tool-bar, and a double-cutting tool mounted in the tool-holder, whereby the tool may be made to cut in a direction parallel with the axis of the tool-bar and through any degree of the circle around the said tool-bar.

2. In a slotting-machine, the combination of a tool-bar adjustable on its axis, a tool-holder having a rocking movement in the tool-bar, a tool-reversing rod mounted on the tool-bar, and a stationary tappet-bracket, substantially as and for the purpose herein specified.

3. The combination, in a slotting-machine, of the tool-bar A, mounted in bearings on the ram, the rocking tool-holder B, mounted in the said bar, the tappet-rod C, made in two parts and connected by the block *i*, the tappets on said rod, and the fixed tappet-bracket, all ar-

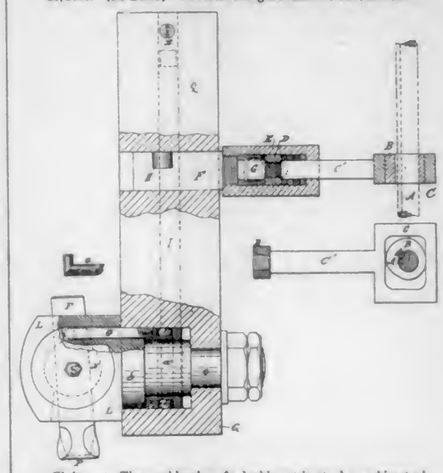
298,267.



ranged to operate substantially as set forth.

4. The combination, with the ram of a slotting-machine, of the tool-bar A, the rocking tool-holder B, the tappet-bar C, its lower end provided with a hook or projection to engage the tool-holder, and arranged to play in a groove in the tool-bar, and its upper part provided with tappets, and coupled to the lower part in the axis of the tool-bar by means of the block *i*, and the fixed tappet-bracket D, all arranged to operate substantially as set forth.

5. The combination, with the ram of a slotting-machine, of a cylindrical tool-bar bearing a cylindrical tool-holder, gripping-blocks, and a sustaining-ring, substantially as herein specified



298,268. TOOL-OSCILLATING DEVICE FOR SHAPING-MACHINES. JOSEPH ANGUS, South Lambeth, County of Surrey, England. Filed Oct. 3, 1881. (No model.) Patented in England Mar. 13, 1880, No. 1,091.

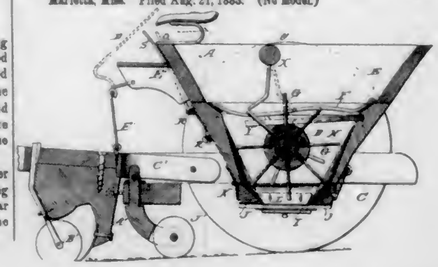
Claim.—1. The combination of a double-cutting tool, a rocking tool-holder, in which the tool is mounted, the reciprocating tappet-rod *j*, adapted to rock on its axis, a stationary tappet-bracket, a rod, *l*, adapted to slide in a socket on the tappet-rod, and the mechanism connecting the said rod *l* with the tool-holder, whereby the tool-holder is rocked and the tool reversed at the termination of each forward and return stroke of the machine irrespective of the various adjustments of the machine connected with the tool.

2. The combination of the double-cutting tool D, rocking tool-holder C, tool-holder socket B, sliding collar *a*, connecting-rod *f*, oscillating shaft *g*, provided with the arms *j'* and *h*, slide *i*, sliding and rocking bar *j*, rod *l*, tappet-rod *m*, and tappet-bracket *o*, substantially as and for the purpose herein specified.

298,269. TOOL-OSCILLATING DEVICE FOR PLANING-MACHINES. JOSEPH ANGUS, South Lambeth, County of Surrey, England. Filed Nov. 26, 1880. (No model.) Patented in England Mar. 13, 1880, No. 1,091.

Claim.—1. The combination of a double-cutting tool, a rocking tool-holder, and a tool-holder socket, the socket being adjustable in a vertical plane on a horizontal axis, and the tool-holder and tool rocking in the socket on an axis at right angles to the axis of the socket, whereby the tool may be set to cut the work at any angle.

2. The combination of a tool-bar, a tool-holder socket mounted in the tool-bar and adjustable therein to any position on its axis, a tool-holder rocking on its axis in the socket, a double-cutting tool mounted in the tool-holder and rocking therewith, and the means, substantially as herein described, for automatically rocking the tool-holder and reversing the tool, for the purpose herein specified.



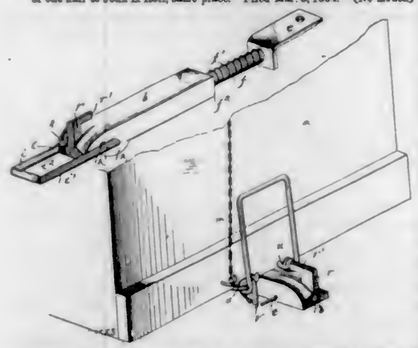
3. The combination of a tool-bar adjustable in a vertical plane on a horizontal axis, a tool-holder socket adjustable on its axis in the tool-bar, a tool-holder rocking on its axis in the socket, and a double-cutting tool mounted in the tool-holder, for the purpose herein specified.

4. The combination of a tool-bar adjustable in a vertical plane on a horizontal axis, and longitudinally in the same plane, a tool-holder socket adjustable on its axis in the tool-bar, a tool-holder rocking on its axis in the socket, a double-cutting tool mounted in the tool-holder and rocking therewith, and the means, substantially as herein described, for automatically rocking the tool-holder and reversing the tool irrespective of the adjustments of the tool-bar and tool-holder socket.

5. The combination, with the tool-bar Q, of the socket-piece L, mounted rotatively therein, the tool-holder N, rocking in the socket-piece, the axis of the two crossing at right angles, the tool P, arranged to fit a transverse aperture in the tool-holder, and its ends to play in circumscribed slots or openings in the socket-pieces, the hook-rod O, collar K, operating-rod I, provided with arms J J H, and the slide F, arranged to be automatically reciprocated, substantially as set forth.

6. The combination, with the tool-bar Q, of the socket-piece adjustable on its axis, the tool-holder N, rocking in said socket-piece, the hook-rod O, sliding collar K, operating-rod I, slide F, relief-spindle A, cam B, strap C, and stem C', connected with the slide F by means of a yielding coupling, substantially as and for the purposes set forth.

298,270. FERTILIZER-DISTRIBUTER. BENJAMIN FRANKLIN ARCHER, Marietta, Miss. Filed Aug. 21, 1883. (No model.)



Claim.—1. The combination of the axle carrying the distributing toothed roller, the hopper having an upper compartment with walls converging toward the said roller, and a lower compartment with hinged bottom and walls converging toward the line of the furrow, the hinged grating forming the bottom of the upper compartment, the spring-scraper, and the inner and outer gage-plates in the outlet-slot, substantially as shown and described.

2. The combination of the hounds C', the opening-plow A', and cutter B', secured to said hounds, the lever D', the rod F', connecting the lever to the hounds, and the catch G', for holding the lever, substantially as shown and described, whereby the tongue and hounds may be adjusted and held in a position to support the plow and cutter at an elevation, to regulate the depth of furrow, as specified.

3. The hopper having the lower compartment, H, provided with converging side and end walls, and the hinged bottom J, formed in one piece, and adapted to be opened downward, and having a slot, I, and plates L M, substantially as shown and described.

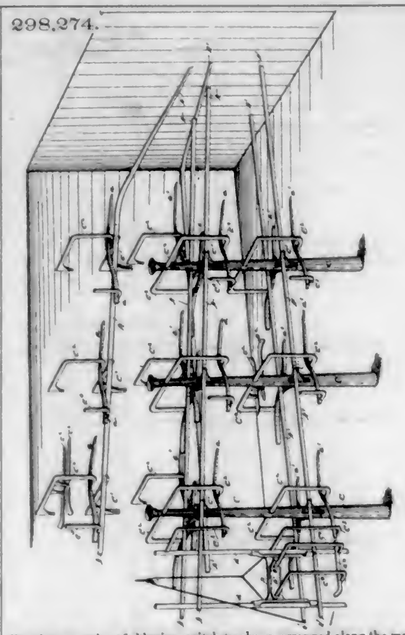
298,271. WITHDRAWN.

298,272. CAR-COUPLING. EDWIN M. BATES, Springfield, Ill., assignor of one-half to John E. Roll, same place. Filed Mar. 3, 1884. (No model.)

Claim.—1. In a car-coupling, the combination, with the coupling-head supported in guides, and having a spring and stop mechanism, of the pivoted coupling-link, provided on one of its arms with a sector-shaped projection, the hook pivoted thereto, and the main and auxiliary chains for setting and coupling the link, substantially as specified.

2. In a car-coupling, the combination, with the coupling-head having the vertical hook at its forward end, of the pivoted coupling-link having the sector-shaped projection and the pivoted hook, and the main chain, the auxiliary chains, and pulleys, substantially as specified.

298,273. ATTACHMENT FOR BOTTLE-STOPPERS. CHARLES H. BENNETT, Cheltenham, assignor of one-fourth to Jacob B. Rohrer, Lancaster, Pa. Filed Jan. 19, 1884. (No model.)



Claim.—1. In a bottle-stopple fastener, the combination of a stopple having a lug, a revolving key passing through said lug and bent over the center of the stopple to form a retaining device, a saddle having lugs for the key, and means, substantially as described, in the key for adjusting and holding the latter in place, substantially as described.

2. The combination of stopple A, having top B, with a recess, *b*, and lug-opening *b'*, the key F, having curved or bent end *f* and adjusting mechanism, and saddle E, with bearings *e e'*, substantially as shown and described.

298,274. CONVEYER APPARATUS. GEORGE C. BLICKENSDERFER and HERVEY SMITH, Erie, Pa. Filed Mar. 17, 1884. (No model.)

Claim.—1. In a conveyer apparatus substantially as shown, the combination, with a series of main supports, C, of main tracks A A', formed of series of bars supported on brackets and graded in opposite

directions, a series of shipping switch-tracks, *a*, arranged along the main track A, and a series of receiving switch-tracks, *a'*, arranged along the main track A', which switch-tracks are formed of bars and are supported on brackets independently of said main tracks, as shown.

2. In a conveyer apparatus substantially as shown, the combination of main lines formed of bars supported on brackets, and switch-tracks formed of properly-carved bars supported independently of the main tracks on brackets, substantially as shown.

3. In a conveyer apparatus substantially as shown, the combination, with a series of main supports, C, of a main track, branch tracks, and transfer switch-track, all formed of bars supported from said main supports, substantially as and for the purposes set forth.

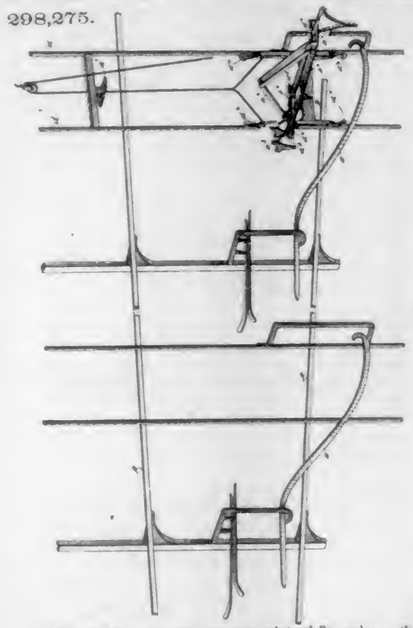
4. In a conveyer apparatus substantially as shown, the combination, with a main and a branch or intersecting track, of a transfer switch-track formed of a curved bar pointed at each end, as shown, and for the purposes set forth.

5. In a conveyer apparatus substantially as shown, the combination, with two parallel tracks, A' A', and the guides c^3 c^3, of the guide-supports c^3 c^4 c^5, sustained by said tracks, as shown.

298,275. CONVEYER APPARATUS. GEORGE C. BLICKENSDERFER and HERVEY SMITH, Erie, Pa. Filed Mar. 18, 1884. (No model.)

Claim.—1. In a conveyer apparatus substantially as shown, a car having a running-gear for use on the main or direct track, and a hook by which it can be caught by the switching devices, substantially as shown.

2. In a conveyer apparatus substantially as shown, the combination, with the main or direct track and a car having a running-gear for use upon said track and a hook thereon, of a switching device consisting of devices, substantially as shown, for engaging with said hook and conveying the car from said main track thereby.



3. In a conveyer apparatus substantially as shown, a car having a running-gear for use on the main or direct track, which is adapted, substantially as shown, to be tripped, and a hook by which the car can be caught and sustained when said running-gear is tripped, substantially as shown, and for the purposes mentioned.

4. In a conveyer apparatus substantially as shown, the combination, with the main track, of a switch-track, which is set at a sufficiently precipitous angle thereto, as shown, to serve as a slideway for the cars when caught thereon by a hook, as shown and described.

5. In a conveyer apparatus, the combination, with a precipitously-inclined track, of a car having thereon a brake, which is held against the track by the plumb position of the car, as shown.

6. In a car for a conveyer apparatus substantially as shown, the combination of the body C, standard C^2, wheels C^3, and hook C^4, substantially as and for the purposes mentioned.

298,275.

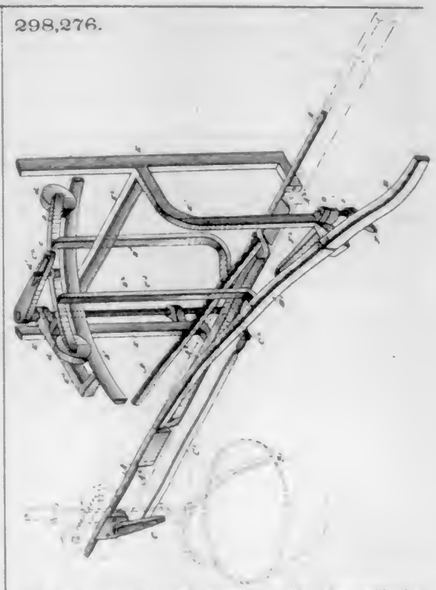
7. In a car for a conveyer apparatus substantially as shown, the combination of the body C, standard C', wheels C², hook C³, and shoe C⁴, substantially as and for the purposes mentioned.

8. In a conveyer-car substantially as shown, the combination of the body C, standard C', wheels C², hook C³, and brake C⁵, substantially as and for the purposes mentioned.

9. In a conveyer-car substantially as shown, the combination of the body C, standard C', wheels C², block c', toggle c^4, pivoted hook C³, lug c^5, and spring c^6, substantially as and for the purposes set forth.

10. In a conveyer-car substantially as shown, the combination, with the body C, of the pivoted bail E, with catches e', and the ears E', with the notches s, substantially as and for the purposes mentioned.

11. In a conveyer-car substantially as shown, a body, C, formed of wicker-work, and having an oval form, with rounded bottom and ends, as shown and described, and for the purposes mentioned.



12. In a conveyer-car, the combination of the body C, standard C', wheels C², hook C³, and rollers C⁴ C⁴, as shown, and for the purposes named.

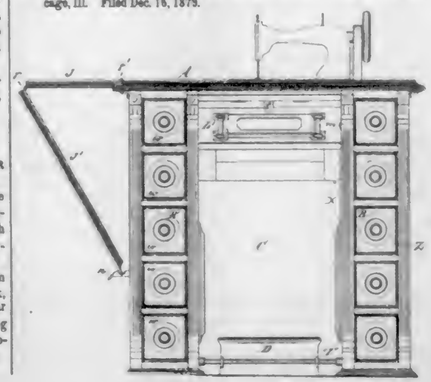
13. In a conveyer apparatus substantially as shown, the combination of the guide-posts d d, elevator-frame D, and friction-rollers d^3 d^3 d^3 d^3, placed at the corners of said frame, substantially as and for the purposes mentioned.

14. In a conveyer apparatus, a car loading or shipping apparatus consisting of the combination of an elevator-frame, a platform on said frame, a slide on said platform, horns for holding the car on said slide, a lever for moving said slide forward, an inclined surface for raising up and letting down the forward end of said slide as it is moved forward, and a spring for moving said slide backward, substantially as shown.

15. In the car elevating and shipping device of a conveyer apparatus, the combination of the posts d d, frame D, platform D', slide D², toggle D⁴, and the plate d', substantially as shown.

298,276.

3. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated track with an offset or notch and a swinging section in said notch, a swinging-switch track, an arc-track, a sliding hanger mounted on said arc-track, and supporting said swinging-switch and main-track section, gearing, substantially as shown, for moving said sliding hanger from the levers C and F, and a pendent car with means, substantially as shown, for moving said levers C and F as it passes them.



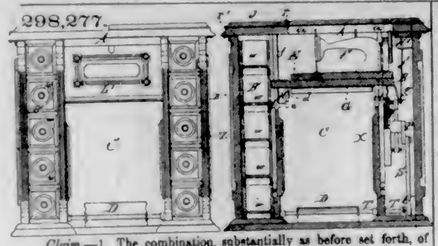
4. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated main track, a pendent car, and a swinging switch which is actuated from the movement of the car.

5. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated main track, a pendent car, and a swinging switch and swing section of main track which are actuated from the movement of the car.

6. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated main track having a swinging section, a swinging switch lying opposite said swing-track section, and means, substantially as shown, for moving said two swing parts simultaneously from the action of the passing car.

7. In a conveyer apparatus substantially as shown, the combination, with a taut-wire main track, of the deflecting-iron A², the swinging-track section A', and the swinging switch B'.

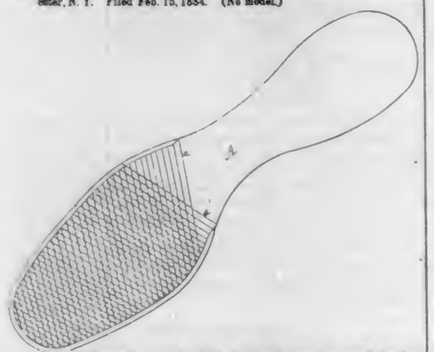
298,277. CABINET FOR SEWING-MACHINES. JAMES BOLTON, Chicago, Ill. Filed Dec. 16, 1879.



298,276. CONVEYER APPARATUS. GEORGE C. BUCKENDORFER and HERVEY SMITH, Erie, Pa. Filed Mar. 22, 1884. (No model.)

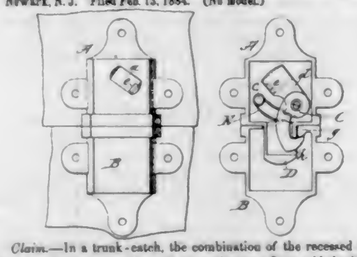
Claim.—1. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated track, a swinging-switch track, a pendent car, and gearing for swinging said switch, which is actuated by coming in contact with the said car as it passes, substantially as shown.

2. In a conveyer apparatus substantially as shown, the combination of the following elements: an elevated track, a swinging-switch track, the arc-track D', the slide or car D, a hanger connecting said slide or car with the swinging switch, gearing, substantially as shown, for moving said slide from the levers C and F, and a pendent car having means, substantially as shown, for moving said levers C and F as it passes them.



298,277.

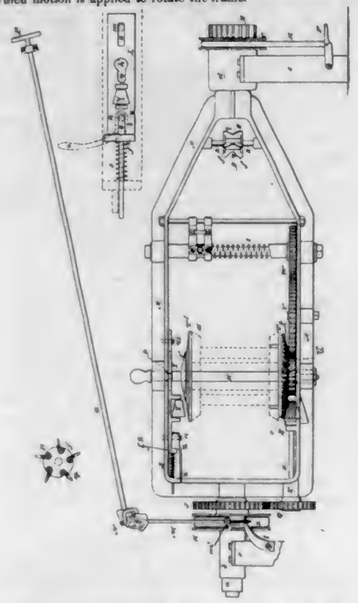
Claim.—1. The combination, substantially as before set forth, of the perforated top, the movable platform, the grooved guides for the slides, the trunks having openings in their sides for the ends of the platform, and the slides constructed of the required breadth to close the said openings and form panels therefor.



2. The combination, substantially as before set forth, of the perforated top, the articulated folding extension-cover, and the lugs for supporting the edge of the extension-cover when opened.

298,278. INSOLE FOR BOOTS OR SHOES. THOMAS BOLTON, Rochester, N. Y. Filed Feb. 15, 1884. (No model.)

Claim.—As an improved article of manufacture, an insole having one face provided with two series of cross incisions or slits crossing each other in a diagonal direction, extending but part way through, and producing a scarified surface, the opposite face of the insole being uncut, as herein shown and described



298,279. TRUNK OR BOX FASTENER. EDWARD W. BRETTELL, Newark, N. J. Filed Feb. 13, 1884. (No model.)

Claim.—In a trunk-catch, the combination of the recessed casing A, having a slot, a, pivots b c, and recessed tongue D, provided with side opening, h, the hook or lever C, pivoted in said casing and having an arm, d, provided with thumb-piece e, the spring E, and the keeper B, having opening f and catch g, substantially as described.

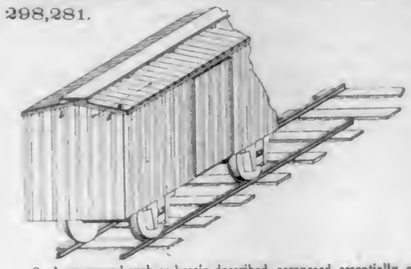
298,280. TWISTER AND SPOOLER FOR THE MANUFACTURE OF WIRE FENCING, &c. ORLANDO P. BRIGGS, Chicago, Ill., assignor to the Thorn Wire Hedge Company, same place. Filed Sept. 16, 1882. (No model.)

Brief.—The frame carrying the reel is rotated in boxes supported at each end thereof. The reel is mounted on a spool-shaft and clamped between two opposing plates or disks. One of said disks is conical on its outer surface, and is pressed by an adjustable conical roller to clamp the reel between the disks. On the outer face of the other disk is a beveled rack or gear. The reel is rotated by a bevel-pinion at the end of a shaft meshing with said bevel-gear, rotation being given to the bevel-pinion by means of a pinion on the outer end of the shaft engaging with a spur-gear on the box in which one of the journals of the frame rotates. This spur-gear is held stationary, or caused to rotate at a less speed than the frame, by means of a rod universally jointed to a downwardly-extending rod screw-threaded at its lower end, which is fitted to a hole in a band nearly encircling a pulley mounted on the box with the spur-gear. The journal at the opposite end of the frame is provided with a pinion, to which motion is applied to rotate the frame.

Claim.—1. The combination, with the frame A, of the disk T, and mechanism for rotating the same, movable spool-shaft H, apertured removable disk T', and a self-adjusting friction-roller or presser for forcing the latter disk against the spool, substantially as described.

2. The combination, with the rotating spool-carrying frame A, disk T, and means for rotating said disk, of the opposing disk T', adjustable in the direction of its axis, and having a conical outer surface, a roller arranged to bear on said conical surface, a sliding support for the roller, a spring arranged to force the roller inwardly toward the axis of the disk, and suitable means for retracting the roller, substantially as and for the purposes set forth.

3. In combination with the frame and with the disk T', adjustable as described, the disk T, and a removable spool-shaft, the longitudinally-sliding plate X, roller Y, spring s, and cam Z, connected, arranged, and operating substantially as and for the purposes specified.

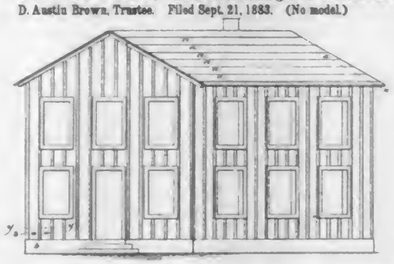


4. In combination with the twister-frame and removable spool-shaft H, having the reduced part p, the sliding plate X, provided with the open slot q', the spring s, and the cam Z, arranged and operating substantially as described, and for the purposes specified.

5. The combination, with the rotating spool-carrying frame, spool-holding disks T and T' therein, friction mechanism, substantially as shown, for rotating the disks and spool, and a screw-threaded rod, M, for regulating the friction of such mechanisms, of a rod, O, universally jointed with the rod M, and extended to the head of the twister, substantially as and for the purpose set forth.

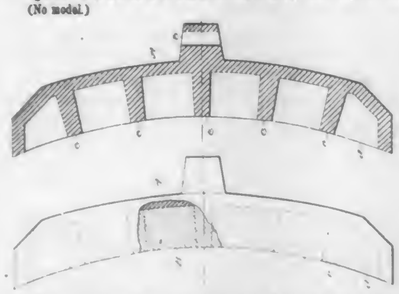
298,281. ASBESTUS COMPOUND AND ARTICLES MADE THEREFROM. CHARLES F. BRIGHAM, Worcester, Mass., assignor of three-fourths to D. Austin Brown, Trustee. Filed Sept. 21, 1883. (No model.)

Claim.—1. A compound such as herein described, composed, essentially, of asbestus and oxide of magnesium, incorporated and tempered or made plastic to be molded, substantially as described.



298,281.

2. A compound such as herein described, composed, essentially, of asbestus, oxide of magnesium, and paper-pulp, mixed and suitably tempered to render the same plastic, substantially as described.

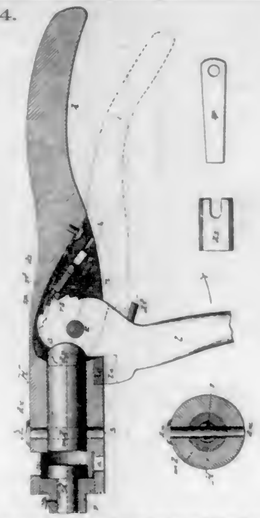


3. A board or other molded article composed of asbestus, having incorporated with it oxide of magnesium, substantially as described.

298,282. FIRE AND WATER PROOF MATERIAL FOR ROOFING, &c. CHARLES F. BRIGHAM, Worcester, Mass., assignor of three-fourths to D. Austin Brown, Trustee. Filed Sept. 21, 1883. (No model.)

Claim.—The herein-described roofing or sheathing, composed of asbestus board or paper treated with silicate of soda and with chloride of calcium, substantially as described.

298,283. BRAKE-SHOE. CHARLES F. BRIGHAM, Worcester, Mass., assignor of three-fourths to D. Austin Brown, Trustee. Filed Sept. 21, 1883. (No model.)



Claim.—1. As an improved article of manufacture, a brake-shoe consisting of a metal frame, and a contained molded body, B, composed of asbestus hardened, substantially as described.

2. As an improved article of manufacture, a brake-shoe consisting of a metal frame, and a contained molded body, B, composed of asbestus hardened, substantially as described, and mixed with an extending heat-resisting material—such as plumbago, lime, or earth—as set forth.

298,284. SEAL-PRESS. EDWARD J. BROOKS, East Orange, N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Oct. 19, 1883. (No model.)

Claim.—1. In a seal-press, the combination, substantially as herein specified, of a lever-handle, a movable die or dies actuated thereby, and a pawl-and-ratchet device which prevents retracting said die or dies after a pressing operation is begun until the same is completed, as means for insuring uniform impressions and perfected fastenings in pressed seals, in the manner set forth.

298,284.

2. The combination, in a seal-press, substantially as herein described, of a main casting comprising a recessed head, H, a recessed neck, *n*, and a rigid handle, A, the former provided with a pair of dies, a lever-handle casting comprising a lever-handle, *l*, and a combined cam and ratchet-sector, *c rs*, and a spring detent-pawl, *sp*, secured within said recessed neck and engaging with said ratchet-sector, to prevent reversing the motion of said lever-handle, to release the seal, until the pressing operation is fully completed and the seal thus perfected.

3. The disengaging-slide *ds*, in combination with the tappets *dt st* on the lever-handle casting, and the detent-pawl *sp*, substantially as shown and described, for disengaging the latter and freeing the same, in the manner set forth.

298,285. DIE FOR MAKING VISE-JAWS. JOHN CAIN, Pittsburg, Pa., assignor to the Gillespie Tool Company, same place. Filed Dec. 10, 1883. (No model.)

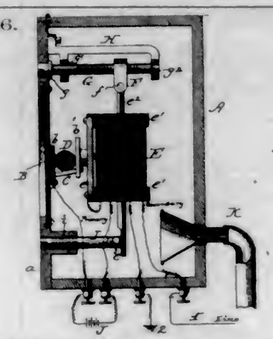
Claim.—1. The die *a*, for forming vise-jaws, having a recess, *a'*, for receiving the shank, a lateral recess, a^2, for forming the head, and an intermediate connecting-cavity, a^4, substantially as and for the purposes described.

2. The die *a*, for forming vise-jaws, having recesses a' a^2 a^3 a^4, substantially as and for the purposes described.

3. The combination of the die *a*, having a cavity, a' a^2 a^4, with the die *b*, having a cavity, *b'*, substantially as and for the purposes described.

298,286. TELEPHONIC TRANSMITTER. HENRY CLAY, Philadelphia, Pa., assignor to the Clay Commercial Telephone Company, same place. Filed May 1, 1883. (No model.)

Claim.—1. In a telephonic transmitter, the combination of a diaphragm, an induction-coil, and electrodes interposed between said diaphragm and induction-coil, which by its gravity maintains and regulates the force of contact of said electrodes, substantially as described.



2. In a telephonic transmitter, the combination of a diaphragm, an adjustably suspended or supported induction-coil, and electrodes interposed between the diaphragm and induction-coil, substantially as described.

3. The combination, with a diaphragm, B, having brackets C C, and electrode *b*, of a carbon block, D, held on said brackets, and electrode *b'*, substantially as described.

4. The combination of a diaphragm carrying an electrode, a suspended and adjustable induction-coil having an electrode, and a carbon block between said electrodes, substantially as shown and described.

5. The combination of a diaphragm, B, induction-coil E, having a projecting core, electrodes interposed between the diaphragm and coil,

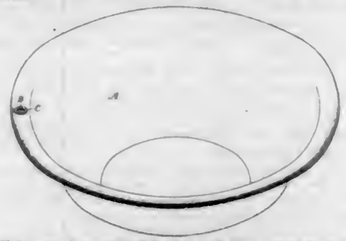
298,286.

and magnetic bar I, substantially as described.

6. In a telephonic transmitter, the combination of a diaphragm and an induction-coil arranged to regulate by its gravity the force of contact between the electrodes and to dampen the prolonged vibrations of said diaphragm, substantially as set forth.

7. The combination of diaphragm B, induction-coil E, having core e^3, electrodes interposed between the diaphragm and coil, and magnetic bar I, substantially as shown and described.

8. The combination of diaphragm B, induction-coil E, having core e^3, electrodes interposed between the diaphragm and coil, bar I, and ear piece or tube K, substantially as shown and described.

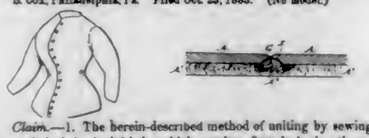


9. The combination of diaphragm B, the pivoted or suspended induction-coil E, having core e^3, electrodes interposed between the diaphragm and coil, and adjustable bar I, substantially as shown and described.

10. The combination of diaphragm B, pivoted and adjustable induction-coil E, electrodes interposed between the diaphragm and coil, and adjustable bar I, substantially as shown and described.

11. In a telephonic transmitter, the combination, with the induction-coil E, of core e^3, nut F, and screw G, substantially as shown and described.

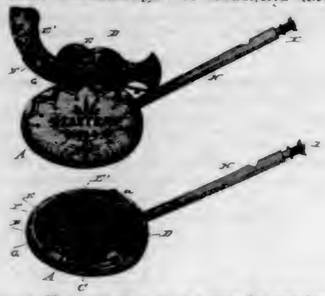
12. The combination of diaphragm B, carrying electrode *b*, and brackets C C, the adjustable induction-coil E, carrying electrode *b'*, and the carbon block D, supported upon said brackets, and presenting diametrical points of contact to the electrodes, substantially as shown and described.



298,287. ENAMELED IRON WASH-BASIN. JAMES COCHRAN, New Lots, and JOHN C. MILLIGAN, Brooklyn, assignors to the Lalance & Grosjean Manufacturing Company, New York, N. Y. Filed Oct. 30, 1883. (No model.)

Claim.—1. As a new article of manufacture, a wash-basin having a hole near its periphery and an eyelet inserted therein.

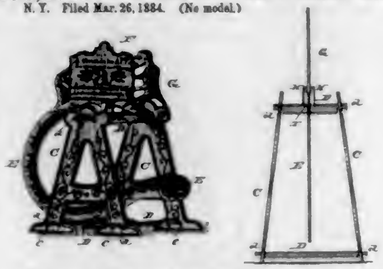
2. A wash-basin of iron coated with a non-corrosive substance and having a hole near its periphery, with an eyelet inserted therein.



298,288. METHOD OF SEAMING PLUSH-BACK FABRICS. LEWIS S. COX, Philadelphia, Pa. Filed Oct. 23, 1883. (No model.)

Claim.—1. The herein-described method of uniting by sewing two pieces of plush-backed fabric, which consists, first, in laying them upon each other face to face, then joining them by a line of stitches and trimming the said pieces close to said line of stitches, then spreading said pieces out flat and pressing the seam, and finally felting the plush fibers of the back over said seam to protect and render it invisible, substantially as described.

2. As a new article of manufacture, a garment having a plush or felted back, in which the edges of the fabric are united by seams formed by two pieces of the fabric placed face to face and secured together by a line of stitches, and having the surplus cloth trimmed or cut off close to said line of stitches, and the plush or felt fibers on the back felted over the seam, substantially as set forth.



298,289. TOY. JESSE A. CRANDALL, Brooklyn, N. Y., assignor to himself and John W. Seaman, same place. Filed Mar. 20, 1884. (No model.)

Claim.—1. The combination, with the recessed receptacle, of the figure constructed in two parts pivoted together, one part serving to hold the figure in place when concealed, and the catch and spring for releasing and ejecting the figure, substantially as specified.

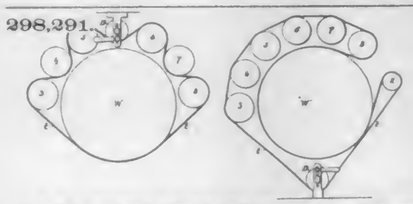
2. The combination, with a recessed figure representing an egg provided with a whistle, of a jointed figure adapted to be received in said recess, and a catch and spring arranged to hold and eject the jointed figure, all substantially as set forth.

298,290. ALPHABETICAL TOY. JESSE A. CRANDALL, Brooklyn, N. Y. Filed Mar. 26, 1884. (No model.)

Claim.—1. In an alphabetical toy, the supporting-letters having curved slots, and the cross-pieces provided with curved tenons to fit the slots and form a frame for the rocker, substantially as specified.

2. The rocker provided with a ground or shield upon which letters or verses may be applied, substantially as specified.

3. The rocker provided with a shield or ground for letters or other devices, and with the figure of an animal or other object, substantially as specified.

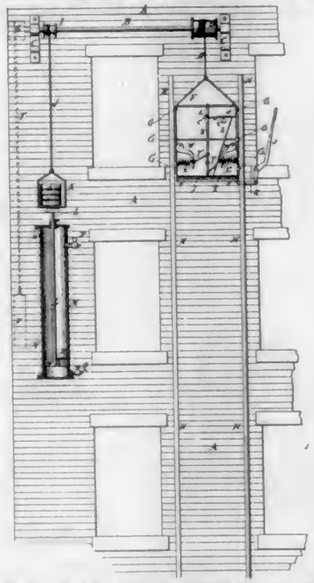


4. The combination of the supporting-frame, formed of letters of the alphabet, as described, and the connecting cross-pieces of a balanced rocker with pointed studs, which rest upon the upper cross-piece of the frame, substantially as specified.

298,291. BELT-GEARING FOR MACHINERY. JOHN H. CROMIE, Camden, N. J., assignor to Merrill A. Furbush and Charles A. Furbush, both of Philadelphia, Pa. Filed Mar. 31, 1884. (No model.)

Claim.—1. The combination of a belt, *t*, and a series of pulleys to which the belt is adapted, with means, substantially as described, whereby said belt may be slackened when it is desired to remove the same from the pulleys, as set forth.

2. The combination of the belt *t* and pulleys, the pulley D, the slotted plate A, the pulley-carrier B, guided thereon, and having two transverse ribs, *a a'*, and the eccentric E, hung to a fixed pin on the said plate A, substantially as set forth.



298,291.

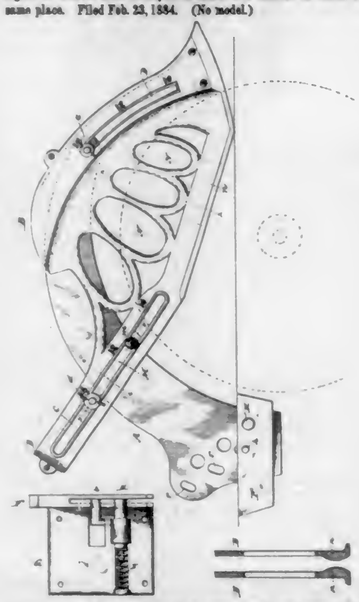
3. The combination of the belt *t* and pulleys, the pulley D, the plate A, the pulley-carrier B, having ribs *a a'* and stop *g*, and the eccentric E, having two projections, *m n*, substantially as specified.

298,292. FIRE-ESCAPE. CHARLES R. S. CURTIS, Quincy, Ill. Filed June 23, 1883. (No model.)

Brief.—The car moves upon corrugated ways, and is provided with pivoted cam-brakes and an operating-lever. The car is suspended from a shaft journaled at the upper part of the building, and a weighted piston working in an air-cylinder is also connected to this shaft by a rope wound thereon in an opposite direction from that of the car-rope.

Claim.—1. In a fire-escape, the combination, with a shaft journaled in the upper part of a building, of a carriage suspended from a drum thereon and a piston working in an air-cylinder and connected to drum on the said shaft, the connecting-ropes of the carriage and piston being wound in opposite directions on the drums, substantially as herein shown and described.

2. In a fire-escape, the combination, with the carriage F, shaft B, provided with the drums D I, and ropes E J, wound in opposite directions thereon, of the piston M and the cylinder N, having stop-cocks P Q in its upper and lower parts, substantially as herein shown and described, whereby the descent of the said carriage will be resisted by compressed air above the piston and a partial vacuum below it, as set forth.



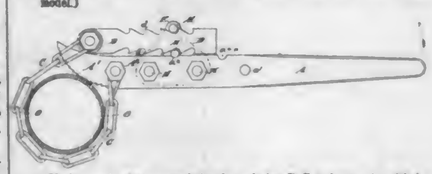
3. In a fire-escape, the combination, with the carriage F, the shaft B, the ropes E J, the piston M, having valve R, and the cylinder N, of the weight O, substantially as herein shown and described, whereby the said carriage will be raised automatically when unloaded and released, as set forth.

4. In a fire-escape, the combination, with the carriage F and guide-posts H, of the lever-cams W, the springs X, the connecting-bars Y, and the lever Z, substantially as herein shown and described, whereby the descent of the said carriage can be controlled, as set forth.

5. In a fire-escape, the combination, with the guide-posts H, provided with corrugated plates V and the spring-pressed cam-levers W, of the lever Z, provided with the pawl *b*, the connecting-rods Y, and the bar *d*, provided with the catch *c*, substantially as herein shown and described.

6. In a fire-escape, the combination, with the carriage F, the lever Z, and pivoted catch-bar *d*, of the hinged plate *f* and the connecting-rod *h*, substantially as herein shown and described, whereby the air-pressure caused by the rapid descent of the carriage is made to release spring-operated cams and check the descent, as set forth.

298,293. SAW-GUARD. WILLIAM H. DALEY, Indianapolis, Ind., assignor of three-fourths to Alpha Medaker and Charles E. Clark, both of same place. Filed Feb. 23, 1884. (No model.)

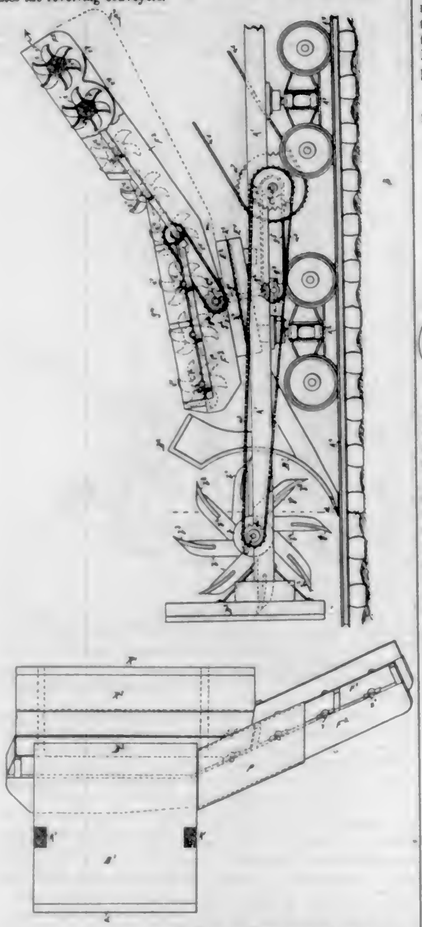


Claim.—1. The arm curved as represented, and provided at its rear end with round and elongated graduated openings, in combination with the box and the plate carrying the sliding bolts, which are adapted to enter the graduated openings in the arm, the whole operating to support the hood and allow a restricted vertical movement of the same, for the purpose specified.

2. The guard B, formed in two parts, and having open-work upon its sides, in combination with the curved arm A, to which it is adjustably connected through slots and by means of set-screws.

3. The guard B, having its forward end curved upward and the two sides or edges of the plates forming it flared outward, substantially as and for the purpose set forth.

4. The enlargements or buffers formed integral with the hood or secured to the same, for the purpose of preventing the wabbling of the saw from interfering with the sides of the said hood, the relative arrangement of the parts being substantially as described.



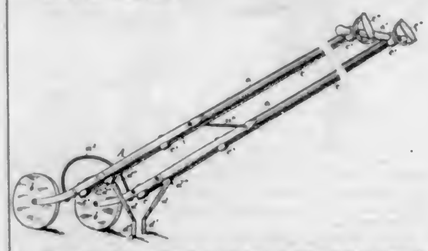
298,294. PIPE-WRENCH. JAMES DOYLE, New York, N. Y., assignor to himself and Patrick McNamara, same place. Filed Oct. 8, 1883. (No model.)

Claim.—A pipe-wrench having chains B C, a lever, A, with its roughened surface A' and notched locking-piece D *d*, in combination with each other and with dogging means M, adapted to engage in any of the several notches *d*, and with means, as H *a' a²*, for changing the point of attachment of the dogging means to the lever A, all substantially as herein specified.

298,295. TRACK-CLEARER. WARREN DUNBAR, Minneapolis, Minn. Filed July 28, 1882. (No model.)

Brief.—Cutting-wheels are placed in advance of the plow. A swinging inclined frame carrying a series of revolving conveyer-drums is placed upon a sub-frame which is revolved upon a turn-table. The top frame may be tilted without affecting the revolution of the shaft which operates the revolving conveyers.

Claim.—1. The combination of a frame mounted upon trucks adapted to run upon a railroad-track, a plow attached to said frame in advance of said trucks, a revolving cutting-wheel in advance of said plow, and a swinging frame carrying a series of revolving conveyer-drums, substantially as and for the purpose set forth.

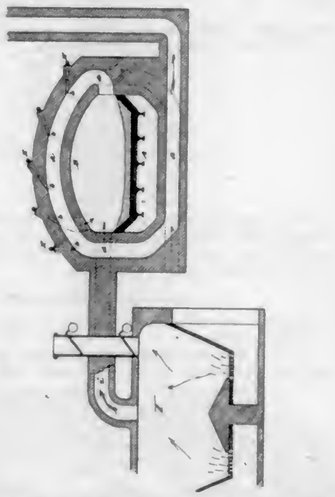


2. The combination of frame A', mounted upon trucks adapted to run upon a railroad-track, a plow, B', attached to said frame in advance of said trucks, side cutters attached to the forward ends of said frame, a revolving cutting-wheel upon said frame in advance of said plow, and a frame swiveled upon said frame A' and carrying a series of revolving conveyer-drums, i^3 i^7, and troughs i^5, substantially as described.

3. The frame A', having the inclined frame E', ring A^1, carrying balls A^2, inclined frame E^2, pivoted centrally upon said frame E' and carrying tilting frame F' F^2, shafts *i*, journaled in said frame F' F^2 and carrying buckets i^7, and means for revolving said shafts *i* and their attached buckets i^7, whereby said frame E^2 may be revolved upon said frame E' and said frame F' F^2 tilted upon said frame E^2 without affecting the revolution of said shafts *i*, substantially as and for the purpose specified.

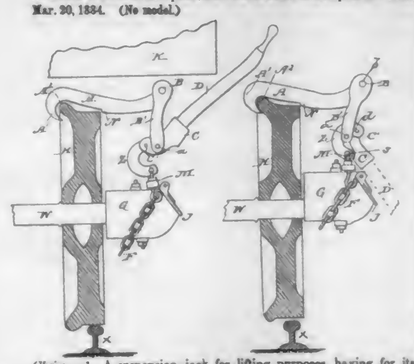
4. The combination of the frame A', carrying the cross-shaft g^4 and inclined frame E', shaft *g'*, journaled in said frame E' at right angles thereto, frame E^2, pivoted centrally upon said frame E' and having shaft C^2 journaled thereon at right angles to shaft *g'*, means for transmitting motion from shaft *g'* through shaft *g'* to shaft C^2, frame F^2, pivoted upon said shaft C^2 and carrying a series of revolving conveyer-drums, and means for transmitting the motion of shaft to said conveyer-drums, substantially as shown and described.

5. The combination of a frame mounted upon trucks adapted to run upon a railroad-track, a plow attached to said frame in advance of said trucks, a revolving cutting-wheel in advance of said plow, a swinging frame carrying a series of revolving conveyer-drums and snow-guard R' R^2, and combined scraper and guard P, substantially as and for the purpose described.



298,296. WHEEL-HOE. SOLOMON FULLER, Danvers, Mass. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination of the wheeled frame, the independent rocking rods mounted in bearings on the frame, and the weeders or hoes secured to the rods, said rods having means whereby they can be independently or simultaneously rocked in their bearings to adjust the hoes laterally while traversing the ground, substantially as described.

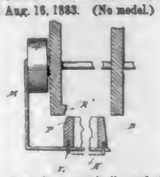


2. The combination of the wheeled frame, the independent rocking rods mounted in bearings on the frame and provided with handles at their ends, and the weeders or hoes secured to the rods, said handles serving to propel the wheeled frame and to independently or simultaneously rock the rods to adjust the weeders or hoes laterally while traversing the ground, substantially as described.

298,297. REGENERATIVE FURNACE. JOHN W. GALVIN, Portsmouth, Ohio, assignor of one-half to Levi D. York, same place. Filed Oct. 23, 1882. (No model.)

Claim.—The regenerative furnace herein described, having the grate A, domes B B, and double walls to form passages *d*, arranged alternately with cold-air passages *c*, the tangential holes or flues *b*, leading through the outer wall into the passages *d*, and covers F, for closing said flues, all constructed, arranged, and adapted to serve as and for the purposes set forth.

298,298. SUSPENSION-JACK FOR REMOVING JOURNAL-BOXES OF CARS. JOHN M. GARVERICK, Harrisburg, Pa., assignor of two-thirds to Charles Wollerton, same place, and John Rhoads, Philadelphia, Pa. Filed Mar. 20, 1884. (No model.)

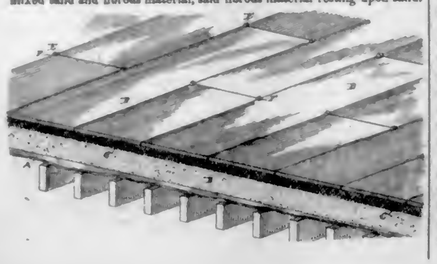


Claim.—1. A suspension-jack for lifting purposes, having for its support an extended arm adapted at its inner end with a hook for clutching the flange of a car-wheel, and adjacent thereto a hold for hugging the outer edge of the tread of said wheel, substantially as and for the purposes set forth.

2. A lifting-jack having for its support an extended arm, A, provided at its inner end with hook A^2 and hold N, for attaching it instantly on a car-wheel, and provided at its outer end with hanger B', in combination with lever C, coupled with swinging link Z, all pivoted or hinged together, and operating to set automatically said lever when the swinging link is raised full throw, substantially as herein shown and described.

3. The combination, with the suspending parts A and B' and the lifting parts C and Z, of means F M Q for hitching the jack mechanism to an oil-box, G, or other object vertically beneath the point B of suspension on said part A, and operating substantially as set forth.

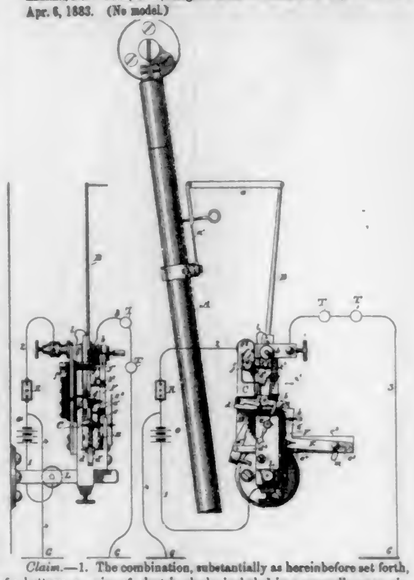
4. The combination, with the suspension-arm A, hanger B', lever C, provided with removable handle D, and swinging link Z, constituting a lifting-jack of invariable throw, of the adjustable hitching device consisting of cross-bar M, with coupling-staple Q thereon, and a chain, F, connected with said cross-bar by screw-eye O and screw-hook P, and nuts *m n*, to vary the length of the hitch, substantially as and for the purposes set forth.



298,299. SEPARATOR FOR PEAS, &c. ROBERT DAVIS GLADNEY, McCandy, Miss. Filed Aug. 16, 1883. (No model.)

Claim.—The combination, in a pea-huller, of the crank-shaft, the connecting-links, the vertically-vibrating sieve, and the casing, having vertically-beveled edges, adapted to impart lateral motion to the sieve, substantially as and for the purposes specified.

298,300. FLOORING. DANIEL HAM, Iowa City, Iowa. Filed Feb. 13, 1884. (Model.)



Brief.—Metal plates resting upon sand or upon a layer of intermixed sand and fibrous material, said fibrous material resting upon sand.

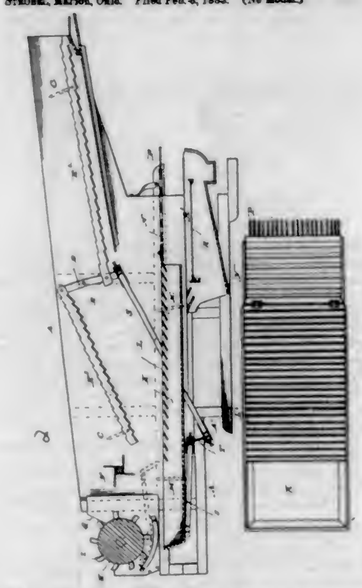
Claim.—1. A floor for buildings, skating-rinks, dancing-halls, and other structures, composed of an under layer of sand and a surface of metal plates, substantially as and for the purpose set forth.

2. A floor composed of a base consisting of intermixed sand and matting or fibrous or porous material, and a metallic upper surface, substantially as and for the purpose set forth.

298,301. CIRCUIT-CLOSER FOR ELECTRIC CLOCKS. VITALIS HIMMER, New York, N. Y., assignor to Ida C. Himmer, same place. Filed Apr. 6, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a battery, a series of electric clocks included in a normally-open circuit of said battery, a normally-open shunt-circuit around said clocks, means for periodically closing said shunt-circuit, and means, substantially such as described, for momentarily substituting said clock-circuit for said shunt-circuit.

2. The combination, substantially as hereinbefore set forth, of a battery, a series of electric clocks included in a normally-open circuit of said battery, a normally-open shunt-circuit around said clocks, and means, substantially such as described, for causing the connections of said shunt-circuit to remain completed during the operation of closing and interrupting the connections of said clock-circuit.



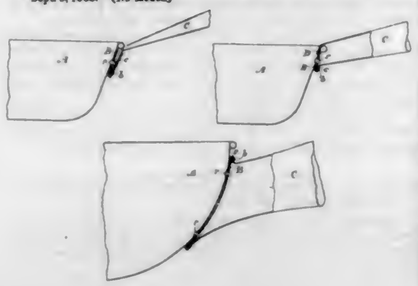
3. The combination, substantially as hereinbefore set forth, with the pendulum of a clock, of a lever actuated thereby, a pawl carried upon said lever, a ratchet-wheel actuated by said pawl, a pin carried upon said ratchet-wheel, a second lever periodically actuated by said pendulum through the agency of said first lever, ratchet-wheel and pin, and two contact-points, one of which acts when the second lever is actuated to close an electric circuit, while the other is placed in the path of a circuit-closing point carried upon said first lever.

4. The combination, substantially as hereinbefore set forth, of a vibrating lever, a pawl carried upon said lever, a ratchet-wheel actuated by said pawl, a circuit-closing lever, means for periodically actuating said circuit-closing lever through the agency of said ratchet-wheel to close an electric circuit, and a contact-pin carried upon said vibrating lever acting to momentarily interrupt said circuit and complete the connections of a second circuit.

5. The combination, substantially as hereinbefore set forth, of a vibrating lever, a pawl carried upon said lever, a ratchet-wheel actuated by said pawl, a circuit-closing lever, means for periodically actuating said circuit-closing lever through the agency of said ratchet-wheel to close an electric circuit, a contact-pin carried upon said vibrating lever acting to momentarily interrupt said circuit and complete the connections of a second circuit, and means, substantially such as described, for interrupting the first-named circuit after the action of said contact-pin.

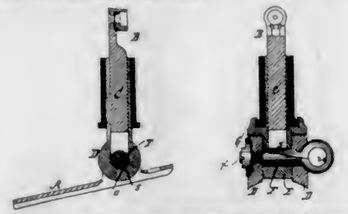
6. The combination, substantially as hereinbefore set forth, of a vibrating lever, a circuit-closing point carried thereon, a pawl actuated by said lever, a ratchet-wheel actuated by said pawl, a circuit-closing arm, and means, substantially such as described, for causing said arm to be periodically placed in the path of said circuit-closing point through the action of said pawl and ratchet-wheel.

298,302. GRAIN-SEPARATOR. EDWARD HUBER and FREDERICK STROBEL, Marion, Ohio. Filed Feb. 3, 1883. (No model.)



Claim.—As an improvement in grain-separators, the combination, with the shakers F^2 and F^3 and their connections, of the grain-carrier K, having a slatted or perforated top, the swinging links M, supporting said carrier, the riddle N, provided with fingers P and hinged to the rear of said top, and the suspensory links supporting the rear end of said riddle, so as to give it vibratory motion relative to the grain-carrier, substantially as and for the purpose set forth.

298,303. COLLAR-BUTTON. GEO. KREMENTZ, Newark, N. J. Filed Dec. 14, 1883. (No model.)

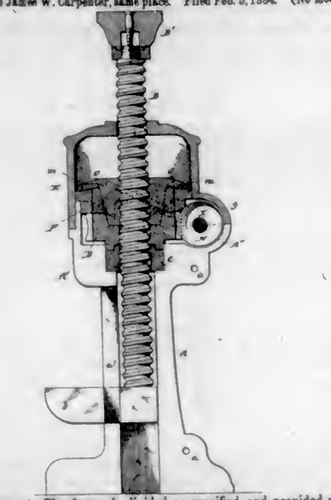


Claim.—A collar or sleeve button having a hollow head and stem, the said head, stem, and the base-plate or back of the said button being shaped and made of a single continuous piece of sheet metal, substantially as herein shown and described.

298,304. HANDLE ATTACHMENT FOR SHEET METAL VESSELS. EMILE KREPPENDORFF and HOWARD C. MARSH, Wood Haven, assignors to the Lalance & Grosjean Manufacturing Company, New York, N. Y. Filed Sept. 5, 1883. (No model.)

Claim.—The combination of the sheet-metal vessel, the handle C, having the flange *c*, and the intervening connecting-collar, B, having the flange *b* on its outer edge, overlapping the flange *c* on the handle, the collar affording a bearing for the handle, whereby it is supported by a double thickness of metal, substantially as described.

298,305. SIGHT FOR FIRE-ARMS. WILLIAM LYMAN, Middlefield, Conn. Filed Mar. 4, 1884. (No model.)



Claim.—1. The combination, substantially as hereinbefore described, of the base and the sight-shank, having corresponding knuckles, either of which is provided with an internal notch, the axial bolt uniting the knuckles, and the spring-catch of the bolt adapted to engage the notch for locking the sight in its upper position.

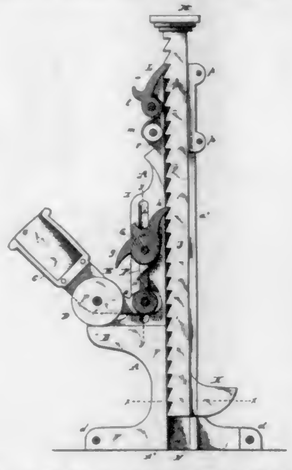
2. The combination, substantially as hereinbefore described, of the base and the sight-shank, having corresponding knuckles, either of which is provided with an internal notch, the axial bolt uniting the knuckles, the spring-loop on one end of the bolt, and the catch projecting inwardly from the loop to engage the notch for locking the sight in its upper position.

3. The combination, substantially as hereinbefore described, of the base having knuckles, the sight-shank having a knuckle corresponding to those of the base, provided with an internal notch, the axial bolt uniting the knuckles, the spring-catch of the bolt, the screw-threaded projection of reduced diameter at one end of the bolt, and the nut having a beveled inner surface.

298,306. LIFTING-JACK. THOS. MAXON, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Feb. 5, 1884. (No model.)

Claim.—1. The frame A, divided as specified, and provided at its upper end with the case A', having inclined openings *c c* in its edge, and adapted to contain the working mechanism of the jack, substantially as herein specified.

2. The box D, formed internally with two parallel sides and two beveled sides, and having sloping grooves on the parallel sides, and the bottom having a circular opening for the jack-screw, and provided externally with a gear-wheel, in combination with the case A and worm-wheel N, substantially as and for the purpose set forth.

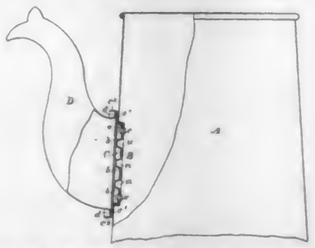


3. The block E in two threaded parts, in combination with the screw B, the box D, and the collar F, constructed substantially as set forth.

4. The dome G, with its inclined slots, in combination with the col-

lar F, and the divided screw-block E, and a pin for operating the collar, substantially as and for the purpose set forth.

5. The combination of the case A', box D, as constructed, the divided block E, the screw B, and the worm-wheel N, the several parts being constructed substantially as and for the purpose specified.

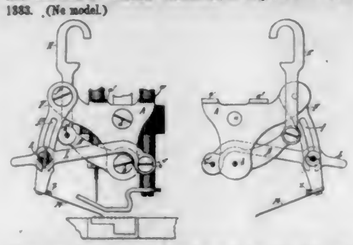


298,307. LIFTING-JACK. THOS. MAXON, Dayton, Ohio, assignor of one-half to James W. Carpenter, same place. Filed Nov. 23, 1883. (No model.)

Claim.—1. The frame A, cast in two parts, bolted together as described, and provided with grooved wings I and table B, in combination with lever E and its wheel, connecting-bar F, pawl G, with its tooth *h* and projection *g*, and the pawl L, the several parts being constructed and connected substantially in the manner and for the purpose set forth.

2. The bar F, having flanges upon its edges which take into the guiding-grooves *i* of the wings I, said bar being pivoted to and between the pawl G and the end *e* of the lever C, as and for the purpose specified.

298,308. ATTACHMENT OF LIPS AND SPOUTS TO VESSELS. EMILE MOUHOT, Wood Haven, and JOHN C. MILLIGAN, Brooklyn, assignors to the Lalance & Grosjean Manufacturing Company, New York, N. Y. Filed Oct. 16, 1883. (No model.)

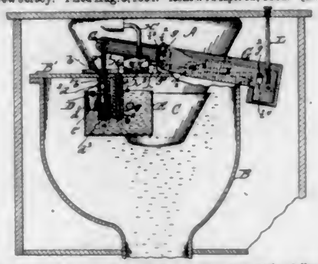


Claim.—1. The combination, substantially as hereinbefore set forth, with the body of a vessel having a section of its side forced outward, of a spout or lip and an intervening flanged fastening-plate conforming in shape to said section.

2. The combination, substantially as hereinbefore set forth, of a vessel having a section of its side forced out of the line of its surface, said section being perforated, a perforated plate fitting said section, and a spout or lip attached to said plate.

3. The combination, substantially as hereinbefore set forth, with a vessel having a series of perforations formed through its side and the portion containing those perforations forced outward from its surface, of a plate having perforations corresponding to the perforations in said vessel and fitting upon said portion, and a spout or lip attached to said plate.

298,309. RUFFLING AND GATHERING ATTACHMENT FOR SEWING-MACHINES. LANSING ONDERDONK, Pamrapo, N. J. Filed June 7, 1883. (No model.)



Claim.—1. In a ruffling attachment for sewing-machines, the combination of the main plate, the lever pivoted thereto, and adapted to be actuated by the rise and fall of the needle bar or arm, the pitman pivoted to the short arm of the actuating-lever, the blade-carrier jointed to the pitman, the fulcrum of the lever, and the point of attachment of the pitman thereto being arranged relatively to each other, as described, whereby when the needle is at or near the beginning or completion of its stroke the movement of the ruffling-blade is suspended, substantially as set forth.

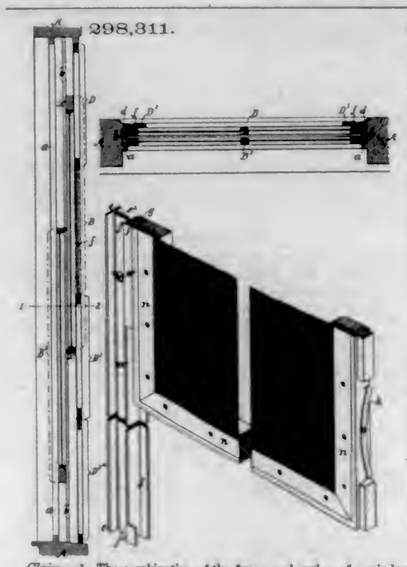
2. The combination, with the crimping-blade carrier, the arm of its lower end and the crimping-blade secured thereto, of the set-screw adapted to bear upon the blade, whereby the tension of the same may be regulated, substantially as specified.

3. In a gathering or ruffling attachment for sewing-machines, an actuating-lever, a pitman, an arm hinged at one extremity and bearing a crimping-blade at the other, said arm being provided with a slot and set-screw adjustable within said slot and connecting said pitman to said arm, all so combined and arranged that by varying the position of said screw in said slot the range of oscillation of said arm may be varied, as and for the purposes described.

4. In a gathering and ruffling attachment for sewing-machines, an actuating-lever, a pitman united to said lever at one extremity, and at the other connected to a swinging arm bearing a crimping-blade, said arm being provided with a stud and said pitman with a hook, the whole so combined and arranged that the pitman may be engaged with or disengaged from the arm by engaging or disengaging said hook from said stud, as and for the purpose described.

298,310. WATER-CLOSET. CHARLES F. PIKE, Philadelphia, Pa., assignor, by mesne assignments, to the National Anti Sewer Gas Company, of New Jersey. Filed Aug. 3, 1881. Renewed Apr. 12, 1882. (No model.)

Claim.—1. In a water-closet, the combination of the following elements, viz: a receiver, a bowl, a pan therefor having an attached and an intercommunicating receptacle, which receives a flange depending from an opening in the receiver, and an operating-lever for said pan connected to said receptacle, substantially as shown and described.



2. The combination, in a water-closet, of a sealing-pan, mechanism for operating the same, a water-supply pipe having a cock, with flushing-pipe for the bowl of the closet, and a branch pipe or conduit from said water-supply pipe leading to the pan, for effecting a running-water seal therefor, substantially as specified.

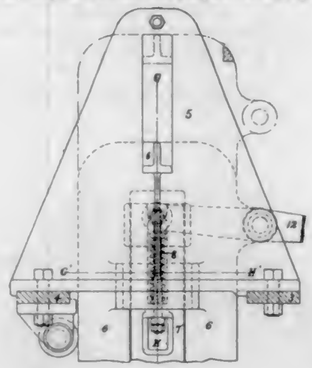
3. The combination of bowl A, receiver B, formed with lugs B^2 B^3, depending tubes *b' b²*, with pan C, shaft D, and water-supply pipe H, having branch H^2, substantially as and for the purpose set forth.

298,311. WINDOW-SCREEN. JOSIAH K. PROCTOR, Philadelphia, Pa. Filed Sept. 13, 1883. (No model.)

Brief.—A window-screen consisting of two or more vertically-operated screen-sections and constructed to bear upon the rails of the sashes. Bars are secured to the frame, to which are secured laterally-adjustable guide-bars.

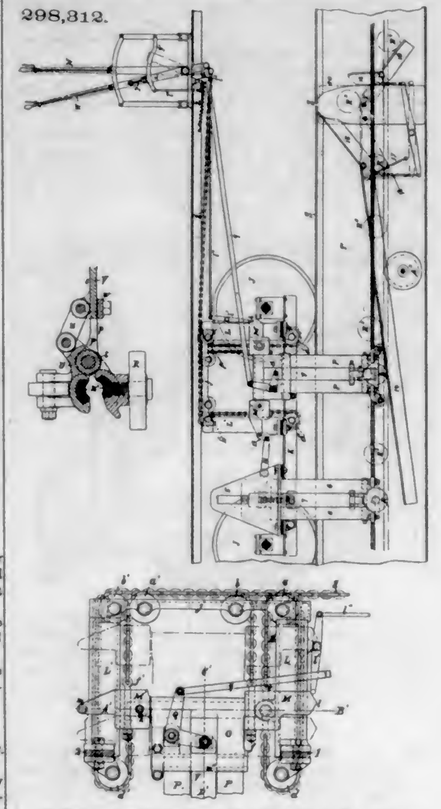
298,311.

Claim.—1. The combination of the frame and sashes of a window with a screen made in two or more sections, guided vertically on said frame, and constructed to bear upon the rails of one of the sashes, as set forth.



2. The combination of the frame and sashes of a window with the screens D, D', and D^2, guided vertically on the frame, as described, and occupying the relation set forth to one of the sashes.

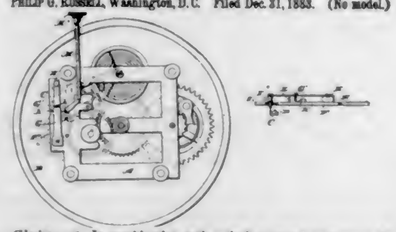
3. The combination of the screen-frames, the bars *e*, secured to the frame of the window, and the guide-bars *f*, secured to but laterally adjustable on the bars *e*, as set forth.



298,312. METHOD OF GRIPPING AND CROSSING CABLES. ROWLAND RANSOM, Philadelphia, Pa. Filed Dec. 3, 1883. (No model.)

Brief.—A main and an auxiliary grip are respectively automatically released, applied, and the former again applied from and to an under cable in crossing an upper cable through a sectional inclined track, which elevates said gripe, whereby, through their connection together, one grip is made to control the action of the other. The operating hand-lever is sectional, and is disconnected to release main grip through connecting mechanism actuated by the vertical movement of said grip by the inclined tracks.

Claim.—1. A slotted conduit, T, with branches on one or both sides, and having flanges 14 15 16 18 19 attached or formed on its interior, over which the gripping mechanism rolls, and is carried safely over a cable, which passes through or into said conduit, and above the cable, traveling longitudinally along said conduit, substantially as shown in Fig. 1.

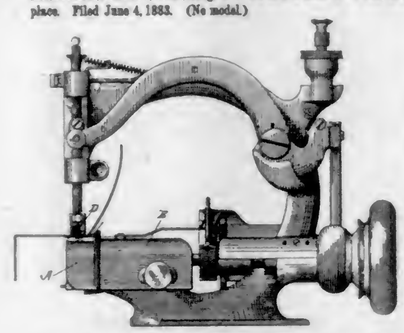


298,312.

2. The combination, in a cable-grip, of a fixed jaw, P, movable jaw U, plate V, link O, cross-head M M', posts L L', girder *j*, pulleys *a a' b b' c d d'*, bell-cranks Q, and the rods *q l' k*, chains *g*, projection *l*, levers *l' y'*, springs *y z*, and levers N and W, all constructed and combined to operate substantially in the manner hereinbefore described, as the main grip, for the purpose specified.

3. The combination, in a cable-grip, of slotted plates 5 5, a fixed jaw having cross-head 6 6 6, movable jaw U, plate 7, spring 8, bolt 9, lever 12, and pawl 13, all constructed and combined to operate substantially in the manner hereinbefore described, as the auxiliary grip, for the purpose specified.

298,313. STOP MECHANISM FOR CLOCKS AND WATCHES. PHILIP G. RUSSELL, Washington, D.C. Filed Dec. 31, 1883. (No model.)



Claim.—1. In combination with a clock or watch movement, the stop device adapted to engage the end of the escape-lever and force the same to either side of its dead-center, so as to stop the movement and put the balance-spring under sufficient stress to make certain the starting of the movement when the stop device is disengaged from the escape-lever, substantially as shown and described.

2. The combination of the escape-lever, having a portion made V-shaped in cross-section, with the stop-lever, provided with a stop-pin adapted to engage said V-shaped portion of the escape-lever, substantially as and for the purpose described.

3. An escape-lever and stop device whose engaging portions are adapted to cause the lever to be carried to either side of the middle point of its arc of motion when the stop device engages said lever, substantially as shown and described.

4. An escape-lever, in combination with a stop device adapted to engage and stop the lever in its vibrations and force it to or toward its limit of motion on either side, and means for causing said stop device to engage and disengage the lever, substantially as and for the purpose described.

298,314. SEWING-MACHINE FOR BRACE-WIRING HATS. MARTIN H. RYDER, Stamford, Conn., assignor of one-half to Eliza A. White, same place. Filed June 4, 1883. (No model.)

Claim.—In a machine for stitching brace-wires and paper linings to hats at one operation, the combination, with the work-plate, the feed, and the feed-bar, of a rocking piece pivoted at the right of the machine, back of the arm and housing, and a feed-operating eccentric and feed-lever located close to the housing, thus leaving the left side of the machine to serve as a horn to support the hat-crown and the paper lining.

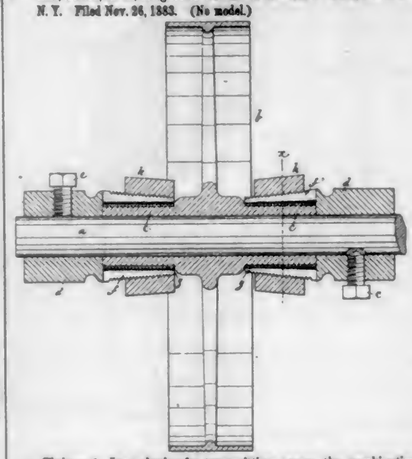
298,315. SEWING-MACHINE TENSION. MARTIN H. RYDER, Stamford, Conn., assignor of three-fourths to Eliza A. White, same place, and the Wilcox & Gibbs Sewing Machine Company, New York, N. Y. Filed June 4, 1883. (No model.)

Brief.—The throw of the hand-lever may be regulated by adjustable stops. The nut and spring on the bolt are used to gage the ordinary tension, the lever serving, together with a friction device, (either in the form of a friction-washer or a cam-bearing,) to give quickly, when desired, an increased or diminished tension.

Claim.—1. In a tension device for sewing-machines, means for holding the thread, and a lever to tighten the tension, in combination with adjustable stops, which limit the movement of the lever in both directions, and means for holding the lever by friction in whatever position it may be placed, whereby the tension may be instantly and accurately changed from one class of stitches to another without stoppage of the machine.

2. The combination, in a tension device, with plates for gripping the thread, and a spring acting thereon, of means for compressing said spring, and adjustable stops which limit the movement of the compressing device in both directions, for the purpose set forth.

3. The combination, with means for holding the thread and a spring for controlling the same, of a lever acting to compress the spring, adjustable stops which limit the movement of said lever, and a friction device for holding said lever in any position, whereby the tension may be adjusted to make two classes of stitches, and the adjustment may be accurately changed from one class to the other without stoppage of the machine.

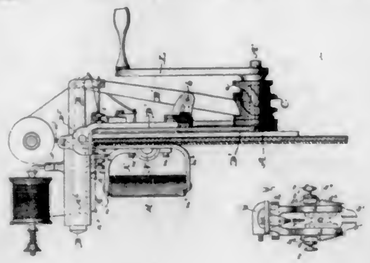


4. Arm H and lever I, in combination with disks B B', spring D, nut G, and pin L, as described, and for the purpose set forth.

298,316. BUTTON-FASTENER. RICHARD SANFORD, Providence, R. I. Filed Feb. 23, 1884. (No model.)

Claim.—The herein-described button-fastening device A, consisting of the plate *a* and prongs *b*, *b'*, *b''*, and *c*, arranged as described, the prong *c* bent to form the loop *d* in the center of said plate *a*, substantially as shown and described.

298,317. DEVICE FOR TRANSMITTING POWER. JOHN A. SHERMAN, Boston, Mass., assignor of one-half to William P. Ward, New York, N. Y. Filed Nov. 26, 1883. (No model.)



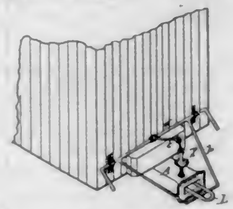
Claim.—1. In a device for transmitting power, the combination, with the member actuated by the motor, of a co-operating member driven thereby, a clamping device, and cushion of yielding material affording a friction-surface for the said clamping device, substantially as described.

2. The combination of the shaft *a*, hub *c*, surrounding the said shaft, and the bushing of yielding material on the said hub, with the clamping device fixed upon the said shaft and engaging the said bushing, the said shaft and hub being intended to be connected one with the actuating-motor and the other with the actuated machinery, substantially as and for the purpose described.

3. The shaft *a* and pulley *b* thereon, having a hub, *c*, loosely fitted on said shaft, combined with the bushing *g* and clamping device *d f k*, fixed upon the said shaft and engaging the said bushing, substantially as described.

298,318. CARPET-SEWING MACHINE. ALPHONSO B. SMITH, San Francisco, Cal. Filed July 11, 1883. (No model.)

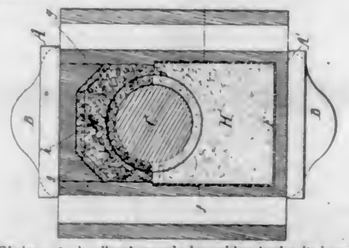
Brief.—The action of the feed-lever and nipper-jaws in grasping the material is such as to force the machine to travel along upon the edges of the carpet. A crutch-piece assists in steadying the device in its operation.



Claim.—1. The combination, with the carrying-frame adapted to rest outside of and travel over the edges of material being sewed, of the steadying-bar having a crutch-piece on one end and the other end adapted to take into a socket on the frame, substantially as herein described.

2. In a carpet-sewing machine, the combination, with the traveling frame adapted to carry all the stitch-forming mechanism and to rest astride of and move over the edges of the material to be stitched, of the nipper-jaws *s s* upon opposite sides of the frame, having dogs *s' s'*, adapted to engage with and grasp between them the material to be stitched, the wedge-piece *r*, and mechanism, substantially as described, whereby the outer ends of said jaws are spread apart and their inner ends pressed together to grasp the material, and thereby form a resistance-point by which progression of the frame is produced, step by step, at each grip of said jaws on the material, substantially as herein set forth.

3. The combination, with the traveling frame having horizontally-reciprocating needle-carrier and vibrating looper, of the feed-lever with the wedge-piece *r*, the fixed loop *d'* on the frame, the brackets *s'*, nipper-jaws supported by said brackets, and the openings A^5 in the plates A and K, below the line of action of the needle, substantially as set forth.



4. The combination, with the traveling frame having horizontally-reciprocating needle-carrier and looper, of the brackets s^4 s^4, feed-bars *s s*, dogs *s' s'*, pivoted on said bars, binding-screws *t*, wedge-piece *r*, actuating-lever D', and cam for operating said lever, substantially as herein set forth.

298,319. CAR-COUPLING. GEORGE W. SOWLES, Chittenango, N. Y. Filed Mar. 25, 1884. (No model.)

Claim.—In combination with the common draw-bar, coupling link and pin, the pivoted lever *a*, extended across the end of the car, the bail *b*, fixed to said lever and reaching under the end of the draw-bar, and the arm *c*, projecting from the lever and connected with the pin, all constructed and combined substantially in the manner shown.

298,320. CAR-AXLE BOX. GEORGE W. STEWART, New York, N. Y., assignor to himself and James F. Wenman, same place. Filed Feb. 4, 1884. (No model.)

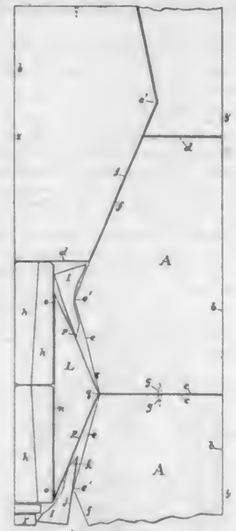
Claim.—1. A railroad-car-axle journal-box having its inner and outer ends cast open, the under surface of its top plate channeled or corrugated, and provided with a drawer and cap-plate for closing its outer end, and a plate or board for closing its inner end and excluding dust, substantially as described.

2. A car-axle journal-box provided with corrugations, channels, ribs, or projections which are transverse of and above the axle-journal, and provided with an upper bearing for a car-axle, formed of suitably-prepared old gummy fibrous material, substantially as and for the purpose described.

3. A car-axle journal-box provided with corrugations, channels, ribs, or projections *g*, a plain surface, *h*, and a depression, *m*, whereby it is adapted for the use either of suitably-prepared old gummy fibrous material in form of an upper journal-bearing or the ordinary brass or composition upper journal-bearing, substantially as described.

4. A car-axle journal-box provided with corrugations, channels, ribs, or projections which are transverse of and above the axle-journal, substantially as and for the purpose described.

298,321. FIRE-HOSE. GEORGE A. STUCK, Selma, Ala. Filed Feb. 4, 1884. (No model.)

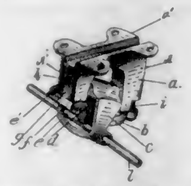


Claim.—1. A hose having two or more internal re-enforcing sectional portions arranged diametrically opposite each other, substantially as specified.

2. In a hose which is composed of a woven exterior and an india-rubber lining cemented together, two or more internal re-enforcing portions, C C, formed on or applied to said lining, substantially as and for the purposes described.

3. As a new and improved article of manufacture, a hose having an exterior layer of woven fibrous material, and a lining composed of two or more india-rubber strips, and internal re-enforced lapped seams, substantially as and for the purposes described.

298,322. DRAWERS. JAMES C. TRACEY, Baltimore, Md. Filed July 24, 1883. (Model.)



Claim.—1. The herein-described method of cutting drawers, consisting in cutting the part comprising the one half of the body and one leg so as to have from the waist to the ankle a continuous straight front edge, *b*, and taking said edge from one selvage of the goods, taking the same edge of the other half-body and other leg from the same selvage, the waist-edge of the two halves abutting, taking the straight front edges of the next pair of drawers from the other selvage of the goods, and extending the tapering back edge, *f*, of the leg whose front is cut from one selvage along the tapering back edge of the leg which has its front cut from the other selvage, and finally cutting all the other parts necessary to complete one pair of drawers from that portion of the goods between the back body-seams, *e*, of the two halves and the selvage, as shown and described.

2. In a pair of drawers, a continuous seamless crotch-piece, L, having a straight front edge, *n*, widest at the crotch or center, and one of the tapering points extending down each drawer-leg, in combination with front facings, l, on each side of the fly-opening, having their lower points, *k*, attached directly to the said seamless crotch-piece, as set forth.

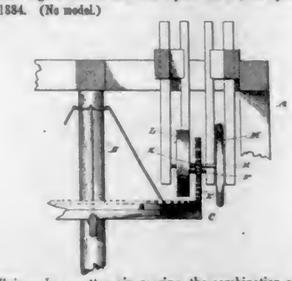
298,323. ROLLER-SKATE. WILLIAM C. VANNEMAN, Richmond, Ind. Filed Jan. 4, 1884. (No model.)

298,323.

Claim.—1. In a roller-skate, the hanger-frame provided with pendent lugs at opposite ends, with a space between the lugs to receive a truck-frame, said lugs being slotted vertically to receive the axles of the roller-supporting truck, substantially as described.

2. In a roller-skate, the bed-plate formed at one end with the forked arm, at the opposite end with the openings *o* and *p*, and between the two ends with the bar *b*, provided with the longitudinal rib *n*, substantially as described.

3. The combination of the hanger-frame provided with pendent lugs slotted vertically, and having at the end a support for a bed-plate, a truck-frame adapted to have an axle connected therewith, and provided with pivots having their bearings in said vertical slots, and a bed-plate connected with said hanger-frame below the pivots of said truck-frame, substantially as described.



4. The combination of the hanger-frame, the truck-frame having a laterally-yielding connection therewith, a bed-plate below said truck-frame, and a spring-cushion between said bed-plate and truck-frame to restore said truck-frame to its normal position when relieved from strain, substantially as described.

5. The combination of the hanger-frame, the truck-frame having a laterally-yielding connection therewith, a bed-plate below said truck-frame, a spring-cushion between said bed-plate and truck-frame, and means for adjusting said bed-plate to tighten or loosen the connection between the parts, substantially as described.

6. The combination of the hanger-frame provided with pendent lugs slotted vertically, and having at the end a support for a truck-frame, a truck-frame provided with journals having their bearings in said slotted lugs, a bed-plate connected with the hanger-frame below the bearings of the truck-frame, a spring-cushion interposed between said truck-frame and bed-plate, and a screw for tightening the connection between said parts, substantially as described.

7. In a roller-skate, the combination, with the wheel and axle, of the washer *q*, provided with the projection on its face, and a linchpin to the axle to one side of the projection, substantially as described.

298,324. COTTON-GIN GEARING. CHRISTOPHER C. WARREN, Lodi, Miss., assignor of one-half to Christopher C. Irvin, same place. Filed Feb. 5, 1884. (No model.)

Claim.—In a cotton-gin gearing, the combination of the frame or structure with the vertical shaft journaled therein, the horizontal crown-wheel geared on its outer edge and supported by the elongated spokes, the vertical gear-wheel engaging with the said crown-wheel and supported by suitable hangers, and the balancing and transmitting mechanism consisting of a horizontal shaft supported by hangers, and provided near one end with a band-wheel and near the other with a fly or balance wheel, and near its center with a pinion-wheel engaging with the vertical gear-wheel which engages with the gear on the driving or crown wheel, all the parts being arranged to operate as an entirety substantially as described.

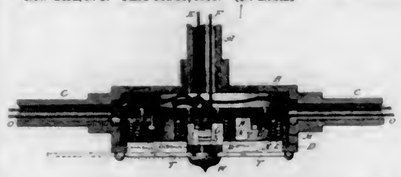
298,325. INCANDESCENT LAMP. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. A carbon conductor for incandescent lamps in the form of a flat or flattened spiral, substantially as described.

298,325.

2. The combination, with an exhausted globe or receiver and metal conductors secured therein, of a carbonized strip or filament in the form of a flat or flattened loop, substantially as described.

298,326. ELECTRIC-CIRCUIT CONNECTOR. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 31, 1883. (No model.)



Claim.—1. The combination, with a body of insulating material, and provided with lugs or ears, contact-terminals secured to the insulating-body, and electrical conductors connected with the terminals, of a socket formed or provided with a notched flange for admitting the body, and retaining the same by the engagement of the lugs with the flange and terminals secured within the socket, as set forth.

2. The combination, with a cord or cable and a plug provided with contact-terminals and having lugs or ears on its sides, of a socket with a flanged rim with notches cut therein, and terminals secured within the socket, all as set forth.

3. The combination, with a plug, G, having ears or lugs L L, terminal plates *g k*, and a cable containing conductors connected therewith, of a socket having the flanged and notched cover H, and spring contact-terminals E F, all as set forth.

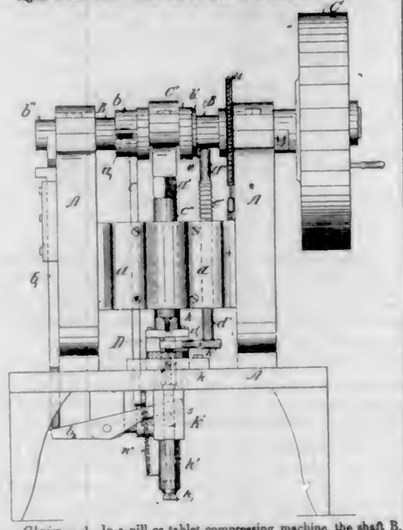
298,327. INCANDESCENT-LAMP FIXTURE. EDWARD WESTON, Newark, N. J., assignor to the United States Electric Lighting Company, New York, N. Y. Filed Oct. 31, 1883. (No model.)

Claim.—1. The combination, with the stem and branches of a chandelier, of metal plates arranged within a box or casing from which the branches extend, a central plate in said box, means for connecting the plates with fusible safety-strips, and conductors arranged within the chandeliers, and connected in the manner set forth.

2. The combination, with the stem and branches of a chandelier, of metal plates with spring seats or rests arranged within the box from which the branches extend, a central plate in said box with spring seats or rests, means for connecting the spring-seats with fusible safety-strips, and conductors arranged within the chandelier, and connected in the manner set forth.

3. The combination, with the stem of a chandelier, a box, and branches extending therefrom, of spring-seats forming terminals of severed branch circuits running through the arms or branches of the chandelier, a cover with slots for the introduction of safety-strips for joining the spring-seats, and means for retaining the strips in place, as herein set forth.

4. The combination, with the stem A, box B, and branches C of a chandelier, of the metal plates L, the central plate, G, means for connecting the central plate, G, with the plates L by fusible metallic strips, and conductors connected in the manner herein described.



5. The combination, with the box B and branches C, of a plate, H, of insulating material, plates L, with spring rests or seats, central plate,

G, with corresponding rests or seats, slotted cover D, fusible safety-strips V, slides T, and conductors for completing the electrical connections, as described.

6. A holder for safety-strips for electric circuits, consisting of metal plates with spring rests or seats forming the terminals of a severed circuit, and contained in a box or casing, in combination with a slotted cover and a slide, or its equivalent, for retaining the strips when placed across the spring-rests, as set forth.

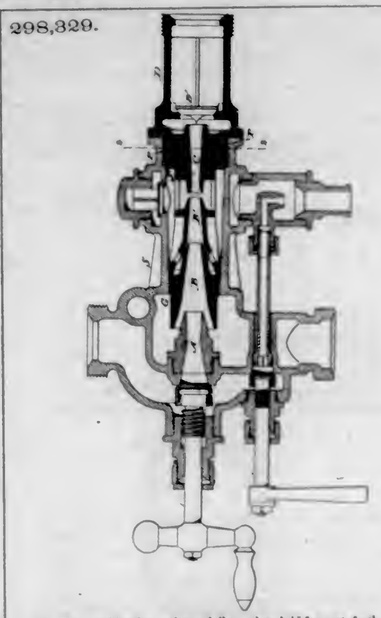
7. The combination, with a box or casing, B, and branches C of a chandelier, of rests or seats forming terminals of severed circuits running through the branches, and slotted cover D, with slides T, arranged for the insertion and retention of safety-strips for completing the circuits within the box, as and for the purpose specified.

298,328. MACHINE FOR MAKING PILLS, TABLETS, &c. AUGUST H. WIRZ and AUGUST V. W. RAUSCH, Philadelphia, Pa.; said Rausch assignor to said Wirz. Filed Oct. 30, 1883. (No model.)

Claim.—1. In a pill or tablet compressing machine, the shaft B, having thereon the crank C', cams *b* and *b''*, in combination with the pivoted lever *c*, operated by the cam *b*, and thus moving the sliding gage D, the vertical sliding bar b_1, the lever b_2, operating the lower plunger, *k'*, and the shaft *c''*, carrying the upper plunger, *k*, all substantially as and for the purpose described.

2. In a pill-compressing machine, the shaft B, connected with suitable operating means, and having thereon the crank C', cams *b b''*, in combination with the shaft *c''*, having the plunger *k*, the sliding gage or measure D, operated by the lever *c*, the plunger *k'*, operated by the vertical sliding bar *b'*, and the cylinder *h*, all substantially as shown.

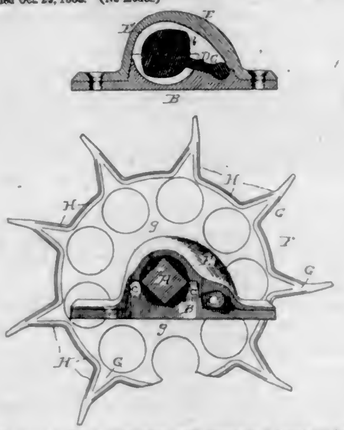
3. In a pill-compressing machine, the plungers *k k'*, operating from opposite directions in the hollow cylinder *h*, the sliding gage D, in combination with the magazine *g*, the bar *d''*, having the finger d_1, and driving-shaft B, all substantially as shown.



4. In a pill or tablet compressing machine, the plungers *k k'*, operating toward each other from opposite directions, and the hollow cylinder *h*, in combination with the finger d_1, connected with suitable operating mechanism for moving the said finger back and forward, thus knocking the finished pill or tablet from off the top of the lower plunger, substantially as shown.

298,329. INJECTOR AND EJECTOR. JOSEPH WOTAPEK, New York, N. Y., assignor to the Nathan Manufacturing Company, same place. Filed Mar. 5, 1884. (Model.)

Claim.—1. The combination, with the shell or body and the nozzles to be withdrawn, of a nozzle-holder screwed to the shell and connected to the nozzles, substantially in the manner hereinbefore set forth, so that while the two shall move longitudinally bodily and together the holder may rotate independently of the nozzles.

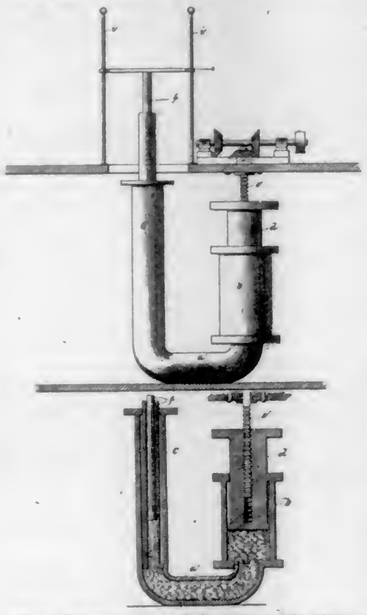


2. The combination, with the nozzles to be withdrawn, of the shell having that portion of its interior which surrounds said nozzles made conical or flaring without recess or depression, so as to gradually increase in diameter toward the delivery end, substantially as and for the purposes hereinbefore set forth.

298,329.

3. The combination, substantially as hereinbefore set forth, of the nozzles to be withdrawn, the shell or body having that portion of its interior which surrounds said nozzles made conical or flaring, so as to gradually increase in diameter toward the delivering end, and the nozzle-holder screwed to the shell or body and connected with the nozzles, substantially in the manner described, so that while the two shall move longitudinally bodily and together the holder may rotate independently of the nozzles.

298,330. CHAIN-PUMP FIXTURE. ARTHUR S. WRIGHT, Moline, Ill. Filed Oct. 29, 1883. (No model.)



Claim.—1. The combination, with the shaft A, having a journal provided with a cam, *b*, of an oscillating pin, C, having a stud, D, adapted to bear against the periphery of said cam and permit said shaft to revolve in one direction, but preventing a reverse motion thereof.

2. The combination, with the shaft A, having a journal provided with a cam, *b*, of an oscillating pin having a stud projecting therefrom, which bears against the periphery of said cam in such position as to permit said shaft to revolve but in one direction, and having a lateral projection extending from the end thereof, by means of which said pin may be oscillated and a reverse motion of said shaft obtained.

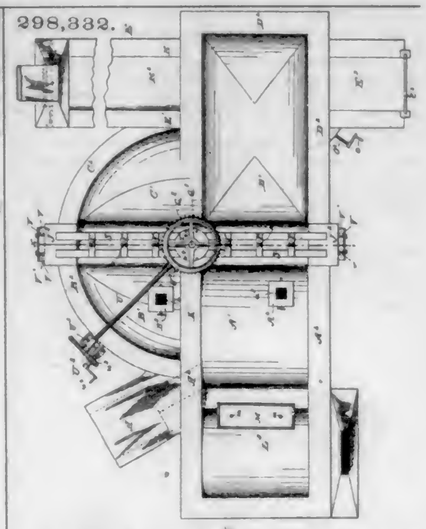
3. The combination of the shaft having a bearing-surface on which is a cam, an oscillating pin having a stud projecting therefrom, and a pillow and cap of the bearing properly recessed, so as to afford protection and permit of the operation of said cam, pin, and stud projecting therefrom within the same.

4. A sprocket-wheel for chain-pumps having forked sprockets, the outer edges of which are re-enforced by a bead which traverses the edges of the rim of said wheel between and is continuous from sprocket to sprocket of said wheel, substantially as and for the purpose set forth.

298,331. ELEVATOR. CHARLES A. YOUNGMAN, Louisville, Ky. Filed Oct. 29, 1883. (No model.)

Claim.—The combination, with the U-shaped fluid-cylinder *a*, constructed substantially as described, having the short diametrically-enlarged branch *b* and the long branch *c*, the elevator-shaft *f*, connecting at its upper end to the platform of the elevator, and telescoped in the said branch *c*, of the piston *d*, screw-shaft *e*, and means for operating the piston to compress the fluid in the fluid-cylinder and raise the platform-shaft, substantially as specified.

298,332. FLATTING AND ANNEALING OVEN FOR GLASS. THEODOR A. ZELLERS, Ottawa, Ill., assignor to the Ottawa Glass Company, same place. Filed Dec. 7, 1883. (No model.)



Claim.—1. The combination, with the heating-chamber of a flatting-oven, and with a gas-generator communicating therewith, of means for introducing steam into the gas before the admission of the gas into the heating-chamber, substantially as described.

2. The combination, with the heating-chamber of a flatting-furnace, a gas-generator, and passages connecting the generator with the heating-chamber, of means for introducing water into the generator, whereby steam is mixed with the gas previous to its introduction into the heating-chamber, substantially as described.

3. The combination, with the heating-chamber of a flatting-oven, of a gas-generator located adjacent thereto, and provided with a gas-chamber, L^2, passages connecting the gas-chamber with the heating-chamber, a water-tank, and a valved pipe connecting said tank with the said gas-chamber, substantially as and for the purposes set forth.

4. The combination, with the heating-chamber of a flatting-oven, of a gas-generator provided with a chamber, L^2, a water-reservoir provided with a pipe extending through the upper wall of said chamber L^2, and a receptacle, M', located within the chamber beneath the exit-opening of said pipe, substantially as and for the purpose set forth.

298,332.

5. The combination, with the heating-chamber of a flatting-oven, a gas-generator, and passages connecting the generator with the heating-chamber, of a revolving wheel or table constructed to support a series of flatting-stones, and forming the bottom of the chamber, said table being provided with apertures *g*, for the admission of air to said chamber, substantially as described.

6. The combination, with the heating-chamber of a flatting-oven, a cooling-chamber located adjacent thereto, and a revolving wheel or table constructed to support a series of flatting-stones, and forming the bottoms of said chambers, of a closed chamber located over the said table between the chambers above mentioned, substantially as and for the purpose set forth.

7. The combination, with the heating and cooling chambers of a flatting-oven, and a revolving table forming the bottoms of the said chambers, and constructed to support a series of flatting-stones, of a closed chamber located over the said table between the chambers mentioned, and provided with a flue or passage having a suitable damper, whereby the temperature in said chamber may be regulated, substantially as described.

8. The combination, with the heating-chamber A of a flatting-oven, a leer or annealing-oven, a cooling-chamber, D, communicating with the leer, a closed chamber, B, and a revolving table, G, constructed to support a series of flatting-stones, and forming the bottoms of the several chambers mentioned, of a chamber, C, located between the chambers B and D and opening into the latter, said chamber C having a low roof constructed to confine the heat to the surface of said stones, and to prevent the too rapid cooling of the glass thereon, substantially as described.

9. The combination, with the heating-chamber of a flatting-oven, a leer or annealing-oven provided with track-rails, a car for supporting the glass within the leer, a cooling-chamber, D, communicating with the leer, and a rotating wheel or table constructed to support a series of flatting-stones, and forming the bottoms of the chambers mentioned, of a turn-table located within the chamber D, adjacent to the flatting-stones, and constructed to receive the car, whereby said car may be turned to a desired position for placing the sheets of glass thereon, substantially as described.

10. The combination of the heating-chamber of a flatting-oven, a leer, a cooling-chamber, D, communicating with the leer, a revolving table constructed to support a series of flatting-stones, and forming the floor of the said heating-chamber and of the chamber D, a car, tracks arranged longitudinally within the leer for supporting the car, a turn-table within the chamber D, and means for rotating said turn-table from the exterior of the oven, substantially as described.

11. The combination, with a flatting-oven, of an annealing-oven or leer communicating with said flatting oven, and cars for supporting the sheets of glass within the leer, the said leer being constructed with a roof which is flat upon its under side, whereby the heated air within the leer is retained in proximity to the sheets of glass upon the cars, substantially as described.

12. The combination, with the walls of a flatting-oven having two or more chambers, and a revolving table or wheel constructed to support a series of flatting-stones within the oven, of a supporting-arch, J', located between the said walls and over said table, a metal casting, P, forming the keystone of the arch, horizontal beams or mantels resting at their outer ends on the side walls of the oven and supported at their inner ends by said casting, and a suitable roof or covering supported upon the outer walls of the oven and upon the said arch, and constructed to form the chambers of the oven, substantially as described.

13. The combination, with the side walls of a flatting-oven, and the revolving table G, for supporting a series of flatting-stones, and a shaft, G^2, constructed to support said table, of an arch, J', located between the side walls of the oven and over the said table, a casting, P, forming the keystone of the arch, and constructed to afford passage for the vertical shaft G^2, horizontal beams or mantels Q, supported at their outer and inner ends by the side walls and the casting P, respectively, and a filling, R, between the arch and the said beams, substantially as described.

14. The combination, with the side walls of a flatting-oven, and a revolving wheel or table, G, of a casting, P, means constructed to support said casting from the walls of the oven, horizontal beams or mantels Q, supported at their outer ends by the said walls and at their inner ends by the casting P, girders S, located over the top of the furnace and supported upon the side walls thereof, and rods *s*, constructed to support the said mantels from the girders intermediately of their ends, substantially as described.

15. The combination, with the side walls of a flatting-oven, and a revolving wheel or table, G, of an arch, J', a casting, P, forming the keystone of the arch, horizontal beams or mantels Q, supported at their inner ends by the said casting, girders S, located over the furnace and supported upon the side walls thereof, rods *s*, connecting said mantels and girders, and rods *t*, connecting the girders with the casting P, substantially as described.

16. The combination, with the side walls and revolving table of a flatting-furnace, of hollow beams or mantels Q, for supporting the partitions over said wheel, and passages connecting the hollow interior of said mantels with the outer air, substantially as described.

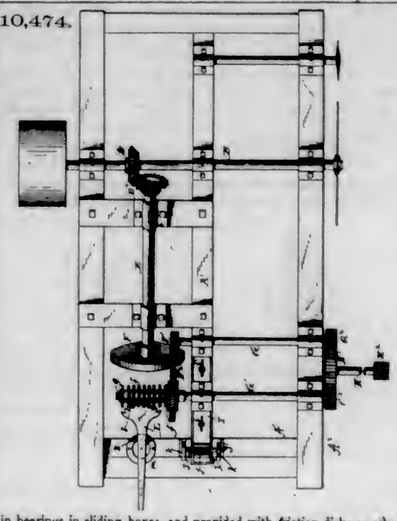
17. The combination, with the outer walls and revolving table of a flatting-oven, of a drum, P, located centrally over said table, means constructed to support said drum from the side walls of the furnace, hollow mantels Q, supported at their outer ends by the side walls of the furnace and at their inner ends by said drum, and passages connecting the hollow interior of said mantels at their outer ends with the open air, and at their inner ends with the interior of the drum, substantially as and for the purpose set forth.

18. The combination, with the outer wall and revolving table of flatting-oven, a hollow mantel, Q, supported at its outer end by the said wall, means for supporting the inner end of the mantel, girders S, and rods *s*, connected with said mantel and girders, of a partition-wall located above said mantel, and provided with passages surrounding said rods, and communicating with the interior of the mantel and with the open air, substantially as and for the purpose set forth.

19. The combination, with the outer walls and revolving table of a flatting-furnace, and the partition-wall J, of the hollow mantels Q, girders S, supported by the outer walls of the furnace, rods *s*, connected with said girders and mantels, and tubes s^3, located within the partition-wall around the rods and communicating at their lower ends with the interior of the mantels, and passages connecting the ends of said mantels with the outer air, substantially as and for the purpose set forth.

20. The combination, with the partition-wall J, of mantels Q, provided with apertures q', having slotted extensions q^3, supporting-rods *s*, having beads s^3, and vertical apertures in said wall communicating with said apertures q' and surrounding the rods, substantially as and for the purpose set forth.

REISSUES.



10,474. CIRCULAR SAW MILL. WALTER J. F. LIDDELL, Charlotte, N. C. Filed Dec. 5, 1883. Original No. 274,129, dated Mar. 20, 1883.

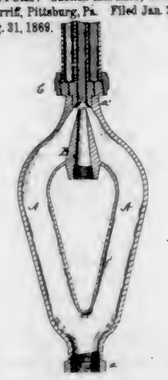
Claim.—1. The combination, in a saw-mill feed mechanism, of a friction wheel or disk, F, secured to its actuating-shaft, and the shafts G G', geared to the carriage and provided with friction wheels or disks arranged to bear upon the opposite faces of the disk F, and adapted to be moved together laterally—the one into and the other out of contact with said disk—by the joint lateral movement of their shafts, substantially as described.

2. In a saw-mill-carriage feed mechanism, the combination, with the saw-mandrel, of a shaft geared to said mandrel, and provided with a friction wheel or disk, F, secured to one end thereof, two parallel shafts, G and G', geared to the carriage, and provided with friction-wheels F' and F^2, arranged upon the same side of the axis, and to bear upon the opposite faces of disk F, and means for moving said friction-wheels F' and F^2 for reversing the feed of the carriage, substantially as described.

3. The shaft E, geared to and actuated by the saw-mandrel, and provided with a friction disk or wheel, F, in combination with the shafts G and G', geared to and operating the carriage, said shafts being mounted

10,474.

in bearings in sliding boxes, and provided with friction disks or wheels F' and F^2, arranged on opposite sides of and adapted to be moved into or out of contact with the disk F, substantially as and for the purpose described.



4. The combination, in a saw-mill feed mechanism, of a friction wheel or disk, F, secured to the end of its actuating-shaft, and the shafts G G', supported by bearings fixed to the frame at their ends nearest to the carriage, to gear therewith, provided with friction-wheels, and journaled at their opposite ends in a sliding bearing-block, I, substantially as and for the purpose described.

5. The combination, in a saw-mill-carriage feed mechanism, of the friction-disk F, secured to one end of a shaft geared to and driven by the saw-mandrel, the friction-disk F^2, mounted upon a shaft at right angles to the shaft E of disk F, and geared to the saw-mill carriage, said disk F^2 being made adjustable on its shaft across the face of the disk F, and means for adjusting said disk F^2 lengthwise of its shaft.

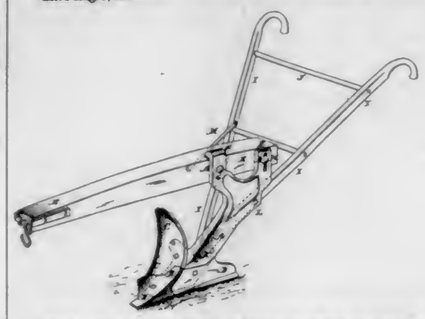
6. The combination, in a saw-mill feed mechanism, of a friction-disk secured to a shaft actuated by the saw-mandrel, friction-wheels arranged upon opposite sides of said disk, secured to shafts geared to and actuating the saw-mill carriage, and mounted in movable bearings, and means for adjusting one of the friction-wheels independently of the other across the face of the disk, substantially as described.

7. The combination, in a saw-mill-carriage feed mechanism, of the friction wheel or disk F^2, made adjustable across the face of its actuating-disk F, for varying the feed of the carriage, and provided with a hub or sleeve having annular cogs or teeth, a lever provided with a toothed segment engaging with said toothed hub or sleeve for adjusting said disk on its shaft, and means for holding said lever at any desired adjustment, substantially as described.

10,475. STEAM-PUMP. GEORGE MCFEELY, Steubenville, Ohio, assignor to William J. Sherriff, Pittsburg, Pa. Filed Jan. 24, 1884. Original No. 94,426, dated Aug. 31, 1869.

Claim.—1. The steam-pipe B, in combination with the curved pipes A A, joined at their upper and lower ends, for connecting with the suction and discharge pipes, and bush C, having a short pipe or tubular extension at its outer end, all arranged substantially as described.

2. The combination, in a steam-pump, of curved outer pipes, joined at their upper and lower ends, with a steam-pipe arranged at or near the upper point of junction, and a bush arranged in the discharge end and provided with a short pipe or tube extending into the discharge-pipe, substantially as described.



10,476. LOCKING-NUT. GENERAL W. SAMPSON, Springfield, Iowa. Filed Feb. 4, 1884. Original No. 289,143, dated Nov. 27, 1883.

Claim.—1. In lock-nuts, the combination of a dog or block and a spring acting on the dog with a nut having an inclined recess, whereby the dog is pressed against the surface of the bolt, substantially as shown and described.

2. The combination, with a nut having a recess, *a*, of dog C and spring *b*, substantially as described.

10,477. PLOW. ARABELLA G. STARKE, Richmond, Va., Executrix of Patrick H. Starke, deceased. Filed Feb. 29, 1884. Original No. 117,574, dated Aug. 1, 1871.

Claim.—The plow-standard A, having a front bearing or projection flanged to overlap the top of the beam, in combination with the bearing-plate F, adjustable in the recessed rear bearing or projection of the standard, said bearing being adapted to receive studs G H, to secure the beam to said standard and enable said beam to be turned on a center in the forward bearing, and thereby regulate the depth of the plow.

PHOTO-LITH. NORRIS PETERS WASHINGTON, D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

U. S. Circuit Court—District of Vermont.

VERMONT FARM MACHINE COMPANY *et al.* v. MARBLE, COMMISSIONER OF PATENTS.

Decided October 11, 1883.

1. The case of *Campbell* v. *James* must be construed to forbid the patenting of an invention by a party who has already patented the same invention, and not merely described it in a patent. The statute does not make prior description in a patent a bar, but being patented. (Sections 4886, 4887, and 4920.)
2. Where four claims of an applicant have been rejected solely on the ground of their subject-matter being described in a patent granted to the same party before the date of filing of the application, *Held* that the rejection is erroneous, and the applicant is entitled to a patent embracing such claims.

Mr. William E. Simonds and *Mr. Kittridge Haskins* for the orators.

WHEELER, *J.*:

The orators, on March 30, 1880, filed an application for a patent for improvements in milk-setting apparatus, consisting, as finally amended, of nine claims, the last five of which have been allowed. The first four have been refused because described although not claimed in a prior patent to the same inventors, No. 207,738, dated September 3, 1878. Prior public use to bar the patent is denied on oath by the applicants and is not shown. The refusal rests solely apparently on the prior description and *Campbell* v. *James*, (104 U. S., 356.) What is said in that case, taken at large, would seem to show that a patent could not be granted for an invention described in a former patent to the same inventor. What was so spoken of there had been not only described but patented in the former patent. What was said is to be understood by reference to what it was spoken of. That part of that case relied upon in this rejection is where it is said—

> It is hardly necessary to remark that the patentee could not include in a subsequent patent any invention embraced or described in a prior one granted to himself any more than he could an invention embraced or described in a prior patent granted to a third person. Indeed, not so well, because he might get a patent for an invention before patented to a third person in this country, if he could show that he was the first and original inventor, and if he should have an interference declared. (Section 382.)

The latter part of this extract relates to the same subject as the former part. It expressly refers to patented inventions by others, and seems to show that patented inventions by the same inventor were intended when inventions embraced or described in his prior patent were referred to. The statute does not make prior description in a patent a bar, but being patented. (Sections 4886, 4887, and 4920.)

The court appears to have merely referred to the plain effect of these statute provisions. In *Battin* v. *Taggart* (17 How., 74) it appears to have been expressly adjudged, upon the same statute provisions as are in force now, that an inventor might have a patent for an invention described in a prior patent to himself. The same seems to have been decided in *Graham* v. *McCormick* (XI Fed. Rep., 859) on full argument and much consideration.

According to the terms of the statutes the orators seem to be entitled to the patent for these claims. There does not appear to be any settled construction to control otherwise.

Let there be a decree for the applicant adjudging that he is entitled to receive a patent for the inventions covered by these first four claims of his application.

U. S. Circuit Court—Northern District of New York.

SWIFT *v.* JENKS *et al.*

Decided March 3, 1884.

1. NON-CLAIM OF APPARENT DEVICE—ABANDONMENT.
   The omission by an inventor to claim a combination or device apparent upon the face of his patent amounts to a dedication of the neglected contrivance to the uses of the public.
2. INJUNCTION—NOT TO ISSUE WHEN IT WOULD WORK INJUSTICE.
   An injunction should not issue when it would work great harm to one party without corresponding benefit to the other, at least where adequate protection can be afforded by other means.

MOTION for preliminary injunction.

Messrs. Duell & Hey for the complainant.
Mr. Neri Pine for the defendants.

COXE, *J.*:

This is a motion for a preliminary injunction. The complainant is the inventor of an alleged improvement in lubricators, for which letters patent were issued August 28, 1883. The claims in controversy are as follows:

> 5. In combination with the steam-condensing duct and its horizontal extension *c*, the lubricant-cup composed of metal and provided in front of the duct-extension *c* with an observation-port, *r*, covered with a transparent plate, substantially as and for the purposes set forth.
> 6. In combination with the oil-cup of a lubricator, the port *r*, covered by a glass plate, and the pipe or tube *c*, having an inclined end or face, substantially as set forth.

Prior to this time, and on the second day of May, 1882, letters patent for a similar invention were issued to the defendants. An interference was declared, and after a thorough investigation the examiners and Commissioner concurred in deciding that the complainant was the prior inventor. But the proceedings in the Patent Office determined more. Upon defendants' motion to dissolve the interference the Commissioner was required to pass upon the question whether or not the subject-matter claimed was patentable. Various references, which, as was urged by the defendants, anticipated the complainant's invention, were presented, and

although the Examiners-in-Chief and the Commissioner were not in accord upon this question, it cannot be denied that the issuing of the patent was, to the extent that the question was there investigated, a decision in favor of the complainant. The proceedings in the Patent Office having, as between these parties, determined, first, that the complainant was the prior inventor, and, second, that the subject-matter of the patent was not void for want of novelty, the complainant would be entitled, if there were no other considerations, to the injunction prayed for, there being no dispute as to the infringement. *Smith* v. *Halkyard*, 16 Fed. Rep., 414; *Shuter* v. *Davis*, Id., 564. But the defendants again insist that the patent is void for want of patentable novelty, and in support of this defense they produce various references not presented to the examiners. They also produce affidavits tending to show that one Giles was the original inventor of the patented device or combination. But the argument having the most weight with the court is the one based upon the complainant's prior patent of March 21, 1882. It is urged that he there fully discloses the subject-matter of claim 5, *supra*. The language of the specification is as follows:

> It is not essential that the cylinder should be wholly of glass so long as that portion directly opposite the end of the tube or pipe E is transparent, to expose to view the end thereof * * * the cylinder may be constructed of metal, with a window or "sight" on a line opposite the tube or pipe.

The metal cylinder with the glass observation-port opposite the end of the tube was not claimed in the March patent, and the language of Mr. Justice Bradley in *Miller* v. *Brass Co.* (104 U. S., 352) is therefore applicable:

> But it must be remembered that the claim of a specific device or combination, and an omission to claim other devices or combinations apparent on the face of the patent, are in law a dedication to the public of that which is not claimed. It is a declaration that that which is not claimed is either not the patentee's invention, or, if his, he dedicates it to the public.

It is argued for the complainant that the patent in suit is not for a particular device, but for a combination, and that, construed most favorably for the defendants, the March patent discloses but one element of that combination. This contention presents for consideration a number of questions not argued upon the motion, but which may perhaps be sufficiently suggested by an examination of *Slawson* v. *Grand St. R. R.*, (107 U. S., 649; S. C., 2 Sup. Ct. Rep., 663,) and other like authorities. Although the papers presented on this motion have been carefully examined, it is not the purpose of the court to discuss the defenses referred to at this time or express an opinion regarding them; they should be disposed of only after careful consideration on final hearing. They are mentioned here simply to show that the defendants have succeeded in raising a sufficient doubt as to the validity of the complainant's patent to induce the court to withhold the writ asked for provided the complainant's right can be fully protected without resort to so positive a remedy. Where an injunction will work great injury to one party without corresponding benefit to the other, it should not ordinarily issue, especially where adequate protection can be had without it.

An injunction should issue unless the defendants, within fifteen days after service of a certified copy of the order entered upon this decision, shall give a bond with two or more sureties, to be approved by a commissioner of this court, conditioned to keep an account of all the lubricators manufactured and sold by them, and to file such account, duly verified, once a month in the office of the clerk of this court, and to pay the amount of any final decree which may be awarded against them, the penalty of the bond to be in such sum as may be agreed on by the parties; or, if they are unable to agree, as may be fixed by the court upon proof by affidavit or otherwise of the extent of the defendants' business.

U. S. Circuit Court—District of Vermont.

VERMONT FARM MACHINE COMPANY *et al.* v. MARBLE, COMMISSIONER OF PATENTS.

Decided April 16, 1884.

Where a bill in equity is brought to obtain a patent (under section 4915 R. S.) in the district of Vermont, and the Commissioner of Patents accepts service, *Held* that by such acceptance the Commissioner consented to be found in said district, and his act in this respect is binding upon his successor.

MOTION for a rehearing.

Mr. Frank T. Brown for the Commissioner of Patents.
Mr. William E. Simonds for the orators.

WHEELER, *J.*:

The bill was brought for an adjudication that the orators were entitled to a patent pursuant to Section 4915 Revised Statutes. The defendant accepted service of the subpœna to have the same effect as if duly served on him by a proper officer, and acknowledged receipt of a copy, but did not appear in court nor make any objection to proceeding to decree. After hearing the orators a decree was made and entered in their favor. (19 Fed. Rep., 307.) The present Commissioner now moves for a rehearing, principally upon the ground of alleged want of jurisdiction of this court. One mode of attempting to show that this court has not jurisdiction is by claiming that the Supreme Court of the District of Columbia has exclusive jurisdiction. The language of this section, however, seems to preclude this idea. It reads:

> Whenever a patent, on application, is refused, either by the Commissioner of Patents, or by the Supreme Court of the District of Columbia upon appeal from the Commissioner, the applicant may have remedy by bill in equity.

This seems to clearly imply that the remedy may be elsewhere. (*Whipple* v. *Minor*, 15 Fed. Rep., 117.) Another, and the principal mode, is by claiming that no circuit court of a district away from the Patent Office, and in which the Commissioner does not reside, can acquire jurisdiction of such cases. The circuit courts have original jurisdiction: "Ninth. Of all suits at law or in equity arising under the patent or copyright laws of the United States." (Rev. Stat., sec. 629.) This is unquestionably a suit so arising. There is no restriction upon proceeding in these courts in such cases, except that civil suits against inhabitants of the United States are not to be brought by original process in any other district than that in which the defendant resides or is found at the time of service. (Rev. Stat., 739.) The court had general jurisdiction of this subject, and the defendant, by his acceptance of service, consented to be found in this district, and did not appear in court to object to being bound by his consent.

In *ex parte Schollenberger* (96 U. S., 369) Mr. Chief Justice Waite, in delivering the opinion of the Court, says:

> The act of Congress prescribing the place where a person may be sued is not one affecting the general jurisdiction of the courts. It is rather in the nature of a personal exception in favor of a defendant, and one which he may waive. If the citizenship of the parties is sufficient, a defendant may consent to be sued anywhere he pleases, and certainly jurisdiction will not be ousted because he has consented.

Here no question was made before; now when one on this subject is made, it is not whether the Commissioner can be compelled to answer, but whether he can consent to be sued away from the seat of Government and his residence. *Prentiss* v. *Ellsworth* (Mirror of Pat. Off., 35; Law's Dig., 103; Wharton's Dig., 365) raised the question as to the compulsion, and not as to the consent, and it was held upon apparently sound reasoning by Judge Randall that the Commissioner could not be compelled by process issuing out of the Circuit Court for the Eastern District of Pennsylvania to answer there. The question of jurisdiction founded on consent did not arise. It is further objected against the jurisdiction here that the court here could not compel obedience of the Commissioner of Patents at the Patent Office to its decree. It is to be presumed, however, that a high officer of a department of the Government will do his duty without compulsion, or even command, from any quarter, especially in a matter where he has no interest, nor the Government any, except that the duty be done. This provision of the statute is framed according to this view. The court does not decree that the Commissioner shall issue a patent, but only "may adjudge that such applicant is entitled, according to law, to receive a patent for his invention as specified in his claim, or for any part thereof, as the facts in the case may appear; and such adjudication, if it be in favor of the right of the applicant, shall authorize the Commissioner to issue such patent," &c. Granting the permission expressed the will of Congress, which would be sufficient. Neither the adjudication or issuing the patent under it will conclude any individual rights. The validity of the patent will be open to trial under the law. But if it is not granted, no suit for infringement can be brought, and the right to the invention cannot be judicially tested. This jurisdiction has been exercised without challenge, except in *Prentiss* v. *Ellsworth*, before cited. *Ellithorpe* v. *Robertson*, 2 Fish., 83.

As this case is now considered, the jurisdiction upon the consent of the Commissioner seems to be ample. The question involved in the case on the merits was purely one of law, requiring the production of no models or exhibits, and no personal attendance, and might well be submitted anywhere. Whether under the circumstances it should be submitted here rested in the discretion of the Commissioner. His act in this respect is binding upon his successor like any other lawful act, and it oppresses no one. This ground presents no reason that appears to be sufficient for opening the case. All the grounds now urged on the merits of the application for the patent were fully considered before, and no sufficient reason appears for going over the ground again.

The motion is denied.

U. S. Circuit Court—Eastern District of Pennsylvania.

PRENTISS v. ELLSWORTH, THE LATE COMMISSIONER OF PATENTS.

Decided April 11, 1846.

1. When the sections of the statute are construed together, it is held that when there are two interfering patents the circuit court of the district whereof the defendant is an inhabitant or where he may be found is the court "having cognizance," and where an original application for a patent has been refused and a remedy is sought in equity, and the process is to be served on the Commissioner of Patents, then the Circuit Court of the District of Columbia is the proper tribunal to entertain the suit.
2. An objection to the jurisdiction of the circuit court in Pennsylvania is that it has no mode of enforcing obedience to its decree, since the circuit courts outside of the District of Columbia have no authority to issue a writ of mandamus to an officer of the United States commanding him to do a ministerial act.

STATEMENT OF THE CASE.

The complainant filed his bill complaining that the defendant as Commissioner of Patents had refused to grant him a patent for certain improvements made by him in the art of weaving goods of various kinds, and prayed the court should by decree order the letters patent prayed to be issued. The defendant filed a plea to the jurisdiction and a general demurrer to the bill. Mr. B. H. Brewster, for Commissioner of Patents, maintained that the court has no jurisdiction; that the defendant did not reside and was not within its jurisdiction at the time process issued. (Act of Congress, sec. 11, 1839.) The only court that can have jurisdiction at any stage of proceedings to obtain a patent is the Circuit Court of the District of Columbia. (Acts of 1801 and 1815, 4 Cranch, 421; 5 Cranch, 288; 8 Wheaton, 699; 7 Cranch, 202; 1 Peters, C. C. R., 489.) Unless the court has jurisdiction under the patent laws or by some other act of Congress, the bill must be dismissed. (5 Cranch, 173; 1 Wash., 232; 4 Dallas, 7.) The patent laws contain no provision investing the circuit courts with such authority. The policy of the law is against the exercise of this authority. The Commissioner would be exposed to endless trouble and inconvenience. He would be compelled to answer at the same time at different points of the Union, and, if the prayer of the bill were granted, to carry with him the models, books, papers, and documents that are of record in the office at Washington, when thereby the public interests would require them to be in the custody of the Department at the seat of Government. (2 Kent, 355 to 372; Phillips on Patents, 313, 57, 379.) The law furnishes a remedy for the errors of a hasty examination of an application for a patent. (Sec. 7 of act of 1836.) The complainant must strictly conform to the provisions of that act before he can apply for the intervention of a court of equity, even had this court jurisdiction, and he must aver in his bill that he has conformed to the provisions of the law. That he has not done. The bill does not state that he has complied with the provisions of the act of 1839. (Peters, C. C. R., 356; 3 Howard, 441.) The Commissioner of Patents is the judge created by law to decide upon these questions. To him must application be made and renewed after a certain formal method laid down in the act, and this court could not now assume to decide the question even had it concurrent jurisdiction, much less when the exclusive jurisdiction is vested in the Commissioner. (9 Wheaton, 532; 1 Paine, 620.) This court has no power to enjoin or command an officer of the General Government residing at Washington to perform any act. How, then, could it enforce its decree? (1 Kent, 322; 3 Dallas, 42; 9 Peters, 574, 602; 8 Peters, 306; 12 Peters, 524; 13 Peters, 279; 7 Peters, 634; 7 Cranch, 577.)

Mr. Waln, in reply, said:

> If the court has no jurisdiction, then the party aggrieved is without remedy. The argument *ab inconvenienti* can never be urged to deprive man of his rights and all legal protection. The jurisdiction is expressly given by the sixteenth section of the act of 1836 and tenth section of the act of 1839. The law provides that expenses shall be paid by complainant in contemplation of the inconvenience to which the Commissioner might be subjected in complaints like this. If parties are confined to the courts of the District of Columbia, then they could not have the decrees of the courts enforced in any other part of the United States except in their local jurisdiction. It is a narrow construction of the law to oust the jurisdiction.

RANDALL, *J.*:

The bill in this case charges that on or about the 8th day of March, 1843, the complainant entered a caveat in the Patent Office of the United States describing cer-

tain improvements made by him in the art of weaving, and that on or about the 8th day of August, 1844, he referred his petition to the Commissioner of Patents, wherein he represented that he had invented certain new and useful improvements in the apparatus for weaving goods of various kinds, and did therein claim as new, as specified in the bill. The bill further charged that the complainant, having in all things complied with the terms and conditions of the act of Congress in such cases made, having furnished specifications, drawings, and models, and paid into the Treasury the legal fee, he did pray that letters patent of the United States might be granted, vesting in him and his legal representatives the exclusive right to the said invention, &c., and that the Commissioner, intending, &c., absolutely refuses to comply with the said reasonable request. After stating the formal excuses or pretenses and propounding certain interrogatories, the orator prays that a copy of the bill may be served on the Commissioner of Patents, and that he may be required to answer, to produce the specification, model, drawing, and claim, and that the court will order and decree that the letters patent be issued, as specified in his claim. To this bill the defendant has filed a special plea, denying the jurisdiction of this court, "because," he says, "the supposed causes of complaint, and each and every of them, accrued out of the jurisdiction of this court, and that the said defendant, Commissioner as aforesaid, was not found within the jurisdiction of the court at the time of serving the writ in this complaint, nor was he an inhabitant within the jurisdiction of this court at the time of serving the writ of subpœna on this complaint, and that he is not liable, as Commissioner as aforesaid, to the jurisdiction of this court." He has also filed a general demurrer to this bill. It is admitted that unless the jurisdiction is given by the sixteenth section of the act of July 4, 1836, (4 Story, 25, 11,) and the tenth section of the act of March 3, 1839, (9 Laws U. S., 1020,) the complainant cannot have the relief prayed for in this court.

By the seventh section of the act of 1836 it is enacted—

That on the filing of any such application, description, and specification, and the payment of the duty hereinafter provided, the Commissioner shall make or cause to be made an examination of the alleged new invention or discovery; and if on any such examination it shall not appear to the Commissioner that the same had been invented or discovered by any other person in this country prior to the alleged invention or discovery thereof by the applicant, or that it had been patented or described in any printed publication in this or any foreign country, or had been in public use or on sale with the applicant's consent or allowance prior to the application, if the Commissioner shall deem it to be sufficiently useful and important, it shall be his duty to issue a patent therefor. But whenever on such examination it shall appear to the Commissioner that the applicant was not the original and first inventor or discoverer thereof, or that any part of that which is claimed as new had before been invented or discovered, or patented or described in any printed publication in this or any foreign country, as aforesaid, or that the description is defective and insufficient, he shall notify the applicant thereof, giving him briefly such information and references as may be useful in judging of the propriety of renewing his application or of altering his specification to embrace only that part of the invention or discovery which is new. In every such case, if the applicant shall elect to withdraw his application, relinquishing his claim to the model, he shall be entitled to receive back twenty dollars, part of the duty required by this act, on filing a notice in writing of such election in the Patent Office, a copy of which, certified by the Commissioner, shall be a sufficient warrant to the Treasurer for paying back to the said applicant the said sum of twenty dollars; but if the applicant in such case shall persist in his claim for a patent, with or without any alteration of his specification, he shall be required to make oath or affirmation anew in manner as aforesaid; and if the specification and claim shall not have been so modified as in the opinion of the Commissioner shall entitle the applicant to a patent, he may, on appeal and upon request in writing, have the decision of a board of examiners, to be composed of three disinterested persons, who shall be appointed for that purpose by the Secretary of State, one of whom at least to be selected, if practicable and convenient, for his knowledge and skill in the particular art, manufacture, or branch of science to which the alleged invention appertains, who shall be under oath or affirmation for the faithful and impartial performance of the duty imposed upon them by said appointment. Said board shall be furnished with a certificate in writing of the opinion and decision of the Commissioner, stating the particular grounds of his objection and the part or parts of the invention which he considers as not entitled to be patented; and the said board shall give reasonable notice to the applicant as well as to the Commissioner of the time and place of their meeting, that they may have an opportunity of furnishing them with such facts and evidence as they may deem necessary to a just decision; and it shall be the duty of the Commissioner to furnish to the board of examiners such information as he may possess relative to the matter under their consideration; and on an examination and consideration of the matter by such board it shall be in their power, or of a majority of them, to reverse the decision of the Commissioner, either in whole or in part; and their opinion being certified to the Commissioner, he shall be governed thereby in the further proceedings to be had on such application: *Provided, however*, That, before a board shall be instituted in any such case the applicant shall pay to the credit of the Treasury, as provided in the ninth section of this act, the sum of twenty-five dollars; and each of said persons so appointed shall be entitled to receive for his services in each case a sum not exceeding ten dollars, to be determined and paid by the Commissioner out of any moneys in his hands, which shall be in full compensation to the persons who may be so appointed for their examination and certificate as aforesaid.

The eighth section provides—

That whenever an application shall be made for a patent which, in the opinion of the Commissioner, would interfere with any other patent for which an application may be pending, or with any unexpired patent which shall have been granted, it shall be the duty of the Commissioner to give notice thereof to such applicant or patentee, as the case may be; and if either shall be dissatisfied with the decision of the Commissioner in the question of priority of right or invention, he may appeal from such decision on the like terms and conditions as are provided in the preceding section.

The sixteenth section then enacts—

That whenever there shall be two interfering patents, or whenever a patent or application shall have been refused on an adverse decision of a board of examiners, on the ground that the patent applied for would *interfere* with *an unexpired patent previously granted*, any person interested in any such patent, either by assignment or otherwise in the one case, and any such applicant in the other case, may have remedy by bill in equity; and the court having cognizance thereof, on notice to adverse parties and other due proceedings had, may adjudge and declare *either* the patents void in the whole or in part or inoperative and invalid in any particular part or portion of the United States, according to the interest which the parties to such suit may possess in the patent or the inventions patented, and may also adjudge that such applicant is entitled, according to the principles and provisions of this act, to have and receive a patent for his invention as specified in his claim, or for any part thereof, as the fact of priority of right or invention shall in any such case be made to appear; and such adjudication, if it be in favor of the right of such applicant, shall authorize the Commissioner to issue such patent on his filing a copy of the adjudication and otherwise complying with the requisitions of this act: *Provided, however*, That no such judgment or adjudication shall affect the rights of any person, except the parties to the action and those deriving title from or under them subject to the rendition of such judgment.

This section gives the remedy by bill in equity to those cases only provided for by the eighth section of this act; but by the tenth section of the act of 1839 it is declared—

That the provisions of the sixteenth section of the before-recited act shall extend *to all cases where patents are refused for any reasons whatever*, either by the Commissioner of Patents or by the Chief Justice of the District of Columbia, upon appeals from the decision of said Commissioner, as well as where the same shall have been refused on account of or by reason of interference with a previously-existing patent; and in all cases where there is no opposing party a copy of the bill shall be served upon the Commissioner of Patents, when the whole of the expenses of the proceeding shall be paid by the applicant, whether the final decision shall be in his favor or otherwise.

The effect of this section is to give to all persons whose applications are refused under the seventh section (and who were concluded by the decision of the Board of Commissioners under the act of 1836) the same remedy as was provided for those who came within the provision of the eighth section. The remedy is by bill in equity in the court *having cognizance thereof.*

On the part of the complainant it is contended that inasmuch as the seventeenth section of the act of 1836 declares—

That all actions, suits, controversies, and cases arising under any law of the United States, granting or confirming to inventors the exclusive right to their inventions or discoveries, shall be originally cognizable as well in equity as at law by the circuit courts

of the United States, or any district court *having the powers and jurisdiction of a circuit court*—

that Congress did not intend to give jurisdiction to the courts of the District of Columbia, where there is no district court *having the power of a circuit court*, but to the courts of the United States established by the judiciary act of 1789, and the complainant being a resident here this court has the jurisdiction.

In the construction of statutes every part of the act and acts in *pari materia* are to be taken together for the purpose of discovering the intention of the legislature, which, when ascertained, is to prevail. It shall be so construed, if possible, that no clause, sentence, or word shall be rendered superfluous or void; and when great inconvenience will result from a particular construction, that construction shall be avoided, unless the meaning of the legislature be plain, in which case it must be obeyed. (2 Cranch, 386.)

With these rules in view, let us examine the question presented for consideration.

By the section of the act of September 24, 1789, establishing the judicial courts of the United States, it is enacted—

That no person shall be arrested in one district for trial in another in a civil action before a circuit or district court, and no civil suit or action shall be brought before either of the said courts against an inhabitant of the United States by any original process in any other district than that *whereof he is an inhabitant or in which he shall be found* at the time of serving the writ.

The third section of the act of February 27, 1801, concerning the District of Columbia, (3 Story, 2039, appx.,) declares—

There shall be a court in the said District, which shall be called the "Circuit Court of the District of Columbia;" and the said court and the judges thereof shall have all the power by law vested in the circuit courts and the judges of the circuit courts of the United States.

And by the fifth section—

The said court shall have cognizance of all cases in law and equity between parties both or either of whom shall be a resident or found within said district.

The fourth section of the act of March 3, 1815, vesting more effectually jurisdiction in State courts, (2 Story, 1531,) enacts—

That the district courts of the United States shall have cognizance concurrent with the courts and magistrates of the several States and the circuit courts of the United States of all suits at common law when the United States or any officer thereof, under the authority of an act of Congress shall sue, although the debt, claim, or other matter in dispute shall not amount to one hundred dollars.

Various other statutes have been passed either imposing penalties or providing relief, in which it is said the district or circuit courts of the United States shall have jurisdiction; but in all such cases it is understood the intention of Congress was to give jurisdiction to those courts according to well-known and settled principles. These principles are, that process for the institution of a suit either at law or equity in the district or circuit courts shall not run beyond the limits of the district for which the court from which it issues is held, and that the circuit court for the District of Columbia has full equity powers where both or either of the parties shall be found within that jurisdiction. The prohibition of the service of process out of the jurisdiction is, however, a personal privilege which may be waived; but in the present case the defendant has availed himself of the first opportunity to make the objections.

Another objection to the jurisdiction of this court is the mode of enforcing obedience to its decree. It is to be presumed that a court will not take cognizance of a cause unless it can execute its judgment. Now, if this court should take jurisdiction of the complainant's bill and decide that he is entitled to a patent, how can that decision be enforced if the Commissioner should refuse to issue the patent? The proper remedy would seem to be by a mandamus; but the Supreme Court have decided that the circuit courts out of the District of Columbia have no authority to issue a writ of mandamus to an officer of the United States commanding him to do a ministerial act, but that the Circuit Court for the District of Columbia has such power. *Kendall* v. *United States*, 12 Peters, 525. In every aspect of the case it appears to me that this court has no jurisdiction of the complaint. By this construction full effect may be given to every word of the section under consideration: Where there are two interfering patents the circuit court of the district whereof the defendant is an inhabitant or where he may be found is the court "having cognizance," when an original application for a patent has been refused and there is no opposing party, so that the process, a copy of which is to be served on the Commissioner of Patents, the Circuit Court of the District of Columbia, of which the Commissioner is an inhabitant, and which can enforce its judgment, is the proper tribunal. This view also avoids the great inconvenience which would result from the construction contended for by the counsel for the complainant.

The bill prays that the Commissioner be required to produce on the hearing the specifications, models, drawings, &c., and these may be necessary to enable the court to determine upon the validity of the application for a patent. If the Commissioner can be required to produce these in this court, he may with as much propriety be called on to answer similar applications in any circuit court of the Union; an inconvenience, to say the least of it, which, if it had been intended by Congress, they would have used plain, precise, and clear language, such as would not leave the intention open to judicial construction or leave it liable to be misunderstood. This view renders it unnecessary to consider the argument urged in support of the demurrer.

The plea to the jurisdiction is sustained, and the bill dismissed for want of jurisdiction.

U. S. Circuit Court—Western District of Pennsylvania.

BRADLEY *et al.* v. DULL *et al.*

Decided March 24, 1884.

1. An assignment of a patent by an administrator is valid under the act of July 8, 1870. The decision in the case of *The Shaw Relief Valve Company* v. *The City of New Bedford* approved on this point.
2. A part which under certain conditions may be a serviceable addition to the machine, but is not indispensable, and is not mentioned in the claim, held not to be an element of the patented combination.
3. Patent granted December 12, 1871, to Allen G. Bauman, construed, sustained, and held to be infringed.

Messrs. Bakewell & Kerr for the complainants.
Mr. George H. Christy for the respondents.

ACHESON, *J.*:

The grounds of defense are, first, that the plaintiffs have not shown title to the patent sued on, and, second, that there has been no infringement by the defendants.

1. The patent was granted on December 12, 1871, to Allen H. Bauman. He subsequently died intestate, and letters of administration upon his estate were duly

issued to Reuben F. Bauman, who as administrator sold and assigned the patent to the plaintiffs. The defendants controvert the title thus acquired, maintaining that upon the death of the patentee intestate the patent became vested in his heirs, and, therefore, that the administrator was without authority to make sale and assignment thereof. The argument is based on the change in the patent law made by the twenty-second section of the act of July 8, 1870, (reproduced in section 4884 of the Revised Statutes,) whereby it is enacted that the patent shall contain "a grant to the patentee, his heirs, or assigns," the previous legislation having provided for a grant to the "patentee, his heirs, administrators, executors, or assigns." This change, in connection with some other provisions of the existing law, it is contended, indicates an intention on the part of Congress to secure the benefits of the invention to the heirs of the deceased patentee, in case of intestacy, to the exclusion of the administrator. An impressive argument was made by counsel in support of this view. But the contrary has just been decided in the first circuit in the case of *The Shaw Relief Valve Company* v. *The City of New Bedford*, in which was involved the identical question now before me. To the able opinion of Judge Lowell in that case I can add nothing. Adopting his conclusion, I must overrule this defense.

2. Whether or not the defendants infringe depends on the construction to be given to the claim. The subject-matter of the patent is a machine for drying sand and gravel. The invention (so the specification declares) relates to the combination of iron or metal pipe or pipes so constructed and arranged in parallel and longitudinal lines as to form a surface upon which the wet sand or gravel is placed to be dried by the application of fire or steam. The surface formed by the pipe or pipes forms the bottom of a box or frame which contains the wet sand or gravel. The pipe or pipes throughout the whole surface are heated by fire or steam passing through them, so as to dry the sand or gravel, which, when dried, slips and passes through the openings or spaces between the lines of pipe, the wet sand or gravel in the box or frame above drying gradually and passing through ready for shipment and use.

A A is the box or frame in which the wet sand or gravel is placed preparatory to being dried. The bottom of this box or frame is formed by the sets of pipes shown by *c c*, &c. On the surface formed by these pipes the wet sand or gravel rests and adheres until it becomes dried, when it passes through the openings or spaces between the pipes.

28

If fire is used, the pipes are heated from a fire-chamber at one end, the fire, heat, and smoke passing through the pipes into flues at the other end; but the arrangement described for heating the pipes is somewhat different when steam is employed. In the body of the specification occurs the following passage:

Immediately underneath the whole of the surface formed by the pipes is placed a wire sieve, F F, to prevent the sand or gravel from passing too rapidly through the spaces or openings between the pipes, and before the same is sufficiently dried, the sieve so used to be coarse or fine according as the sand or gravel is coarse or fine.

There is but a single claim, which is in these words:

The apparatus herein described for drying gravel or sand, consisting of the fire-chamber, flues, heating-pipes, and case, all constructed and arranged substantially as set forth.

The word "case" does not appear in the descriptive part of the specification, and is used in the claim only. What does the term comprehend? The defendants insist that it includes the sieve F F as an essential constituent; and as they do not use a sieve or any substitute therefor, it is contended that they do not infringe. Webster defines "case" to be "a covering, box, or sheath; that which incloses or contains." Now, turning to the specification, we discover that A A is a "box or frame" in which the wet sand or gravel is placed to be dried. What constitutes the bottom of this box? Is it the sieve? Certainly not, if the specification is to furnish the answer, for it distinctly asserts, not once only, but twice, that the bottom of the box or frame A A is composed of sets of pipes so constructed as to form a surface upon which the wet sand or gravel rests during the drying process. We have, therefore, the "case" complete in all its parts without the aid of the sieve F F. In fact, it is not an essential part of the machine, for without its co-operation the apparatus successfully performs its contemplated work. The truth seems to be that the sieve under certain conditions may be a serviceable addition to the machine, but is not an indispensable part; and as it is not mentioned in the claim and is not necessary either to constitute the "case" or to the successful working of the apparatus, it would seem to be a fair conclusion that it is not an element of the patented combination. This view but conforms to the spirit of the rule for the interpretation of patents authoritatively declared in *Klein* v. *Russell*, (19 Wall., 466,) where it is said:

The court should proceed in a liberal spirit, so as to sustain the patent and the construction claimed by the patentee himself, if this can be done consistently with the language he has employed.

Let a decree be entered in favor of the plaintiffs.

DESIGNS.

14,995.—ORNAMENTATION OF CANDLES.—*Francis Baumer*, Syracuse, N. Y. Application filed March 31, 1884. Term of patent 7 years.

14,996.—KNIT SHIRT.—*Switz Condé*, Oswego, N. Y. Application filed December 11, 1883. Term of patent 7 years.

14,997.—WATCH-CASE.—*John C. Dueber*, Newport, Ky. Application filed February 25, 1884. Term of patent 7 years.

14,998.—HARNESS ORNAMENT.—*David C. Lockwood*, Newark, N. J., assignor to *The Rubber and Celluloid Harness Trimming Company*, same place. Application filed March 6, 1884. Term of patent 14 years.

14,999.—GIRL'S COSTUME.—*Catherine Shiels*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed March 27, 1884. Term of patent 3½ years.

15,000.—CURTAIN.—*John Sweeney*, New Haven, Conn., assignor of one-half to *James Graham*, same place. Application filed March 26, 1884. Term of patent 14 years.

15,001.—LADY'S WALKING-SKIRT.—*Louise Tully*, New York, N. Y., assignor to *The Butterick Publishing Company, (Limited,)* same place. Application filed March 27, 1884. Term of patent 3½ years.

15,002.—PARLOR-STOVE.—*Walter P. Warren, Gurdon G. Wolfe*, and *Robert Scorer*, Troy, N. Y., assignors to *The Fuller & Warren Company*, same place. Application filed August 29, 1883. Term of patent 7 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upwards are registered under the act of March 3, 1881.]

11,175.—HAND-MADE TIN CANS.—*Can Makers' Mutual Protective Association*, Baltimore, Md. Application filed February 23, 1884.

"The letters 'C. M. M. P. A.'"

11,176.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.

"The symbol of an anchor, the words and signs 'J. & J. CLARK & Co.,' and the design of a gold center encircled with a black band."

11,177.—SPOOL-COTTON.—*Clark Thread Company*, Newark, N. J. Application filed March 20, 1884.

"The words, letters, and signs 'J. & J. CLARK & Co.,' the representation of an anchor, and the words 'CABLE LAID.'"

11,178.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed March 1, 1884.

"The word 'MECHANIC.'"

11,179.—STIFFENING RIBS OR BONES FOR CORSETS.—*Freeman D. Marckwald*, New York, N. Y. Application filed March 12, 1884.

"The word 'WHALEBONEINE.'"

11,180.—HORSE-BLANKETS.—*Newichawanick Company*, South Berwick, Me. Application filed March 31, 1884.

"The word 'BURLEIGH's' and the portrait of John H. Burleigh."

11,181.—WIRE RODS, FLAT STEEL STRIPS, HOOP IRON AND STEEL, AND SIMILAR HALF PRODUCTS OF IRON AND STEEL.—*E. Boecking & Co.*, Mülheim-on-the-Rhine, Germany. Application filed March 7, 1884.

"The representation of crossed hammers in connection with the letters 'E. B. C.'"

11,182.—SMOKING AND CHEWING TOBACCO.—*P. H. Mayo & Bro.*, Richmond, Va. Application filed April 2, 1884.

"The word 'MAYO's'"

11,183.—EMBROIDERY-SILK.—*James Pearsall & Co.*, London, county of Middlesex, England. Application filed April 9, 1884.

"The letters and words 'FILO-FLOSS.'"

11,184.—PIPES, FITTINGS, AND PLUMBERS' SUPPLIES.—*Reuter & Mallory*, Baltimore, Md. Application filed April 1, 1884.

"The representation of a crescent."

11,185.—LAUNDRY-SOAPS.—*James S. Kirk & Co.*, Chicago, Ill. Application filed February 28, 1884.

"The word 'CERES.'"

11,186.—LAUNDRY-SOAP.—*James S. Kirk & Co.*, Chicago, Ill. Application filed March 1, 1884.

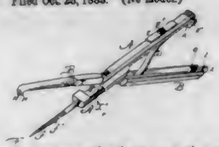
"The word 'REVENUE.'"

11,187.—CIGARS.—*Celestino Palacio & Co.*, New York, N. Y. Application filed November 21, 1883.

"The word 'TELEGRAFO.'"

LABELS.

4,116.—Title: "BEGGS' CHERRY COUGH SYRUP."—*F. M. Beggs*, Elk Point, Dak. Ter., and *C. E. DeWitt*, Sioux City, Iowa. Application filed April 21, 1884.



4,117.—Title: "SOUTHERN CATHARTIC PILLS."—*Southern Medicine Company*, Caldwell, Tex. Application filed April 22, 1884.

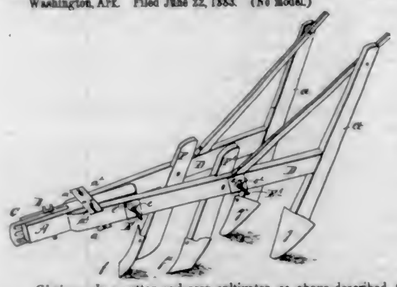
4,118.—Title: "SOUTHERN CHILL TONIC."—*Southern Medicine Company*, Caldwell, Tex. Application filed April 22, 1884.

PATENTS

GRANTED MAY 13, 1884

298,333. INSTRUMENT FOR SETTING BUTTONS. JAS. F. ATWOOD, Boston, Mass. Filed Oct. 25, 1883. (No model.)

Claim.—1. In a button-setting instrument, the combination, with the jaw A, provided with a device for engaging with a wire fastening, of the jaw B, provided with the inwardly-projecting prongs H, between which the wire is held, substantially as and for the purpose set forth.

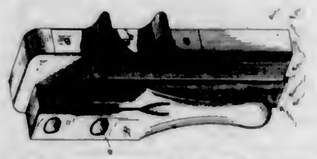


2. In a button-setting instrument, the combination of the jaw A, provided with the depression K, and the jaw B, provided with the former L, constructed and arranged substantially as and for the purpose described.

3. In a button-setting instrument, the combination, with the jaw A, provided with the depression K, of the jaw B, provided with the former L, having side grooves, *l*, all substantially as and for the purpose set forth.

4. In a button-setting instrument, the combination, with the jaw B, provided with the former L, of the jaw A, provided with the depression K and notches or grooves K', substantially as and for the purpose specified.

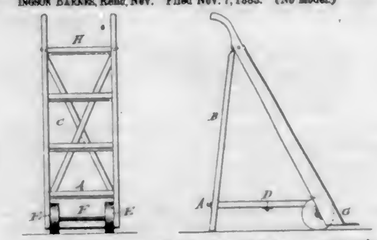
5. The herein-described button-setting instrument, consisting, essentially, of the jaws A and B, provided with a spreading and a locking device, the knife-edges, I I', needle F, and prongs H, all arranged and constructed substantially as and for the purpose set forth.



298,334. COTTON AND CORN CULTIVATOR. THOMAS H. BAIRD, Washington, Ark. Filed June 22, 1883. (No model.)

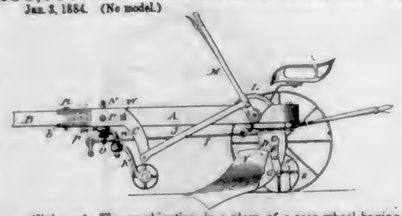
Claim.—In a cotton and corn cultivator, as above described, the combination of plates *a*—one being rigidly secured on the upper and the other on the lower edge of tongue A—with pins *a'* pivoting beams D at their front ends—one on either side of tongue A—with threaded rod E passing transversely through the front ends of said beams D and the rear end of tongue A, threaded rod E' passing transversely through the rear ends of said beams, and hand-nuts *e* working on said threaded rods and against either side of said tongue, and against chips *e²*, secured on the inner and outer sides of said beams D, all substantially as shown and described, and for the purposes set forth.

298,335. LIFTING-JACK. MARVIN R. BALDWIN, Sandy Creek, N. Y. Filed Mar. 7, 1884. (No model.)



Claim.—1. In a lifting-jack, the combination, with the upright or standard A, beveled at its upper end, of a lever pivoted near the upper end thereof, and a beam, C, pivoted to the end of said lever, substantially as set forth.

2. In a lifting-jack, the combination, with an upright beveled at its upper end, of a lever pivoted near the upper end thereof, and a beam, C, recessed near its end to form an angular portion, said beam being connected to the end of the lever, substantially as set forth.

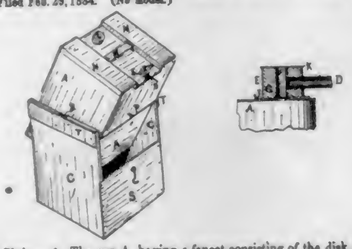


3. The combination, with a standard or upright beveled at its upper end, and a lever pivoted thereto, of a beam pivoted to the upper end of said lever, and a plate connecting said lever on the opposite side, and provided on its upper face with a metal plate having a seat for the reception of a vehicle-axle, substantially as set forth.

298,336. COMBINED TRUCK AND STEP-LADDER. AMOS HUTCHINSON BARNES, Reno, Nev. Filed Nov. 7, 1883. (No model.)

Claim.—An improvement in trucks, with the necessary attachment to form a step-ladder, with steps H between the main arms of the truck, with standards B B hung to the handles of the truck, and with the necessary braces C, with jointed bar D attached to the standards at one end and to the lower step at the other, thus forming a steady support for the step-ladder.

298,337. SULKY-PLOW. SAMUEL W. BARR, Mansfield, Ohio. Filed Jan. 2, 1884. (No model.)



Claim.—1. The combination, in a plow, of a rear wheel having a hollow axle or journal, and a spindle or bolt passing through the axle and secured at one end to the landside, and at the other end to a vertical arm depending from the standard, said spindle serving as a journal

for the wheel, and a brace or spreader between the landside and standard, substantially as shown and described.

2. The combination, with the beam A and tongue B, of the curved bar C, forming one side of the vertical hinge between the beam and tongue, block Y, pivot-bolt W, and lever connection J M, substantially as shown and described.

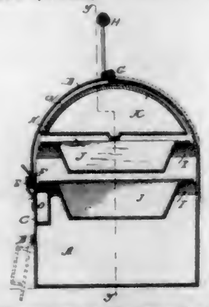
3. The combination, with the tongue and plow-beam, of the block Y, socket Q, spring S, bolt R, and hinge-plates, substantially as described, and for the purpose set forth.

298,338. CAN AND CASE. JAMES M. BEAN, Watertown, MASS. Filed Feb. 29, 1884. (No model.)

Claim.—1. The can A, having a faucet consisting of the disk J, attached to the can, a cap, K, tube F, secured to the cap and to the disk, an outer cylindric case, E, having a spout, D, secured thereto, and a packing, G, substantially as described.

2. The can A, provided on its upper end with the bars N and on its opposite sides with the case-pieces P, secured to the bars N, and secured to the can by the metal strips R, substantially as described.

3. The combination of the can A, provided with the top bars, N and on its opposite sides with the case-pieces P, secured to the bars N, and secured to the can by metal strips R, with the case end pieces, C, provided with the cross-cleats T and short back and front portions, S, adapted to be connected together and disconnected, substantially in the manner described, as and for the purposes set forth.

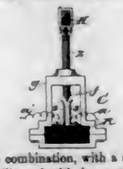


298,339. FRYING-UTENSIL. EDWIN BENDER, Philadelphia, Pa. Filed Apr. 28, 1883. (No model.)

Claim.—1. A frying-utensil consisting of dishing body formed of wire, a rigidly-connected handle continuous of the top ring of said body, and a removably-connected guard-rim at the upper end of the body, substantially as and for the purpose set forth.

2. The frying-pan body formed of wire-work, in combination with a rim, C, set in said body and removably connected therewith by the hooks D, which engage with the top thereof, substantially as and for the purpose set forth.

298,340. LUNCH-BOX. WILLIAM FREDERICK BERGHOFER, Slater, Mo. Filed Mar. 6, 1884. (No model.)



Claim.—1. The combination of the body of the box, having its upper part made semi-cylindrical, and formed with an opening in one side thereof, and a partly-cylindrical hood pivoted to the ends of said body and adapted to be swung forward to cover said opening, and having a bail attached to its rear edge, whereby the weight of the box, when suspended by the bail, will hold the hood in closed position, substantially as specified.

2. The combination of the body of the box, the swinging hood pivoted to the ends thereof, the hinged lid adapted to be engaged by the hood, and the spring-catch attached to said lid and adapted to engage a bead on the edge of the hood, substantially as shown and described.

3. The combination of the body of the box, the swinging hood pivoted to the ends thereof, the hinged lid adapted to be engaged by the hood, the spring-catch adapted to connect the said hood and lid together, and the bail attached to the hood, and means for supporting the bail rigidly, whereby it may serve as a handle for separating the hood from the lid, substantially as specified.

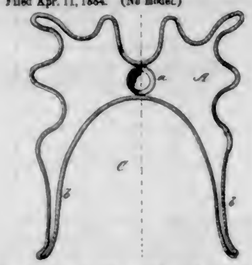
4. The combination of the body of the box, having its upper part made semi-cylindrical and provided with an opening in one side thereof, the partly-cylindrical hood pivoted to the ends of the said body, and the partly-cylindrical liquid-receptacle supported in said upper part of the box, substantially as shown and described.

298,341. ELECTRIC WORK-INDICATOR FOR MILLS. AARON D. BLODGETT, Boston, MASS. Filed Dec. 20, 1882. (No model.)

Claim.—1. The combination, with a series of looms or other machines at one or more mills, and with the starting and stopping mechanism thereof, of a series of electric circuits and circuit-closers therefor—one for each loom—the said circuit-closers being adapted to be operated by the movements made to start and stop the loom, and a recording apparatus located at a central point, and common to all of the looms and circuits, whereby the work of each loom may be automatically registered, substantially as described.

2. In a system of electrical recording, wherein the respective periods of action and inaction of any number of looms or other machines is automatically registered at any suitable central point, the combination, substantially as hereinbefore described, of a rotating metal drum carrying a graduated sheet of chemically-prepared paper, a series of direct line-wires—one for each loom—extending between the several looms and the central point, each wire terminating at the said central point in a metal reed, pen, stylus, or other suitable terminal resting on the prepared paper of the rotating drum, a common return-wire, or an electrical equivalent therefor, branching to all the looms, and also extending to the central point, there being connected with the metal substance of the rotating drum a voltaic battery in the circuit of the common return or ground wire, a series of circuit-closers—one for each loom—connected between the ends of the direct wires and the branches of the return-wires, and means, as indicated, whereby the starting and stopping of each loom is enabled also to close or open its corresponding circuit-closer, so that when the circuit-closer of any loom is closed the circuit of the direct wire belonging thereto shall be completed through the drum and the prepared paper, for the purposes specified.

3. The combination, substantially as hereinbefore described, of a series of looms and their shippers or controlling-levers, and a circuit-closer attached to each of the said shippers and operated by the movements thereof, with a recording apparatus at a distant point, whereon the operative condition of any loom at any given time is recorded, a series of direct wires extending one from each circuit-closer to the said recording apparatus, and a return-wire connected also with the recording apparatus, and extending therefrom through a battery and by means of branches to each and every circuit-closer, for the purposes specified.



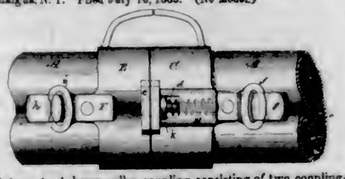
4. In a system for recording electrically the respective periods of operation and rest of a series of looms, a recording apparatus consisting of a metal drum or roller rotated by a suitable motor, a prepared registry-sheet attached thereto, clamping devices for attaching the said registry-sheet to the drum, a series of metal line-terminals resting on the prepared sheet, guides or holders for holding the said terminals in position, and a return-conductor connected with the axis and surface of the drum and leading to a voltaic battery and to a series of distant circuit-closers, whereby the circuit of the battery may be completed through any or all of the direct wires, and whereby each of the said direct wires is enabled, when its circuit is so completed, to trace a line on the prepared paper.

5. The combination, with a series of direct line-wires, a return-wire common to the series, and a voltaic battery in the circuit of the said common return-wire, of a rotating drum coated with a graduated suitably-prepared record-sheet, the said drum having its substance in metallic contact with the return-wire, and the graduated sheet thereon being in electrical connection with all of the direct wires, and a series of circuit-closers, whereby the circuit of any of the direct wires may be completed through the return-wire, substantially as and for the purposes specified.

6. The combination, substantially as hereinbefore described, of the shipper or starting lever of a loom or other manufacturing-machine, with the circuit-closer of an electric circuit extending by a direct line and by a branch and main stem of a common return-line to a distant recording apparatus, whereby the motion of stopping or starting the machine automatically and simultaneously also makes or breaks the said electric circuit, for the purposes specified.

7. The combination, in an electrical registering apparatus, of a rotating metal drum or roller, a chemically-prepared graduated record-sheet spread thereon, a series of direct wires having their metal terminals resting on the prepared paper and extending outwardly therefrom, each to one side of the circuit-closer, a return or ground wire connected with said drum and extending in branch circuits to the other side of each of the circuit-closers, and an electrical battery in the circuit of said return-wire, substantially as described.

298,342. BILLIARD AND POOL BRIDGE. GEORGE BORST, Rochester, N. Y. Filed Apr. 11, 1884. (No model.)



Claim.—1. A billiard or pool bridge having an arch or space under it of sufficient size to admit of the bridge being placed over a ball while resting on the table, substantially as and for the purpose set forth.

2. The combination, with a suitable handle, of a billiard or pool bridge constructed of wire and adapted to rest on the table when in use, substantially as and for the purpose specified.

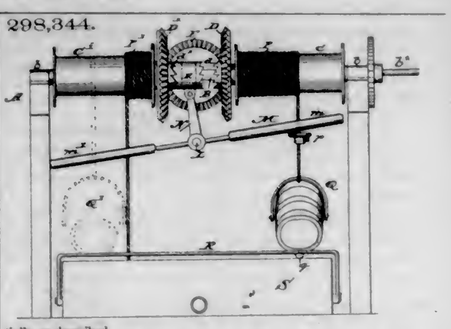
3. A billiard or pool bridge having an arch, as described, and constructed of wire, substantially as and for the purpose set forth.

298,343. HORSE-COLLAR COUPLING. SYLVESTER J. BOWERS, Canandaigua, N. Y. Filed July 16, 1883. (No model.)

Claim.—1. A horse-collar coupling consisting of two coupling-sections adapted to be attached to the ends of the collar, one of said sections having a loop or keeper upon its exterior and the opposite section a housing containing a spring-bolt, said housing being formed separate and independent of the coupling-section and afterward connected thereto, substantially as and for the purpose set forth.

2. A horse-collar provided at its ends with coupling-sections and loosely-attached devices for connecting thereto the ends of a hame, substantially as and for the purpose specified.

3. In a horse-collar, the combination of two coupling-sections having loosely attached thereto devices for connecting the ends of the hame, one of said sections being provided with a loop or keeper upon its exterior, and the opposite section with a spring-bolt and housing, substantially as and for the purpose described.



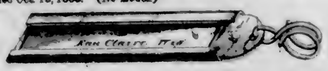
298,344. WATER-ELEVATOR. DEWITT S. BOTAKIN, St. Louis, Mo. Filed Sept. 6, 1883. (No model.)

Claim.—1. The combination of the shaft B, squared at *b'*, the clutch E and means for operating the same, the link G, the shaft I, and the sleeve H, substantially as described.

2. The combination of the shaft B, the clutch E and means for operating the same, the gears D D' F, the parts *d d'*, the link G, the sleeve H, and the shaft I, substantially as described.

3. The shaft I, the spring J, the bearing *i*, the collar K, the gears D D' F, and the shaft B, in combination with operative means, substantially as described.

298,344.

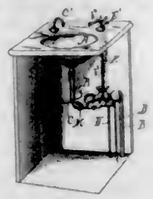


4. The shafts B I, the gears D D' F, the clutch E and means for operating the same, the parts *d d'*, the link G, the sleeve H, and the spring J, in combination substantially as described.

5. The combination of the shafts B I, the drums C C', the gears D D' F, the parts *d d'*, the clutch E and means for operating the same, the link G, the sleeve H, and the spring J, substantially as described.

6. The combination of the shafts B I, the drums C C', the gears D D' F, the clutch E, the link G, the sleeve H, the spring J, the lines P P', the projections *p*, the lever M, and the arm N, substantially as described.

298,345. MAIL-SACK TAG. SEWARD W. BRACKETT, Eau Claire, Wis. Filed Oct. 15, 1883. (No model.)



Claim.—In a mail-sack tag, a body provided with side flanges turned over, whereby side grooves are formed for the reception and retention of the card, the lower end of said body being provided with a suitable stop or bottom rest for the card, the upper end of said body having an opening, in combination with a hook having a loop, said loop being secured in said opening, and forming a top stop to prevent the displacement of the card, as specified.

298,346. BOOT OR SHOE. GEO. C. BUSH, Eureka, Mo. Filed Mar. 14, 1884. (No model.)

Claim.—The combination, substantially as described, of the inner sole, A, the welt A', the counter C, extended as described, the outer sole, D, the heel E, having the rabbet *e* and the plate F.

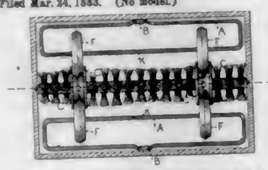
298,347. COMPOUND WATER-COCK AND SEWER-GAS CUT-OFF. WILLIAM CAHOON, Jr., Chicago, Ill., assignor to Walter M. Keenan, same place. Filed June 29, 1883. (No model.)

Claim.—1. The combination, with the waste-pipe and the hot and cold water pipes having suitable drop-valves or cocks for opening and closing the same, of a conical valve for opening and closing the waste-pipe, and a rod having a crank for operating said waste-pipe valve, and a cam for operating said cocks in the water-pipes, so that said waste-pipe may be closed, except when said water-pipe valves are opened, substantially as specified.

2. The combination, with the waste-pipe B, of the conical valve *b*, its valve-seat *b'*, handle b^2, rod b^3, crank-arm b^4, link b^5, cam *a*, secured to said rod b^3, water-pipe D, valve *d*, valve-seat *d'*, valve-stem d^2, and button d^3, whereby said valve is operated by the cam *a*, substantially as specified.

3. The combination, with the waste-pipe B, of the conical valve *b*, its valve-seat *b'*, handle b^2, rod b^3, crank-arm b^4, link b^5, cam *a*, secured to said rod b^3, hot-water pipe D, and cold-water pipe D', each provided with valve *d*, valve-seat *d'*, valve-stem d^2, and adjustable button d^3, whereby said valves *d* are operated by the cam *a*, substantially as specified.

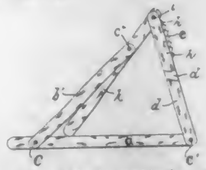
4. The combination, with waste-pipe B, hot and cold water pipes D and D', united together at *c*, water-pipe C, conical valve *b*, for closing the waste-pipe, and drop-valve *d*, for closing the hot and cold water pipes, mechanism for simultaneously operating the valve of said waste-pipe, and either said hot or cold water pipe, and a device for independently lifting the valve of either the hot or cold water pipes, so that both the hot and cold water may be allowed to flow at the same time and mingle together in the pipe C, substantially as specified.



5. The combination of the rod b^3, for operating the valve of the waste-pipe, with cam *a*, secured thereto, for simultaneously operating the valve of the water-pipe, substantially as specified.

298,348. ELEMENT FOR STORAGE-BATTERIES. WILLARD R. CASE, Auburn, N. Y. Filed Nov. 13, 1883. (No specimens.)

Claim.—1. An element or electrode for a secondary or storage battery, composed of an amalgam, with mercury, of any lead alloy, containing a non-oxidizable metal, and having a lower fusing-point than lead alone, any substance capable of storing electrical potential in said battery, and any substance inert in said battery, and capable of occluding gases, substantially as described.

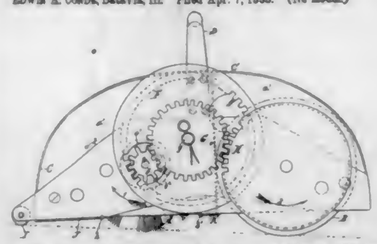


2. The process of forming electrodes for secondary or storage batteries, consisting in, first, making an alloy of lead and any other non-oxidizable metal or metals, said alloy having a lower fusing-point than lead; second, then adding mercury to form an amalgam which shall be pasty while hot; third, then adding any substance capable of storing electrical potential in a secondary battery; fourth, then adding any substance inert in said battery and capable of occluding gases; and, fifth, molding the electrode in suitable shape, substantially as described.

298,349. CARPET-SWEEPER. ERWIN B. CLARKE, Grand Rapids, Mich. Filed Mar. 24, 1883. (No model.)

Claim.—In a carpet-sweeper, the combination of the brush-roller provided with the pinions D D, and the rectangular spring-wires *a a*, loosely connected to the opposite sides of the sweeper-casing, and each wire provided with the wheels F F, the several parts being arranged relatively to each other, substantially in the manner as and for the purpose herein shown and described.

298,350. WAGON-JACK. GEO. B. CLARK, Bozrahville, Conn. Filed Mar. 24, 1884. (No model.)



Claim.—In a wagon-jack, the combination, with base *a*, of strips *d d'*, jointed to one end of said base, and having pivot *i* and metallic steps, as described, and strips *b b'*, jointed to the other end of base *a*, having pivoted in their upper or free end a lever, whose short end is provided with a hook to engage pivot *i*, the several parts named being of such size and so connected that when said jack is elevated the fulcrum of lever *k* passes below a line drawn through *e i*, as and for the purpose specified.

298,351. HARNESS-BUCKLE. HENRY C. COLTON, Montpelier, Vt. Filed Feb. 21, 1884. (No model.)

Claim.—An improved harness-buckle having a raised guard upon the frame to protect the end of the buckle-tongue, all substantially as shown and described.

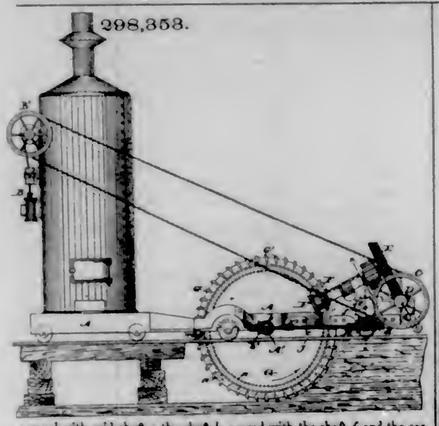
298,352. HORSE-CLEANING MACHINE. CORNELIUS S. CONDE and EDWIN A. CONDE, Batavia, Ill. Filed Apr. 7, 1883. (No model.)

Claim.—1. The horse cleaning, brushing, or combing machine comprising the closed portable arch-shaped frame having a bow-shaped handle, the partition, the dust-traps, and the knocker-rod, suitable driving-gearing, the combing, brushing, or cleaning cylinder, the traction-rollers, and the coupling devices between the gearing and the cylinder, substantially as and for the purpose described.

2. An animal brushing, combing, or cleaning machine comprising a closed portable frame having a partition and a handle, hinged dust-trap doors, a knocker-rod, suitable driving-gearing, a traction-roller, an adjusting-roller, and the coupling means between said gearing and cylinder, substantially as and for the purpose described.

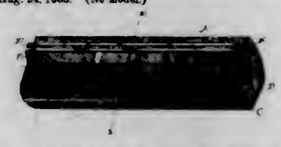
3. The horse brushing, combing, or cleaning machine comprising the arch-shaped closed portable frame having a loop or bow shaped handle at the crown of its arch, the removable brushing, combing, or cleaning cylinder having its stiff tufts of bristles, whalebone, or other stiff substance arranged on spiral lines and alternately out of line with one another, the dust-trap doors hinged and provided with spring fastening-extensions, the knocker-rod, the driving-gearing, the traction and adjusting rollers, and the coupling means, whereby the said cylinder and gearing are coupled and uncoupled, substantially as and for the purpose described.

4. The combination of the frame C, provided with a handle, the brush-cylinder A, provided with a coupling-disk, the sliding short journal provided with a coupling-disk and pins, the pinion, the internally-toothed wheel, the two gears, and a traction-roller, substantially as and for the purpose described.



5. The combination of the short journal having gear *f*, coupling-disk and pins, gear F, spiral spring, the revolving brush having a perforated coupling-disk, a traction roller or wheel, and a frame provided with a handle, substantially as and for the purpose described.

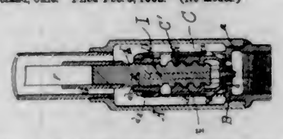
6. The revolving combing-brush provided with a short journal, *b'*, at one end, and a perforated disk, *b*, at its other end, in combination with the short journal *c*, having a pinion, and provided with the spring b^4, and coupling-disk b^3, having pins b^3, and the arched frame with its gearing, substantially as and for the purpose described.



298,353. ROTARY QUARRIER AND STONE-SHAPER. JOHN CRUMP and RICHARD BRERETON, Philadelphia, Pa. Filed July 24, 1883. (No model.)

Claim.—A rotary quarrier and stone-shaper consisting of the carriage A, engine B, with driving-wheel B', band-wheel C, gear-wheel D on the band-wheel shaft C', two shafts, E' E'', geared together, the gear-wheel E on the shaft E' meshing with the gear-wheel D, studs F F' on the shafts E' E'', the rotary cutter G, with openings *a* for the studs F F', the cutter-shaft A', the shaft *c*, gearing with the cutter-shaft, the shaft *f*, geared with said shaft *c*, the shaft A, geared with the shaft *f*, and the carriage-wheels H on the shaft A, said engine being supported on the carriage, and the hand-wheel shaft C', the shafts E' E'', the cutter-shaft A', and the shafts *c f* A having their bearings on said carriage, the parts being constructed and operating substantially as and for the purpose set forth.

298,353.



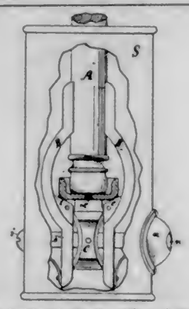
298,354. CARD HOLDER AND EXHIBITOR. SPENCER L. DAVIS, Minneapolis, Minn., assignor of one-half to Henry Tucker, same place. Filed Aug. 24, 1883. (No model.)

Claim.—1. A holder or exhibitor for cards, pictures, and analogous articles, having rounded or carved sides and a weighted bottom and an upwardly-extending slotted portion for receiving and holding said articles, substantially as set forth.

2. A card or picture holder and exhibitor slotted or grooved in its upper face, and having an upwardly-extending slotted portion to adapt it to receive and hold the articles to be exhibited, and having rounded sides and a weighted bottom, substantially as and for the purpose set forth.

298,355. HYDRANT AND STREET-WASHER. ALBERT G. DAYKIN, Cleveland, Ohio. Filed Feb. 8, 1882. (No model.)

Claim.—1. In a water-hydrant, and in combination, the valve-seat frame having one or more standards provided with a relief-port, connecting the space above the valve with the open air, a spindle having quick and slow right and left turn screws, adapted by the same operation to close the water-supply and open the relief-port, as set forth.

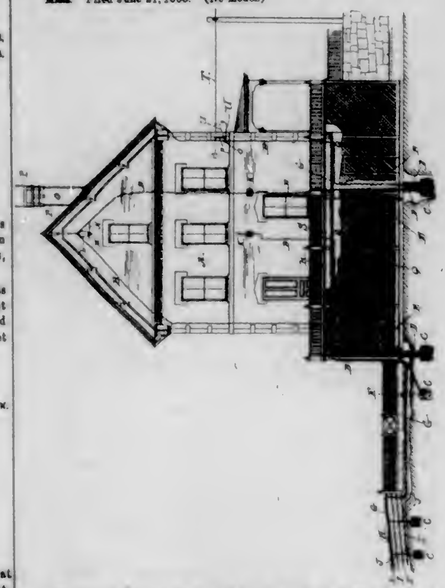


2. The frame B, having standards B', provided with relief-port I, combined with the valve C, stem F, and valve-frame D, as set forth.

3. The frame B, having standards B', provided with port I, combined with the stem F, valve C, having grooves c^2, and the valve-frame D, having arms *d*, as set forth.

4. The combination, with the spindle having threads of different pitch, of the valve-seat frame B, the valve C, having grooves c^2, and the valve-frame D, having arms *d*, substantially as and for the purpose set forth.

298,356. WHIP-SOCKET. WM. F. DOSE, New Haven, Conn. Filed Jan. 10, 1884. (No model.)



298,356.

Claim.—1. A locking device for whip-sockets, consisting of the pivotal clamping-levers B and B, provided with springs *d d*, and journaled to the receiving-base D, the levers B and B being adapted to be operated by the cam C upon the shaft E, with a suitable key upon the key-stem *f*, substantially as and for the purpose set forth.

2. In a whip-socket, the combination of the whip-socket S with the pivotal clamping-levers B and B, journaled to the receiving-base D, as shown and described, and provided with springs *d d*, together with the cam C and shaft E, having a key-stem, *f*, all being arranged to operate substantially as and for the purpose set forth.

298,357. LIGHTNING-CONDUCTOR. THOMAS H. DODGE, Worcester, Mass. Filed June 21, 1883. (No model.)

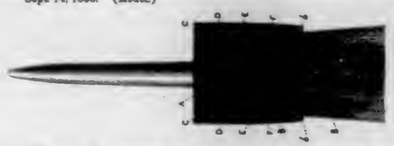
Claim.—1. The combination of the air-terminal of a lightning rod or conductor with the metallic wires of a barbed fence.

2. The combination, with the wire or wires of a barbed-wire fence, of a lightning-conductor and a series of earth-connections.

3. The combination, with the earth-connections, of a mass or package of barbed wires, C, substantially as and for the purposes set forth.

298,358. PROCESS OF PRODUCING ORNAMENTS FROM METALS, &c. WILLIAM C. EDGE, Newark, N. J. Filed Oct. 1, 1883. (No model.)

Claim.—The process described of making open-work ornaments, which process consists in first uniting the sheet or sheets from which the ornament is to be made to a foundation plate or sheet, *a*, in then em-



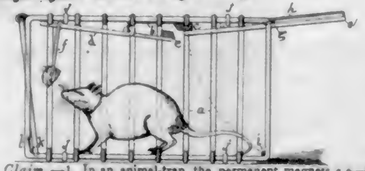
298,358.

bossing the whole, then filing down to the foundation sheet or plate, and finally obliterating the foundation sheet or plate, as specified.

298,359. PAINT-BRUSH. JAMES ELLIOTT, Philadelphia, Pa. Filed Sept. 14, 1883. (Model.)

Claim.—The combination, with a square or oblong brush, or the guards E, applied on opposite sides thereof, and projecting, as described, beyond the permanent fastening of the bristles, and the removable bridle applied around and supported by said guards, substantially as specified.

298,360. COMBINED SEAM-STRENGTHENER, GUSSET, AND FLY. JOHN F. EBENSINGER, Toledo, Ohio. Filed Jan. 3, 1884. (No model.)



Claim.—1. A combined gusset, seam-strengthener, and button-hole fly for pantaloons, substantially as specified.

2. The combination, with the pantaloons, of the gusset *a*, having extensions *b b*, for strengthening the inner seams of the legs, the rearward extension, D, for strengthening the back-seam, and the forward extension, E, for strengthening the front seam, and forming the button or button-hole fly, substantially as specified.

298,361. ANIMAL-TRAP. PETER R. ERLING, Chicago, Ill. Filed June 4, 1883. (No model.)

Brief.—A magnet attached to the top of the cage holds the door open until a second magnet, carried by the bait-hook lever, is brought in contact with the upper magnet by the animal pulling at the bait, when the door is released, owing to the superior attraction of one magnet for the other over the unmagnetized metallic door. The parts of the cage are hinged together to enable closing or folding.

Claim.—1. In an animal-trap, the permanent magnets *c e*—one operated by a lever attached to the baiting-hook, and the other attached to the deck of the trap—in combination with a door, *o*, operated by gravity, substantially as specified.

2. In an animal-trap, the combination of the four sides and end *r* with hinges *j* and pins *k*, substantially as specified.

3. In an animal-trap, the combination of the four sides, end *r*, and hinges *j* with a door provided with loops *h*, lever *d*, and magnets *c e*, substantially as specified.

4. In an animal-trap, a door closed by gravity, of which the lower edge is magnetic, in combination with magnets *c s* and lever *d*, substantially as specified.

5. In an animal-trap, the combination of the four sides and end *r*, provided with pins *k*, all united by hinges *j*, and attached to one of said sides, a magnet, *c*, and the door, hung in loops *h*, magnet *e*, and lever *d*, substantially as specified.

298,362. MACHINE FOR MANUFACTURING BOTTLE-WIRES. MARTIN V. B. ETHERIDGE, Lynn, Mass., assignor, by mesne assignments, to John E. Wheeler, Trustee, same place. Filed Aug. 17, 1882. Renewed Nov. 6, 1883. (No model.)

Brief.—Spring-jaws attached to a sliding-bar reciprocate across the front of the machine, and draw the wire so that its middle portion will come in front of the holding and twisting jaws. These twisting-jaws move forward between the clamping-jaws, grasp the wire, and draw it back between the clamping-jaws, which then close on the wires. The twisting-jaws are then rotated, thus forming an eye at the middle of the wire. The sliding bar which carries the spring-jaws has a projection at the end opposite the jaws, which strikes a lever carrying a cutter, thus severing the wire. A stationary projection from the frame strikes a lever, which forces open the spring-jaws at the end of the stroke of the sliding jaw.

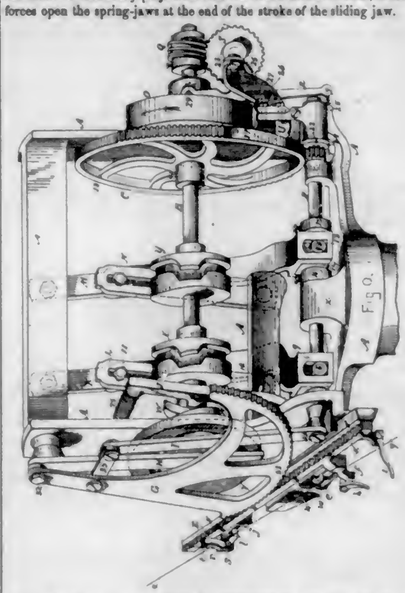


Fig 0.

Claim.—1. In a machine for manufacturing bottle-wires, the improved feeding device described, consisting of the spring jaws or nippers *d e*, cam *g*, and lever *h*, in combination with the slide F, and stop *i*, and operative mechanism, substantially as specified.

2. In a machine for manufacturing bottle-wires, the improved twisting device described, consisting of the shaft D, twister-jaws *a b*, former *c*, sleeve 5, levers K L, cam X, levers M N, cam Y, sleeve 14, gear C, pinion T, and latch U, in combination with the clamping-levers J J, having jaws *w w* and operative mechanism, substantially as set forth.

3. In a machine for manufacturing bottle-wires, the improved registering mechanism described, consisting of the gears Q S, pin 41, lever R, latch 23, and spring 28, in combination with the pulley O, clutch P, and operative mechanism, substantially as set forth.

4. The combination of a feeding device consisting of the spring-jaws *d e*, double cam *g*, lever *h*, and stop *i*, a cutting device consisting of lever *l*, bifurcated or slotted at one end, contractile spring *n*, stop *p*, blade *r*, cam *t*, and slide F, a clamping device consisting of nipper-levers J J, provided with spring 75, a twisting device consisting of sliding shaft D, carrying pivoted twister-jaws *a b*, and former *c*, and suitable actuating mechanism, substantially as described.

298,363. SHOE. THOMAS R. EVANS, Philadelphia, Pa. Filed Mar. 4, 1884. (No model.)

Claim.—1. A shoe having a sole formed of an outer sole of rubber, an inner sole of cork, and a covering for the inner sole of fabric, substantially as and for the purpose set forth.

298,363.

2. A shoe having a vamp, side flaps loose or disconnected therefrom at their front ends, and a sole formed of a rubber outer sole, a cork inner sole, and a covering for the inner sole, the parts of the compound sole and upper being secured together, substantially as and for the purpose set forth.

3. A shoe having a vamp and a water-proof sole, said vamp having openings at or about the toe portion, substantially as and for the purpose set forth.

4. A shoe having a sole formed of an outer sole of rubber, an inner sole of cork, and a covering for the inner sole, and a heel formed of a block of cork and a tread of rubber, both secured to the upper, and all parts constructed and operating substantially as and for the purpose set forth.

298,364. CASE FOR PENCILS. LE ROY W. FAIRCHILD, New York, N. Y. Filed Feb. 28, 1884. (No model.)

Claim.—1. In an extension-case provided with a magic movement, the combination of the magic movement, the propelling-spring D, the spring-catch *c*, and collar *d*, said parts being constructed and arranged to operate substantially as shown and described.

2. In combination with the tube C, provided with the collar *d*, the sliding tube A, provided with the spring-catch *c*, spring D, and the sliding head E, all arranged to operate substantially as and for the purpose set forth.

3. In an extension-case, the combination of the spring-hook *c*, the collar *d*, or an equivalent shoulder for the hook to engage with, and a releasing device arranged to come in contact with the hook *c* and release it from its hold upon the locking-shoulder, substantially as herein set forth.

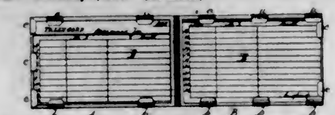
298,365. METALLIC ALLOY FOR SAFES. JOHN FARREL, New York, N. Y. Filed Nov. 2, 1883. (Specimens.)

Claim.—1. The new composite metal or alloy of tin-plate scrap, iron, and franklinite iron or its equivalent, substantially as described.

2. The method of forming a composite metal of tin-plate, scrap iron, and franklinite iron or its equivalent, substantially as described, consisting in melting the ordinary tin-scrap to form an alloy, and fusing this alloy at the same time or subsequently with the franklinite.

298,366. RENDERING GOODS AND FABRICS WATER-PROOF. ROBERT S. FORBES, New York, assignor to Water Repellant Finishing Company, New York, N. Y. Filed Aug. 29, 1883. (No specimens.)

Claim.—1. The process of making goods and fabrics water-proof, consisting in soaking them in a waterproofing solution, drying, and then steaming them, substantially as herein described, whereby the waterproofing solution is fixed on the fibers and the odor is removed, as set forth.

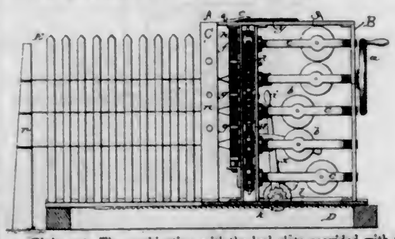


2. The herein-described improvement in making goods and fabrics water-proof, consisting in subjecting the goods treated with a waterproofing compound or solution to the action of dry steam, substantially as herein shown and described.

3. The herein-described solution for making goods and fabrics water-proof, consisting of a vegetable or mineral wax or paraffine, or a mixture of the same, dissolved in a light hydrocarbon, then subjected to the action of sulphuric acid, and then washed, substantially as herein described.

4. The herein-described solution for making goods and fabrics water-proof, consisting of a vegetable or mineral wax or paraffine, or a mixture of the same, dissolved in a light hydrocarbon, then subjected to the action of sulphuric acid mixed with it, and then washed and neutralized by means of an alkaline solution, substantially as herein described.

5. As an improved article of manufacture, a fabric made waterproof, and subjected to the action of steam when the coating has dried, substantially as herein described.

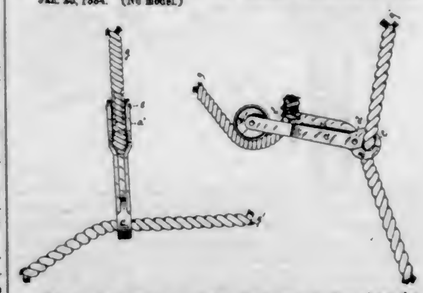


298,367. TALLY-CARD HOLDER. ROBERT L. FRENCH, Wellington, Ohio. Filed July 9, 1883. (No model.)

Claim.—1. A tally-card holder consisting of sections A and B, connected to each other by a hinge-joint, that they may be opened and closed one upon the other, the edges of which sections being provided with lips or hooks turned inward over the face thereof, under which lips tally-cards or tablets are inserted and retained in place while being used, in combination with an elastic band or strap for securing the card-holder to the arm, substantially as set forth.

2. The card-holder arranged in two sections, jointed together that they may fold up, and provided with lips *a*, *b*, and *c*, lapping on each section, respectively, in combination with the tablet, substantially as and for the purpose set forth.

298,368. UPRIGHT WIRE-FENCE-MAKING MACHINE. JOHN MANN FULTZ, Quincy, Ill. Filed Nov. 16, 1883. (Model.)

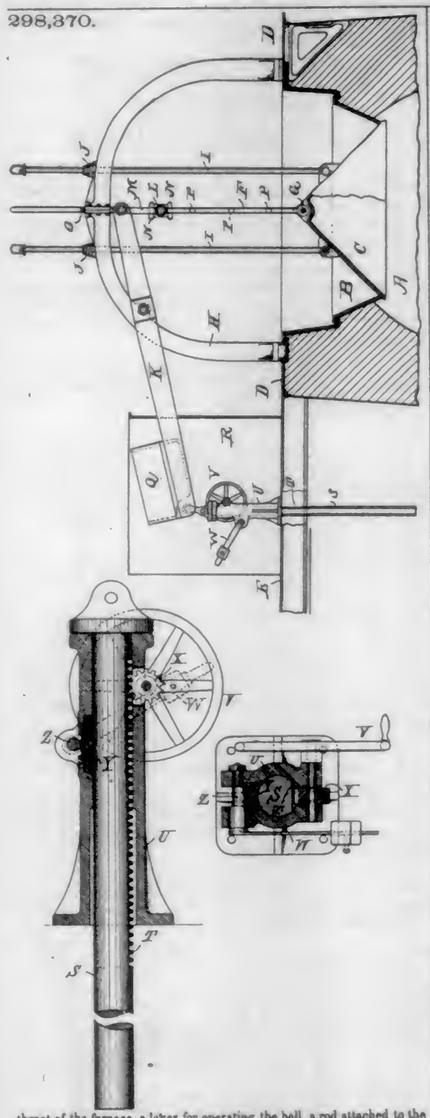


Claim.—1. The combination, with the bed-plate provided with the toothed rack, of the frame provided with the revolving twisters carrying the bobbins, the sprocket-wheels, plain wheels, and endless chain, and the vertical shaft having arms, and the operating lever and spring, substantially as specified.

2. The combination, with the frame having the perforated board *n*, and the mechanism for twisting the wires and moving the frame, of the board *r*, provided with pins to fit the perforations in the board *n*, substantially as specified.

3. The combination, with the bed-frame provided with the toothed rack, of the movable frame carrying the twister mechanism, and provided with the shaft carrying the pinion *k*, ratchet-wheel *j*, lever *i*, and spring-pawl *m x*, substantially as specified.

298,369. LINE-STOPPER. JOHN FURGUSON, Phillipsburg, Pa. Filed Jan. 25, 1884. (No model.)

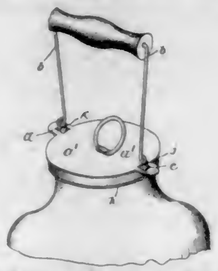


Claim.—A line-stopper consisting of the arms *a b*, pivoted together, having jaws *c c*, the gripping face of each jaw being concave in form, having a sheathing of a non-metallic substance, and forming a cavity at right angles with the longitudinal line of the stopper, the wheel *e*, and the line *g*, substantially as and for the purpose specified.

298,370. BELL AND HOPPER MECHANISM FOR BLAST-FURNACES. FRED. W. GORDON, Pittsburg, Pa. Filed Oct. 22, 1883. (No model.)

Claim.—1. In a blast-furnace, a bell, a hopper, an arch over the

298,370.

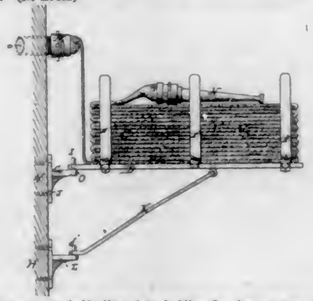


throat of the furnace, a lever for operating the bell, a rod attached to the bell and reaching upward through an eye in the arch, a mortise and pin or equivalent arrangement at the rod above the arch, for supporting the bell independent of the lever mechanism, and a connection between the lever and the rod fitted to take hold of the rod at different points in its length, combined substantially as set forth, for the purpose of enabling the bell-lifting mechanism to be used in removing the hopper.

2. In a blast-furnace, a bell and hopper, an arch over the throat of the furnace, a lever to operate the bell, a rod connecting the lever with the bell, and one or more rods independent of said connecting-rod provided with enlargements at their upper ends attached to the bell and engaging through eyes in the arch, combined substantially as set forth, for the purpose of supporting the bell in its open position when the connection between the bell and lever is broken.

3. In a blast furnace, the combination of a bell and hopper, a lever for operating the bell, a vertically-arranged rack hung to the tail of the lever, a crank-wheel and pinion engaging said rack, friction-pad engaging said rack, an eccentric engaging the friction-pad, and a weighted lever to said eccentric, substantially as and for the purpose set forth.

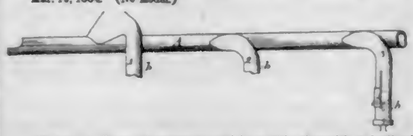
4. In a blast-furnace, the combination of a feed-hopper, bell, and operating-lever with the cylindrical weight S, having teeth T, the crab-stand U, fitting the cylindrical weight, the crank and pinion V X, the friction-pad Y, the weighted lock-lever W, and the eccentric Z, substantially as and for the purpose set forth.



298,371. JUG. JAY R. GRAVER, Lincoln, Nebr. Filed Sept. 12, 1883. (Model.)

Claim.—1. A cork secured with metal coverings closely fitting the mouth of the jug or jar, and secured to the jug by a bail and ears fastening through slots in the cover, as and for the purposes set forth.

2. A bail fastened to a wire with ears attached, the wire passing around the neck of the jug or jar, and the ears extending up through the slots in the cover, as and for the purposes set forth.



298,372. ADJUSTABLE SHELF FOR HOLDING FIRE-HOSE. JOHN C. M. GUIBERT and WILLIAM M. ANDRUS, New York, N. Y. Filed Mar. 29, 1884. (No model.)

Claim.—1. A shelf adjusted for holding fire-hose at any elevation desired, substantially as described, and for the purpose specified.

2. A shelf adjusted for holding fire-hose at any elevation desired, in combination with brace, brackets, and uprights, substantially as described, and for the purpose specified.

298,373. CASH-CARRIER. OSBORN B. HALL, Malden, Mass. Filed Mar. 19, 1884. (No model.)

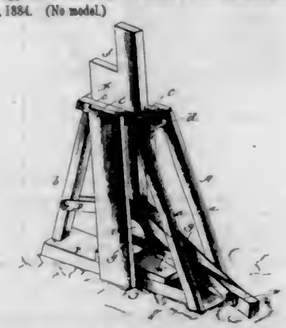
Claim.—1. In a cash-conveyer, and in combination with an inclined tubular forwarding-conduit, A, a series of depending sections, *b*, obliquely connected, and communicating with said main conduit, and respectively provided with an elevating device, whereby the cash-ball when placed in such sections may be impelled through the same and into the main conduit, substantially as specified.

2. In a cash-conveyer, a return conduit or way provided with a series of deliveries and corresponding switches for respectively opening and closing the same, with mechanism connecting therewith and communicating with the cashier's desk or central station, whereby the cashier or attendant at such station may at will open any desired one of said deliveries for the escape of the ball thereat, substantially as specified.

3. In a cash-conveyer, and in combination with a series of deliveries and corresponding switches, with opening devices communicating with the central station, a switch-board or indicator numbered or marked coincidently with the switches, and arranged in connection with said opening devices, to respectively indicate whether said switches are open or closed, substantially as specified.

4. In a cash-conveyer, the combination, with a return-conduit having a series of numbered or severally-marked deliveries, with switches thereto, and devices for operating the same, communicating with the central station, with a switch-board numbered or marked to correspond with said conduits, of a series of cash-balls respectively numbered or marked to correspond with said deliveries and switch-board, whereby the cashier or central operator can by the mark or number on each ball determine which of said switches should be opened to deliver said ball at the counter from whence it was forwarded, substantially as specified.

5. In a cash-conveyer, the combination, with the return conduit or way with a series of deliveries arranged therein, of a rock-shaft or pivot, *c*, having an arm, *f*, secured thereon, with means for actuating the same at the central station, and an arm or section, *d*, secured on said pivot and arranged to arrest the returning ball when raised and to close the delivery when lowered, and also an arm or section, *e*, secured on said pivot and arranged to serve as an operative lever, whereby the ball when arrested by arm *d* will shut the same down by the act of entering the delivery from the main line, substantially as specified.



6. A metallic cash-ball overlaid with rubber vulcanized *in situ*, to render said ball noiseless, substantially as specified.

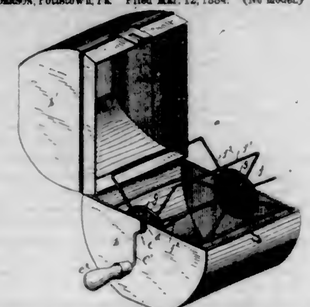
7. A spherical cash-ball having a central disk-like cash-cavity therein, substantially as specified.

8. A cash-ball spherical upon its exterior, with a cash-cavity therein, and having diametrically and equally loaded poles adapted to augment its momentum, substantially as specified.

9. A spherical cash-ball formed with a central disk-like cash-cavity therein, and a pivoted corresponding section adapted to give access to and close said cavity, and provided with means to secure the same in position when closed, substantially as specified.

298,374. LIFTING-JACK. WILLARD L. HALL, Fremont, Nebr. Filed Mar. 22, 1884. (No model.)

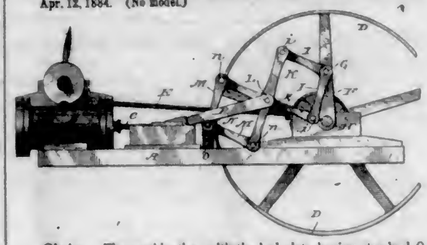
Claim.—1. In a lifting-jack, the combination, with a vertical upright, of a lever connected thereto, and a roller journaled between said upright and lever, substantially as set forth.



2. In a lifting-jack, the combination, with a vertical upright, of a lever connected thereto, a roller journaled between said upright and lever, and plates secured to the lower end of said upright, and to the beam *b*, substantially as set forth.

3. In a lifting-jack, the combination, with a vertical upright, of a lever pivoted thereto by means of metal plates, a roller journaled between plates secured rigidly to the said lever and plates pivoted to the vertical upright, and plates pivoted to the lower end of the vertical upright at one end, and to the upright *b* at their other ends, substantially as set forth.

4. In a lifting-jack, the combination, with the vertical upright, of a lever pivoted thereto, a roller journaled between said upright and lever, and an inclined strip upon which the said roller is adapted to move, substantially as set forth.



5. In a lifting-jack, the combination, with a supporting-frame having guides at its upper end, of a vertically-moving upright mounted between said guides, a lever pivoted thereto, a roller journaled in a bracket consisting of plates pivoted to the lower end of said upright and plates rigidly secured to the lever, plates secured to the upright *b* at one end and pivoted to the lower end of the vertical upright at the other end, and an inclined strip or block secured upon the upper side of the base-strip, substantially as set forth.

298,375. COMBINED EGG BEATER AND DISH. WILLIAM BOWEN REMMERSON, Pottstown, Pa. Filed Mar. 12, 1884. (No model.)

Claim.—The sectional dish having the sections hinged together, and provided with end notches and suitable fastenings, and the removable galvanized-wire beater, adapted to be rotated within the sectional dish, substantially as specified.

298,376. MECHANICAL MOVEMENT. GEORGE S. HENSLEY, Middletown, assignor of one-half to Zachariah Thompson, Clinton, Ark. Filed Apr. 12, 1884. (No model.)

Claim.—The combination, with the bed-plate having standard O and shaft H, provided with crank F, of the connecting-rod P, levers K K, and pitmen I I and M M, arranged substantially as shown and described.

298,377. MAGAZINE-GUN. LEWIS L. HEPBURN, Ilion, N. Y. Filed Dec. 3, 1883. (No model.)

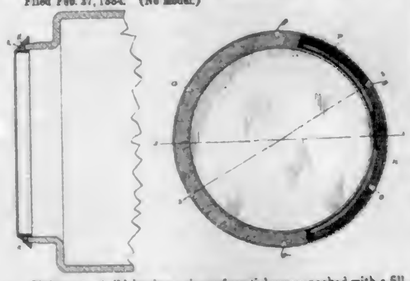
Claim.—1. The combination, in a magazine-gun, of the reciprocating breech-bolt B B', the pivoted cartridge-carrier E, and locking-brace C, with the operating-lever L, provided with an extension, L', which is offset or made to project laterally within the frame, so as to work by the side of the carrier, locking-brace, and breech-closer or plug B', substantially as described.

2. The pivoted carrier E, provided with a lip, I, and pawl G, in combination with the lever L, provided with the spring-detent *m*, and the stud or projection *o*, said parts being constructed and arranged in relation to each other substantially as described, whereby the carrier is both depressed and then elevated during the forward motion of the lever to open the breech.

3. In combination with the reciprocating breech-bolt provided with the shoulder *u*, and carrier E, provided with a shoulder, *t'*, the pivoted locking-brace C, provided with the shoulders *i* and *k*, said parts being arranged relatively substantially as shown and described, whereby the brace is caused to lock both the breech-bolt and the carrier in position,

as set forth.

4. In combination with the pivoted carrier E and locking-brace C, both journaled on the same pivot or bolt, the operating-lever L, provided with a shoulder or projection, *e*, arranged to bear against or under a projection, *l*, on the locking-brace when the breech is closed, whereby said lever is made to lock or hold the locking-brace and carrier in position, as shown and described.

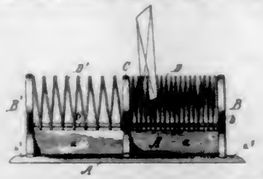


5. The combination of the reciprocating breech-bolt, the pivoted carrier E, having the curved recesses *l* formed in its upper face near the rear, and the operating-lever L L', said parts being constructed and arranged to operate in relation to each other substantially as described, whereby the carrier is made to rise and strike the withdrawn cartridge-shell some time before the breech-bolt has completed its backward movement, and thus eject the empty shell with ease and certainty.

6. The combination of the reciprocating breech-bolt provided with the recess A, the pivoted carrier E, and the operating-lever L L', said parts being constructed and arranged substantially as described, whereby the lever is permitted to move far enough to throw down the locking-brace and carrier before it commences to operate on the breech-bolt, as set forth.

7. The combination, in a breech-loading or magazine gun, of a reciprocating breech-bolt, a pivoted or swinging brace arranged to lock the breech-bolt closed, and an operating-lever, L, provided with an extended arm, L', which is offset or made to project laterally and work alongside of the locking-brace within the frame, substantially as shown and described.

8. The means for securing the front end of the magazine-tube to the barrel, consisting of the ring C', provided with a projection adapted to fit in a corresponding recess in the side of the barrel, and the screw *d'*, the same being arranged substantially as shown and described.

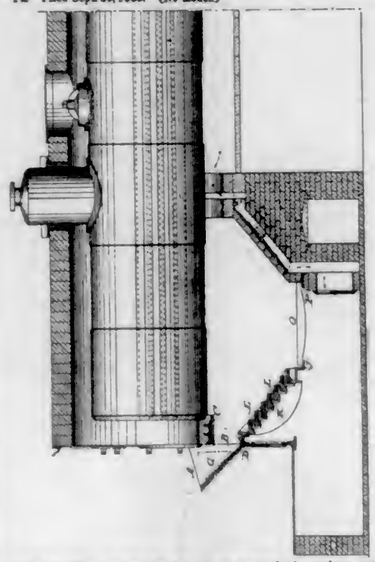


298,378. HERMETIC JAR. THOMAS HEFFLER, Middletown, Ohio. Filed Feb. 27, 1884. (No model.)

Claim.—1. A lid having a circumferential recess packed with a filling of fusible sealing material adhering thereto, and having embedded in said packing a string serving to bind the same together, for the purposes described.

2. A lid having a circumferential recess on its under side, packed with a filling of fusible sealing material adhering thereto, and further secured therein by a string embedded in said material, in combination with prongs extending beneath the same, substantially as described.

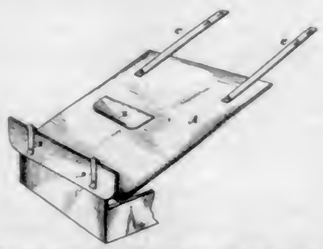
298,379. COMBINED PAPER-WEIGHT AND PEN-RACK. ISAAC W. HEYDRICK, Philadelphia, Pa. Filed Feb. 23, 1884. (No model.)



Claim.—1. In combination with a metal base, A, the narrow elevated longitudinal rib *a a'*, having one or more coiled springs, D D', supported along the top of the said rib *a a'*, and overhanging the sides of the same, substantially as and for the purpose set forth.

2. The combination of the cast-metal base A, supporting-rib *a a'*, one or more coiled-wire racks, D D', end supporting-caps, B B', and one or more flat longitudinal guide-rods, *b b'*, lying within the said coiled rack or racks, substantially as herein shown and described.

3. The end supports, B B', having the hooked fingers b^2 b^2, adapted to engage in the sockets a^2 a^2 of the base A, and the coil-guiding rods *b b'*, firmly attached to the said supports B B', in combination with the head or support C, having the socket *c*, adapted to receive the free ends of the said guiding-rods *b b'*, when brought into place by the rivet *c'*, or its equivalent, together with the base A and one or more coiled-wire racks, D D', the whole constructed substantially as and for the purposes set forth.



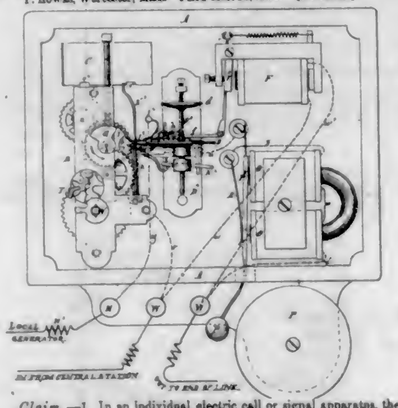
4. A pen-rack adapted to stand upon a desk, consisting of a base, A, and a series of elastic loops or coils, D, elevated above the level of the same by means of a raised rib or its equivalent, *a'*, so that the said elastic loops shall overhang the sides of the said rib and be adapted to grasp and securely hold out of contact with the base or rib a pen-holder, when inserted in said loop or coil, with its projecting point directed downward as well as horizontally, substantially as and for the purposes described.

298,380. BOILER-SETTING. WILLIAM T. HILDRUP, Jr., Harrisburg, Pa. Filed Sept. 26, 1883. (No model.)

Claim.—The heating-flue box Q, constructed of cast-iron, open at the bottom, and provided with the foot R, and flanges *b*, for securing the box in place in the fire-bridge, and strengthened by the longitudinal and transverse ribs *a*, inclined from the center outwardly, said flue-box being arranged within the fire-bridge, substantially as hereinbefore set forth.

298,381. CARRIAGE-APRON. AARON C. HOLDEN, Pittston, Pa. Filed Feb. 4, 1884. (No model.)

Claim.—1. The combination, with U spring-clasps, of an apron the lower end of which is folded and secured to the clamps in the manner shown, whereby the lower edge of the apron will overlap the dash-board, substantially as set forth.



2. The combination, with spring-clasps, of an apron the lower portion of which is folded and inserted in the clasps and secured thereto, whereby the lower edge of the apron will overlap the dash-board, substantially as set forth.

298,382. FOUNTAIN-PEN. GEO. C. HOLT, Hartford, Conn., assignor of one-third to Samuel L. Holt, Mittineague, Mass. Filed June 6, 1883. (No model.)

Claim.—In combination with a writing-pen, an ink-reservoir plate having its upper end rigidly secured to the under side of the pen above the flexible part thereof, and having a stem or step, *b*, fitted to the concave of the pen, and formed lengthwise from the foot of said stem or step to fit the profile of the pen, and in cross-section extended flush with the outer edges of the pen, substantially as and for the purpose set forth.

298,383. INDIVIDUAL ELECTRIC CALL APPARATUS. ALBERT P. HOWES, Worcester, Mass. Filed Mar. 22, 1883. (No model.)

Claim.—1. In an individual electric call or signal apparatus, the combination of an oscillating or rotating electrode actuated by electric impulses indicating the signal-number, and a revolving electrode mechanically operated for closing the signal-operating circuit, said electrodes moving in planes or arcs that cross or transversely intersect with each other, whereby contact of the electrodes is effected at a single position, and means for electrically starting said revolving electrode, as hereinbefore set forth.

2. In an electrical individual call apparatus, the combination of an adjustable electrode electro-magnetically controlled for changing position in accordance with electrical impulses sent over the line, a mechanically-operated electrode adapted to move transversely to or across the arc of motion of said adjustable electrode, and at one position to make contact therewith for closing the circuit of an electrical signaling device, and means for electrically starting the mechanism into action and for mechanically stopping the apparatus when the parts and electrodes are at a normal position, as set forth.

3. In an electric call apparatus, the combination, substantially as hereinbefore described, of a ratchet-wheel carrying an adjustable electrode-arm operated by electrical impulses through the aid of an electro-magnet, swinging armature, and pawl, as set forth, and a mechanical train carrying a revolving electrode adapted to swing into contact with said electrode-arm for closing the signal-actuating circuit, and means for starting the mechanical train with the action of the ratchet-wheel mechanism, and for releasing the ratchet and stopping the apparatus by action of the mechanical train, as set forth.

4. The electro-magnet F, the swinging armature F', carrying the pawl *f*, the ratchet-wheel D, and the spring *d*, for moving the arm or electrode E by and in accordance with electrical impulses through said magnet, in the manner set forth, in combination with the segmental electrode G, mounted upon a shaft, *b*, in transverse position thereto, the mechanism for starting, stopping, and revolving said shaft, signaling devices, and electrical conductors arranged in connection therewith, substantially as described.

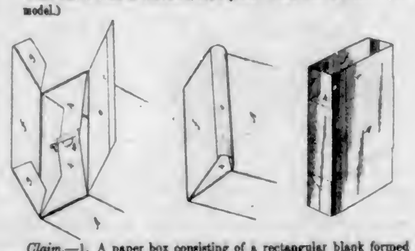
5. The guard-wheel J, lever K K' K^2, and arm L, in combination with the mechanical train and ratchet-wheel spindle, substantially as and for the purpose set forth.

6. The cam M, arm *n*, rocker N, and cast-off lever N', in combination with the mechanical train, ratchet-wheel D, arm A, and pawl *f*, for the purposes of releasing said ratchet devices, substantially as set forth.

7. In an electrical call apparatus, the combination with actuating mechanism, of a rotating recessed disk-electrode in circuit with the main line, mounted to revolve into contact with a spring or electrode having a conductor leading to the local generator or battery, for the purpose of short-circuiting said local generator, substantially as set forth.

8. The disk I, having recess *i*, mounted to revolve with the mechanical train and electrically connected with the main line, in combination with the spring-electrode I', supported at stationary position and joined by a conductor with the local generator, substantially as and for the purpose set forth.

9. The combination, with the mechanical train and an electrical call or signal apparatus, of an inclosing-case having a guard or door located in front of the winding-arbor of said train, a latch device for retaining said door closed, and a latch-tripping device controlled by said mechanical train, for automatically releasing said latch, substantially as and for the purpose set forth.



10. In an electric call apparatus, the combination, with the mechanical train and its inclosing-case, of the guard or door for protecting the winding-arbor, provided with automatic latch or fastening devices located at the interior and inaccessible from the exterior of the case, and the latch-tripping mechanism controlled by the mechanical train, and operating in connection with said door and its fastenings, in the manner set forth, whereby said door is retained closed until the time for winding the train, and its closure then resisted until the train is again wound up.

11. The combination, with the key-arbor V and annunciator or doors S, of the winding-stop V', provided with the tripping-arm T, the latch-spring *t'* and catch *t*, and the pressure-spring S', substantially as and for the purposes shown and described.

12. In an individual call-signal apparatus, the combination, substantially as described, of the rotating electrode-arm E, adjustable on the ratchet-wheel D, the electro-magnet F in the main line, the swinging armature F', carrying the actuating-pawl *f*, the mechanical train having revolving electrode G, the starting-levers L K^2 K', cast-off levers *n* N N', and the signal-actuating electro-magnet O P', the line connections or studs W W', and the conductors *v u x z*, arranged substantially as shown, and for the purposes described.

13. In an electrical call apparatus, a mechanical train, B, governed by a revolving fan, C, without escapement devices, and carrying an electrode formed as revolving segmental disk, in combination with a counter-electrode formed as flat spring, and adapted to make contact at its end upon the peripheral surface of said disk, and a stop device for releasing and arresting the movement of said train, in the manner substantially as hereinbefore set forth.

298,384. PAPER BOX. JAMES C. HURD, Springfield, Mass., assignor of one-half to John K. Stannard, same place. Filed Feb. 28, 1884. (No model.)

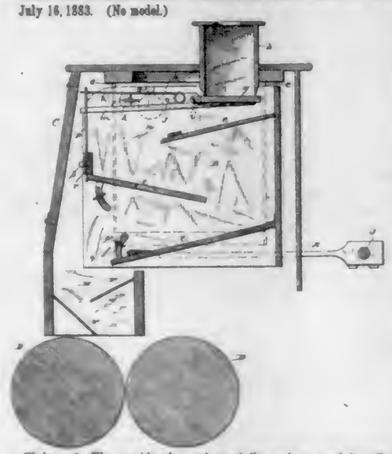
Claim.—1. A paper box consisting of a rectangular blank formed into a rectangular tube, and slit and bent at the end to form a tongue, *e*, and end section, *f*, with side edges turned in along the width of the section to form inturned side flanges, and with independent side flaps the width of the side sections, substantially as described.

2. A paper box consisting of a substantially rectangular blank formed into a rectangular tube, and slit upon the straight line *t* and bent line *s*, to form independent tongues and flaps for infolding to close the ends, substantially as described.

3. A paper box having a rectangular body, inwardly-folded end pieces extending from the sides, and the width of the latter, an outer end piece with inturned edge flanges extending along its entire width and independent from the side flaps, and a tongue inserted between the flanges and the end piece, substantially as described.

4. A box having a rectangular body prolonged at the front and back to form an end section, *f*, and a tongue, *e*, with a crease, *v*, and with side flanges on the end section of equal width therewith, and flaps independent of the end flanges extending inward from the sides, substantially as described.

298,385. WIRE-STRETCHER. THOMAS HUSTON, Kokomo, Ind. Filed July 12, 1883. (No model.)



Claim.—In a wire-stretcher, the combination, with the block *b*, having a handle, *b'*, and an indented plate, *c'*, of the block *a*, hinged to the block *b*, and faced with a projecting plate, *c*, and provided with studs or prongs and a ring, as described.

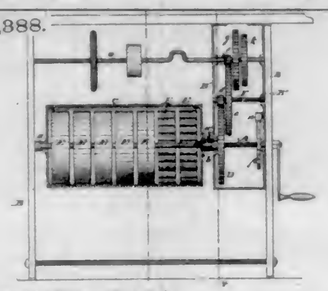
298,386. HINGE FOR MIRRORS. ANTON JELINEK, Chicago, Ill., assignor of one-half to James A. Craig, same place. Filed Apr. 20, 1883. (Model.)

Claim.—A hinge having suitable screw-plates, bowl-shaped lugs projecting at right angles from said plates, so that their concavities face each other, a rivet for holding said lugs together, so as to form an inner chamber, and a spring placed within said chamber, substantially as hereinbefore set forth.

298,387. AUTOMATIC SHELF-FEEDER FOR MIDDLINGS-PURIFIERS AND ROLLER-MILLS. WILLIAM M. JEWELL, Denver, Colo. Filed July 16, 1883. (No model.)

Claim.—1. The combination, substantially as shown and described, of a stationary hopper, a frame provided with distributing-shelves beneath it, means to shake or vibrate such frame, and a shelf pivoted in said frame at the discharge end of said hopper, and provided with a counterbalancing device to render it automatic, and a hook to engage said shelf to limit its range of movement, as and for the purpose set forth.

2. The combination, substantially as shown and described, of the stationary hopper, the shaker suspended beneath it, the shelf for closing the discharge end of said hopper, pivoted in said shaker and moving with it, means, as set forth, for vibrating said shaker, the adjustable counterbalancing mechanism connected with said shelf to vary its resistance, and means, substantially as specified, for limiting the fall of the shelf and for positively preventing its fall, as and for the purpose described.



3. In a middlings-purifier or roller-mill, the combination, substantially as shown and described, with the hopper and its discharging-shelf, of the shaking-frame and its bottom or delivery shelf, having adjusting mechanism, as set forth, to insure a uniform distribution of the material fed relatively to the level of the purifier or roller-mill, as set forth.

298,388. SPRING-MOTOR. ALEXANDER KANTHACK, Philadelphia, Pa., assignor of one-half to John M. Driver, same place. Filed Mar. 13, 1884. (No model.)

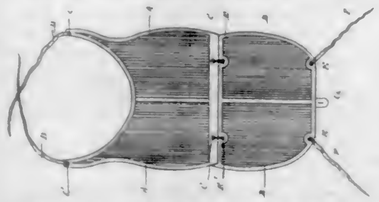
Claim.—1. A spring-motor having a multiple spring formed of a series of parallel springs, and an unbroken shaft, and a drum with which the springs are connected, said shaft and drum being common to all of the springs, substantially as and for the purpose set forth.

2. A winding-shaft and a spring connected therewith, in combination with a drum inclosing a spring and connected therewith, a hollow journal and sleeve on opposite ends of the drum, a gear-wheel with a hub which freely encircles the shaft and is encircled by the sleeve of the drum, and a power-transmitting shaft and intermediate gearing, substantially as and for the purpose set forth.

298,388.

3. A multiple spring, in combination with an inclosing-drum, a winding-shaft, a hollow journal and sleeve on opposite ends of said drum, a gear-wheel having a hub which encircles said shaft and is fixed to said sleeve, a train of gearing, and a power-transmitting shaft, substantially as and for the purpose set forth.

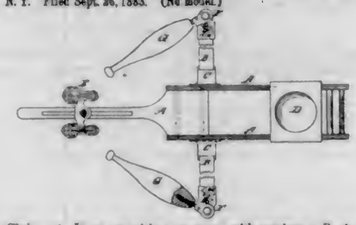
298,389. BAND-TUCKER. WYLEY M. KEALEN, Payson, Ill., assignor to Elam B. Hale and John B. Markee, both of Birmingham, Ill. Filed Aug. 30, 1883. (No model.)



Claim.—A band-tucker composed of the metal shield or cap A, having flange *a*, adapted to fit the inner face of the thumb and its base, in combination with the stall B, of flexible material, provided with a suitable device for securing it to the wrist, substantially as and for the purpose set forth.

298,390. FORCE-FEED FOR GRAIN-DRILLS. JOHN H. KEEDY, West Alexandria, Ohio. Filed Feb. 12, 1884. (No model.)

Claim.—In a force-feed grain-drill, a feed-wheel having on its periphery a series of arrow-head ribs and alternating arrow-head-shaped depressions, and arranged upon the shaft, as described, to rotate in the direction of the arrow-points, substantially as specified.

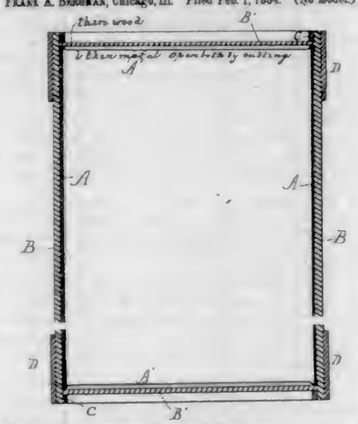


298,391. SHIRT-BOSOM PROTECTOR. CHAUNCEY S. KELLOGG, New Orleans, La. Filed Aug. 23, 1883. (No model.)

Claim.—1. A shirt-bosom protector made of celluloid, having an upper and lower section, as shown and described, and for the purposes set forth.

2. In a shirt-bosom protector, the combination of upper section, A, made of celluloid, having apertures C C' and tape D, adapted to fit the bust, with section B, having apertures E E', as described, and for the purposes set forth.

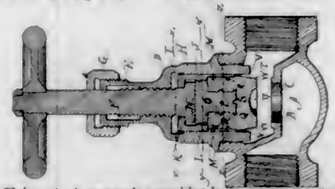
298,392. EXERCISING APPARATUS. JOHN M. LAFLIN, New York, N. Y. Filed Sept. 26, 1883. (No model.)



Claim.—1. In an exercising apparatus with outriggers B, the friction-wheel *a*, cap *j*, with rim *l*, lugs *m m*, shoe *p*, and lever *o*, substantially as, for the purpose specified.

2. In an exercising apparatus with outriggers B, the friction-wheel *a*, with rib or vein *w* on the rim thereof engaging with the toothed wheel *q* of a counter, substantially for the purpose described.

3. In an exercising apparatus with outriggers B, friction-wheel *a*, cap *j*, rim *l*, lugs *m m*, shoe *p*, lever *o*, rib or vein *w*, and tooth-wheel *q*, all constructed, arranged, and operated substantially as described and shown.

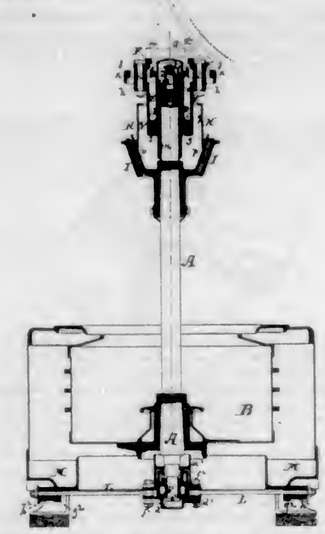


298,393. PACKAGE FOR MIXED PAINTS. EDWARD T. MASON and FRANK A. BERGMAN, Chicago, Ill. Filed Feb. 1, 1884. (No model.)

Claim.—1. The package for mixed liquid paints, consisting of the sealed cylindrical vessel A A', the heads being of thin metal, and a wood jacket projecting beyond the heads of the vessel, and consisting of the cylinder B, the heads B', and the hoops C D, substantially as specified.

2. The package for mixed liquid paints, consisting of the inner metal vessel having heads formed of thin metal, a covering-jacket projecting beyond said heads, and thin or readily-removable wood heads secured in said jacket, substantially as specified.

298,394. COCK AND FAUCET. GEORGE B. MCCRACKEN, Willimantic, Conn. Filed Aug. 7, 1883. (No model.)



Claim.—1. A stop-cock comprising in its construction the top section of the valve-body, having the piston-recess and the squared-off inner end or edge, the reciprocating piston in the said recess, and the soft-metal valve-disk, whereby the disk may be trued from the squared edge, substantially as set forth.

2. The herein-described valve-piston, comprising the piston-shell having the annular interned flange at its top and formed with the annular interior flanges, the lock-nut arranged in the piston and having the annularly-flanged stem, the spindle having the enlarged end working between the lock-nut and the interned flange, and the soft-metal valve-disk molded in the piston and around the stem of the nut to lock the parts securely together, substantially as and for the purpose set forth.

3. The combination of the body of the valve, the projecting valve-seat arranged therein, the removable top section of the body, having the piston-recess and formed with the squared-off inner end, the piston-shell fitting neatly in the recess and having the square lower end, the operating-spindle, and the valve-disk secured in the piston, substantially as and for the purpose set forth.

4. The combination of the body of the valve, the seat therein, the removable top section of the body, having the piston-chamber, the spindle working through this section and formed with the enlarged end, the piston-shell having the annular interned top flanges and the interior annular flanges, the lock-nut having the annularly-flanged stem, and arranged in the piston to form the spindle-seat, and the soft-metal valve-disk molded in the piston and around the lock-nut, substantially as and for the purpose set forth.

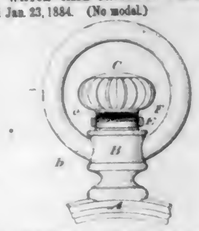
298,395. CENTRIFUGAL MACHINE. THILE H. MÜLLER, New York, assignor to Samuel S. Hepworth, Yonkers, N. Y. Filed Dec. 31, 1883. (No model.)

Claim.—1. The combination of the spindle A, having the upper enlargement, *a*, with the washers *d*, supporting-plate *e*, tubular head D, ball-and-socket joint *f g*, tube E, bolts *i*, and suspension-socket F, having tubular extensions *j*, that pass through apertures in the flange *k* of the head D, substantially as herein shown and described.

2. The combination of the spindle A and its prolongation C and upper enlargement, *a*, with the washers *d*, tubular head D, and means, substantially as described, for supporting said head, and with the plate *e* and oil-tube *o*, that extends upward from said plate *e*, said plate *e* having a passage in alignment with the bore of the tube *o*, substantially as and for the purpose herein shown and described.

3. The combination of the suspended spindle A, and means, substantially as described, for holding it suspended, with the pulley H, having conical portion *p*, and with the conical brake I, horizontal pivot *s* of said brake, and means, substantially as described, for swinging said brake on said pivot, as set forth.

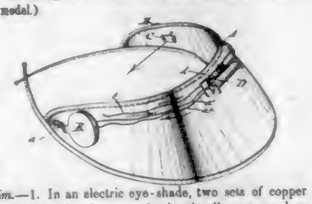
4. The combination of the suspension-socket F, having tubular extensions *j*, with the tube E, suspension-head D, having flange *k*, through which the tubes *j* pass, spindle A, enlargement *a*, washers *d*, supporting-plate *e*, pulley H, and brake I, all arranged so that when the brake is applied the spindle will be slightly lifted and pressure on the washers relieved, as set forth.



5. The combination of the suspended spindle A with the guard a^3, split sleeve b^3, chamber d^2, horizontal braces L, fixed flange or projection g^3, and cushions k^3, substantially as and for the purpose herein shown and described.

6. The combination of the upright spindle A and means, substantially as described, for suspending it at its upper end, with a bottom bear-

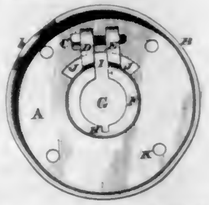
ing and centering braces and cushions L A^2, substantially as herein shown and described.



7. The combination of the split sleeve b^2 and oil-chamber d^2, having a vertical prolongation to above the level of the oil, and outer flange for bolts f^2, with a guard, a^2, resting on the inner bushing, b^2, and reaching over said projection of the oil-chamber, and forming upper flange for attaching tension-bolts L, as set forth.

298,396. WATCH-CASE PENDANT. DANIEL O'HARA, Waltham, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—In a stem-winding-watch case, the combination of externally-screw-threaded pendant B, and externally-screw-threaded winding-stem crown C, and the internally-screw-threaded band E, substantially as and for the purposes set forth.



298,397. ELECTRIC EYE-SHADE. LOUIS K. OPPENHEIMER, Cincinnati, Ohio, assignor to Simon Lindeman, same place. Filed Nov. 5, 1883. (No model.)

Claim.—1. In an electric eye-shade, two sets of copper and zinc plates, constituting the elements of galvanic piles, arranged one at each side of the shade, in each of which one ultimate element or plate is attached to the plate, but insulated therefrom, and the other mounted upon a spring-arm electrically connected with an electrode or distributing-plate arranged to act against or in region of the temple of the wearer of the shade when in use, said plates forming a clamp to hold removably a moistened pad, and provided with suitable circuit-connections, substantially as described.

2. The combination, in an electric eye-shade, of one or more galvanic piles and an induction-coil (and circuit-breaker) having its primary arranged in closed circuit with the pile or piles, and two distributing-electrodes arranged to rest against the head of the wearer, and arranged in the open secondary circuit, substantially as set forth.

298,398. SHAFT-COUPLING. JOHN H. OSBORN, Evansville, Ind. Filed Mar. 27, 1884. (No model.)

Claim.—1. As a new article of manufacture, the head or disk A, having a hub, F, lugs D E, key-seat H, slot I, and opening J, the inner periphery of the latter being coincident with the outer periphery of said hub, as herein described.

2. A cylindrical coupling-box consisting of the head A, perforated annular flange or rim B *b*, bolt C, lugs D E, hub F, key-seat H, slot I, and opening J, the inner periphery of the latter being coincident with the outer periphery of said hub, for the purpose specified.

3. The combination, in a shaft-coupling, of heads A A', bolts C C', lugs D D' E E', hubs F F', key-seats H H', slots I I', openings J J', holes K K', keys O O', and retaining devices L, substantially as herein described

298,399. HAT-BINDING ATTACHMENT FOR SEWING-MACHINES. GEORGE W. PARKINSON, Newburg, N. Y. Filed Feb. 20, 1884. (No model.)

Claim.—1. In a hat-binding attachment for sewing-machines, a base-plate having at one end a recess, the edge of said plate bordering on said recess being beveled, as described, combined with a scroll for uncurling and guiding the edge of the hat-brim, and for guiding the binding, substantially as set forth.

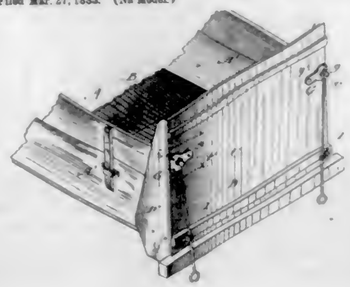
2. The base-plate, the scroll attached thereto, and having a downwardly-turned lip for uncurling the hat-brim, and at its apex a passageway that is approximately vertical, combined with a guide arranged approximately parallel with said scroll and adapted to co-operate with the latter in guiding the partially-uncurled edge of the hat-brim, substantially as set forth.

3. The base-plate having at one end a beveled-edged recess, combined with an uncurling and guiding scroll, arranged partially over the beveled edge of said recess, a guide for the lower edge of the binding, and a guide adapted to co-operate with said scroll in guiding the partially-uncurled edge of the hat-brim, substantially as described.

4. The base-plate and the scroll secured thereto, and having a downwardly-turned lip for uncurling the hat-brim, in combination with a guide having a downwardly-turned hook arranged approximately in line with the apex of said scroll, substantially as described.

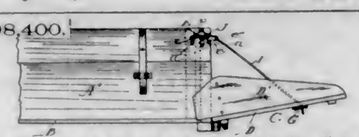
5. The base-plate, the scroll secured thereto, and having a downwardly-turned lip for uncurling the hat-brim, and the guide for the lower edge of the binding combined with a guide adapted to co-operate with said scroll in guiding the partially-uncurled edge of the hat-brim, substantially as described.

6. The combination of the base-plate A, having the recess A', and the beveled edge *a'*, partially surrounding said recess, the scroll B, secured to said base-plate, the adjustable guide C, having the downwardly-turned hook *c'*, and the adjustable guide D, for the lower edge of the binding, substantially as set forth.



7. The combination of the base-plate A, having the recess A', and the beveled edge *a'*, partially surrounding said recess, the scroll B, secured to said base-plate, the guide C, having the hook *c'*, the screw *c*, for pivotally and adjustably attaching said guide to said base-plate, the guide D, having the slot *d'* and guiding-hook d^3, and the thumb-screw *d*, substantially as described.

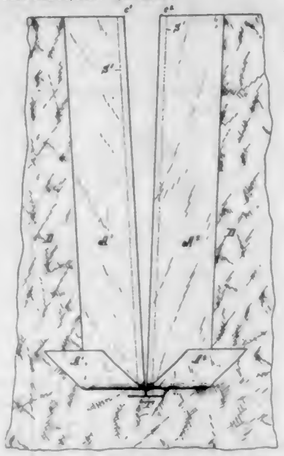
8. The presser-foot E, recessed on its inner side, leaving the projection *e* cut away on its bottom, as shown, combined with means for uncurling and guiding the hat-brim and the binding, substantially as described.



9. The presser-foot E, recessed on its inner side and having the projection *e*, which is cut away on its bottom, said cut-away portion or recess being curved slightly outward to facilitate the turning of the work, combined with means for guiding the hat-brim and binding, substantially as described.

10. The presser-foot E, recessed on its inner side, leaving the projection *e*, which is cut away on its bottom, as shown, combined with the base-plate A, the scroll B, and the guides C and D, substantially as set forth.

298,400. WAGON END-GATE. HAZEN H. PERKINS, Kewanee, Ill. Filed Mar. 27, 1883. (No model.)



298,400.

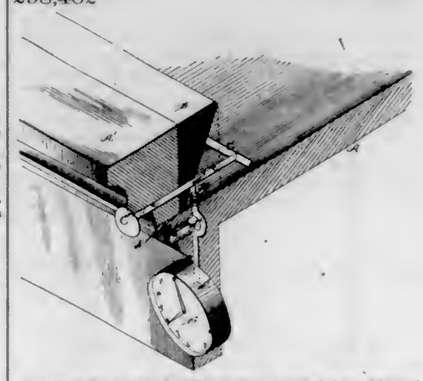
Claim.—1. In an end-gate fastening, in combination with the wagon-box, the end-gates and rods I and J, the plates E, having holes *e* in their outer ends and curved at *e'*, and adapted to fit either side of the wagon-box for different adjustments, substantially as and for the purpose set forth.

2. In an end-gate fastening, in combination with the wagon-box, plates E, turn-down end-gate, and hook-rods I, the plates G, having holes *g* of quarterfoil shape, substantially as and for the purpose specified.

298,401. STAYING-PIECE FOR GARMENTS. GEO. W. PINE, Troy, N. Y. Filed Jan. 31, 1884. (No model.)

Claim.—1. In a combined button-lap and stay for garment-slit openings, the combination of a cross-slit made in the garment below the vertical slit-opening, an overlap attached to one side of the garment above the cross-slit, an underlap attached to the other side of the garment-slit above the cross-slit, with the underlap sewed to the upper edge of the cross-slit, and its lower end passed frontwardly through said cross-slit, turned up, and sewed to the inner facing of the overlap, and the latter sewed to the lower edge of the cross-slit, as shown and described.

2. In a combined button-lap and stay for garment-slit openings, the combination of the cross-slit T at the bottom of the slit O, the plackets A' A^2, each attached, as shown, upon one of their side edges to one of the opposite sides of said slit O, and each folded longitudinally and attached on their other sides to the garment exterior above the cross-slit, with the folded placket A^2, attached to the upper edge of said cross-slit, passed frontwardly through the latter, turned up, and sewed to the inner facing of the placket A', and the latter sewed to the lower edge of the cross-slit and the garment exterior, below the latter, as shown and described.

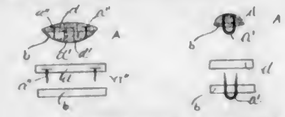


298,402. TIME-REGISTER FOR BILLIARD-TABLES. EDWIN B. PORT, Chicago, Ill. Filed Dec. 26, 1883. (No model.)

Claim.—1. The combination, with a billiard-table, of means adapted to be moved at will, for obstructing the course of the balls, means for registering the lapse of time, and intermediate connection between the two, whereby the movement of the former will start and stop the latter, substantially as and for the purpose set forth.

2. In a time-register for billiards or similar games, a removable obstacle adapted to obstruct the course of the balls, in combination with a time-register, a connection actuated by the obstacle to stop the register, a key adapted to actuate the connection to start the register, and means for locking the obstruction in place, substantially as and for the purpose set forth.

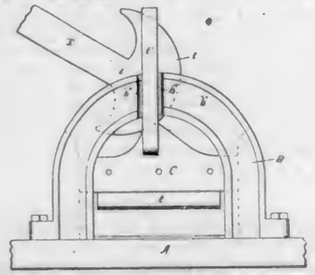
3. The combination, with a billiard-table, of an obstacle adapted to be projected over the table or withdrawn beneath the cushion, a time-register, and an intermediate connection between the two, adapted to start or stop the register as the obstacle is moved, substantially as and for the purpose set forth.



298,402

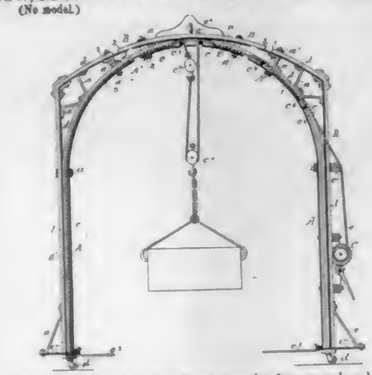
4. In a time-register for billiard-tables, an obstacle located beneath the overhanging cushion, and provided with means for projecting it over the table at will, in combination with a time-register, and an intermediate connection between the register and obstacle adapted to lock the latter in its forward position, substantially as and for the purpose set forth.

5. The combination, with the table A, constructed as usual, and the rod C, provided with the auxiliary rod *c*, having notch *c'*, of the spring-latch D, formed with the hook *d'* and shoulder d^2, and the register E, all constructed and arranged to operate substantially as and for the purpose set forth.



298,403. BUTTON. GEORGE W. PRENTICE, Providence, R. I. Filed Mar. 3, 1884. (No model.)

Claim.—1. A solid button or button-head composed of two or more layers of plastic material, formed as described, and provided with eye-holes, staples, or other suitable means for attachment, substantially as set forth.

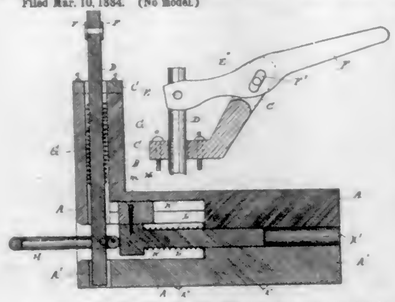


2. The herein-described button or button-head A, consisting of the layers *b* and *d* and fastenings *a''*, with a metallic eye or fastening, the whole arranged substantially as shown and described.

298,404. TOBACCO-CUTTER. GEO. A. PRIEST, St. Louis, Mo. Filed Sept. 5, 1882. (No model.)

Claim.—In a tobacco-cutter, the combination of a suitable base, a support, B, formed with vertical longitudinal opening *b* and side plates, *b'*, one side plate having guide-ribs *b''* on the outside, a sash, C, between the plates, having a cutter, and a vertical arm, *c'*, secured to one side thereof, outside the support, to work between the guide-ribs, having lateral projection *c''*, extending over the said opening, and a lever, E, pivoted to the side plates in the same plane as the sash, having a head, *e*, formed with cam *e'*, fitting between the top of the sash and the projection, as set forth.

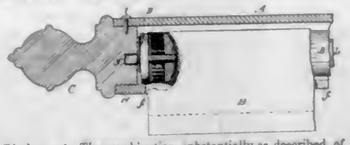
298,405. DERRICK. ADAM RETTS, St. Louis, Mo. Filed Apr. 7, 1884. (No model.)



Claim.—1. A portable derrick constructed to form an arch, as herein shown and described, the rope or cable passing from a crab on one leg, up and over the arch to its middle, thence down and through pulley-blocks, and finally up and over the other half of the arch, down, and fastening to the foot-plate of the other leg.

2. In a portable derrick, the legs A and B', and double arch A' and B, formed in sections or of one piece, the foot-plates C', casters or wheels d', crab C, and the rope or cable c, all combined and constructed as herein shown and described, as and for the purpose set forth.

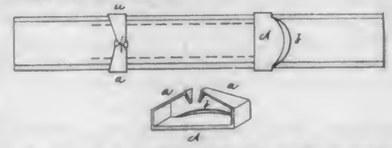
3. In a portable derrick, the legs and arches, being constructed of plate metal, having ribs d, and the groove d^2 in the inner arch and legs, and the braces a and straps a', all constructed as herein shown and described, and for the purpose set forth.



298,406. CAR-COUPLING. JOHN RIDENOUR, Mount Vernon, Ind. Filed Mar. 10, 1884. (No model.)

Claim.—1. In a car-coupler, the draw-head A A', having blocks *b b* and openings K K' K'' *k k*, in combination with bolt I I', having guide block M and spiral spring L, as described, and for the purposes set forth.

2. In a car-coupler, a draw-head composed of upper and lower pieces, A A', and blocks *b b'*, an attachment, B, secured to the top thereof by bolts *f*, having attached thereto by screws *e* a cap, C, having a forked arm, C', in combination with the lever F, having a slot, F', a bolt, F'', a bolt, E, and coupling-pin D, having spring G and shoulders D', adapted to rest upon the link H, as described, and for the purposes set forth.

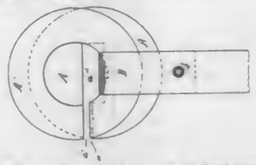


298,407. CURTAIN-FIXTURE. FRANK G. ROBBINS, Lynn, Mass. Filed Jan. 18, 1884. (No model.)

Claim.—1. The combination, substantially as described, of a cornice consisting of a tube provided with a longitudinal slot and ornamental caps or plugs closing the ends of said tube, an automatic spring shade-roller within said tube, journaled in the inner ends of said ornamental plugs, and a shade wound on said roller and hanging through said longitudinal slot.

2. The shell *d*, having the spring-roll D, and provided with the strip *g*, or means for attaching a lace curtain, substantially as set forth.

298,408. STRAP-FASTENER. JEROME W. ROPP, Elyria, Ohio. Filed Feb. 25, 1884. (No model.)



Claim.—A cap, A, provided with the lip *b*, and arms, as described, in combination with the rivet C, all as above set forth, and substantially as described.

298,409. COFFIN. JACOB V. ROWLETT, Richmond, Ind. Filed Aug. 25, 1883. (No model.)

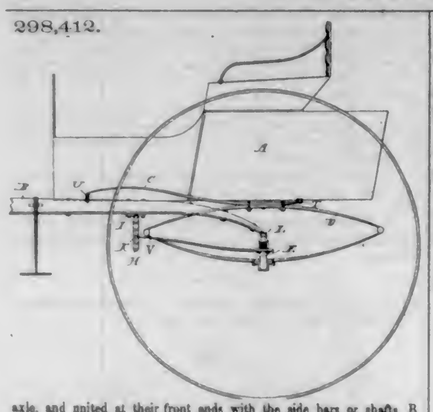
Claim.—In a coffin or packing-case, the lock herein described, consisting of two plates, one of said plates having a practically semicircular lug formed on its edge, the outer edge of said lug being bent slightly inward, the other plate having two lugs of the same construction as the lug aforesaid, the single lug being adapted to lie between the two lugs on the engaging-plate, in combination with a semicircular longitudinal locking-block, substantially as set forth.

298,410. BALE-TIE. ARMER ERWIN RUSSELL, Benton, Miss. Filed Mar. 12, 1884. (No model.)

Claim.—The buckle and washer constructed substantially as specified, in combination with the tie-band, for the purpose set forth.

298,411. PEN-HOLDER. ALDIS EDDY SAGE, Minneapolis, Minn., assignor of one-half to John G. Emery, Jr., same place. Filed Nov. 22, 1883. (No model.)

Claim.—1. A pen-holder consisting of a tube or barrel, B, having inclined slots *a*, and a holder or clamp, A, provided with lugs *b*, adapted to fit into said slots, substantially as and for the purpose set forth.



2. The combination of the barrel B, having the slots *a*, and the holder or clamp A, having the lugs *b*, and projection *d*, substantially as and for the purpose specified.

298,412. TWO-WHEELED VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed July 12, 1883. (No model.)

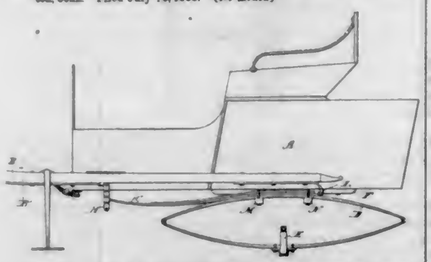
Claim.—1. The combination of the axle, shaft-frame pivoted thereto, braces rigidly secured to the axle extending forward beyond the pivot-point and beneath the shaft, adjustable connection between the brace and shaft-frame, spring-supported body, and adjustable connection between the front body-spring and its support, substantially as set forth.

2. In a two-wheeled vehicle, the shafts pivotally connected to the axle B, in combination with under braces, V, rigidly secured to the

298,412.

axle, and united at their front ends with the side bars or shafts, B through the medium of pivoted hanger-links H, substantially as and for the purpose set forth.

3. In a two-wheeled vehicle, the combination of the axle, the shafts or side bars pivotally connected to the axle, and the flexion under braces, V, rigidly united to the axle, and connected by an adjusting device to the shaft-frame in advance of the axle, substantially as and for the purpose set forth.



4. The flexion spring-braces rigidly secured to the axle, and extending back of the latter to form arms I.', united to the shaft B, and projecting forward to unite with an adjusting device connecting it to the shaft-frame, substantially as set forth.

5. In a two-wheeled vehicle, the combination of springs D and C, the rear end of the latter rigidly secured to the top member of the spring D, and extended forward and pivotally connected to the body, and the rear end of the body pivotally supported upon the springs D, the whole combined and arranged to operate substantially as and for the purpose set forth.

6. In a two-wheeled vehicle, the two separately-arranged adjusting devices, combined with the frame, axle-body, and springs, the one to regulate the set of the shafts in relation to the axle and the other to regulate the hang of the body in relation to the shafts, substantially as set forth.

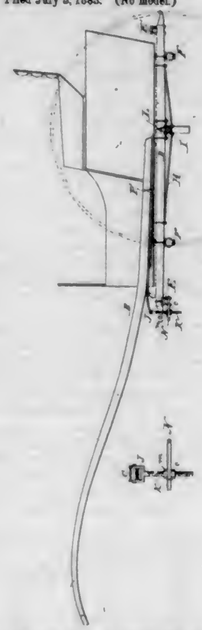
7. In combination with the springs and the side bars or shafts, B, the hangers having their upper ends pivotally connected to the shaft-frame, and a connection for the spring adjustable on the hangers, substantially as and for the purpose set forth.

298,413. TWO-WHEELED VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed July 16, 1883. (No model.)

Claim.—1. In a two-wheeled vehicle, the combination of a spring-platform connected to the axle and supporting the body, a shaft-frame jointed to the platform at the rear, and springs extending from the platform forward of the axle and connected to supports below the top of the shaft-frame, substantially as described.

2. The combination of the body, springs supporting the same, shaft-frame pivoted at the rear, and springs C, connected to the platform, extending forward and connected at the front ends to adjustable connections suspended from the shaft-frame, substantially as set forth.

3. The combination of the axle, springs secured thereto, body supported by the springs, shaft-frame pivoted at or near the tops of the body-supporting springs, springs extending from the platform below the shaft-frame, and adjustable connections between the front ends of the springs and the shaft-frame.



4. In combination, the elliptical springs D, and the spring-braces C, connected to the upper half of the elliptical springs, and at the front ends united with the shaft-frame, substantially as and for the purpose set forth.

5. The combination of the springs D D, between the body and axle, spring-braces C, shaft-frame pivoted to the running-gear at the rear end, and adjusting devices interposed between the front end of the spring-braces and the shaft-frame, substantially as set forth.

6. The under brace, V, secured to the axles, with the opposite ends bent up and connected with the shaft-frame, in combination with the spring-patform, substantially as set forth.

7. In a two-wheeled vehicle, the combination of the axle E, body A, elliptical springs D, shaft-frame pivotally connected to the platform at L, and the springs C, pivotally connected to the front end of the body, substantially as specified.

298,414. TWO-WHEELED VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed July 5, 1883. (No model.)

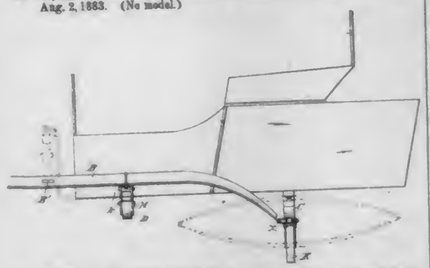
Claim.—1. In a two-wheeled vehicle, the combination of the axle, platform-frame connected therewith and supporting the springs, body supported by said springs, and shaft or pole frame pivoted to the axle, and spring longitudinally interposed between the shaft-frame and platform-frame, substantially as set forth.

2. The combination, with the platform-frame, springs, and shaft-frame pivoted to the axle, of springs interposed between the frames, and adjustable connections between the ends of said springs and the platform-frame, substantially as set forth.

3. In a two-wheeled vehicle, the combination of side bars rigidly secured upon the axle, semi-elliptic side springs connecting the cross-bars and adapted to support the body, and shafts or pole pivotally connected to the axle and secured to the front end of the frame by longitudinal springs, substantially as specified.

4. In a two-wheeled vehicle, the combination of a platform-frame connected to the crank-axle, a spring-platform supported by the said frame, adapted to carry the body, and shaft or pole frame, connected to the axle and to the front end of the frame by elastic connections, substantially as specified.

5. In a two-wheeled vehicle, the combination of a platform-frame secured upon the axle, a spring-platform, and shaft-frame supported upon flexion-springs extending from the axle to the front end of the platform-frame, substantially as specified.



6. In a two-wheeled vehicle, the combination, with the platform-frame secured to the axle, of an extension or projection beyond the sides of the platform, and shafts secured to the said extension and having their rear ends pivotally connected to the axle, substantially as specified.

7. In a two-wheeled vehicle, the combination of a platform-frame

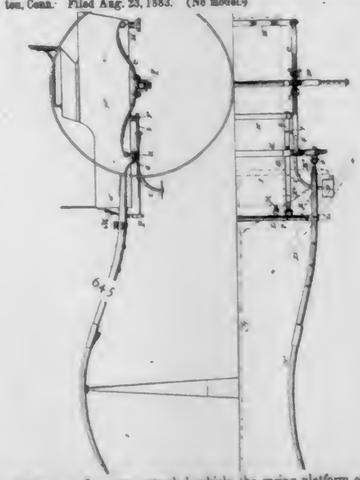
connected to the axle, and a phanton or "drop-front" body having its elevated rear portion carried by a spring-support mounted upon the rear end of the frame, and the drop-front of the body carried upon a spring or springs suspended from the side bars, substantially as specified.

8. In two-wheeled vehicles, an adjusting device composed of the vertical bolt K, the top end of which is adapted to a pivotal connection, plate N, in two sections connected by the hinge-joint N², and set-nuts *m o*, substantially as and for the purpose set forth.

298,415. ROAD-CART. CYRUS W. SALADEE, Torrington, Conn. Filed Aug. 2, 1883. (No model.)

Claim.—1. In a road-wagon, the combination of a crank-axle, body, intermediate spring platform supported by the lower part of the axle, shaft-frame pivotally connected to the upper part of the axle, and spring-connection between the shaft-frame and forward part of the body, substantially as set forth.

2. The combination, with the front spring-support, crank-axle, shaft-frame pivotally connected with the axle, body extending between the shafts, and front supporting-spring, of an adjustable connection whereby to alter the relative set of the body and shaft-frame, substantially as specified.



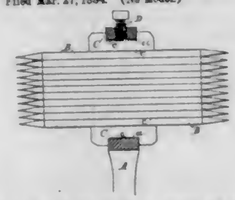
3. The combination of the crank-axle, body, rear supporting-spring, C, parallel to the axle, and connected to the depressed portion thereof, and front spring connected to the shaft-frame, substantially as set forth.

4. The combination of the axle, body-supporting springs, and shaft-frame, consisting of two sections jointed together, the rear section jointed to the axle, and an adjusting device connecting the sections, substantially as described.

5. The combination of the axle, spring-supported body, shafts pivoted at the rear ends to springs connected to the axle, and spring-connections between the front of the body and shaft-frame, substantially as described

---

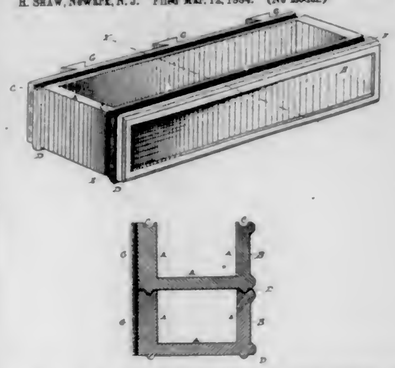
298,416. TWO-WHEELED VEHICLE. CYRUS W. SALADEE, Torrington, Conn. Filed Aug. 23, 1883. (No model.)



Claim.—1. In a two-wheeled vehicle, the spring-platform consisting of the axle E, longitudinally-arranged semi-elliptic side springs, C, the front ends of which are pivotally connected to a cross-bar, G, carried by the front end of the body, and their rear ends shackled to the cross-spring H, carried by the rear end of the body, in combination with shafts or pole pivotally connected to said cross-bar G, and supported in front of the body by arms or springs D, extending from the body and connecting with the cross-bar L of the shafts or pole, substantially as and for the purpose set forth.

2. In combination with the cross-bar G and spring or arm D, the step having its shank fixed to the cross-bar G, and formed with a single arm extended rearward from the cross-bar and fixed to the spring-arm D, substantially as described.

3. The pole N, curved upward from in front of the cross-bar L, in combination with a truss-brace, substantially as and for the purpose set forth.



4. In combination, the tongue having the brace-rod K', the sustaining-rods K, transverse bracket K, and the double-tree L, substantially as described.

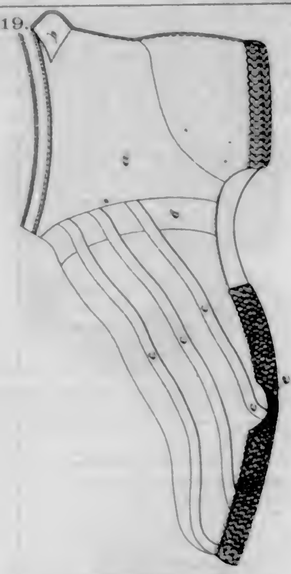
298,417. SANDSTONE-CRANDALL. FERDINAND SCHUDDE, St. Louis, Mo. Filed Mar. 27, 1884. (No model.)

Claim.—In a crandall, the handle A, having slot *a*, the points B, blocks C and C', having notches or open slots *c* and long faces *c'*, and the set-screw D, all combined, constructed, and arranged to operate as and for the purpose set forth.

298,418. MANUFACTURE OF BRICKS MADE OF GLASS. FRANCIS H. SHAW, Newark, N. J. Filed Mar. 12, 1884. (No model.)

Claim.—1. Bricks made of glass or other vitreous substance, the upper and lower and end faces of which are alternately tongued and grooved.

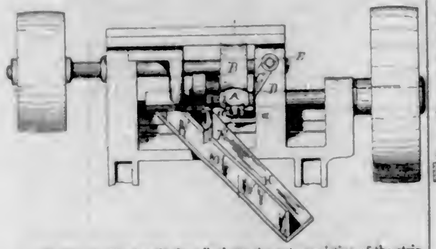
2. Bricks made of glass or other vitreous substance, the upper and lower and end faces of which are alternately tongued and grooved, in combination with dovetailed keys on the rear face.



3. Bricks made of glass or other vitreous substance, the upper and lower and end faces of which are alternately tongued and grooved, with dovetailed keys in the rear face, in combination with iron braces inserted in the dovetailed keys, substantially as and for the purposes specified.

298,419. RUBBER SHOE. FREDERICK M. SHEPARD, East Orange, N. J. Filed Mar. 25, 1884. (No model.)

Claim.—1. A high-quarter rubber shoe having an elastic homogeneous quarter and vamp, provided at the rear, near the ankle-opening with a lug or projection, substantially as described.



2. A high-quarter rubber shoe having an elastic homogeneous upper provided with strengthening ribs or strips extending to the edge of said upper, and having the sole overlapping the ends of these ribs or strips substantially as described.

298,419.

298,420. MACHINE FOR FORMING COUNTER-STIFFENERS. GRANVILLE T. SHEPLEY, West Groton, assignor to Edwin H. Sampson, Boston, Mass. Filed Mar. 31, 1884. (No model.)

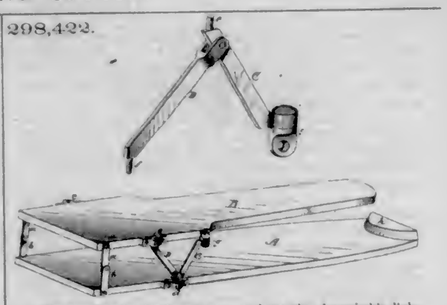
Brief.—Improvement on Letters Patent No. 178,869, dated June 20, 1876.

Claim.—1. The herein-described attachment, consisting of the strip C, secured to the frame at one end, and at the other provided with the plate F, having its inner edge concaved to allow of its being set close to or against the convex periphery of the former, substantially as described.

2. In combination with the former A, the plate F and its support C, for the purposes and substantially as described.

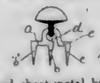
3. The combination of former A, plate F, provided with slots *a a*, strip or arm C, and spout H, substantially as described

---



298,421. TOOL. JOHN A. SHERMAN, Boston, Mass., assignor of one-half to William P. Ward, New York, N. Y. Filed Nov. 26, 1883. (No model.)

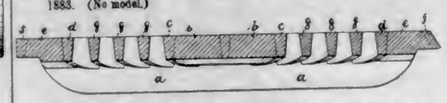
Claim.—1. A tool-shank consisting of a stem forming a portion of, or adapted to be rigidly connected with, the tool, combined with a bushing of soft material fixed upon the said stem, substantially as and for the purpose described.



2. As an improved article of manufacture, a rotary-operating tool having its shank composed of a portion of the material of the tool, provided with a bushing of rawhide fixed thereon, substantially as described.

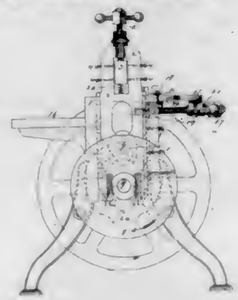
298,422. IRONING-BOARD. JOHN W. SHALLEY, Pittsfield, Me. Filed Dec. 28, 1883. (No model.)

Claim.—Two ironing-boards connected together by suitable links pivoted to each other and to the boards, said boards having connected to their sides eye-plates, in combination with brackets consisting of two arms pivoted together, and having at their ends suitable pins to engage with the eye-plates, said brackets being permanently swiveled or pivoted to one of the boards, substantially as and for the purpose specified.



298,423. BUTTON-FASTENER. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Mar 13, 1884. (No model.)

Claim.—1. An improved sheet-metal button-fastener and lacing-stud combined, consisting of a base with integral prongs, one of which projects from the upper edge of said base over and by the end thereof, forming a loop and prong, and two or more prongs projecting from the opposite edge of the base and in the same plane thereof, all the prongs terminating in substantially the same direction, and to be subsequently bent or clinched, the metal composing said device being in the same condition as it existed in the sheet from which it was cut, and ready for use when so cut, substantially as and for the purpose set forth.



2. As an improved article of manufacture, the herein-described lacing-stud and button-fastener combined, consisting of the base *a*, having prongs *b b'*, and further provided with the arm *c*, formed with the staple *d*, and terminating in prong *e*, the complete device cut from sheet metal, ready for use when so cut, substantially as and for the purpose specified.

298,424. GRATE-BAR. STERRY SMITH, Salem, Mass. Filed Aug. 16, 1883. (No model.)

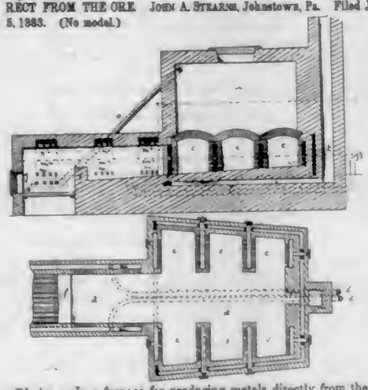
Claim.—The combination and arrangement of the two side bars, *a a*, extending below the main body of the grate-bar, the short longitudinal bars *e e* at each end of the grate, the central longitudinal bars, *b b*, and the intermediate angular bars, *g g*, arranged as shown, and for the purpose set forth.

298,425. MACHINE FOR CREASING PAPER. JOHN E. STANNARD, Springfield, Mass. Filed Dec. 30, 1882. (No model.)

Claim.—1. In the art of scoring or creasing paper or other kindred substances preparatory to bending the same for use in the manufacture of paper boxes and similar articles, the step herein set forth, which consists in making the crease or score by means of successive blows or pressures, the first of which is lighter than the following one.

2. The within-described method of creasing paper or kindred substances for use in the manufacture of paper boxes and similar articles, consisting in subjecting the material to be creased to an initial pressure between a matrix and creasing-blade, discontinuing that pressure, and afterward repeating it with greater force.

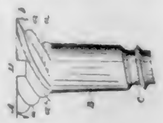
3. In a machine for creasing paper or kindred substances, the combination of cam-disks with a creasing-blade, plunger, and suitable guide bars, such cam-disks being provided with grooves, and such grooves being so shaped as to cause said plunger, when connected with said cam-disks by suitable guides, to give successive creasing blows or compressions at each revolution of the cams, the first of which blows shall be lighter than the following.



4. In a machine for creasing paper or kindred substances for use in the manufacture of paper boxes or similar articles, an inclined yielding guide, 50, secured in position in front of the creasing-blade, substantially as and for the purpose described.

5. The combination of the cam-disks, each provided with a groove, 20, having two inward trends, 21 and 23, and one made nearer the center of the disk than the other, guide-bars 2, each having a stud engaging in said groove, and the plunger 3, secured to said guide-bars, whereby said plunger is made to give successive blows at each revolution of the cam-disks, substantially as described.

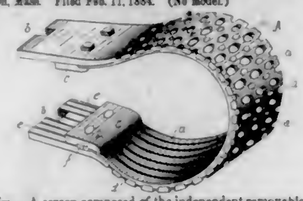
6. The combination of the cam-disks, each provided with a groove having two inward trends—one made nearer the center of the disk than the other—the guide-bars 2, each having a stud engaging in said groove, the plunger 3, and a yielding matrix and a creasing-blade—one secured in the lower face of the compressing-plunger and the other to the platen or bed of the machine—substantially as described.



7. The combination, with the compressing-plunger provided with the yielding matrix, the creasing-blade, and the table 16, of the inclined yielding guide 50, secured in a position in front of the creasing-blade, substantially as and for the purpose set forth.

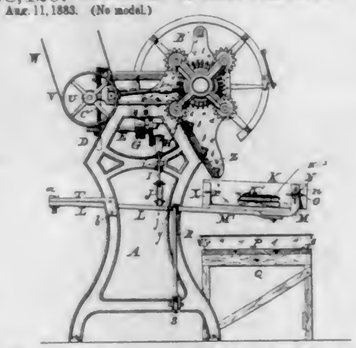
298,426. FURNACE FOR THE MANUFACTURE OF METALS DIRECT FROM THE ORE. JOHN A. STEARNS, Johnstown, Pa. Filed July 5, 1883. (No model.)

Claim.—In a furnace for producing metals directly from the ore, the combination of a reducing-chamber situate on both sides of and above the rear end of the smelting and refining chamber, and communicating therewith at the sides, the line of the openings being substantially at right angles with the line of the draft through the furnace, partition-walls arranged in the reducing-chamber, and having air-passages and outlet-orifices arranged therein, a smelting and refining chamber having a floor or hearth sloping from the rear end to the bridge-wall, and a flue or flues leading from the rear end of the smelting-chamber around the walls of the reducing-chamber, substantially as and for the purpose specified.



298,427. SCREW. HENRY A. STONE, Brooklyn, N. Y. Filed June 11 1883. (Model.)

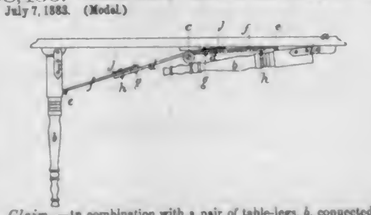
Claim.—1. A screw having the conical portion of its head provided with spiral cutters having a pitch greater than that of the thread of the screw, said spiral cutters gradually decreasing in depth toward and terminating at the periphery of the head, substantially as described.



2. A screw having a conical head, which is provided with spiral cutters *a* and flange-cutters *b*, substantially as described.

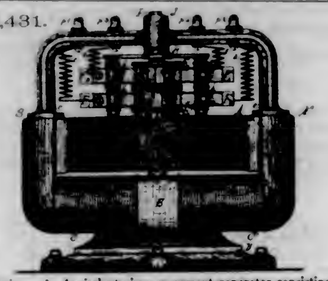
298,428. SCREEN FOR ATTRITION-MILLS &c. THOMAS LEGGETT STURTEVANT, Framingham, assignor to the Starteavant Mill Company, Boston, Mass. Filed Feb. 11, 1884. (No model.)

Claim.—A screen composed of the independent removable bars and the permanent backing supporting the same, said backing being grooved or other otherwise recessed to receive and steady the bars, substantially as described.



298,429. CORN-SIFTER. JOB TAYLOR, Orchard Park, N. Y. Filed Aug. 11, 1883. (No model.)

Claim.—1. The combination, with the frame A A', the arm T, the bar L, pivoted to said arm at *a*, and having the arms M M', the bar X, the frame K, pivoted at *x x* to the bar X, and the sifters K' K², removably secured to said frame, as shown and described.



2. The combination, with the frame A A', the support T, the bar L, having arms M M', provided with slots *n*, and pivoted at *a* to support T, the bar X, the frame K, pivoted at *x x*, the removable sifters K' K², and the thumb-nuts O, for adjusting said frame by means of the slotted arms M M', as set forth.

298,430. FOLDING TABLE. ORLANDO A. THAYER, Paris, Me. Filed July 7, 1883. (Model.)

Claim.—In combination with a pair of table-legs, *b*, connected as set forth, the slotted arms *f d*, pivoted at *e* and *c*, the springs *l*, with heads and inclined faces, the spring *j*, having opening *k*, and bolts *g* and *h*, as herein set forth.

298,431. INDUCTORIUM. CHARLES J. VAN DEPOELE, Chicago, Ill. Filed Dec. 31, 1883. (No model.)

Claim.—1. An inductorium or current-generator consisting of an armature and field-magnet provided with coils through which a proper current can be made to circulate, in order to produce the rotation of said armature, in combination with armature-coils wound upon the same core as the driving-armature coils, or wound upon independent armature-cores, but driven by the first, between the poles of a common field-magnet, the coils of which are in a derivation from the primary armature, substantially as and for the purpose described.

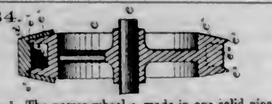
2. In an inductorium or current-generator, an armature driven by a current furnished in an arc-light circuit or other source of electricity, in combination with armature-coils wound upon one or more cores, mounted upon a shaft between the opposite poles of a field-magnet, a derivation from said secondary circuit being also wound upon said field-magnet, and connections whereby the rotation of the system will induce current in a portion thereof, said induced current being utilized partly to run incandescent lamps or do other work, and partly to intensify and steady the magnetic field, and thereby to prevent the variations of the arc circuit affecting the induced current, as described.

3. An inductorium or current-generator having an armature and field-magnet provided with coils through which a proper current is made to circulate, so as to produce a rotary motion of said armature between its field-magnet poles, in combination with an armature or armatures driven by the first armature, in order to produce an induced current in the driven armatures, and proper connections by means of which a small portion of the induced current is diverted through the coils of the field-magnet common to the driving and driven armatures, the main part of the induced current being utilized outside of the machine to run incandescent lamps or to do other work, as may be desired.

4. In an inductorium or current-generator, a driving and a driven armature running between the poles of a field-magnet common to both armatures, the driving-armature and its field-magnets receiving the current from an arc-light circuit or other source of electricity, while the current generated in the driven armature is divided between the outside work and a set of independent coils around the common field-magnet in order to steady the induced current.

5. The combination, with an inductorium or tension-reducing device, as above described, of an arc-light circuit furnishing current to drive the armature or armatures in said inductorium, and a regulator forming a derivation from the main circuit, but controlled by the current of the secondary circuit, and arranged to short-circuit the field-magnets to a greater or less degree, according to the requirements of the said secondary circuit, substantially as described.

298,432. FLAT CHAIN. ADOLPH VENTER, Providence, R. I. Filed June 25, 1883. (Model.)

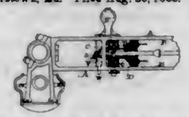


Claim.—The method herein described of making and finishing flat chains, consisting of interlacing or intertwining suitable lengths of spirally-formed wire and subsequently finishing the edges thereof by compressing the protruding ends of such wire to a uniform position against the coils of the chain, in the manner and for the purposes substantially as specified.

298,433. CONDITION-POWDER. CHARLES WHITE, Jr., and JAMES ANDERSON, Versailles, Ind. Filed Jan. 25, 1884. (No specimens.)

Claim.—The herein-described compound, consisting of pulverized fenugreek, pulverized nitrate of potassium, pulverized elecampane, pulverized sulphate of iron, pulverized gentian, and pulverized gum-acacia, in about the proportions specified.

298,434. ROTARY ENGINE. JOHN W. WILES, Carmel, S. C. Filed Jan. 5, 1884. (No model.)



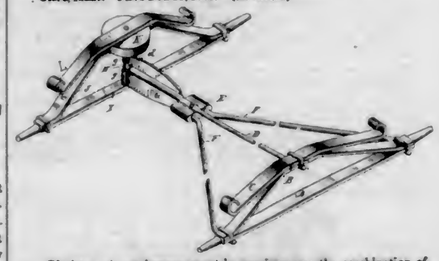
Claim.—1. The power-wheel *e*, made in one solid piece, its rim e^2 being wedge-shaped, the smaller portion pointing outward, and having on its outer periphery buckets or steam-heads e^3, and on either side of said rim V-shaped flanges e^2, all fitting neatly into cover or cap *d*, substantially as shown and described.

2. The cover or cap *d*, having a channel coinciding with rim e^2 of wheel *e*, and grooves coinciding with flanges e^2 e^2, all neatly fitting, substantially as shown and described.

3. In a steam rotary engine, the combination, with a steam-boiler, *a*, and steam-chest *b*, of pipe *c*, cover or cap *d*, having a channel coinciding with rim e^2 of wheel *e*, and grooves coinciding with flanges e^2 e^2, and exhaust-pipe *j*, passing into flue *k*, substantially as shown and described.

4. In a steam rotary engine, the combination of journal-box *g*, having ears *g' g'*, box-seat *h*, and set-screws *i i*, adapted to raise journal-box in said seat, substantially as shown and described, and for the purposes set forth.

298,435. STEAM-PUMP FOR PORTABLE STEAM-ENGINES. WM. C. WOLFE, Hagerstown, Md. Filed Aug. 20, 1883. (No model.)

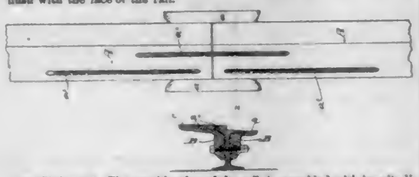


Claim.—1. The combination of the frame provided with suitable flanges, the feed-pump, the detachable valve-chambers applied thereto, and the clamping device for clamping the pump and the chambers against the upper flange of the frame, substantially as shown.

2. The combination of the frame A, provided with the flanges B and slotted flange C, the pump, the removable valve-chambers, the air-chamber U, and a suitable pipe, W, for connection with the air-chamber, the pump and the valve-chambers being clamped together against one of the flanges on the frame, substantially as described.

3. The combination of the pump, the frame A, provided with the flanges B, the valve-chambers O, recessed at their upper ends, the removable guides, which are inserted in the chambers so as to be flush with their tops, and the valves R, substantially as set forth.

4. The combination of the frame A, provided with the flanges B, slotted flange C, with the pump D, having the stud *a* to project through the slot *b* in the flange C, the nut *d*, and the clamping devices P Q and the valve-chambers, which are applied to opposite sides of the pump, substantially as shown and described.

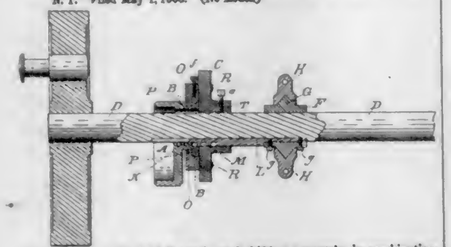


298,436. WAGON RUNNING-GEAR. ALEXANDER WOMACK, Falk's Store, Idaho. Filed Dec. 15, 1883. (No model.)

Claim.—As an improvement in running-gear, the combination of the coupling-plate E, connecting the ends of the rear hounds, the reach secured to the face of the coupling-plate, a headed rod, M, immovably secured at one end within the coupling-plate, a bracket, G, elliptical in form, and having a longitudinal slot, *a*, in which the rod M fits, a recess, *d*, at the front end of the bracket, providing room for the head of the rod and forming arms *g*, and the king-bolt passing through the arms and pivoting the bracket in place, arranged and operating for the purpose set forth.

298,437. TRACK-RAIL ATTACHMENT FOR REPLACING DERAILED CARS. MARSHALL C. WOODS, Indianapolis, Ind., assignor of one half to William N. Wolfe, same place. Filed Aug. 10, 1883. (No model.)

Brief.—Longitudinal grooves are formed in the face of the rail to catch the flange of the wheel as it is thrown onto the rail by the car-replacer, which is a combined fish-plate and car-replacer, and extends up flush with the face of the rail.

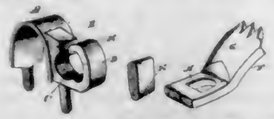


Claim.—1. The combination of the rail A, provided with longitudinal grooves *a'* and the car-replacer B, the top edge, *a*, of which extends up flush with the top of the rail, whereby it is adapted to guide the wheel of a derailed car back onto the track, substantially as set forth.

2. The combination, with the rail A, having longitudinal grooves *a'* in its face, of the combined fish-plate and car-replacer B, the top edge, *a*, of which extends up flush with the top of the rail, and is constructed to form notches at the ends of said edge alongside the rail, substantially as described, and for the purposes specified.

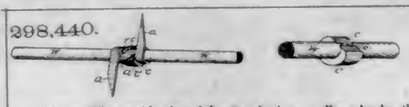
3. The combination, with a car-replacer, of the rail A, having longitudinal grooves *a'* in its face, whereby said car-replacer is aided in performing its function, substantially as set forth.

298,438. STEAM-ENGINE VALVE-GEAR. BISHOP ARNOLD, Auburn, N. Y. Filed May 1, 1883. (No model.)



Claim.—1. An adjustable and shifting eccentric, in combination with a revolving shaft and disk, and a sleeve and rack-bar sliding longitudinally on said shaft for the purpose of actuating said eccentric, said sleeve having a peripheral rib and strap provided with trunnions, and adapted to fit the sleeve, and of such a shape as to retain oil, exclude dirt, and admit of adjustment when worn, as described.

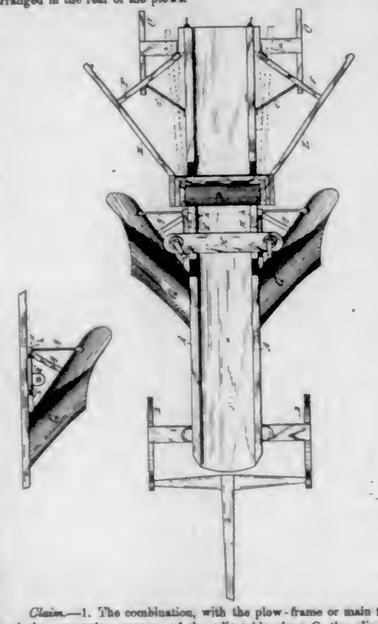
2. The combination, with the shaft D, of eccentric A, provided with inclined teeth and guides B, and disk C, provided with guideways O P, and the rack-bar L, substantially as set forth.



3. The combination of the shaft D, the sliding sleeve F, provided with the V-rib, the strap H, adapted to fit the same, and connected by trunnions to the bifurcated arm of the bell-crank lever K, the rack-bar L, and the eccentric A, each provided with inclined teeth, and the latter provided with guides B, and the disk C, provided with the guideways O P, as shown and described.

298,439. THILL-COUPLING. ALEXANDER O. BONSTEEL, Wilson, N. Y., assignor of one-half to Oscar S. McChesney, same place. Filed Nov. 23, 1883. (No model.)

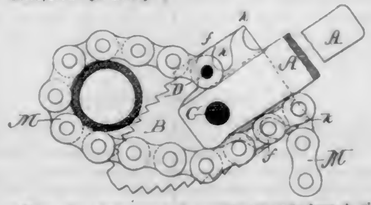
Claim.—The combination, with a clip constructed with a recess in its forward jaw, said recess being formed with projections at the upper and lower ends of the openings leading thereto, of a flexible cushion adapted to be forced laterally into said recess, and a thill-iron provided with an eye, the end bar of which engages the inner side of the cushion, while the sides of the eye engage the edges of the cushion and prevent its lateral displacement, substantially as set forth.



298,440. BARBED WIRE. CURTIS B. BRAINARD, Joliet, Ill. Filed Jan. 11, 1884. (No model.)

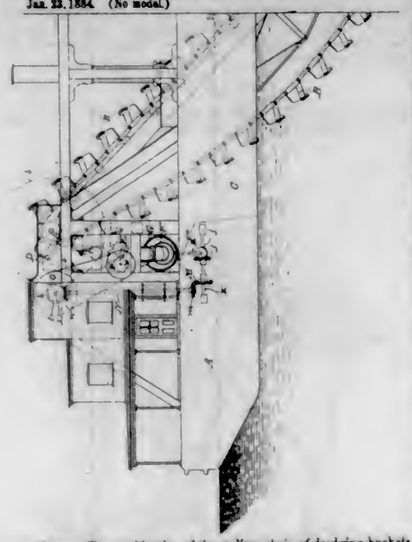
Claim.—The combination of the strand-wire *w*, collar *c*, having the flattened side *d'*, and barb *a*, having its central portion or body lie diagonally across said flattened portion of said collar, and having its prods coiled in opposite directions on said strand-wire, one on either side of said collar, as and for the purpose set forth.

298,441. SNOW-PLOW. PETER BRADFORD BRASH, Cheboygan, Mich. Filed Jan. 24, 1884. (No model.)



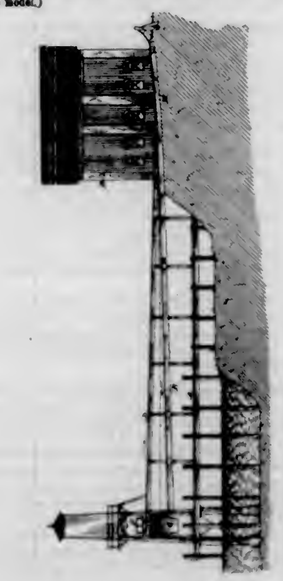
Brief.—The plows are vertically adjustable upon guide-frames, and are held in position by screw rods and nuts. Hinged wings and bars are arranged in the rear of the plows.

Claim.—1. The combination, with the plow-frame or main frame and the supporting-runners, of the adjustable plows G, the adjustable pivoted wings E, and hinged bars F, substantially as and for the purpose set forth.



2. The combination, with the side beams, A A, of the metallic guideways *h h*, connected thereto, the plates H H, provided with the plows G G, the cross-bar K, and screw rods and nuts *k k'*, substantially as and for the purpose specified.

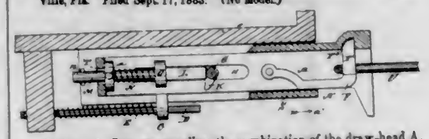
298,442. CHAIN-WRENCH. WILLIAM H. BROCK, Corsen, N. Y. Filed Feb. 2, 1884. (No model.)



Claim.—In a chain-wrench, the combination of the lever A, pin D, chain M, and bolt C with the jaws B, made with claws *f f* and lugs *k k*, of the structure shown, for holding fast the chain when locked, so as to prevent its falling out whatever be the adjustment of the wrench, substantially as described.

298,443. APPARATUS FOR DREDGING, CRUSHING, AND WASHING PHOSPHATE-ROCK. FRED BROTHERHOOD, Charleston, S. C. Filed Jan. 23, 1884. (No model.)

Claim.—The combination of the endless chain of dredging-buckets, the driving-shaft thereof, the engine-shaft, the gears on said driving-shaft actuated by pinions on the engine-shaft, the crushing-rolls, the conveyer by which the material as excavated and elevated is delivered to said rolls, the belt-and-pulley connections between the crushing-rolls and the engine-shaft, the washing-cylinders, the gearing by which they are connected with and driven from the engine-shaft, and the conveyer by which the material is directed from the crushing-rolls to the washing-cylinders, all substantially as and for the purpose hereinbefore set forth.



298,444. MEANS FOR LOADING VESSELS WITH PHOSPHATE-ROCK, &c. FRED BROTHERHOOD, Charleston, S. C. Filed Jan. 23, 1884. (No model.)

Claim.—1. The hereinbefore-described improved means for transferring and loading phosphate-rock, &c., consisting of the inclined outgoing track or tracks, the storage or drying shed or sheds from which the material is discharged into the cars on the outgoing track or tracks, the incline return track or tracks, the switch or switches, elevating apparatus for transferring the cars from the level of the outgoing track or tracks to that of the return track or tracks, and the conveyer or conveyers, all substantially as and for the purpose hereinbefore set forth.

2. The hereinbefore-described improved means for transferring and loading phosphate-rock, &c., consisting of the inclined outgoing tracks having additional inclines at their inner ends, the inclined return track or tracks having automatic switch connection with the outgoing tracks, the elevating apparatus at the outer ends of the tracks, and means for conducting the material as discharged from the cars into vessels at the sides of the wharf upon which the elevating apparatus is located, as and for the purpose hereinbefore set forth.

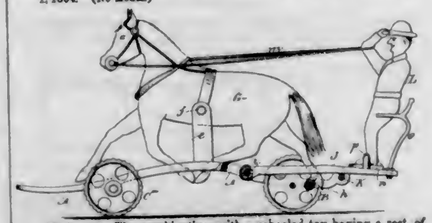
298,445. CAR-COUPLING. THOMAS ELLWOOD BUCKMAN, Jacksonville, Fla. Filed Sept. 17, 1883. (No model.)

Claim.—1. In a car-coupling, the combination of the draw-head A, rear apertured at T, and having slots *d* H, the sides B B, having flanges Q', inner recesses, R, and slots *g*, the shaft G, having outer arm, G', and cam K, the block L, having a rear spindle, M, collar O, and spring N, the journaled collar P, and the pawls Q, as and for the purpose described.

2. The combination, with a rod, D, surrounded by a spiral spring, E, and placed below the draw-head, of the apertured lug C, arranged on the bottom of the draw-head, as and for the purpose specified.

3. The combination, with a sliding draw-head, A, of the upwardly-swinging hook F, the shaft G, provided with a cam projection, K, the swinging locking-block L, the pawls Q, the spring E, and the cross-plate S, substantially as herein shown and described.

4. The combination, with the sliding draw-head A, of the upwardly-swinging hook F, the shaft G, provided with a cam projection, K, the block L, having a spindle, M, the collars O and P, of which the latter is provided with pivots *a*, the spring N, the spring E, and the cross-plate S, substantially as herein shown and described.



5. The combination, with the sliding draw-head A, of the upwardly-swinging hook F, the shaft G, having a cam projection, K, the block L, the spindle M, the spring N, the pawls Q, held in recesses R in the plates B at the sides of the draw-head, the cross-plate S, and the spring E, substantially as herein shown and described.

6. The combination, with the pivoted hook-coupler F, and bottom S, having slot A', of the draw-head A, projecting beyond the hook and having in the top a recess, F, to receive the hook-point, as shown and described.

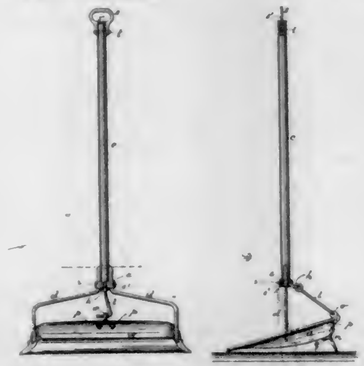
7. The combination, with the sliding draw-head A, having slots H, of the side plates, B, having recesses R, the pawls Q, held in the recesses, the swinging hook F, the shaft G, provided with a cam projection, K, and a swinging block for locking the sliding draw-head in place, substantially as herein shown and described.

8. The combination, with a sliding draw-head, of an upwardly-swinging hook pivoted in the same, the shaft G, a swinging locking-block adapted to catch on the shaft and lock the draw-head in place, the handle-lever G', and the pendulum-pawl J, substantially as herein shown and described.

298,446. TOY. FRANCIS W. CARPENTER, Harrison, N. Y. Filed Feb. 1, 1884. (No model.)

Claim.—1. The combination, with a wheeled toy having a rest, of a toy figure, the figure and rest being connected by one part having a notch to receive the other part, substantially as set forth.

2. The combination, with a wheeled toy, of a figure and a pin and socket, by means of which the parts are connected, substantially as set forth.



3. The combination, with a toy figure, of a notched rest, a base, a pin, and an opening for receiving the pin, substantially as set forth.

4. A toy figure, in combination with the pivoted bar, a frame or support, the wheels, and the crank-pin or lifter, substantially as set forth.

5. A toy figure, in combination with a pivoted lever, a pivoted animal, the frame or support, the wheels, and the crank-pin or lifter, substantially as set forth.

6. In a wheeled toy, the combination, with a pivoted animal, of a wheel and a crank-pin or projection acting upon the animal to swing the same, and a figure connected with such toy, substantially as set forth.

298,447. DUST-PAN. FRANCIS W. CARPENTER, Harrison, N. Y. Filed Feb. 21, 1884. (No model.)

Claim.—1. The combination, with a handle, of a wire bail passed across through the handle and bent at the sides of and parallel to the handle, and a clamping-band slipped upon the handle and over the parallel portions of the bail-wire, substantially as set forth.

2. The combination, with the dust-pan, of a handle, a wire bail passing across the handle, and a metallic clamping-band slipped on, to include the handle and parallel portion of the bail-wire, substantially as set forth.

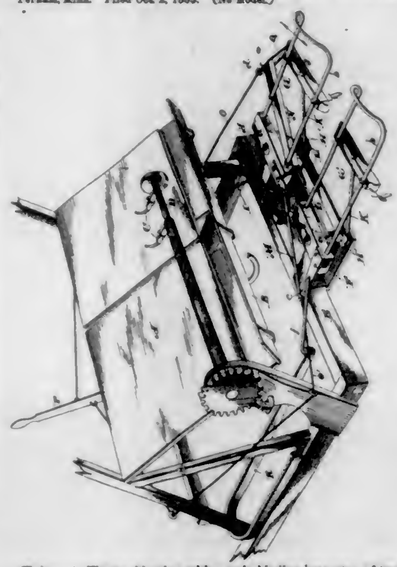
3. The metallic band *a*, having an eye, *h*, for the reception of a hook, and notches or recesses at its opposite sides, in combination with the handle and the bail-wire, substantially as set forth.

4. The suspending-loop *s*, having a cross-piece, *s'*, to pass into a groove at the upper end of the handle, and ends for the reception of the attaching-rivet, substantially as set forth.

5. In combination with the dust-pan, a cast-metal rest, an eye at the upper part of the rest-piece, a hook, and the handle, substantially as set forth.

6. The combination, with a handle, of a wire bail passed into the handle, and bent at the sides of and parallel to the handle, and a clamping-band having notches or recesses at its opposite sides, slipped upon the handle and over the parallel portions of the bail-wire, substantially as set forth.

7. The combination, with a dust-pan, of a handle, a wire connected with the dust-pan and passed into the handle, and a clamping-band having notches or recesses at its opposite sides, and slipped upon the handle and parallel portion of the wire, substantially as set forth.



298,448. NIGHT-LIGHT. SAMUEL CLARKE, Childs Hill Works, County of Middlesex, England. Filed Jan. 29, 1884. (No model.) Patented in England Dec. 27, 1883, No. 5,877.

Claim.—1. A night-light having the block of fatty material shouldered or of two diameters, the plaster bottom and the plaster case extending about the block of fatty material from the bottom to the surrounding shoulder of the block, substantially as hereinbefore set forth.

2. The hereinbefore-described method of manufacturing night-lights, consisting in molding a block of fatty material of two diameters, or with a surrounding enlargement at the end remote from the base, and then applying a wrapper around this block, and pouring plaster between said wrapper and the block, thereby forming of plaster both the bottom of the light and a case extending about the sides of the block of fatty material, substantially as described.

298,449. BUNDLE-CARRIER FOR GRAIN-BINDERS. WM. COLLINS, Perham, Minn. Filed Oct. 2, 1883. (No model.)

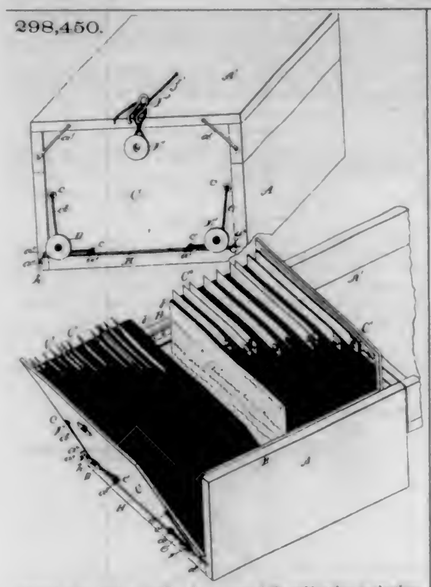
Claim.—1. The combination, with a grain-binding harvester, of two horizontally-movable leaves hinged thereto, means for opening and closing the leaves, and a rod or other device connecting the leaves, whereby they are moved simultaneously and in opposite directions, substantially as set forth.

2. The combination, with a grain-binding harvester, of two horizontally-movable leaves hinged thereto, devices for locking the leaves in closed adjustment, and mechanism whereby they are moved simultaneously in opposite directions.

3. The combination, with a grain-binding harvester, of two horizontally-movable leaves pivotally secured to the machine-frame, each leaf consisting, essentially, of a head, *a*, and U-shaped frame, said frames being turned up at their outer ends, and devices connecting the leaves, whereby they are moved simultaneously in opposite directions.

4. The combination, with a grain-binding harvester, of two horizontally-movable leaves pivotally secured to the machine-frame, the brace-rods K, and braces J, all of the above parts combined as described.

5. The combination, with two leaves pivotally secured to a binder-frame, and adapted to be moved simultaneously in opposite directions, of a locking-lever journaled to one of the leaves for the purpose of locking both leaves in a closed position, and adapted to be operated by the driver, substantially as set forth.



6. The combination, with a grain-binding machine, of the two leaves, one of which is provided with a diagonal brace, N, devices for connecting the two leaves, whereby they are moved simultaneously in opposite directions, the locking-lever, and devices for opening and closing the leaves, substantially as set forth.

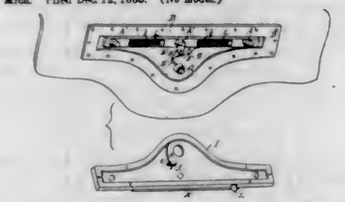
298,450. LETTER-FILE AND CABINET. ARTHUR L. COLTON, Milwaukee, Wis. Filed Jan. 14, 1884. (No model.)

Claim.—1. In a file-cabinet, a letter-file consisting of front and rear boards and intermediate independent movable division-sheets bearing index or classification marks, in combination with adjustable supporting cords or tapes passing through holes in the boards and sheets, and securing devices, substantially as set forth.

2. A cabinet having open front and hinged cover, inner side strips of less length than the sides to which they are secured, and projections and eyebolts, in combination with a letter-file having front and rear boards

298,450.

adapted to be held in position by means of the said strips, projections, and eyebolts, intermediate independent movable division-sheets, adjustable supporting tapes or cords, and securing devices, substantially as set forth.



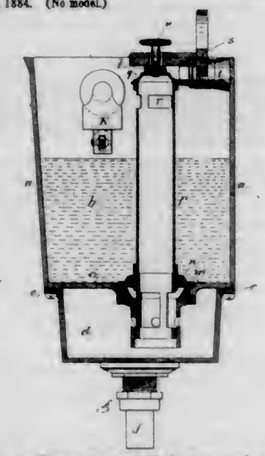
3. The combination, with a case or cabinet having perforated side strips, of a letter-file secured within said cabinet, and having movable division-sheets and an adjustable fastening device adapted to be secured in any of the perforations of the side strips, so as to be always just back of the last division-sheet, substantially as and for the purpose set forth.

4. The combination of the cabinet A, having eyebolts or perforated projections a^3 a^3, with a letter-file secured within said cabinet, and having a front board provided with holes to receive the projections a^3, and the fastening device H, substantially as set forth.

5. The combination of the cabinet A, with hinged cover A', having braces *a'*, catch F', and cord or tape *f'*, with a letter-file secured within said cabinet, and having a front board removably hinged to the bottom of the cabinet, and provided with a belaying-pin, F, substantially as set forth.

6. The combination of the cabinet A and letter-file secured within the same, having a front board removably hinged to the bottom of the cabinet, with the spring I and the link I', substantially as set forth.

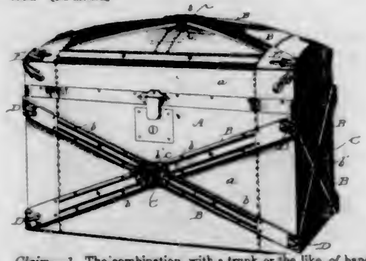
298,451. LOCK FOR MAIL-POUCHES. GUSTAVE DEMME, Hancock, Mich. Filed Dec. 12, 1883. (No model.)



Claim.—1. In a locking device, and in combination with the spring locking-plate D and spring-pawl E thereof, the sliding plate K, provided with the pin *s*, to engage the pawl E, substantially as and for the purpose set forth.

2. In combination with the notched studs A', fastened to the frame of a pouch, and constructed to pass through the flap of the same and into the plate B, secured to said flap, the locking spring-bolt D, secured to said plate and engaging said studs A', and provided with the spring-pawl E, the sliding plate K, secured on the face of said lock, and carrying the pin *s*, constructed to come in contact with said pawl and bring it within the path of the tooth H on the key-spindle G, substantially as and for the purpose specified.

3. In a pouch-lock, and in combination with the spring-plate D and spring-pawl E, the sliding plate K upon the outer face of the said lock, having an opening to display the post-office address, and provided with a pin, *e*, projecting through the slot *f* in the face of said lock, to control the pawl E, the movement of said plate being limited by the studs *d*, projecting therefrom and passing through slots in the front of said lock, whereby the said plate serves the double purpose of displaying an address and of throwing said locking mechanism into a fixed position to be operated on by the tooth of the key-spindle, substantially as described.



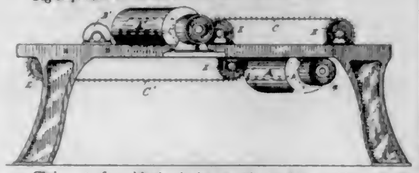
298,452. CISTERN FOR WATER-CLOSETS. JOHN DEMAREST, New York, N. Y., assignor to the J. L. Mott Iron Works, same place. Filed Apr. 4, 1884. (No model.)

Claim.—1. The combination, with the cistern and valve-seat, of the rubber ring-valve *n*, the tube *p* within the valve, having a slotted lower end, forming a guide within the valve-seat, and overflow-openings near the upper end, the cap *q*, the lever *s*, and the screw passing through a hole in the lever into the said cap *q*, substantially as set forth.

2. The lever *s*, pivoted at the inside of the closet-cistern and extending out laterally, in combination with the tube *p*, the cap at the upper end of such tube, the screw passing through the lever into the cap, the washer *l*, the valve *n* around the tube *p*, and the brass valve-seat secured in the bottom of the cistern, substantially as set forth.

298,453. TRUNK. JOHN R. DUGUID, Toledo, Ohio. Filed Feb. 14, 1884. (No model.)

Claim.—1. The combination, with a trunk or the like, of bands secured diagonally over its surface, substantially as and for the purpose set forth.



2. As an improved article of manufacture, a trunk or the like having bands secured diagonally over its surface and crossing each other, said bands being jointed together at their point of juncture with each other, substantially as set forth.

3. The combination, in an improved banding for trunks, with the bands secured diagonally over the surface of the trunk and crossing each other, of the clamps secured to the face of the bands at this point of junction, and having the inwardly-extending flanges binding against the edges of the bands on opposite sides, substantially as set forth.

4. As an improved article of manufacture, a trunk or the like hav-

ing pairs of bands secured diagonally over the surface of its sides and ends, and extending from one corner to another, said bands being jointed into each other at their point of juncture, substantially as set forth.

298,454. SHINGLE-PLANING MACHINE. ALONZO W. ELDRIDGE, Big Rapids, Mich. Filed Mar. 19, 1884. (No model.)

Claim.—1. In a shingle-planing machine, and in combination with the cutter thereof, and as a means for feeding the shingles to said cutters, the band-feed made of a steel band, with projecting spurs upon one side and cogs or corrugations upon the other, and pulleys carrying said band, provided with cogs or corrugations coincident with those upon said bands, substantially as described.

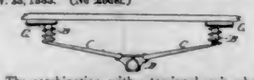
2. In a planing-machine, the combination of the two planer-heads, arranged on opposite sides of the bed, and journaled diagonally to such machine and parallel to each other, one being adapted to plane the upper and the other adapted to plane the under side of a shingle, in combination with steel band carriers or feeds, the parts being constructed, arranged, and operating substantially as and for the purposes specified.

3. A shingle-planing machine consisting of a suitable bed, to which are diagonally journaled planer-heads, steel-band feeds adapted to feed the shingle to such planer-heads, and the saws adapted to true the shingle before it reaches either of said planer-heads, the parts being constructed, arranged, and operating substantially as and for the purposes set forth.

4. A shingle-machine consisting of a suitable bed, two planer-heads, A A', arranged one above and the other below said bed, steel-band feeds adapted to feed the shingles to said planer-heads, the saws B B', adapted to true the shingle before it reaches either of said planer-heads, one of said saws being adjustable upon its arbor, and the marker-wheel D, adapted to mark or stamp the face of the shingle, the parts being constructed, arranged, and operating substantially as and for the purposes set forth.

298,455. SUBMARINE PROJECTILE. JOHN ERICSSON, New York, N. Y. Filed Oct. 3, 1883. (No model.)

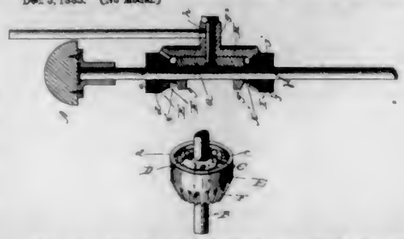
Claim.—1. The combination, with a submarine projectile, of a steering-plate attached to its upper side, and presenting its face in an outward direction from the axis of the projectile, substantially as and for the purpose herein set forth.



2. The combination, with a submarine projectile, of a steering-plate hinged thereto, and a spring between the said plate and the tail of the projectile, substantially as and for the purpose herein described.

3. The combination, with a submarine projectile having a tail provided with straight longitudinal wings or fins to prevent it from turning, of a steering-plate attached to its upper side, and presenting its face in an outward and upward direction from the axis of the projectile, to control its course in a vertical direction, substantially as herein described.

4. The combination, with the projectile having ribs *a a a'* on its tail, of the hinged steering-plate D and the spring E, substantially as and for the purpose herein described.



5. The combination, with the tail of the projectile and the hinged steering-plate D, of the guard *e*, substantially as and for the purpose herein described.

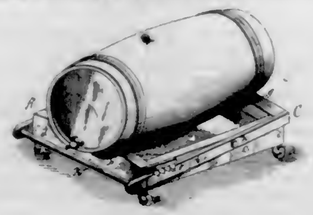
298,456. WAGON-SPRING. CHRISTIAN FALLENDI, Brooklyn, N. Y. Filed Nov. 23, 1883. (No model.)

Claim.—The combination, with a torsional-spring bar, and with an arm extending therefrom in a plane at about a right angle with its length, of an auxiliary spiral spring formed or fitted at the end of said arm, to operate by compression, substantially in the manner and for the purpose herein set forth.

298,457. HAND-DRILL. ISAIAH M. FURBISH, Augusta, Me. Filed Dec. 5, 1883. (No model.)

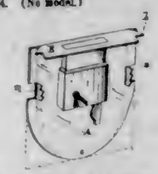
Claim.—In a hand-drill, the combination, with a spindle carrying disks rigid thereon, collars inclosing said disks, said collars being provided on their inner sides with a series of teeth, pawls pivoted on said disks, springs to hold the same in position, cap-plates *e*, inclosing the ends of said collars, which are also provided with teeth upon their outer sides, and a gear-wheel suitably mounted for operating the same, substantially as set forth.

298,458. COMBINED NECKTIE AND COLLAR-BUTTON. ADELBERT L. GILBERT, Milwaukee, Wis. Filed Feb. 27, 1884. (No model.)



Claim.—1. In neck-wear, the combination of a collar-button, a safety-pin, and a necktie, said safety-pin being detachably connected to the shank of said button, substantially as set forth.

2. In neck-wear, the combination, with the collar-button A, having opening or recess B, of the spring-catch E, having circular recess *a*, eyelet *b*, safety-pin H, and necktie M, said eyelet *b* serving as a place of attachment for said safety-pins, said pin H serving to temporarily connect said tie with said spring-catch and the collar-button, substantially as and for the purpose specified.

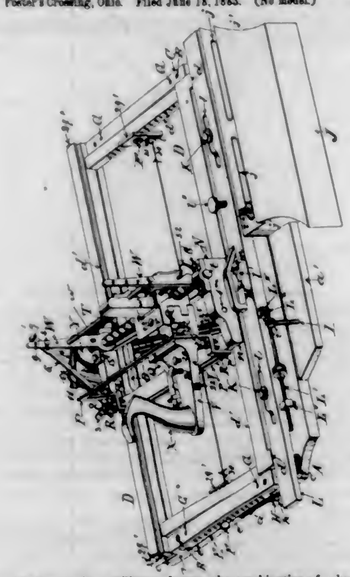


3. In a necktie-fastener, the combination, with the collar-button A, having socket B, of the spring-catch E and fastening-pin H, formed in a single piece, said spring-catch and pin being adapted to serve as a means of attaching a necktie to the collar-button, as set forth.

298,459. BARREL TRUCK AND ELEVATOR. HARRY E. GILCHRIST, Oneonta, N. Y. Filed Feb. 19, 1884. (No model.)

Claim.—In combination, a main supporting frame or platform mounted on casters, its forward end provided with a concave recess or seat, and its sides cut away at their rear end to form right-angular shoulders, which, in connection with a brace secured to the remaining portions of said sides, form a seat, a lever-frame pivotally connected to the main frame or platform, its sides provided with angular notches or recesses and extended beyond the front end of the main frame and connected by a brace, and latches or dogs pivoted to the sides of the main frame at its rear end, and arranged to automatically engage the notches or recesses in the sides of the lever-frame, substantially as described, and for the purpose specified.

298,460. LOCK FOR DRAWERS. EMANUEL G. GORY, Cincinnati, Ohio, assignor to the Corbin Cabinet Lock Company, New Britain, Conn. Filed Feb. 19, 1884. (No model.)



Claim.—1. The combination of a drawer-front having a gain or cavity, having its rear wall sloping outwardly at the bottom to form both a vertical and inner bearing for the lower edge of a lock-plate, and its side walls provided at the top with countersunk depressions, with the lock fitting within said gain and having spurs *b* projecting from its selvage to overlap the side walls of said gain and enter the depressions therein, substantially as described.

2. A cabinet-lock having a portion of the edges of its front plate bent inward, forming flaring lugs to enter an undercut mortise, and the remaining portion left straight to close the cavity, and with the bent portion retain the lock in place.

3. A cabinet-lock having its front plate extending laterally beyond the lock-case, and a portion of the edges of said plate bent inward upon each side to form retaining-wings, and the ends of said inwardly-bent wings serrated or barbed to retain the lock in an undercut routed cavity without extraneous fastenings, substantially as described.

298,461. MILLSTONE-DRESSING MACHINE. DAVID S. GREELY, Foster's Crossing, Ohio. Filed June 18, 1883. (No model.)

Claim.—1. In a millstone-dresser, the combination of a bed-frame having a series of horizontal perforations in its ends, a tilting frame having a corresponding series of horizontal perforations in its ends, one hole of each series of perforations being at the middle part of the end, and pivot-pins to support and hold down the tilting frame from the bed-frame, the pivot-pins being adjustable from or toward a central position, either in or out of line with each other, and forming the fulcrums on which the tilting frame can be tipped toward either side of the bed-frame.

2. In a millstone-dresser, the combination of a bed-frame having a series of horizontal perforations, and slots beneath the perforations in its ends, a tilting frame having a corresponding series of horizontal perforations in its ends, pivot-pins to form adjustable fulcrums to secure the tilting frame to the bed-frame, and bolts adjustable in the slots to limit the tip of the tilting frame.

3. In a millstone-dresser, the combination of a rectangular frame, a tilting frame having a series of holes in its ends, plates secured on the ends of the rectangular frame, having shoulders for the carriage-frame, and mortises, center block having tenons to occupy the mortises, and a series of holes corresponding to the holes in the ends of the tilting frame, and adjustable pivot-pins securing the frames together.

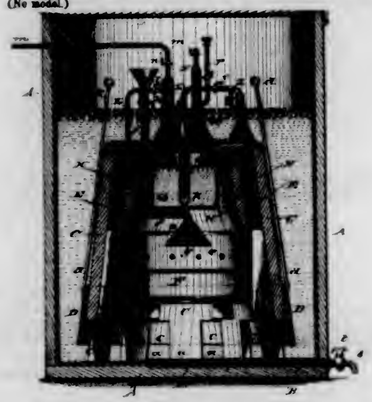
4. In a millstone-dresser, the combination of a bed-plate having posts K, a tilting frame, D, having pin M, and a sliding sill, L, having crooked slots *l* to receive the posts, and slanting groove *l'* to receive the pin, as set forth.

5. In a millstone-dresser, the combination of a bed-plate, a tilting frame pivoted to the ends of the bed-plate having ears, posts extending upward from the bed-plate, and a sliding sill having slots to receive the posts, and thus adapted to move sidewise beneath the ears of the tilting frame.

6. In a millstone-dresser, the combination of bed-plate A, having swinging nut L'' thereon, a tilting frame, D, and a sliding sill, L, provided with a yoke, L'', and adjusting-screw L', tapped within the swinging nut and having its head engaged by said yoke, as set forth.

7. In a millstone-dresser, the cross-carriage Q, having a part, V, hinged to swing laterally, provided with diamond-holders arranged one in advance of the other, and a screw, 23, to adjust the hinged part to place the holders either in or out of line, as set forth.

8. In a millstone-dresser, the combination of main carriage N, cross-carriage Q, feed-screw T, by which the cross-carriage is hinged to the main carriage, the adjustable bar P P', to limit the upward and downward movement of the cross-carriage, and at the same time discharge the functions of a leveling-gage, and screws 20 21, to respectively limit the upward movement of and adjust the cross-carriage, as set forth.



9. In a millstone-dresser, the combination of main carriage N, adjustable screw T, mounted in bearings thereon, having necks *t*, cross-carriage Q, hinged to the screw, arms W, hinged to the necks, bar w, supported by the cross-carriage and supporting the upper ends of the arms, and set-screw adjustable through an arm to limit the excursions of the cross-carriage.

10. In a millstone-dresser, the positively-acting feed mechanism, consisting of reversely-directed ratchet Y Y' on the screw-shaft T, in combination with the vertically-rocking cross-carriage Q, arm W, connected by rod 6 with vibrating plate 2, carrying the two sets of pawls 14 16 and 15 17, and the reversing-cams 18, substantially as set forth.

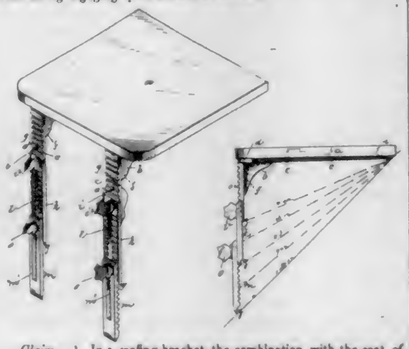
11. In a millstone-dresser, the combination, with the frame and the carriages, of the stretched thong, fulcrum-ears 29', and hooks by which the thong is secured to the fulcrum-ears, as set forth.

12. In a millstone-dresser, the combination of a bed-plate, A, having horizontal lugs *a'*, supporting-bolts I, and the weights J, adapted to slide longitudinally on the lugs, having slots *j* to receive the bolts, as set forth.

298,462. APPARATUS FOR GENERATING AND CARBURETING HYDROGEN GAS. LEMOT S. GROVES, Afton, Iowa, assignor to Joshua F. Bishop, same place, and J. H. Patt, Creston, Iowa. Filed June 23, 1883. (No model.)

Claim.—1. The inner wooden jacket or skirt surrounding the gasoline-tank within the upper portion of the hydrogen-chamber, substantially as specified.

2. The open-bottom wooden casing C, having marginal ways or notches in its lower edge, and surrounding the hydrogen-chamber, substantially as specified.



3. The adjustable annular gate extending around the incasement C, and adapted to close the ways or notches thereof, substantially as specified.

4. The combination, with the incasement C and its adjustable annular gate, of a coiled or convoluted and perforated waste-pipe, substantially as specified.

5. The combination, with the basket F, for holding the clippings of iron, of the cleansing device, consisting of the tube *f*, provided near its upper end with the check-valve *h*, and the expanded discharge-chamber *e*, having a perforated base and cap *g*, substantially as specified.

298,463. ROOFING-BRACKET. ALFRED GUEDLE, Canal Dover, Ohio. Filed Feb. 23, 1884. (No model.)

Brief.—Consists of a seat having horizontal angle-irons provided with serrated vertical portions and intermediate slotted detachable and adjustable leg-sections secured together by screws and washers, said sections having engaging-spurs at their lower ends.

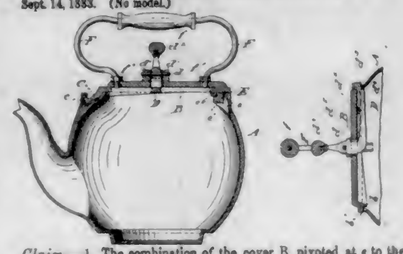
Claim.—1. In a roofing-bracket, the combination, with the seat, of the angle-irons having their horizontal portions secured to the under face of the seat, and provided with the strengthening-lugs and webs made integral with the horizontal and vertical portions of said irons, and the vertical portions provided at their lower ends with the spurs for engaging the roof, substantially as specified.

2. In a roofing-bracket, the combination, with the seat provided with angle-irons secured by their horizontal portions to the under face of the same, and having the vertical leg-sections provided with lateral serrations on their outer faces, and screw-holes intermediate of their ends, of the slotted leg-sections serrated on both faces, and provided with spurs at their lower ends, and set-screws and washers for adjustably securing said slotted double serrated sections to the upper leg-sections, substantially as specified.

3. In a roofing-bracket, the combination, with the seat and angle-irons carrying the serrated upper leg-sections, provided with screw-holes, of the intermediate slotted leg-sections, serrated on both faces, and provided with screw-holes in line with their slots near their lower ends, and the lower serrated and slotted sections having engaging-spurs at their lower ends, and set-screws and washers for adjustably connecting the lower and intermediate leg-sections together, and for adjustably connecting the intermediate sections to the upper sections, substantially as specified.

4. A roofing-bracket having serrated and slotted detachable and adjustable leg-sections secured together by set-screws and washers, substantially as specified.

298,464. BUTTON-FASTENER. WILLIAM HALKYARD, Providence, R. I. Filed Mar. 24, 1884. (No model.)



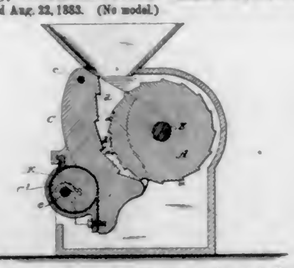
Claim.—1. As a new article of manufacture, the combined button and fastener A herein described, consisting of the button D, flanged eyelet C, and spring-staple B, the latter provided with means for retaining it in position within the eyelet, the whole combined, arranged, and adapted for use substantially as shown, and for the purpose set forth.

2. In a button-fastening, the two-prong spring-staple B herein described, provided with a loop, *b*, and slightly curved and notched or barbed ends *b*², substantially as shown and set forth.

3. The combination of the metallic flanged eyelet C with the spring-staple B, the latter provided with a button-retaining loop, *b*, and prongs *b*², terminating in the notched ends *b*², said staple adapted to pass loosely through the eyelet and retained therein, as shown and set forth.

298,465. TEA-KETTLE. IVORY W. HARLOW, Plymouth, Mass. Filed Sept. 14, 1883. (No model.)

Claim.—1. The combination of the cover B, pivoted at *e* to the kettle-body A, having a tongue, C, stop *b*, and the locking-latch D, shaped and arranged in relation to the cover as specified, with the kettle-body A, having the catch *c*, all substantially as and for the purposes described.



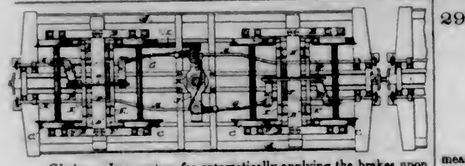
2. The cover B, having the downward-projecting stop or lug *b*, cast therewith, and the latch D, pivoted at *d* to the cover, to have an automatic oscillating movement in relation thereto, all substantially as and for the purposes set forth.

3. The combination of the kettle A, having the pivot-hole a^3 d^4, shaped as described, and stop a^4, with the kettle-cover B, having the pivot *e*, with a locking-projection, e', all substantially as and for the purposes described.

4. The combination of the cover B, pivoted to the body of the kettle, and having the downwardly-projecting tongue C, with the catch *c*, all substantially as and for the purposes described.

5. The combination of the cover B and lever D, pivoted to the cover, as described, and having the stop d^3, with the body A, all substantially as and for the purposes described.

298,466. COTTON-SEED HULLER. HENRY HEARD, Greensborough, Ga. Filed Aug. 22, 1883. (No model.)



Claim.—1. A grinding-cylinder having contiguous inclined teeth or ridges extending entirely across its face and parallel with its axis, in combination with an adjustable concave or segmental bed, also having contiguous inclined teeth extending entirely across its inner face, the teeth on said concave or bed being wider and deeper than those on said cylinder, substantially as described.

2. A grinding-cylinder having contiguous inclined teeth or ridges extending entirely across its face and parallel with its axis, and a concave or bed also having contiguous inclined teeth extending entirely across its inner face, the teeth on said concave or bed being wider and deeper than those on said cylinder, in combination with a spherical eccentric for adjusting said concave relative to said cylinder, substantially as described.

3. The combination, with a grinding-cylinder, of an adjustable concave or segmental bed having a concave bearing, C², and a spherical eccentric for adjusting said bed relative to said cylinder, as set forth.

298,467. CAR-BRAKE. MARTIN M. HINER, Harrisburg, Pa. Filed July 13, 1883. (No model.)

Claim.—In a system for automatically applying the brakes upon the cars of a railway-train through the momentum of the train, the combination, with each car and with its brake appliances, of a frame constructed of two continuous rods connected by cross-bars, and mounted to have jointly free longitudinal play under the car, each longitudinal rod of the frame being made to extend the entire length of the car, on either side thereof, from bumper-head to bumper-head, in position to align and contact directly with a counterpart projecting arm or rod on the locomotive or tender, and to produce by its rearward movement in unison with its parallel rod an application of the brakes on the car, substantially in the manner and for the purpose herein set forth.

298,468. LUBRICATOR. WILLIAM HOPE and JAMES HOMAN, Spring field, Ohio. Filed Feb. 25, 1884. (No model.)

Claim.—1. The combination, with the cap or cover of a lubricating-cup provided with a suitable oil-opening, of a hinged valve arranged upon the under side thereof, substantially as set forth.

2. The combination, with the cap or cover of a lubricating-cup provided with a suitable oil-opening, of a spring-pressed hinged valve arranged upon the under side of said cap, adapted to close said opening, substantially as set forth.

3. The combination, with a cap or cover of a lubricating-cup provided with a suitable oil-opening, of a hinged valve arranged upon the under side of said cap, the upper surface of which is made convex in form, substantially as set forth.

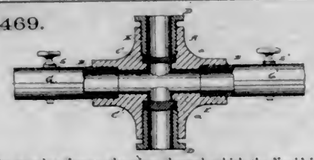
4. The combination, with a cap or cover of a lubricating-cup provided with a suitable oil-opening, of a hinged valve, the upper surface of which is made convex, and a spring for holding the same in said oil-opening, substantially as set forth.

5. The combination, with the cap or cover of a lubricating-cup provided with a suitable oil-opening, of a hinged spring-pressed valve secured to the under side of said cap or cover, and made convex in form, substantially as set forth.

6. The combination, with a cap or cover of a lubricating-cup provided with a suitable oil-opening located at about the center of said cap, said opening being concave in form upon its under side, of a hinged spring-pressed valve secured to the under side of said cap or covering, and made convex in form to fit the concave opening of the said cap, substantially as set forth.

7. The combination, with a cap or cover of a lubricating-cup provided with a suitable oil-opening, of a valve adapted to fit in said opening to close the same, said valve being formed with an extension or projection upon its lower end, and a spring for holding the same in contact with the under side of the cover, substantially as set forth.

8. The combination, with a cap or cover of a lubricating-cup provided with a suitable oil-opening, of a valve hinged at its rear end upon a shaft secured in downwardly-projecting brackets, substantially as set forth.



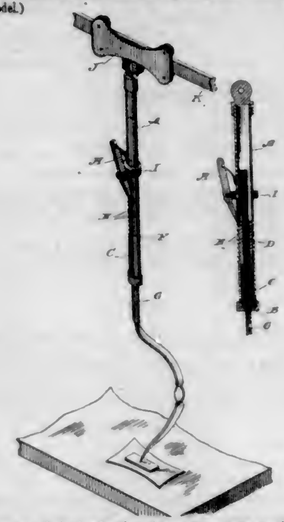
9. The combination, with the cover of a lubricating-cup provided with a suitable oil-opening, of a valve pivoted upon a shaft secured in brackets, and a spring mounted upon said shaft and formed with a loop to engage the under side of the valve, substantially as and for the purpose set forth.

10. The combination, with the cover of a lubricating-cup provided with a suitable oil-opening, of a valve for closing the same, pivoted upon a shaft secured in brackets to the under side of the cover, a coil-spring mounted upon said shaft and formed with a loop to bear against the under side of the valve, and a rod for limiting the movement of said valve, substantially as set forth.

298,469. FLUID-INSPECTOR. JULIUS L. HORNIG, Jersey City, N. J. Filed Oct. 18, 1883. (No model.)

Claim.—1. A fluid-inspector consisting of a pipe or tube through which flows the liquid and apertures upon opposite sides thereof, covered by a transparent medium, so that a stream, ray, or rays of light will pass through the liquid at or about at right angles to its flow, substantially as set forth.

2. The combination, with a cross or four-way pipe intersection, of



means for securing thereto the pipes through which the liquid is to flow, transparent media placed in each cross, and means for securing the media therein, substantially as set forth.

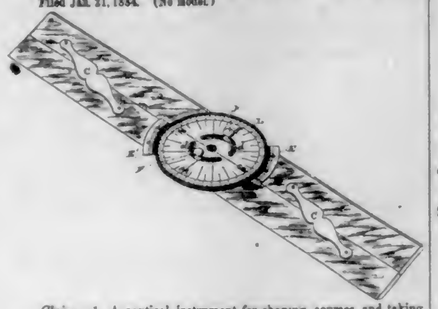
3. The combination, with a cross or four-way pipe intersection, of means for securing thereto the pipes through which the liquid is to flow, transparent media placed in each cross-arm, means for securing the media therein, and an elastic packing interposed between the media and its seat.

4. The combination, with a fluid-inspector substantially such as described, of cocks interposed to regulate flow of the liquid through the inspector, substantially as set forth.

298,470. DEVICE FOR CLAMPING PATTERNS ON GOODS. JAS. ALFORD HOUSE and CHAS. H. DIMOND, Bridgeport, Conn. Filed Feb. 6, 1884. (No model.)

Claim.—1. A device for clamping patterns onto goods, consisting of a rod adapted to be adjusted to any vertical plane, and having interiorly arranged therein a threaded clamping-bar engaging with a nut within said rod, substantially as set forth.

2. A device for clamping patterns to goods, consisting of a rod pivotally attached to a traveling block or frame, and having interiorly arranged therein a threaded clamping-bar adapted to travel in a nut, substantially as described.



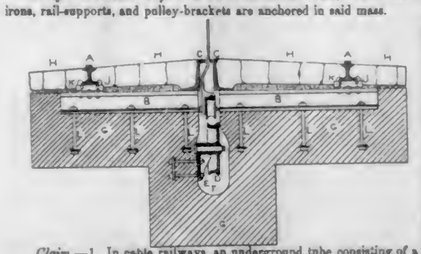
3. In a device for clamping patterns to goods, a rod pivotally attached to a traveling block or frame, and having interiorly arranged therein a nut provided with ratchet-teeth and supported in an elevated position by a spring, in combination with a threaded clamping-bar adapted to travel in said nut, and a pawl attached to said rod and adapted to engage with said teeth and hold the bar against upward movement, substantially as shown and described.

4. In a device for clamping patterns to goods, the threaded clamping-bar adapted to engage with an adjustable nut arranged interior of a rod capable of being adjusted to any vertical plane, substantially as set forth and described.

5. The threaded clamping-bar adapted to engage with a nut in the rod, in combination with means independent of the screw action of the bar for enabling the latter to be brought down and held upon the pattern, and returning said bar to its normal position, substantially as specified.

6. The rod A, having shoulder B and elongated slot F, and with nut D and coil-spring C, arranged interiorly therein, in combination with the threaded clamping-bar G, sliding block J, and pawl H, attached to said rod and engaging with teeth in said pawl, substantially as and for the purpose set forth.

298,471. NAUTICAL PARALLEL RULER. CHARLES HUTCHINSON, San Francisco, Cal., assignor of one-half to William Bendt, same place. Filed Jan. 21, 1884. (No model.)



Claim.—1. A nautical instrument for shaping courses and taking cross-bearings, consisting of the parallel rulers A B, connected by links C, the compass-plate D, having slot *d*, and the thumb-screw F, whereby said plate may be turned to indicate any angle of variation with the rulers, substantially as herein described.

2. A nautical instrument for shaping courses and taking cross-bearings, consisting of the parallel rulers A B, connected by links C, the compass-plate D, having slots *d*, and thumb-screws F, and the variation-arc E, substantially as herein described.

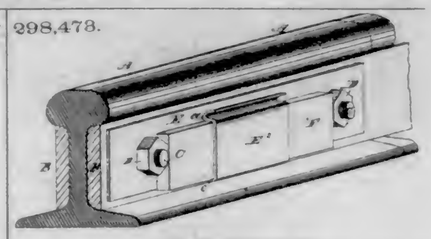
3. A nautical instrument for shaping courses and taking cross-bearings, consisting of the parallel rulers A B, connected by links C, the two-part compass-plate D, having slots *d*, and thumb-screws F, and the variation-arcs E E', substantially as herein described.

298,472. MODE OF CONSTRUCTING TUBES AND ROAD-BEDS FOR CABLE RAILWAYS. JOHN D. ISAACS, Oakland, Cal. Filed Jan. 18, 1884. (No model.)

Brief.—The cable-way is cored from a concrete mass, and the slot-irons, rail-supports, and pulley-brackets are anchored in said mass.

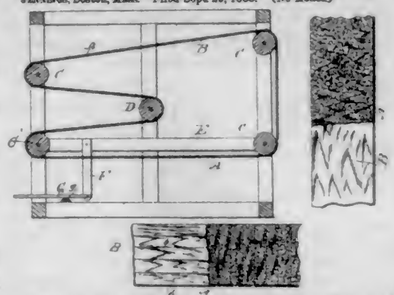
Claim.—1. In cable railways, an underground tube consisting of a mass of concrete cored longitudinally to form a ropeway, with slot-irons on top, to form the passage for the grip-shank to move in, anchored therein, and brackets to carry the cable-supporting pulleys, similarly anchored in the concrete, substantially as herein described.

2. In cable railways, an underground tube consisting of a combination of a mass of concrete cored longitudinally to form a ropeway, with slot-irons on top, to form the passage for the grip-shank to move in, anchored therein, substantially as herein described.



3. In cable railways, an underground tube and road-bed consisting of a combination of a mass of concrete cored longitudinally, with slot-irons on top, to form the passage for the grip-shank to move in, anchored therein, brackets to carry the cable-supporting pulleys, also anchored in the concrete, and a continuous mass of concrete passing under the rails to which said rails are anchored, substantially as herein described.

4. The combination of the concrete mass G, cored to form the tube F, and supporting the rails A A, the sleepers B B, resting horizontally on top of the concrete, and connecting together the rail-chairs and the channel-irons, and the bracket-supports for the cable-carrying pulleys anchored in the concrete, substantially as herein described.



298,473. RAILWAY-JOINT AND NUT-LOCK. WILLIAM M. JENKINS, Defiance, Iowa. Filed Feb. 23, 1884. (No model.)

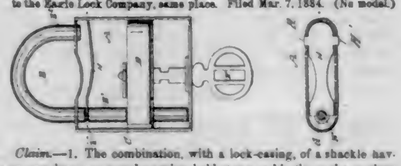
Claim.—The clasp-plate E, formed with the openings E' and the central clasping tongue, E², and having the spring-lips *b*, formed about the openings E', substantially as and for the purposes set forth.

298,478.

298,474. SMOOTHING AND POLISHING MATERIAL. RALPH S. JENNINGS, Boston, Mass. Filed Sept. 29, 1883. (No model.)

Claim.—1. The polishing or smoothing material constructed, substantially as hereinbefore set forth, of sand, emery, or similar grinding substance secured to sheets or strips of wood, which in turn are fastened to other sheets or strips having the grain running transversely relative to the grain of the aforesaid sheets or strips, substantially as set forth.

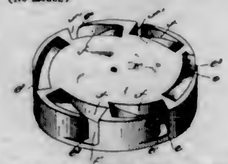
2. The herein-described polishing or smoothing material, consisting of sand or emery secured to flexible wooden sheets or strips, substantially as set forth.



298,475. LAND-ROLLER. KINEY W. JONES, Lemoore, Cal. Filed Jan. 21, 1884. (No model.)

Claim.—1. The spring I for the seat, consisting of a single leaf, one end of which is riveted fast, and the other is curved inwardly on itself, and has a play by reason of a slot, *j*, and guide-pin J, substantially as herein described.

2. The rear frame, A, having rollers B and connecting-arms *b*, formed in one piece, in combination with the frame C, having roller D, curved bar G, seat-spring I, forming a single leaf, and having a raised rear portion, under which and over the bar G the arms *b* are pivoted, substantially as herein described.



298,476. PADLOCK. CHARLES W. JUDSON, Terryville, Conn., assignor to the Eagle Lock Company, same place. Filed Mar. 7, 1884. (No model.)

Claim.—1. The combination, with a lock-casing, of a shackle having an annular groove, and a spring held at one end in the casing a short distance from the top, which spring has its opposite free end forked and passed into an annular groove in the shackle, substantially as herein shown and described.

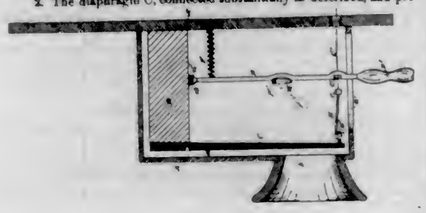
2. The combination, with a lock-casing, of the shackle B, having an annular groove, G, and the flat spring H, having one end forked and pressed into the groove G, and provided at the opposite end with two side lugs, H', passing into apertures in the sides of the casing, substantially as herein shown and described.

298,477. WATER-WHEEL. JAMES KELLAM, Ellsworth, Ind. Filed Oct. 2, 1883. (No model.)

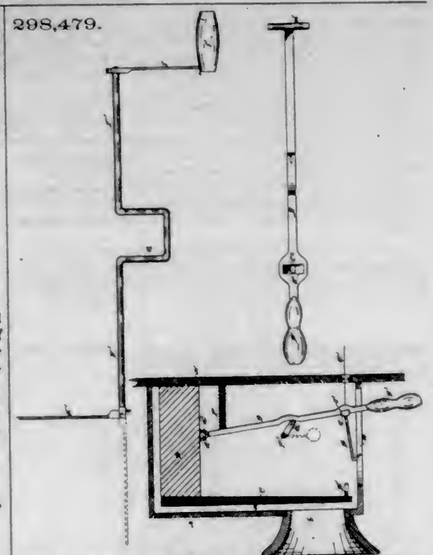
Claim.—1. The herein-described turbine, consisting of the wheel F, having the vertical peripheral inclined buckets *f*, the lower ends of which have downwardly-inclined radial openings or passages *f'*, the rear ends of the said buckets being beveled to form sharp edges *e'*, substantially as set forth.

2. The combination, with the forebay and floor provided with openings, of a turbine-wheel mounted on a shaft in close contact to the under side of said floor, and having the inclined buckets *f*, provided with openings *f'*, and having beveled edges *e'*, substantially as set forth.

298,478. REFLECTOR-SUPPORT FOR CANDLES. ALBERT KONSTENT, New York, N. Y. Filed Oct. 4, 1883. (No model.)



Claim.—As a new article of manufacture, a metallic collar adapted to encircle and rest upon the upper end of a candle, and fitted with a reflector attached to one side, and a counterpoise-handle attached to the opposite side thereof, substantially in the manner and for the purpose herein set forth.



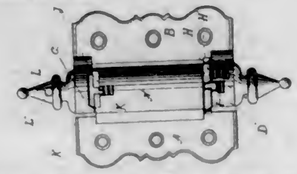
298,479. MECHANICAL TELEPHONE. A. BRENTON KURTZ, Cincinnati, Ohio, assignor of one-half to Freeman C. Ludlow, same place. Filed May 10, 1883. (No model.)

Claim.—1. In a telephone, a diaphragm connected at or near one portion only of its edge to a support, as B, the remaining portion being free to vibrate, and a transmitting-wire adapted to be connected to said diaphragm at some point between its free edge and its point of connection, and to be disconnected therefrom at will, substantially as and for the purposes specified.

2. The diaphragm C, connected substantially as described, and provided with an eye or staple, E', in combination with the wire C', connected to a hook, E, said hook having a cross-bar, *e*, and a lever, D, hinged or pivoted at its upper end, said lever being adapted to engage with the cross-bar *e*, by which the hook E may be drawn forward to engage the eye E', substantially as and for the purposes specified.

298,479.

3. The lever D, pivoted at its upper end, and provided with a cup or recess, *e'*, in combination with the wire C', passing through said lever, and connected to a cross-bar, *e*, in front of the lever, said cross-bar being adapted to rest in the cup or recess *e'*, and having the hook E, adapted to engage the eye of a diaphragm, substantially as and for the purposes specified.



4. The lever D, pivoted at its upper end, and suitably connected near its lower end to the wire C', in combination with the shaft F', passing through the box A from side to side, and provided with a crank, G, adapted to engage the lever D, said shaft being provided with a suitable crank for causing it to rotate, and a spring, F, placed behind the lever, substantially as and for the purposes specified.

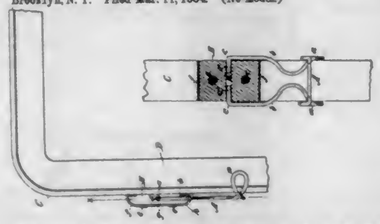
5. The lever D, pivoted at its upper end, and connected near its lower end to the wire C', in combination with the shaft F', having a crank or bend, G, to engage with said lever, one end of said shaft being provided with a crank, *f*, having a handle, *f''*, and the other end being provided with a clapper-rod and hammer for ringing the bell, substantially as and for the purposes specified.

6. The shaft F', being provided at one end with a crank, *f f'*, and at the other end with a clapper-rod, H', having a hammer, A, the clapper-rod being connected to the shaft F' by a knife-blade joint, *h'*, to permit said rod to be turned at right angles to the shaft, or in a line therewith, in combination with the bells H, substantially as and for the purposes specified.

7. In combination with a diaphragm suitably supported and provided with an eye or staple, E', the transmitting-wire provided with hook E, and mechanism for causing the hook to engage with said eye, substantially as and for the purposes specified.

298,480. SPRING-HINGE. GEO. M. LANE, Asbury Park, N. J. Filed Jan. 12, 1884. (Model.)

Claim.—1. The combination of the lower knuckle, the knuckle C, provided with slots C', the knuckle A', arranged between said knuckles,



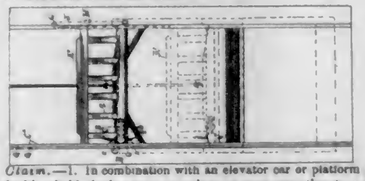
and the spring-cap arranged in knuckle A' and interposed between the spring and the knuckle C, and provided with sliding surfaces adapted to enter the slots C' when the spring is at rest, whereby the longitudinal expansion of the spring is utilized at such times to hold the door against the force of the wind, substantially as set forth.

2. In a spring-hinge, the combination of the knuckle D, having slots D', the spring I, arranged in said knuckle, the plate G, placed on said spring and provided with pawls H, the ratchet-ring having a suitable cross-bar or transverse projections, and the hinge-spring and bifurcated pintle, all arranged and operating substantially as set forth.

3. In a spring-hinge, the combination, with the knuckle A', having slots A^1 A^2, of the spring-cap J, having sliding surfaces K' and slot K^2, and the hinge-spring and pintle, substantially as and for the purposes specified.

4. The combination of the knuckle D, provided with slots D', having lateral wings D^2, the pawl-spring, the pawl-plate provided with pawls having lateral extensions H', and the ratchet-ring, pintle, and hinge-spring, substantially as and for the purposes specified.

298,481. CLASP FOR TRAVELING-BAGS. WILLIAM J. LARGE, Brooklyn, N. Y. Filed Mar. 11, 1884. (No model.)



Claim.—1. The clasp A for traveling-bags, made of spring metal bent to form the arms *b b*, and formed or provided with the cheek-piece *a a*, and adapted to be hinged to the jaw of the bag-frame, substantially as described.

2. The clasp A, made of a single piece of metal forming spring-arms *b*, in combination with the face-plate *f*, formed with the curved flanges *k k*, substantially as and for the purposes set forth.

3. The combination, with the clasp A, having the spring *b*, of the face-plate *f*, formed with the notches *g g* and curved flanges *k k*, substantially as and for the purposes set forth.

298,482. SELF-ACTING ELEVATOR-GATE. SAMUEL J. LAUGHLIN, Guelph, Ontario, Canada. Filed Dec. 26, 1883. (No model.) Patented in Canada Dec. 4, 1883, No. 18,234.

Claim.—1. In combination with an elevator car or platform provided with suitable devices to open or close a passage-way thereto, a gate, as E, working in ways and partially counterbalanced, and constructed to close the said passage-way by its own gravity, and governed in its movement by the car acting directly on its counter-balance, substantially as specified.

2. In combination with an elevator car or platform and the gate E, the counterpoise C, having projection C'', working in the guide K, and acted on directly by the car or platform, substantially as and for the purposes set forth.

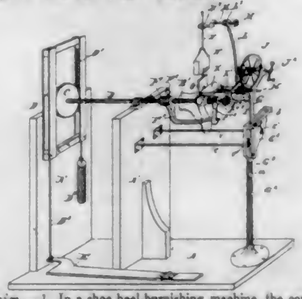
3. In combination with an elevator car or platform and gate E, partially balanced, the counterpoise C, having projection C'' and catch C', attached to the said gate, both arranged substantially as specified, whereby the one engages the car to open a passage-way thereto, and upon its own release the other engages with the said car to govern the closing of said passage-way, substantially as described.

4. The combination of the gate E and catch C', connected therewith, arms B, attached to the car or platform, and plate D, constructed, arranged, and operating substantially as specified.

5. In an elevator provided with a safety-gate, and as a means for automatically operating the same, the arms B, springs N, catches C' C'', weights C H, guide K, and double-inclined plate D, combined and operating substantially as and for the purposes set forth.

6. In combination with the car or platform of an elevator, and a safety-gate connected therewith, the arms B, provided with the outwardly-flaring projections *c'*, the catches C' C'', oppositely inclined, double-inclined plate D, and guides K, constructed substantially as and for the purposes specified.

298,483. DENTAL HAND-PIECE. HENRY LAURENCE, Chicago, Ill. Filed Sept. 24, 1883. (Model.)



Claim.—1. The combination of the shaft E, sleeved shaft I, spindle J, made hollow at one end and provided with serrated jaws, and sleeved collar Q, as constructed and arranged for the purpose of holding the tool and communicating motion to it.

2. The combination of the sleeved shaft I, provided with toothed cone H, and lever T, provided with bayonet-arm V, for the purpose of disengaging the sleeved shaft I, with its clutched end, from the clutched end of shaft E, and holding the sleeved shaft I and spindle J from revolving, as and for the purpose shown.

3. A dental hand-piece having the shell—within which are the revolving parts—made of the screw-cap G, main shell A, removable shell B, and telescopic shell C, all constructed and arranged substantially in the manner and form shown.

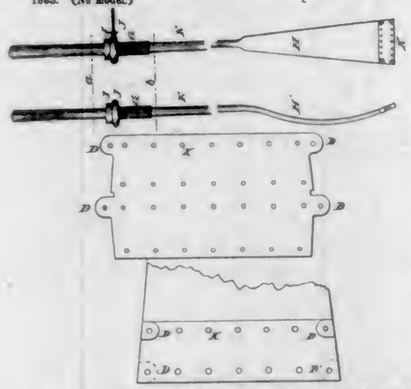
4. The set-screw *a*, in combination with bearing D, and shaft E, and head-piece F, as and for the purpose shown.

298,484. HEEL-BURNISHING MACHINE. ISIDORE LEGAY, New York, N. Y. Filed Oct. 17, 1883. (No model.)

Claim.—1. In a shoe-heel-burnishing machine, the combination, with the oscillating main shaft, of an adjustable shoe clamp or dog fitted upon the end of said shaft by means of a sliding collar encircling the shaft and fixed by a clamping device, substantially in the manner and for the purpose herein set forth.

2. In a shoe-heel-burnishing machine, a shoe clamp or dog secured by one arm to an adjusting-collar encircling the oscillating main shaft of said machine, and carrying upon its opposite arm a screw-bolt terminating in a face-plate, and fitted to traverse in line with the axis of the shaft through a fixed nut on the end of the arm, and to be actuated for adjustment by a suitable crank or hand-wheel, substantially in the manner and for the purpose herein set forth.

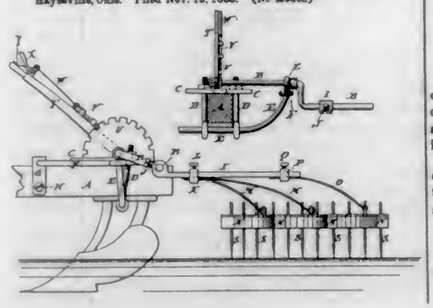
3. In a shoe-heel-burnishing machine, the combination, with its oscillating shaft and shoe-clamping device, of a toothed wheel upon said shaft, a weighted reciprocating rack engaging the same upon one side, and a corresponding rack engaging its opposite side, and actuated by a suitable prime motor for the purpose of imparting an oscillating motion to said shaft, substantially in the manner and for the purpose herein set forth.



4. In a shoe-heel-burnishing machine, a weighted burnishing-tool supported loosely in a vertical plane coincident with the axis of the oscillating shaft, so as to drop automatically upon the heel of a shoe clamped upon and oscillating with said shaft, substantially in the manner and for the purpose herein set forth.

5. In a shoe-heel-burnishing machine, the combination, with a weighted burnishing-tool adapted to rest and bear automatically upon the heel of a shoe carried by the oscillating shaft of the machine, of a stay-block adapted to traverse at right angles to the burnishing-tool, and to bear against the face thereof to steady it and cause it to move back over the heel, substantially in the manner and for the purpose herein set forth.

6. The combination, in a shoe-heel-burnishing machine, with its weighted automatic burnishing-tool, and with a stay-block traversing at right angles to the tool, to bear against the face thereof, of a screw-shaft engaging said stay-block and working through a threaded seat in a fixed bearing, an extended pinion secured upon the shaft, and a toothed wheel engaging said pinion and rotating in fixed bearings, substantially in the manner and for the purpose herein set forth.

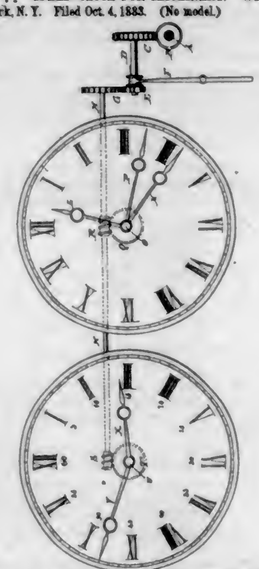


7. The combination, in a shoe-heel-burnishing machine, with its burnishing-tool and the bearings supporting the same, and with a stay-block traversing at right angles to said burnishing-tool, and the bearings supporting the same, of a vibrating arm carrying and supporting upon its upper end the bearings of the burnishing-tool and its stay-plate, and which is pivoted at its lower end to an adjustable standard in line with the oscillating shaft of the machine, to vibrate in a plane at right angles thereto, substantially in the manner and for the purpose herein set forth.

298,485. OAR. SOLOMON LINDENBERGER, Toledo, Ohio. Filed Oct. 22, 1883. (No model.)

Claim.—As a new article of manufacture, an oar the paddle end of which is made in nearly a rectangular form, and covered with a plate of any suitable material, said plate having ears adapted to be folded over upon the sides of the oar, and forming at the point of contact of said ears and sides two thicknesses of metal or material, in combination with means for uniting the whole securely together, substantially as shown, and for the purpose described.

298,486. COMBINED PLOW AND HARROW. ELLIS O. LONG, Hayesville, Ohio. Filed Nov. 13, 1883. (No model.)



Claim.—1. The combination, with the plow-beam A and the harrow N S, of the crank-rod B, the connecting-bar I, and the springs M O, substantially as herein shown and described, whereby the said harrow is adjustably connected with the said plow-beam, as set forth.

2. The combination, with the plow-beam A and the crank-rod B, of the braces E F and clamps C D and G H, substantially as herein shown and described, whereby the said crank-rod is securely connected with the said plow-beam and firmly supported against the draft-strain of the harrow, as set forth.

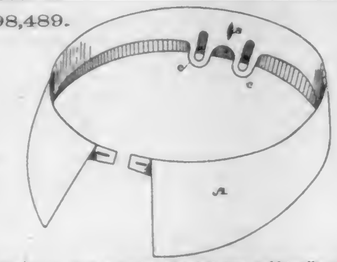
3. The combination, with the crank-rod B and the harrow N S, of the connecting-bar I, the springs M O, and the bands and set-screws K L and P Q, substantially as herein shown and described, whereby the said harrow is adjustably connected with the said crank-rod, as set forth.

298,487. SPEED-CLOCK FOR MACHINERY. WILLIAM H. LORD, New York, N. Y. Filed Oct. 4, 1883. (No model.)

Claim.—1. A speed-clock for machinery, constructed substantially as herein shown and described, and consisting of an ordinary clock-work provided with a third hand and connected by a shaft and gearing with the machinery, and a clock-work connected with the machinery by a shaft and gearing, and provided with two hands arranged to revolve, the one once an hour and the other once in sixty hours, as set forth.

2. In a speed-clock for machinery, the combination, with the drive-shaft A, of the clock-work J, provided with two hands, V X, geared to revolve, the one once an hour and the other once in sixty hours, the shaft H, and the connecting-gearing, substantially as herein shown and described, whereby the amount of lost speed will be indicated, as set forth.

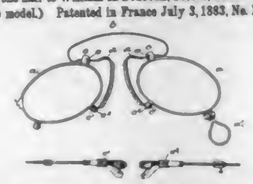
298,488. LATHE-CHUCK. EDWIN LASELLE MANSFIELD, Boston, MASS. Filed Jan. 7, 1884. (No model.)



Claim.—1. The chuck, substantially as described, consisting not only of the part A, having the chambered head and tapering shank, but of the part B, having the conical centering-recess in the outer end of its shank, and the tenon extending from such shank at its other end, all being essentially and for the purpose as set forth.

2. The chuck consisting not only of the part A, provided with the chambered head and tapering shank, but of the part B, having the centering-recess in its outer end, and the tenon and one or more cylindrical steps at its other end, all being substantially and for use as explained.

298,489. COLLAR. ALEXANDER J. MCADAM and NEIL L. MCADAM, San Francisco, Cal. Filed Sept. 7, 1883. (No model.)

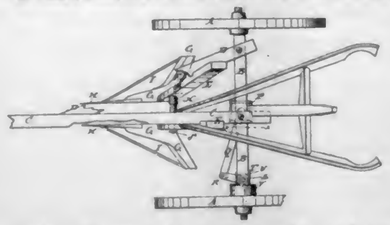


298,489.

Claim.—1. As a new article of manufacture, a shirt-collar provided with an extension or extensions, *c*, in its back, and the elongated slots *a*, for the passage of cravat, arranged below the lower edge of the neckband portion, as and for the purpose set forth.

2. A shirt-collar provided with an extension or extensions, *c*, in its back, and having the slots or openings *a* made therein, one on each side of the back button-hole and below the lower edge of the neckband portion, substantially as and for the purpose herein described.

298,490. EYEGLASSES. JOSEPH PORTER MICHAELS, Paris, FRANCE, assignor of one-half to William R. Donovan, Boston, Mass. Filed Feb. 29, 1884. (No model.) Patented in France July 3, 1883, No. 143,994.

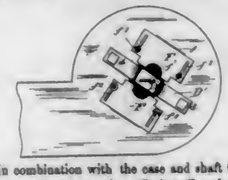


Claim.—1. The combination, with the frames to contain glasses, of nose-pieces pivoted at both ends to said frames, whereby they are adapted to be moved angularly or transversely with relation to said frames, for the purpose specified.

2. In eyeglasses, metallic nose-pieces pivoted to the frames to contain the glasses, and warped or twisted between their pivotal points, substantially as described, and adapted to be moved angularly with relation to the frames, and to present the faces of the nose-pieces or the nose-engaging laminæ, of rubber, horn, or other suitable material, which may be secured to said nose-pieces, against the nose, substantially in the manner and for the purpose specified.

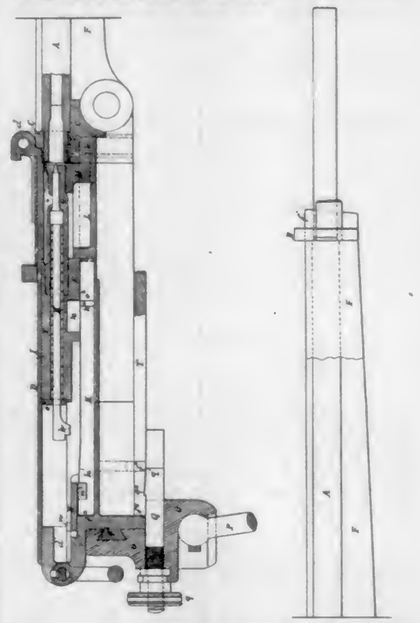
3. In eyeglasses, the frames *a*, having lugs *c c'*, the said lugs *c c'* provided with the grooves and mortises or slots, as set forth, the nose-pieces *d*, pivoted to the said lugs *c c'*, the spring *b*, firmly held in the grooves of the lugs *c*, and the holding-screws, combined in the manner and for the purposes set forth.

4. In an eyeglass, the combination, with the frames having the lugs *c c'*, the said lug *c* provided with the slots or mortises in one side thereof, as described, of nose-pieces pivoted to the lugs *c c'* and adapted to be moved transversely or angularly with relation to the frames and enter the slots or mortises in said lugs *c*, and suitable retaining screws or pivots substantially as described, and for the purpose set forth.



298,491. COMBINED COTTON SCRAPER AND CHOPPER. COLUMBUS JOHNSON MORRISON, Hawthorn, Fla. Filed Dec. 22, 1883. (No model.)

Claim.—1. In a combined cotton chopper and scraper, the standards E, connected together near their lower ends by the bolt J, tubular washer K on said bolt between the standards, the feet G on the lower ends of said standards, and the removable cutters H and scrapers I, secured to said feet, substantially as set forth.



2. In a combined cotton scraper and chopper, the combination, with the axle B and wheel A, of the frame M, the sliding block N, the rod and hoe O P, and the connecting-rod Q, crank-shaft R S, and gear-wheels U V, substantially as herein shown and described, whereby the said hoe will be operated from the said drive-wheel, as set forth.

298,492. ROTARY BLOWER. JOHN L. NEWMAN, West Point, Ga., assignor of one-half to Thomas J. Eady, same place. Filed June 23, 1883. (No model.)

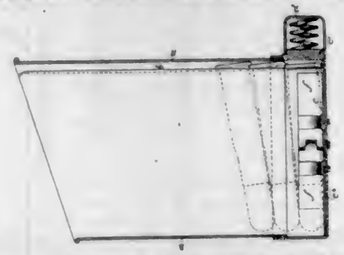
Claim.—In combination with the case and shaft C, the adjusting-slides F, having semicircular openings *f'*, slots *f²*, and upturned edges *f*, and the guide-pins *f³*, as and for the purposes set forth.

298,493. MACHINE-GUN. THORSTEN NORDENFELT, Westminster, England. Filed May 23, 1883. (No model.) Patented in England Oct. 14, 1882, No. 4,899; in France Apr. 14, 1883, No. 154,872; in Germany Apr. 20, 1883, No. 25,956; in Spain July 10, 1883; in Italy Sept. 30, 1883, No. 15,723, and in Austria Dec. 15, 1883, No. 27,846.

Claim.—1. The combination of the frame, the barrels having supporting-connection therewith at front and having grooved lugs formed on their rear ends, the cross-piece C of the frame having recesses into which said lugs enter, and the cover provided with the enlargement received by the grooves of the barrel-lugs, substantially as and for the purpose hereinbefore set forth.

2. The combination of the frame, the barrels having supporting-connection therewith at rear and reduced at their front ends, and a front cross-piece, B, of the frame grooved and perforated within its grooves to receive the reduced ends of the barrels, substantially as hereinbefore set forth.

3. The combination of the longitudinally-moving action-block having the projecting piece I, and inclines *l l'*, and the transversely-moving cartridge-receiver having inclines *m m'*, actuated by the action-block, substantially as and for the purpose hereinbefore set forth.



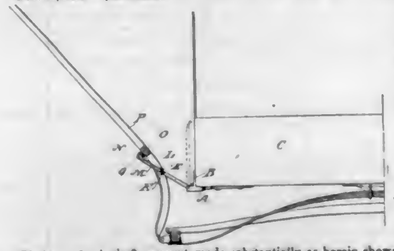
4. The combination of the strikers, the trigger-comb provided with the incline *n²*, and the action-block provided with an incline, *n'*, acting against the incline of the trigger-comb, substantially as and for the purpose hereinbefore set forth.

5. The combination of the frame provided with the cavity *f⁵*, the action-block with the cavity *c²*, and the action-lever having ends *k' k²*, entering said cavities, substantially as and for the purpose hereinbefore set forth.

6. The combination of the frame provided with the socket *f⁴*, having the flange *f⁵*, the action-lever provided with the hollow boss *k²*, entering the frame-socket, and the hand-lever T, having the stud *t*, entering the boss of the action-lever, and provided with the lug bearing against the flange of the frame-socket, substantially as and for the purpose hereinbefore set forth.

7. The combination of the bracket O of the frame or carriage, the adjustable bolt or pin Q, and the hand-lever T, having the spreading lug or finger, substantially as and for the purpose hereinbefore set forth.

298,494. CARTRIDGE-MAGAZINE. THORSTEN NORDENFELT, Westminster, England. Filed Dec. 7, 1883. (No model.) Patented in England May 11, 1883, No. 2,401; in France Nov. 10, 1883, No. 158,473; in Belgium Nov. 14, 1883, No. 63,311, and in Italy Dec. 31, 1883, No. 16,169.



Claim.—1. The combination of the case having the cartridge-ejecting slot and the slide by which the flange of the lowermost cartridge in the case is engaged, and by the actuation of which the cartridges are in turn moved endwise, flanges foremost, and brought into position to be ejected, substantially as and for the purpose hereinbefore set forth.

2. The combination of the case, the slide engaging the lowermost cartridge in the case, and the blades or fingers connected with and operated by the slide for ejecting the lowermost cartridge in the case and supporting and retaining the cartridges above, substantially as and for the purpose hereinbefore set forth.

3. The combination of the case, the slide provided with slots, and the blades or fingers supported by the case and provided with projections engaging the slots of the slide, substantially as and for the purpose hereinbefore set forth.

298,495. SHAFT-SUPPORT. JAMES F. PAGE, Arcadia, La. Filed Nov. 16, 1883. (No model.)

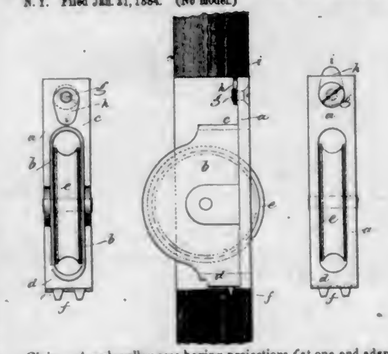
Claim.—1. A shaft-support made substantially as herein shown and described, and consisting of a bar pivoted to the front of the vehicle body or box, and pressed upward by a spring, as set forth.

2. In a shaft-support, the combination, with a plate adapted to be fastened to the front of the vehicle body or box, of a fork or plate pivoted to the plate on the wagon-box, a spring for pressing the fork up, and of a bar held adjustably in the said fork or plate, substantially as herein shown and described.

3. In a shaft-support, the combination, with a plate adapted to be fastened on the front of the wagon-box, of a fork pivoted to the said plate, a bar held adjustably in the fork, a spring for pressing the fork upward, and a notched plate on the cross-bar uniting the shafts, substantially as herein shown and described.

4. In a shaft-support, the combination, with the plate A, of the fork E, pivoted to the same, the spring G, for pressing the fork upward, the serrated plates J, held in the fork, the serrated bar M, and suitable devices for clamping said bar, held between the plates J, substantially as herein shown and described.

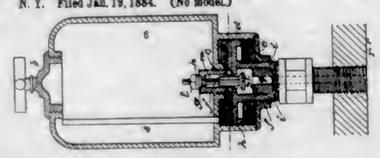
5. In a shaft-support, the combination, with the plate A, of the fork E, the spring G, the serrated clamp-plates J, the screw K, and the longitudinally-slotted serrated bar M, substantially as herein shown and described.



6. In a shaft-support, the combination, with the plate A, having a standard, B, of the fork E, pivoted to the plate A, spiral spring G, passed under the fork E, and having its end recessed in the plate A, substantially as herein shown and described.

7. In a shaft-support, the combination, with the plate A, of a fork or bar pivoted to the same, and of a spiral spring passed under the fork or bar to press or swing it upward, which spring has its ends secured in the plate A, substantially as herein shown and described.

8. In a shaft-support, the combination, with the plate A, having a recess, D, of the fork E, the bolt F, the spring G, the clamp-plates J, the bar M, having a hook, N, and the screw K, substantially as herein shown and described.



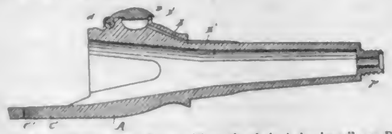
9. In a shaft-support, the combination, with the plate A, of the fork E, pivoted to the same, which fork has a bend, E', in each shank, the clamp-plates J, held within the bends E', the longitudinally-slotted bar M, and of the screw K, substantially as herein shown and described.

298,496. SASH-CORD GUIDE. GEO. W. PERO, West New Brighton, N. Y. Filed Jan. 21, 1884. (No model.)

Claim.—A sash-pulley case having projections *f* at one end adapted to being driven into the wood-work of the window-frame, in combination with a turn-button applied near the other end of the case, the stem of the turn-button passing through the case and terminating with a slotted head, whereby said turn-button may be partially revolved to force the beveled end into the wood of the window-frame, substantially as set forth.

298,497. LUBRICATOR AND MEASURE. JOHN S. PETER, Angelica, N. Y. Filed Jan. 19, 1884. (No model.)

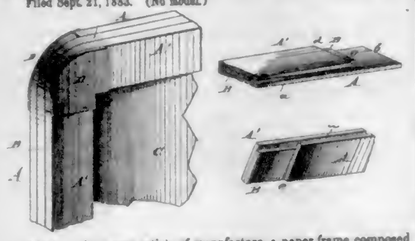
Claim.—1. The combination, with an oil-reservoir, of a measuring-chamber provided with an adjustable bottom having inlet and outlet passages, and valves for alternately closing and opening said passages, substantially as herein shown and described.



2. The combination, with the cup *a*, of the neck *d*, and the plug *g h i*, having passages *m n* to and from the cup and measuring-chamber *o*, respectively, and the valves *k l*, connected to be seated alternately, substantially as shown and described.

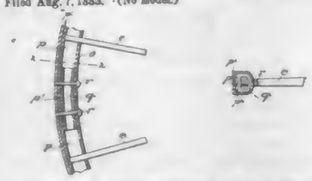
3. The combination, with the cup *a*, and parts *d g h*, forming the measuring-chamber *o*, of the valve *j*, having heads *k l*, adjustable on the valve-stem, to graduate the flow from the cup, substantially as shown and described.

4. The combination, with the cup *a*, neck *d*, plug *g h i*, having passages *m n*, and the valves *k l*, of the aperture-stem *p*, substantially as shown and described.



5. The combination, with the cup *d'* and outlet *a'*, of the stem and plate *g h*, apertured at *w w*, the connected valves *k l*, and the lever *e*, substantially as shown and described.

298,498. WAGON-SKEIN. CHARLES PIERCE, Lisle, N. Y. Filed Aug. 30, 1883. (No model.)



Claim.—In a wagon skein and box, the skein A, having oil-cup D', provided with hinged cover D, channel E, and groove E', in combination with box B, having sand-band H and lugs G, substantially as described, and for the purposes set forth.

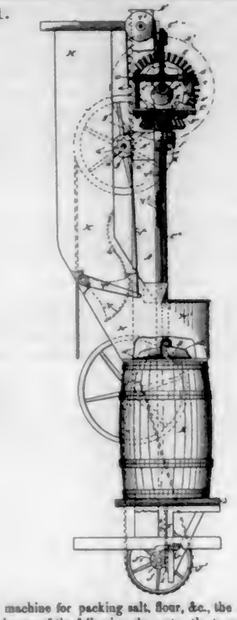
298,499. SLATE-FRAME. ORLANDO M. POND, Independence, Iowa. Filed Sept. 21, 1883. (No model.)

Claim.—As a new article of manufacture, a paper frame composed of broad and narrow strips of paper or pasteboard forming the side and end bars, secured together by means of double lapping joints and cement, and the joints covered with leather or other soft material, substantially as described.

298,500. VEHICLE-WHEEL. LYMAN A. POWERS, Bloomington, Wis. Filed Aug. 7, 1883. (No model.)

Claim.—1. A wheel-rim consisting of the D-shaped plate, whose edges overlap, as at p^2, whereby a double thickness of wearing-surface is afforded.

2. A wheel-rim consisting of the D-shaped plate, whose edges are overlapped, as at p^2, and whose ends are connected by a plate within said rim, and covering the joint between the meeting ends of the rim, substantially as set forth.



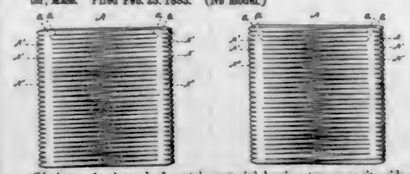
298,501. MACHINE FOR PACKING SALT, FLOUR, &c. RICHARD RADLEY, Buffalo, N. Y. Filed Apr. 17, 1884. (No model.)

Claim.—1. In a machine for packing salt, flour, and other like matter, a tamping-head which is formed with wings which are inclined upward, in combination with mechanism, substantially as shown, which imparts to said tamper a vertical reciprocating and horizontal rotary movement, the said rotary movement occurring as the tamper moves up.

2. In a machine for packing salt, flour, and other like matter, a tamping-head which is formed with wings which are flat in part and in part inclined upward, as at *d* and *d'*, in combination with mechanism, substantially as shown, which imparts to said tamper a vertical reciprocating and a horizontal rotary movement, the said rotary movement occurring as the tamper moves up.

3. In a machine for packing salt, flour, &c., the combination, substantially as shown, of the following elements: a tamping-head formed of wings which are flat in part, as at *d*, and in part inclined upward, as at *d'*, gearing for lifting and pushing down said tamping-head, and gearing for rotating said tamping-head as it is moved up.

298,501.



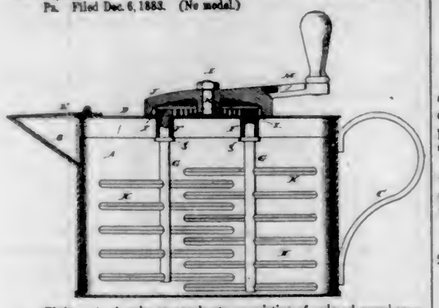
4. In a machine for packing salt, flour, &c., the combination, substantially as shown, of the following elements: the tamping-head D, with blades having the flat part *d* and the inclined part *d'*, the tamping-stem C^3, eccentric-yoke C, guide-bar C', eccentric B^2 on shaft B, which is mounted on the movable frame A', the pawl and ratchet *e* E, gears F F', of which F' is feathered upon the stem C^3, and the drive-wheel B'.

5. In a machine for packing salt, flour, &c., the combination, substantially as shown, of the following elements: a tamper, D, which reciprocates vertically, and rotates and screws out of the barrel, as described, mechanism, substantially as shown, for operating said packer or tamper, a hopper for supplying salt or other matter to the barrel, and a valve or cut-off in said hopper, which is operated from the vertical movement of the tamper as it is lowered into and as it rises up in the barrel.

6. In a machine for packing salt, flour, &c., the combination, substantially as shown, of the hopper H, valve V, valve-moving mechanism V', V^2, V^3, V^4, V^5, and V^6, the sliding frame A', the tamper-moving mechanism B' B^2 B^3 C E *e* F F', and the tamper D.

7. In a machine for packing salt, flour, &c., the combination, substantially as shown, of the following elements: the platform I, the platform-moving devices consisting of the hand-wheel J^4, sprocket-wheels J^3 J', sprocket-chain J^2, shaft J, and racks and pinions *i j i j*, the hopper H, with enlargement H', the tamper D, the moving frame A', carrying the tamper-moving mechanism, and the frame-moving mechanism consisting of the wheel G, shaft G', and rack and pinion *a a'*.

298,502. MAKING MATCH-SPLINTS. CHARLES B. RAWSON, Worcester, Mass. Filed Feb. 23, 1883. (No model.)



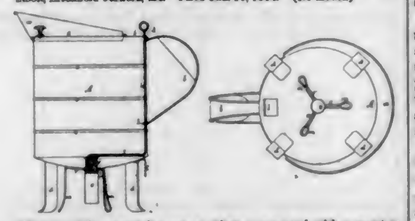
Claim.—1. A card of match material having two opposite sides notched to form the match-heads, and being nearly separated on oblique lines, forming splints, so the pointed end of one splint shall come between the heads of two adjacent matches, as described, and for the purpose set forth.

2. The process of making a card of match-splints, consisting of forming notches on opposite sides of a card of match material, leaving a space between the notches to form the match-head, and afterward partly severing the splints from the card on lines obliquely to the notched sides, so the splints will be wedge-shaped, having the point of each match lying between the heads of the two adjacent matches, as and for the purposes specified.

3. The combination, with a card of match-splints, of a strip of paper, leather, or similar material, attached to the splints at their central section by means of some suitable adhesive substance, as and for the purpose set forth.

4. As an article of manufacture, a roll or package of friction-matches, consisting of a card of cuneiform match-splints, the point of one splint lying between the heads of the two adjacent splints, the several match-splints having some suitable igniting compound attached to their larger ends, and being attached at their central section by any suitable adhesive substance to a strip of paper, leather, or similar connecting material, as and for the purpose set forth.

298,503. EGG AND CAKE BEATER. ALFRED C. REX, Philadelphia, Pa. Filed Dec. 6, 1883. (No model.)



Claim.—1. A cake or egg-beater consisting of a closed vessel combined with rotary beaters having vertical shafts and radiating arms, the arms of one beater passing between the arms of the other during their rotation, said beaters being located and journaled therein, and gear mechanism to rotate said beaters, substantially as and for the purpose specified.

2. The combination of vessel A, removable cover D, and rotary beaters G H, journaled in said cover, substantially as and for the purpose specified.

3. The combination of vessel A, having a spout, removable cover D, having a flap, E, to cover said spout, and rotary beaters G H, journaled in said cover, substantially as and for the purpose specified.

4. The combination of vessel A, removable cover D, and beaters G H, journaled in said cover, pinion I, box spur-wheel J, having internal teeth, and a crank, M, substantially as and for the purpose specified.

298,504. LIQUID-MEASURING VESSEL. MELLEN FREMONT ROBINSON, Litchfield Corners, Me. Filed Jan. 16, 1884. (No model.)

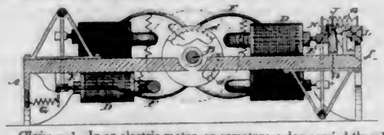
Claim.—The measuring can or pitcher provided with a spout or nose, main and auxiliary legs, a set of ribs, a discharging-tube, and a stopper thereto, arranged and adapted substantially as and for use as represented.

298,505. MAKING ARTIFICIAL BLOCKS, STONES, &c. LOUIS DOSENTHAL, Frankfort-on-the-Main, Germany. Filed Mar. 25, 1884. (No specimens.)

Claim.—1. The preparation, as herein described, of a cast mass of cement made by mixing fresh unset cement with an equal quantity, or rather more, of cement which has already become hardened, (set,) or of finely-ground carbonate of lime, which mass is free from cracks or faults.

2. The preparation of artificial lithographic stones or rollers from cement by mixing unset cement with about an equal quantity of already-set cement finely powdered, or, in lieu thereof, with finely-powdered carbonate of lime, then drying this mixture, pressing it together under a high pressure, sucking a quantity of water necessary for its hardening or setting through it, and finally again subjecting the moist mass to a high pressure, substantially as herein specified.

3. The impregnation of cement stones, rollers, or other formed objects with a liquid saturated with the alkaline and soluble constituents of cement (prepared by stirring cement up with water and pouring off the liquid) until the objects under preparation, by merely grinding, (without the aid of polishing mediums,) show a polish, all substantially in the manner and for the purpose as described.



298,506. BUTTON-FASTENER. RICHARD SANFORD, Providence, R. I., assignor to the Heaton Button Fastener Company, same place. Filed May 7, 1884. (No model.)

Claim.—1. A button-fastener provided with two or more prongs at right angles to each other, one of which is formed with an enlarged end portion, said enlargement forming shoulders, behind which the side prong or prongs are upset when the fastener is secured, substantially as set forth.

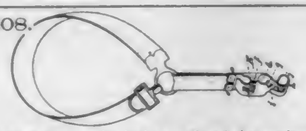
2. The herein-described fastener A, consisting of the table *a*, provided with the prongs *b* and *c*, the latter being formed with an enlarged portion, *d*, having shoulders *a'*, arranged and adapted for use substantially as shown and described.

298,507. ELECTRO-MAGNETIC MOTOR. CHARLES A. SAXE, Philadelphia, Pa. Filed Sept. 5, 1883. (No model.)

Claim.—1. In an electric motor, an armature, a dog carried thereby, and a retracting-spring operating thereon, in combination with a ratchet-wheel engaged and turned by said dog to rotate a shaft, and circuit breaking and closing devices consisting of an oscillating arm, and a piece between the armature and oscillating arm, which piece allows backward and forward motion of said armature, substantially as set forth.

2. In an electric motor, a ratchet-wheel on a shaft, a pawl engaging therewith, an armature carrying said pawl, and a magnet and spring which operate on said armature in opposition to each other, in combination with a slotted piece attached to said armature, an oscillating bar provided with a stud which enters the slot in said bar, and the electrical connections, whereby the circuit is closed when the armature is in one position and broken when it is in another position, substantially as set forth.

3. In an electric motor, a ratchet on a shaft, a pawl, whereby said ratchet is rotated, an armature which carries said pawl, and a magnet and spring which draw said armature in opposite directions, in combination with circuit breaking and closing devices consisting of a slotted piece carried by said armature, an oscillating bar provided with a stud which extends up through the slot in said piece, a screw operating against said oscillating arm, and the necessary electrical connections, substantially as set forth.



4. In an electric motor, a ratchet-wheel, in combination with a dog which operates against it above the platform or table, and another dog which operates on it below the table, in combination with the armatures, magnets, springs, and circuit-closing devices, whereby said dogs are caused to turn said shaft in the same direction, substantially as set forth.

5. In an electric motor, a ratchet-wheel, in combination with two magnets arranged on opposite sides thereof, or respectively above and below the platform or table on which said ratchet is supported, armatures attracted by said magnets, pawls carried by said armatures, springs whereby said armatures are retracted, and circuit breaking and closing devices, the ratchet-wheel having two reversely-arranged series of teeth, and the pawls being arranged to engage therewith respectively, so that the rotation of the ratchet-wheel and its shaft may be reversed at will, substantially as described.

298,508. CLASP. CHRISTOPHER C. SHELEY, New York, N. Y. Filed Dec. 19, 1883. (No model.)

Claim.—1. The clasp consisting of the parts D and E, pivoted together, the latter having the slot or opening forward of the pivot and terminating in the jaw, and the former having the narrowed portion

298,508.

extending through the opening in the part E, and also terminating in a jaw, as described, and the independent spring operating on the two parts to keep their jaws together, substantially as described.

2. The clasp consisting of the part E, having the curved forward portion terminating in a jaw, and provided with the slot, and the part D, pivoted to the part E, having the curved forward portion narrowed to permit it to work through the slot of the other part, and terminating also in a jaw, and having also the portion in rear of the pivot turned down and adapted to bear upon the part E, and form with said part E a second set of jaws, and the independent spring, substantially as described.

298,509. WATCH-CASE. HORACE G. SEDMORE, Cincinnati, Ohio. Filed Jan. 17, 1884. (No model.)

Claim.—1. In a watch-case, the annulus A B, in which the ring part A and the back-rim part B constitute one integral piece of metal, substantially as and for the purpose set forth.

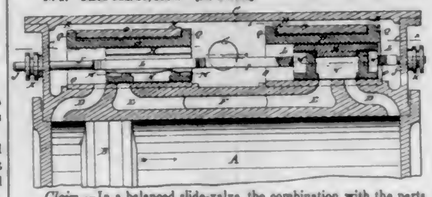
2. In a watch-case, the combination, with the case-center D and annulus A B, of the separable dust-proof panel C, substantially as set forth.

3. In a watch-case, the annulus A B and case-center D, in combination with panel C and bezel E, attached, in the manner described, at the back and at the front, respectively, of said annulus, for the purpose set forth.

4. In a watch-case, the chambered annulus A B, closed at rear and open at front, in combination with the case-springs K L, case-center D, and the pendant H, substantially as set forth.

298,510. HOOK. FRANKLIN A. SMITH, Jr., Providence, R. I. Filed Nov. 21, 1883. (No model.)

Claim.—1. A hook adapted to retain a button in position on a fabric, shoe, or other article, consisting of a base and a partial loop on the same vertical plane, integral therewith, the latter projecting from one edge of the former, substantially as shown and described, whereby its free end is brought directly over and above said edge and sufficiently removed therefrom to permit the passage of the eye of a button between said free end and the edge of the base, the whole being disposed in the same plane, substantially as described.



2. As an improved article of manufacture, the herein-described flat sheet-metal hook A, consisting, essentially, of the base *a* and partial-curved loop *b*, projecting from the edge *c* of said base *a*, both in the same vertical plane, and having its free end, *a'*, above and removed from said edge *c*, to permit the passage of the eye of a shank-button between said parts and to act against the edge of the partial loop, all as shown, and for the purpose set forth.

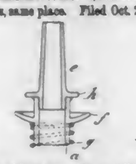
298,511. BUCKLE. JOSEPH WILLIAM SMITH, Newton, Mass. Filed Mar. 24, 1884. (No model.)

Claim.—A fastening for securing the ends of straps or webbings to buckles or the like, consisting of a plate having one edge provided with teeth, adapted to bend back over the central part of the plate, and its other edge plain and adapted to fold back and cover the teeth when bent back over the central part of the plate, in combination with a connecting-shank, a^2, substantially as set forth.

298,512. BALANCED SLIDE-VALVE. WILLIAM G. SMITH, New York, N. Y. Filed Jan. 29, 1884. (No model.)

Claim.—In a balanced slide-valve, the combination, with the parts H of the valve and the valve-boxes O, having recesses R in the ends of its top, of the steel plate P, having flanges Q upon its ends fitting into the said recesses, substantially as herein shown and described, whereby the top of the valve will be protected from steam-pressure and the wear will be taken up automatically, as set forth.

298,513. CAR-COUPLING. JOHN DEVERS SMOOT, Taylor, Tex. Filed Feb. 20, 1884. (No model.)

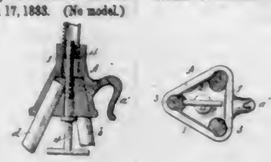


Claim.—1. In a car-coupling, the combination, with a bumper, of arms pivoted therein, their forward ends being provided with hooks, and their rear ends resting within a sliding block having a V-shaped recess, substantially as set forth.

2. In a car-coupling, the combination, with a bumper, of arms pivoted therein, their forward ends being provided with hooks, and their rear ends resting within a block having a V-shaped recess, said block being formed upon its sides with grooves adapted to receive flanges projecting from the inner sides of the said bumper, substantially as set forth.

3. In a car-coupling, the combination, with a bumper, of arms pivoted therein, the forward ends of which are provided with hooks, and having their rear ends resting within a sliding block having a V-shaped recess, and springs secured within the bumper, and having their ends arranged to bear upon the hooked ends of the arms, whereby the same are held in position, substantially as set forth.

4. In a car-coupling, the combination, with a bumper, of arms pivoted therein, the forward ends of which are provided with hooks, and having their rear ends resting within a sliding block having a V-shaped recess, springs arranged to bear against said arms, and a chain secured to said sliding block and connecting the same with a rod secured to the outer side of the car at any suitable point, substantially as set forth.



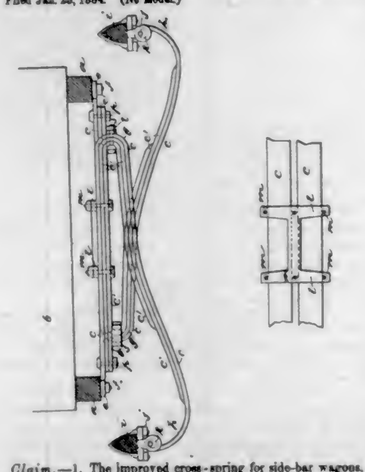
298,514. OILER. ANDREW J. SPERR, Portland, Oreg., assignor to himself and Alfred S. Gross, same place. Filed Oct. 27, 1883. (No model.)

Claim.—1. The combination, with an oil-can, *b*, of the internal presser or follower, *d*, extending out toward the side of can and converging upwardly toward and made integral with the discharge-pipe *a*, as shown and described.

2. The combination, with the spring-supported follower-pipe *a*, of the nozzle *c*, having the collar *h*, as and for the purpose specified.

298,515. HAMMOCK-SUPPORT. GEORGE E. SUTPHEN, Auburn, Ill. Filed Aug. 17, 1883. (No model.)

298,515.



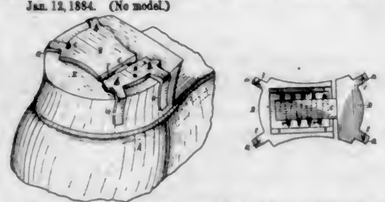
Claim.—1. In combination with the standards G and with the horizontal connection H of a hammock-support, the casting or quarter-turn E, having each of its ends screw-threaded, as set forth, having a hook, 8, on its inner side, and on its outer side the threaded projection 9, provided with a cylindrical bearing to uphold a support for an awning, and provided with a thumb-nut to secure such support in the desired position, and the said support, all substantially as shown and described.

2. In combination, the described tripod-caps, provided each with a hook, *a'*, the quarter-turn castings E, provided each with a hook, 8, and its loose ring, 14, the vertical connecting-pipes G, and the horizontal connecting-pipes, all substantially as shown and described.

3. In combination, the tripod-caps A, made as described, the equal legs *b c d*, removable therefrom, vertical connections G, quarter-turns E, connecting-pipes H H, and the described rings and hooks for suspending and securing the hammock-cord to the quarter-turns and caps.

298,516. SIDE-BAR VEHICLE. JACKSON TAYLOR, Newberry, S. C. Filed Jan. 25, 1884. (No model.)

Claim.—1. The improved cross-spring for side-bar wagons, consisting of two members attached at one end to the rockers *a* of the body, respectively, extended therefrom toward and nearly to the other rocker and alongside of each other, and being therefrom bent backward and extended to and connected with the side bar on the same side of the body that the upper end is connected to, and said members connected together at the middle of the upper horizontal portions, substantially as described.

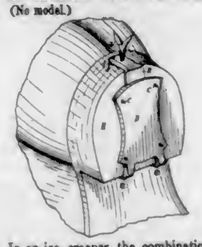


2. A cross-spring for side-bar wagons, consisting of two members connected, respectively, to the rockers *a* of the body, and extended nearly across the body and back to and connected with the side bar of the same side of the body that the upper end is connected to, said members being connected together at the middle of the upper horizontal portions, and also connected to a stiffening-bar, *u*, arranged on said upper horizontal portion of said members, substantially as described.

3. The improved cross-spring for side-bar wagons, consisting of the two members, bent as at *g*, and respectively connected to the rocker *a*, and the side bar, *i*, of the same side of the body, and also arranged side by side in the upper part, and connected together thereat by a clamp device, the said members of the spring and the clamp device being constructed and arranged to enable the said members of the spring to be adjusted along each other for lengthening and shortening the spring, substantially as described.

4. A cross-spring for side-bar wagons, consisting of two members, bent as at *g*, and respectively connected to the rocker *a* and side bar, *i*, of the same side of the body, and also arranged side by side, and connected together in the upper part, the said members having a yoke, *s t*, clamping the plates of which the said members are composed together at the said bends *g*, substantially as described.

5. The combination of the upper parallel parts of the springs *c* with the two H-plates *l*, connected outside of and between the springs by the bolts *m*, substantially as set forth.



298,517. ICE-CREEPER. JOHN J. TEMPLE, Kalamazoo, Mich. Filed Jan. 12, 1884. (No model.)

Claim.—1. An ice-creeper consisting of the two body parts, provided with clamping-arms and ice-spurs, one of said parts provided with a spring-recess and a spring, and the other part provided with a tongue adapted to operate said spring, and means for retaining the tongue and spring in their recess, all substantially as set forth.

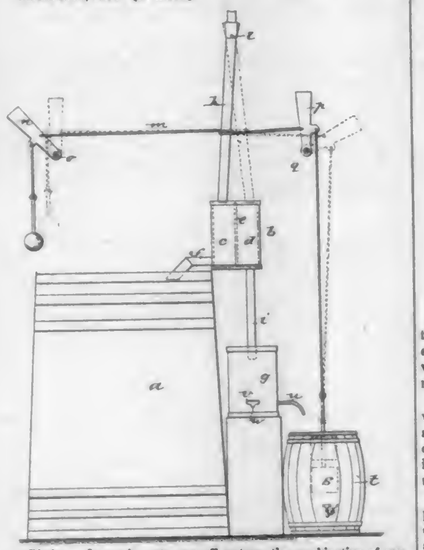
2. A ice-creeper consisting of the two body parts, provided with clamping-arms and ice-spurs, one of said parts provided with a spring-recess and spring located therein, the other part provided with a tongue having the end ing for engagement with the spring, and a cover to said spring-recess, all substantially as set forth.

298,518. ICE-CREEPER. JOHN J. TEMPLE, Kalamazoo, Mich. Filed Feb. 2, 1884. (No model.)

Claim.—1. In an ice-creeper, the combination, with the recessed body, made in one piece, and provided at one end with clamping-arms, of the spring-actuated tongue portion, provided at the outer end with a clamping-arm, and the covering-plate, all substantially as set forth.

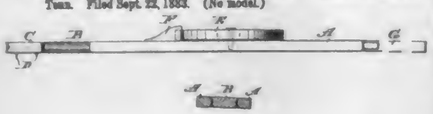
2. In an ice-creeper, the body and tongue provided with clamping-arms having the serrated extensions on the inner face of the upper ends, substantially as specified and shown.

298,519. CARPET-STRETCHER. JOS. W. THOMPSON, Pittsborough, Ind., assignor of one-half to William H. Milan. Filed Feb. 27, 1884. (No model.)

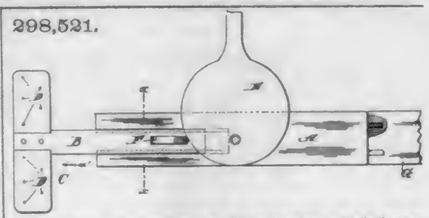


Claim.—1. The above-described carpet-stretcher, having the two cross-heads A and B, in combination with the two arms connected therewith, each of said arms having two hinges, so as to be capable of folding up into three folds, as seen in Fig. 3, and one of said arms having its terminal section or fold slotted, as seen at I, Figs. 2 and 5, to receive the tongue O of the middle fold of the other extension, substantially as set forth.

298,519.

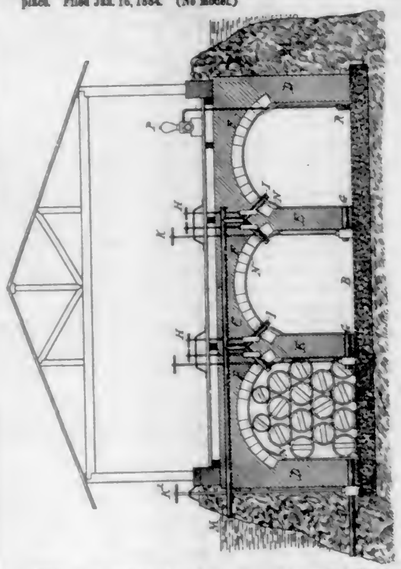


2. In combination with the extension-arm with hinges G H, the tongue O, the cross-head B', bolt L, and slide K, (shown in Figs. 1, 3, and 4 of the drawings,) substantially as and for the purposes set forth.



298,520. RAIN-WATER TRAP. EDWARD T. TOOMER, Mobile, Ala. Filed Dec. 19, 1883. (No model.)

Claim.—In a rain-water cut-off or trap, the combination of conductor or pipe *h*, two-compartment chamber *b*, pipe *i*, and bucket *g*, having the spout *u*, waste-passage *v*, and notch *w* in the lower edge of the waste-passage *v*, substantially as and for the purpose set forth.

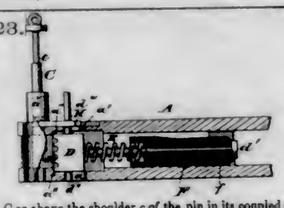


298,521. CARPET-STRETCHER. RUSSELL F. TRUSLOW, Huntingdon, Tenn. Filed Sept. 22, 1883. (No model.)

Claim.—In a carpet-stretcher, the combination, with the base or board A, of the cam E, piece B C, and nose F, as shown and described.

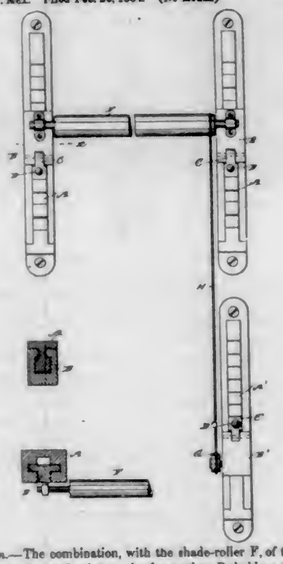
298,522. COLD AND FIRE PROOF STORAGE-BUILDING. BENJAMIN E. VALENTINE, Brooklyn, N. Y., assignor to Charles S. Higgins, same place. Filed Jan. 16, 1884. (No model.)

Claim.—1. A warehouse consisting of a vault or vaults built below the water-level and surrounded by a natural or artificial embankment of earth, as shown at A, around which is the sea or other natural body of water, said vaults being normally free from water, but provided with means, substantially as described, for flooding them.



2. A warehouse having vaults built below the water-level, provided with means for being flooded and emptied, as desired, and surrounded by a natural or artificial embankment of earth, as shown at A, and outside of the embankment by the sea or other natural body of water, and having a superstructure erected over said warehouse-vaults, said superstructure serving the purpose of an ordinary warehouse.

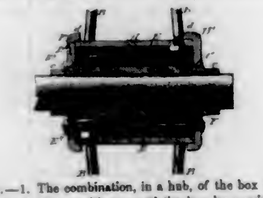
3. A vault for cold and fire proof storage consisting of a wholly or partially submerged vault divided into compartments, substantially as described, and provided with mains M and J, for the access of water, and gates H K, for regulating the supply thereof, substantially as and for the purposes described.



4. The cold and fire proof vault, constructed substantially as described—to wit, in submerged compartments provided with one or more mains, and branches for admitting the flow of water, the pump P, and the gates H K, substantially as and for the purposes described.

298,523. CAR-COUPLING. JOSEPH A. VOGLER, Cincinnati, Ohio. Filed Mar. 17, 1884. (No model.)

Claim.—In a car-coupling, the serrated slide D, whose sliding stem *d'* occupies a sheath, F, containing a helical spring, E, and being pivoted to the draw-head, as at *f*, said slide being guided longitudinally by projections *d''' d''''*, which occupy slots *a a'* in the said head, and having a plate, H, for optional engagement either beneath the point of the uncoupled pin C or above the shoulder *c* of the pin in its coupled or effective condition, substantially as and for the purposes set forth.



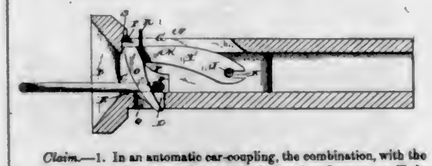
298,524. ADJUSTABLE SHADE-HANGER. JULIUS WAGNER, Silver City, N. Mex. Filed Feb. 26, 1884. (No model.)

Claim.—The combination, with the shade-roller F, of the racks A, having upwardly-projecting teeth, the carriers B, held on the racks A, the pawls C, pivoted to the lower ends of the carriers B, the rack A', having downwardly-projecting teeth, the carrier B' on the rack A', the pawl C', pivoted to the upper end of the slide B', and the roller G on the carrier B', substantially as herein shown and described.

298,525. WHEEL-HUB. JASPER P. WARNER, Dowagiac, Mich. Filed Oct. 23, 1883. (No model.)

Claim.—1. The combination, in a hub, of the box with an outer shell removably held in position around the box by a pair of caps connected with each other by tie-bolts and nuts, by means of which the caps are drawn toward each other, and their inner opposing faces caused to exert a binding force against the outer ends of the said shell, so as to hold the latter in place, substantially as described.

2. The combination, in a hub, of an outer shell for holding the spokes with the inner box for the axle, and a pair of caps located on the box and drawn toward each other and against the ends of the shell by tie-bolts provided with binding-nuts, and passing from one cap to the other, one of said caps being made integral with the shell and both serving to removably hold the shell in position around the box, substantially as described.



3. The combination, in a hub, of an outer shell for holding the spokes with an inner box, C, having an external taper at one or both ends, and a pair of caps located on the box and held against the ends of the outer shell, one or both of said caps being removably fitted on a tapering portion of the box, and wedged thereon by the means employed for drawing and holding it against the shell, substantially as described.

4. The combination, in a hub, of the box having an external taper, *c*, at one or both ends with an outer shell, to which the spokes are secured, and a pair of caps connected together by tie-bolts passing from one cap to the other, one or both of said caps being removably fitted on a tapering portion of the box, and wedged thereon by the binding force of the bolts and nuts which serve to draw the caps against the outer shell, substantially as described.

5. The combination, in a hub, of an outer shell for holding the spokes with a box, C, for the axle, a pair of caps, D D', each provided with a peripheral flange, *d*, fitting upon the perimeter of the shell, and having their opposing faces held against the ends of the latter, and the bolts passing from one cap to the other, and provided with binding-nuts, whereby the said members are removably secured together, substantially as described.

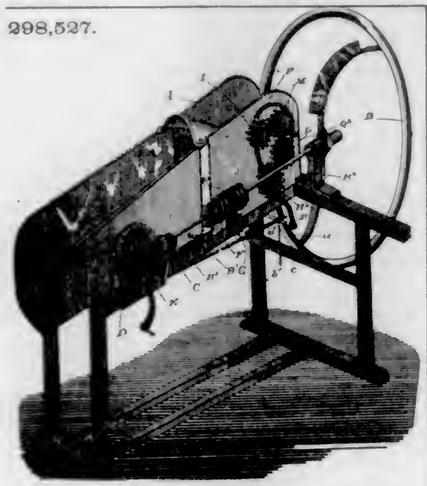
6. The combination, in a hub, of an outer shell for holding the spokes with an inner box, C, provided with a spline, F, at one or both ends, a pair of caps, D D', one or both of which is made separate from the box, and the bolts connecting together the said caps, and serving to draw them toward each other and hold them against the ends of the outer shell, substantially as described.

298,526. CAR-COUPLING. ANDREW LYNCH WASHBURN, New Orleans, La., and ABRAM L. JOURNEAY, Houston, Tex. Filed Jan. 14, 1884. (No model.)

Claim.—1. In an automatic car-coupling, the combination, with the draw-head having flaring mouth B and link-chamber C, a recess, H, in rear of said chamber, and a slot, G, above the same, of a gravity-hook having its shank bifurcated or slotted at K to clasp a transverse pin or bolt, and having its tongue O fitting in a slot in the bottom of the draw-head, and a recess, Q, forward of the slot L, as set forth.

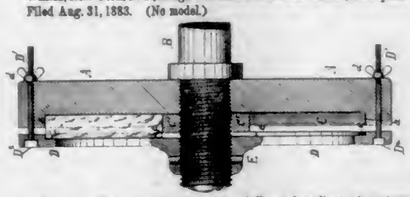
2. As an improvement in automatic car-couplings, the combination, with the draw-head formed with mouth B and a link-chamber, C, having the straight abrupt back wall, D, to obviate damage to pivot of the coupling-hook, of the recess H in rear of the back wall, the slot G, extending from a point over the pivot of gravity-hook to rear edge of mouth B, the slot L at bottom of chamber C, having beveled front edge, forming the only support for the gravity-hook to retain it up in the draw-head, so that an automatic coupling will be effected, a recess, P, in the draw-head, to receive the upper end of hook, and a slot, K, at rear end of the shank of coupling-hook, to receive a transverse pin or bolt, J, the tongue O of the hook being connected to the upper end of the shank, and curving downwardly in a rearward direction, as set forth.

3. In a car-coupling, the combination, with the draw-head having flaring mouth B and link-chamber C, a recess, H, in rear of said chamber, and a slot, G, above the same, of a gravity-hook, I, having its shank bifurcated at its inner end to clasp a transverse pivot pin or bolt, J, stripe N, secured to the side walls of slot G, a tongue, O, of the hook, fitting in a slot, L, in the bottom of the draw-head, and a recess, Q, forward of the said slot L, as set forth.



298,527. FEED-CUTTING MACHINE. JOHN WEICHART, San Francisco, Cal. Filed Jan. 24, 1884. (No model.)

Claim.—1. In a feed-cutting machine, the combination of the cutter-shaft B', having worm-gear F, the shaft G', having gears G G^2, the feed-rollers H^2 I', roller-gears H H^4 I, and intermediate gears or pinions, L M, substantially as shown and described.

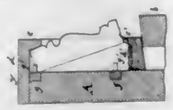


2. In a feed-cutting machine, the combination of the frame A, having slots O Q^2, the feed-rollers H^2 I' and connected gearing, the arms P, depression-plate Q', cross-bars *a c*, pin *b*, spring *d*, and set-screw *f*, substantially as described.

3. In a feed-cutting machine, the combination of the cutter-bar R, depression-plate Q', having lugs Q Q, the curved arms P P', cross-bar *c*, spring *d*, feed-rollers H^2 I', and actuating mechanism, substantially as described.

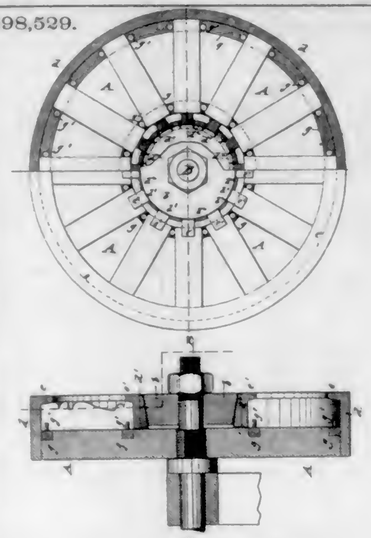
298,527.

298,528. LATHE FOR TURNING POLYGONAL FORMS. LUDWIG WEBER, New York, N. Y., assignor to himself and Oscar Holzer, same place. Filed Aug. 31, 1883. (No model.)



Claim.—1. The combination, substantially as described, of a rotary main disk, a supplementary disk arranged on the face of the main disk, and provided with radial slots adapted to receive polygonal blanks to be turned, a central clamping-nut which shuts over the inner ends of said blanks, a circumferential clamping-ring which shuts over the outer ends of said blanks, and means for adjustably securing said ring to the main disk.

2. The combination, substantially as set forth, of a rotary shaft, a main disk fixed thereto having an outward circumferential flange, a supplementary disk of smaller diameter adapted to fit within the flange of the main disk, said supplementary disk being provided with radial slots adapted to receive polygonal blanks to be turned, a central clamping-nut which shuts over the inner ends of said blanks, a circumferential clamping-ring which shuts over the outer ends of said blanks, and means for adjustably securing said ring to the main disk.

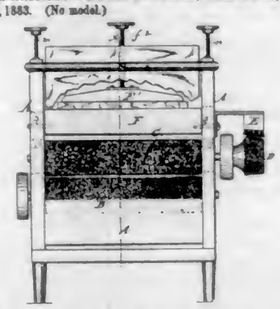


3. The combination, substantially as set forth, of a rotary main disk, a supplementary disk arranged on the face of the main disk and provided with radial slots adapted to receive polygonal blanks to be turned a central clamping-nut which shuts over the inner ends of said blanks, a circumferential clamping-nut which shuts over the outer ends of said blanks, provided with spurs or teeth for grasping the same, and means for adjustably securing said ring to the main disk.

4. The combination, substantially as described, of a rotary disk provided with a circumferential flange, a central clamping-nut for holding the inner ends of polygonal blanks to be turned, a circumferential clamping-ring also for holding said blanks, and means for adjustably securing said ring to said disk.

298,529. WOOD-TURNING LATHE. LUDWIG WEBER, New York, N. Y., assignor of one-half to Oscar Holzer, same place. Filed Feb. 15, 1884. (No model.)

298,529.



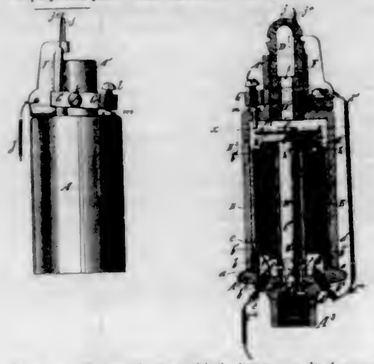
Claim.—1. The combination, with a rotary main disk having a fixed circumferential flange, said flange having an inwardly-projecting shoulder, of inner radially-guided abutments having projecting seats, and means for locking the abutments to the blanks or releasing them therefrom, substantially as set forth.

2. The combination of a rotary supporting-disk, A, having a circumferential flange, *d*, with an inwardly-projecting shoulder, *e*, inner radially-sliding abutments, *d'*, having seats *e'*, fixed guide-cheeks d^2, and a horizontally-adjustable cone, *b*, substantially as described.

3. The combination of a rotary main disk having a circumferential flange, with an inwardly-projecting shoulder, radially-guided abutments having projecting seats, means for applying the abutments to the blanks, and means, substantially as described, for supporting the blanks against laterally-shifting motion, substantially as set forth.

4. The combination of a rotary main disk, A, having a circumferential flange, *d*, with an inwardly-projecting shoulder, *e*, radially-sliding abutments *d'*, having projecting seats *d'*, intermediate guide-cheeks d^2, a horizontally-adjustable cone, *b*, and interchangeable rings *g*, screwed to the disk and provided with retaining-pins *g'*, substantially as specified.

298,530. MACHINE FOR WASHING TABLE-CUTLERY AND OTHER ARTICLES. ANDREW E. WETMORE, Turner's Falls, Mass. Filed May 3, 1883. (No model.)



Claim.—1. In an apparatus for washing cutlery and analogous articles, the combination of the brushes B C, having adjustable bearings in which they revolve, and provided with set-screws to adjust the bearings, with a perforated soap-supplying box located over the upper brush, as set forth.

2. The combination, with the revolving brushes B and C and soap-box F, having a perforated bottom, of the adjustable follower F', having screw f^3 for adjusting it over the soap-box, as set forth.

3. A machine for washing table-ware, consisting of the box A, rotary brushes C B, means for vertically adjusting them, a perforated water-discharge pipe, G, a perforated soap-box, F, and the devices for washing cylindrical articles, composed of the brushes D and E, all constructed and arranged substantially as set forth.

298,531. APPARATUS FOR LIGHTING GAS BY ELECTRICITY. LE ROY S. WHITE, Waterbury, Conn., assignor to the Electric Appliance Company, same place. Filed Jan. 4, 1884. (No model.)

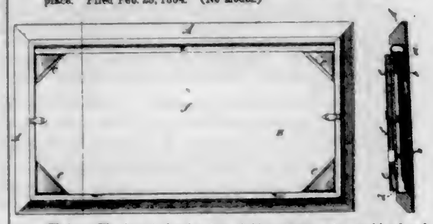
Claim.—1. The combination, with the burner-case having a separable base, of an electro-magnet having a movable core, and the coil of which is attached to and has its terminals passing through said base, a circuit-breaking device outside of said case, and a piece interposed between said core and circuit-breaking device passing through said case from the interior to the exterior thereof, for producing the operation of said circuit-breaking device by the movement of said core, substantially as herein described.

2. The combination of the case A, the base A^2, provided with a valve-seat, *f'*, the tube B', projecting upward from said base, the core C, arranged within said tube, and having the gas-valve *f* at its lower end, and the coil B, surrounding the said tube, and having its terminals *c d* extending through the base, substantially as herein described.

3. The combination of the case A, the base A^2, having the screw-threaded flange *b* and the valve-seat *f'*, the tube B', projecting upward from said base, the core C, having the gas-valve *f* at its lower end, the head B^2, fitting upon said tube and bearing against the flange *b*, the head B^2, applied to the upper end of said tube, and the coil B, surrounding said tube between the heads B^2 B^2, and having its terminals *c d* extending through said base, substantially as herein described.

4. The combination, with the case of an electric gas-burner, provided with a screw-threaded socket or projection for the burner-tip, of circuit-breaking devices upon the top of the case, a pin projecting downward into the case and serving by its upward movement to break the circuit, an electro-magnet arranged within the case, and having a movable core adapted to act upon said pin in its rising movement, and having its armature adjustable in said socket or projection, substantially as herein described.

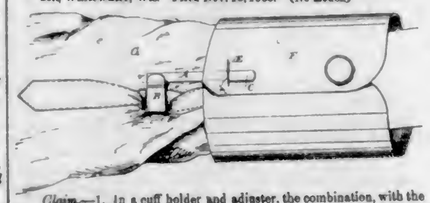
5. The combination, with the case A, provided with the socket or projection A', of the electro-magnet having its core C arranged within the case, circuit-breaking devices on the exterior of the case, the pin *m*, adapted to be acted on by said core in its upward movement, and an iron burner-tip, D, fitted in said socket or projection and acting as an armature to the core C, substantially as herein described.



6. The combination, with the case A, having the socket or projection A', of the coil B and core C, arranged in said case, and the armature composed of the piece D' and burner-tip D, both of which are adjustable in said socket or projection, substantially as herein described.

7. The combination, with the case of an electric gas-burner and an electro-magnet having a movable core arranged within the same, of a circuit-breaking device consisting of a fixed member and a gravitating movable member, and a piece passing through the case and interposed between the said movable core and said gravitating member, for the purpose of producing the circuit-breaking movement of said gravitating member by the movement of said core, substantially as herein described.

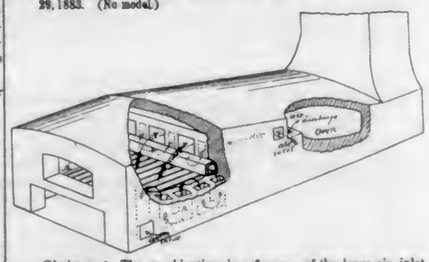
8. The combination with the case of an electric gas-burner and an electro-magnet having a movable core arranged within the same, of the fixed and movable contacts *j j'*, the pivoted gravitating lever or yoke G carrying said contact *j'*, and the pin *m*, adapted to be operated by the said magnet-core to tilt the said lever or yoke and break contact between *j'* and *j* substantially as herein described.



9. The combination, with the case of an electric gas-burner and an electro-magnet with a movable core arranged within the case, of the fixed and movable contacts *j j'* the pivoted gravitating yoke or lever G, carrying the contact *j'*, and provided with the adjusting-screw *l*, and the pin *m* adapted to be operated by said magnet-core to tilt said yoke or lever and break contact between *j'* and *j*, substantially as herein described.

298,532. PORTFOLIO. HENRY S. WILLIAMS and EDWARD L. SHIPMAN, New York, N. Y., assignors to themselves and James D. Shipman, same place. Filed Feb. 23, 1884. (No model.)

Claim.—The box A, having four rigid upright walls, combined and permanently connected by hinge with the portfolio B, the hinge of which is located on the inner face of one of said upright walls, and into which papers are bound for reference, the upper cover of the portfolio constituting, also, the cover of the box, substantially as herein shown and described.

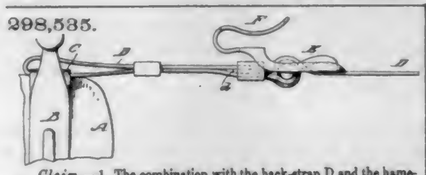


298,533. CUFF FASTENER AND ADJUSTER. THEODORE B. WILSON, Whitewater, Wis. Filed Nov. 10, 1883. (No model.)

Claim.—1. In a cuff holder and adjuster, the combination, with the strip A, having a bend, A', forming a prong, C, at one end, of the clasp B, fastened to the opposite end, substantially as herein shown and described.

2. In a cuff holder and adjuster, the combination, with the strip A, having a bend, A', and a prong, C, and spur D at one end, of a clasp, B, fastened to the opposite end, substantially as herein shown and described.

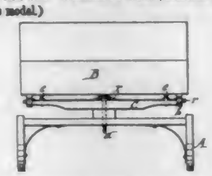
298,534. FURNACE. ODELL WILSON, Cleveland, Ohio. Filed Oct. 29, 1883. (No model.)



Claim.—1. The combination, in a furnace, of the large air-inlet flues, the intermediate shallow return air-flues, and the smoke-flues located above the return air-flues and between the large flues, substantially as shown and described.

2. The combination, in a furnace, of the large air-inlet flues, the intermediate shallow return air-flues, and the smoke-flues located above the return air-flues and between the large flues, and a series of flues constructed in the side walls of the fire-box, conveying the heated air to the point of combustion, substantially as described.

298,535. BACK-STRAP CHECK-HOOK FOR HARNESS. WILLIAM N. WILSON, Shippensville, Pa. Filed Feb. 23, 1884. (No model.)



298,535.

Claim.—1. The combination, with the back-strap D and the hame-strap, of the buckle E, provided on its forward end with a hook, F, the said back-strap being secured at one end to the cross-bar of the buckle, and passing around the hame-strap back through the loop of the buckle, where it may be adjusted by the tongue in the usual manner, substantially as set forth.

2. As an improved article of manufacture, a combined check-rein hook and buckle consisting of a buckle-frame, E, provided near its center with the usual cross-piece and tongue, and having its sides curved upward at one end, and there formed with a cross-piece, F', the said cross-piece being extended in a forward direction and then carved rearward toward the opposite end of the buckle-frame, to form the hook, said buckle-frame, cross-pieces, and hook being all formed in one piece, substantially as set forth.

298,536. SLEIGH. WILLIAM H. WINES, Meridian, N. Y. Filed Mar. 1, 1884. (No model.)

Claim.—1. In combination with a sleigh-bolster and body supported thereon, brackets interposed between the bolster and body, and a metal rod or rods secured to the bolster and projecting over the ends thereof, and terminating with an oscillatory bearing on the brackets, substantially as set forth.

2. The combination of a sleigh-bolster and body supported thereon, brackets secured to the under side of the body, a continuous metal rod secured to the top of the bolster and having its ends projecting over the ends of the bolster and entering an eye in the bracket, and collars fixed to said rod at the ends of the bolster, substantially as described and shown.

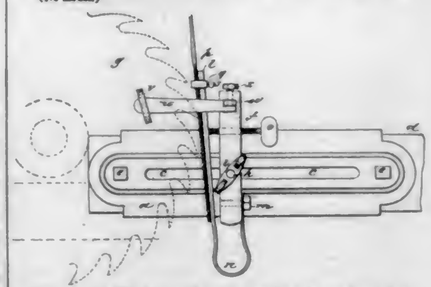
3. In combination with a bolster connected with the sleigh by a king-bolt, and the body supported on said bolster, a continuous metal rod secured to the bolster and provided with an eye for the passage of the king-bolt, and having its ends projecting over the ends of the bolster and entering an eye in the bracket, substantially as described and shown.

4. In combination with the bolster C and body B, the brackets *b b*, secured to the body, the rod *r*, countersunk in the top of the bolster, and having its end projecting over the end of the bolster and provided with the collar *c*, and the clips *e*, fastening the rod to the bolster, substantially as described and shown.

298,537. SWITCH-STAND. JOHN R. WITTY, Indianapolis, Ind., assignor of part to Henry H. McGaffey, Daniel F. Whitcomb, and Byron Hutchinson, all of same place. Filed Oct. 2, 1883. (No model.)

Brief.—The vertically-reciprocating crank-shaft for operating the switch is locked against rotation when in its lower position by described devices, one of which, located near the base of the stand, is protected by a cover fixed to the frame and supplied with a sliding cap fixed to the shaft.

Claim.—1. In a switch-stand, the combination of the frame B, the operating-rod C, and the latch C^3, mounted on said rod near its upper end, and provided with a hub, c^3, as a means whereby said latch may be secured in position on said rod, said latch being also adapted to come in contact with the sides of said frame when the switch is thrown from the main track to one of the side tracks, and thus limit the throw at the proper point, substantially as described, and for the purposes specified.



2. In a switch-stand, the combination of the frame-work B, having an extended base, the operating-rod C, journaled in the top and base of said frame-work, and provided with a clutch part, C^3, and the casing D, secured to the base of said frame-work surrounding said clutch part, and extending up around and in close proximity to said operating-rod, substantially as shown and described, and for the purpose specified.

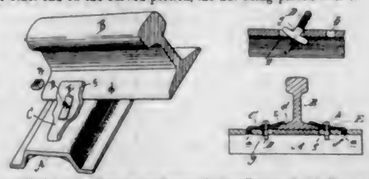
3. In a switch-stand, the combination of the frame-work B, having a projection, b^3, the operating-rod C, having a clutch part, C^3, near its lower end, and the casing D, provided on its front side with a flange, *d*, by means of which it is secured to the horizontal part of the frame B, and on its rear side with a projection, *d'*, which fits under said projection b^3 on the frame, whereby said casting is secured in position, substantially as set forth.

4. In a switch-stand, the combination, with the operating-rod C, having a clutch part, C^3, thereon, of the casting D, its upper end being formed into a neck, and a cap, D', secured to the operating-rod, and adapted to fit down over said neck, thereby preventing any ingress to the clutch, substantially as set forth.

5. In a switch-stand, the combination, with the head-blocks A, stand-frame B, and operating-rod C, provided on its lower end with a crank, C^4, of the piece C^5, bolted between said head-blocks, and provided with an orifice, c^5, into which the end of the wrist of said crank is adapted to fit when the switch is in locked position, substantially as described, and for the purposes specified.

298,538. SAW-JOINTER. HYRAM D. WOLCOTT, Wright's, assignor of one-half to Horace J. Wolcott, Port Allegany, Pa. Filed Dec. 10, 1883. (No model.)

Claim.—1. The improved circular-saw-jointing attachment, consisting of base-plate *a*, supporting-stock *f*, flexibly-connected file-holding plate *l*, attaching-clamp *q s*, and the adjusting-screw *o*, combined and arranged substantially as described.

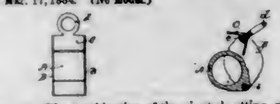


2. The jointing attachment herein described, consisting of base-plate *a*, supporting-stock *f*, file-holding plate *l*, clamp *q s*, and adjusting-screw *o*, combined and arranged substantially as described.

3. The combination, in a circular-saw-jointing attachment, of the base-plate *a*, supporting-stock *f*, file-holding plate *l*, clamp *q s*, adjusting-screw *o*, and the guiding-arms *u* and screw-guides *v*, substantially as described.

4. The guide-arms *u*, having adjusting screw-guides *v*, and connected to the supporting-stock *f* by the overlapping elbows *w*, fitted in a mortise of the stock and secured by the binding-screw *x*, substantially as described.

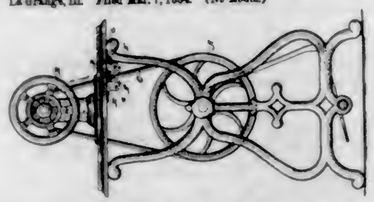
298,539. MEANS FOR SECURING RAILROAD-RAILS TO METALLIC TIES. SIDNEY R. WRIGHT, Wyandotte, Mich. Filed Aug. 8, 1883. (No model.)



Brief.—The fastening-clip is held to the web of a rail by a bolt having an elongated head and square body engaging with a slot in the tie. One end of an oblong leaf-spring rests on the flat portion of the clip and the other end on the curved portion, the nut being placed over it.

Claim.—1. As a means for securing a railway-rail, a hollow metallic tie provided with the slot *c*, in combination with the clip C and the bolt D, provided with an elongated head and square body, engaging with the slot in the tie, said tie being provided with a space below it to admit of turning the bolt, substantially as and for the purposes described.

2. As a means for securing a railway-rail, a metallic tie provided with the slot *c*, in combination with the clip C, having an inclined part at *c*, the oblong leaf-spring E, one end of which rests upon the flat portion of the clip and the other end upon the inclined part *c*, and the bolt D, provided with an elongated head and square body, engaging with the slot in the tie, substantially as and for the purposes described.

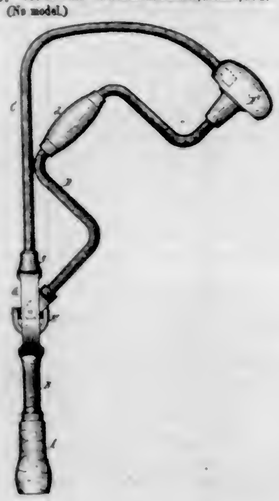


298,540. WATCH-CHARM. REUBEN L. ALLEN, Providence, R. I. Filed Mar. 17, 1884. (No model.)

Claim.—1. The combination of the pivoted setting-rim A, case B B, and the pivoted guard C, adapted to fit the periphery of the setting-rim A, substantially as described.

2. The combination of the pivoted setting-rim A, provided with the hollow *f*, case B B, pivoted guard C, adapted to fit the periphery of the setting-rim A, and the ring *d*, provided with the pivot-eye *g*, cut away at its side, substantially as and for the purpose specified.

298,541. BRAKE FOR SEWING-MACHINES. EDWARD H. AMET, La Grange, Ill. Filed Mar. 7, 1884. (No model.)

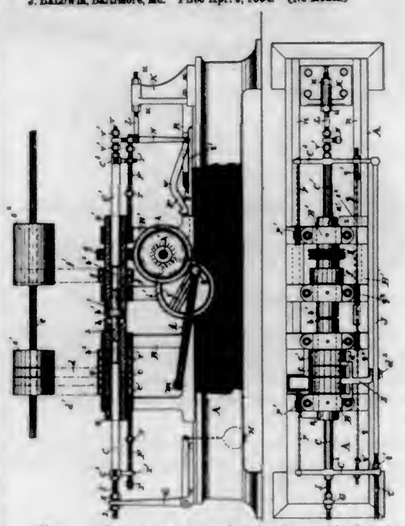


Claim.—1. In combination with the table D, the frame-work E, provided with depending lugs having bearings *e*, adapted to support eccentrics, and having a central aperture for the passage of the belt therethrough, substantially as specified.

2. The combination of the frame E and the table D, the former arranged upon and extending through the latter, whereby the former is strengthened against the strain of the belt when the brake is brought into action, substantially as specified.

3. The blank for the frame E, having a central opening and perforated side and end lugs, all formed in one piece, substantially as specified.

298,542. BIT-BRACE. CHARLES H. AMIDON, Buffalo, N. Y. Filed Oct. 18, 1883. (No model.)



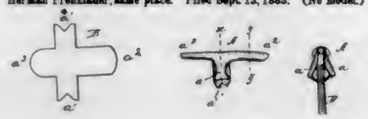
Claim.—1. The combination, with a bit-socket and a crank having its axis arranged at an angle to the bit-socket, of mechanism whereby the rotative motion of the crank is transmitted to the bit-socket, and an angular or elbow-shaped frame or support, whereby the bit-socket and crank are retained in their relative position, substantially as set forth.

2. The combination, with a bit-socket and a crank, D, having its axis arranged at an angle to the bit-socket, of a frame, C, having at one end a head, F, in which one end of the crank is supported, and at its opposite end a bearing, B, in which the shank of the bit-socket is supported, and mechanism whereby the crank is connected with the shank of the bit-socket, substantially as set forth.

3. The combination, with the bit-socket A and shank *a*, of the crank D, the frame C, having a head, F, bearing B, and extension G, and a universal joint, E, connecting the crank D with the shank *a*, substantially as set forth.

298,543. MACHINE FOR TURNING INSULATOR-PINS. JOSEPH J. BALDWIN, Baltimore, Md. Filed Apr. 9, 1884. (No model.)

Claim.—1. In a machine for turning pins, the combination of two hollow mandrels, a cutter-head on each mandrel, and center grips which occupy and move endwise within the hollow mandrels, as set forth.



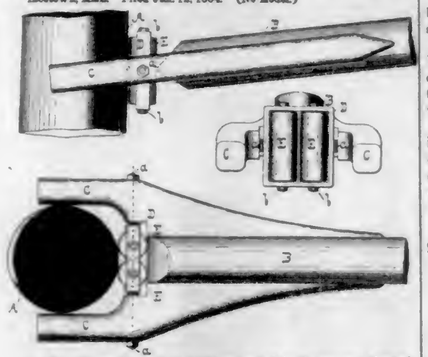
2. In a machine for turning pins, the combination of two hollow mandrels, a cutter-head on each mandrel, center grips which fit the bore of the hollow mandrel, move endwise, and at and for a short distance from their ends are reduced in size, as set forth.

3. In a machine for turning pins, the combination of two hollow mandrels, a cutter-head on each mandrel, center grips which occupy and move endwise within the hollow mandrels, chains and weights to draw the center grips toward each other, and adjustable stop devices to limit the movement of the grips, as set forth.

4. The combination of the center grips adapted to move endwise, a weighted lever to stop the back movement of one grip, and a rod, J, connected rigidly by one end to one grip, extending from thence to and passing loosely through a hole in a cross-bar on the other grip, and provided with a stop-nut, *f*, to press against the said cross-bar, as set forth.

5. The combination of a fixed frame, a reciprocating frame, a hollow mandrel carrying a cutter-head mounted on each frame, and a center grip in each hollow mandrel adapted to move endwise therein, as set forth.

298,544. CLASP-FASTENING FOR ELASTIC STAYS IN CORSETS. THOMAS H. BALL, Chicago, Ill., assignor to himself, Simon Florsheim, and Herman Frentzsaar, same place. Filed Sept. 13, 1883. (No model.)



Claim.—1. A metallic fastening for elastic gores and other like articles, consisting of a divided body adapted to be closed on the ends of the spring, and a cross-head having a projecting arm, whereby the device may be securely fastened to the fabric, substantially as described.

2. A T-headed fastening, A, composed of the two clamping-jaws *a* and the cross-head at their fixed ends, in combination with the fabric C, stitched around one arm of the cross-head, and the coiled metal spring D, the end of which is clasped between the ends of the jaws, substantially as and for the purposes set forth.

3. In combination with the fabric C, having the continuous spring-coil D, the fastening A, composed of the grip-jaws *a*, and the cross-head, one arm, a^2, of which is constructed and arranged to rest upon the adjoining bend in the coil, substantially as and for the purposes set forth.

298,545. BOOM AND GAFF FOR VESSELS. ELIJAH BANGS, Provincetown, Mass. Filed Jan. 12, 1884. (No model.)

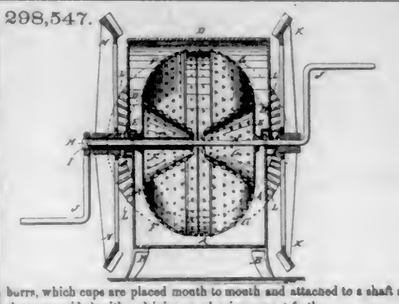
Claim.—In combination with a boom or gaff having a recess formed between the jaws, an open frame supported in the said recess, which swings loosely on fixed bolts or rods extending through the said jaws, and two cylindrical friction-rollers adapted to turn on upright bolts extending through the said frame, substantially as and for the purpose specified.

298,546. RUBBER BOOT. JOSEPH BARNSAN, Providence, R. I. Filed Jan. 17, 1884. (No model.)

Claim.—1. A rubber boot or shoe provided with a leather sole secured by sewing, riveting, or otherwise to a sheet of rubber and a piece of canvas, and secured to the boot or shoe by cementation, as described.

2. A leather sole or tap provided on one side with a sheet of rubber and a piece of canvas, secured together by sewing or otherwise, adapted to be secured to a rubber boot by cementation, as described.

3. A leather sole provided on one side with a sheet of rubber and a piece of canvas adapted to be secured to the sole of a rubber boot by cementation and mechanical means, as described.



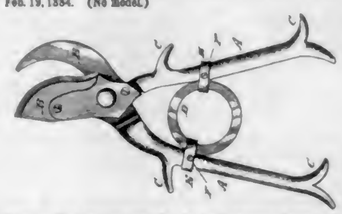
4. The combination, with a rubber boot or shoe, of a leather sole provided on one side with rubber and canvas impregnated with rubber secured together by sewing, or other mechanical means, and by vulcanization, as described.

5. The improved method for securing leather soles to rubber boots, the same consisting in cementing to the leather sole a sheet of canvas with intervening rubber, securing the sole to the canvas by means of sewing, riveting, or other mechanical means, and cementing the whole together before vulcanization, as described.

298,547. POTATO-PARER. GASPAR A. BETANCOURT, New York, N. Y. Filed Sept. 3, 1883. (No model.)

Claim.—1. A potato-parer constructed substantially as herein shown and described, and consisting of a vessel having a close cover and a pair of oblate semispherical cups provided with inwardly-projecting

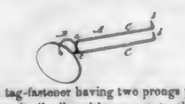
298,547.



burrs, which cups are placed mouth to mouth and attached to a shaft and sleeve provided with a driving mechanism, as set forth.

2. In a potato-parer, the combination, with the vessel A and cover D, of the oblate semispherical cups F G, the shaft and sleeve H I, the connecting gear-wheels K L M, and a driving crank or pulley, substantially as herein shown and described, whereby the said cups will be revolved in opposite directions, as set forth.

3. In a potato-parer, the combination, with the cups F G, having inwardly-projecting burrs, and the shaft and sleeve H I, of the interior conical projections, F' G', having projecting burrs, substantially as herein shown and described, whereby the said cups are more firmly supported and an increased operating-surface is obtained, as set forth.



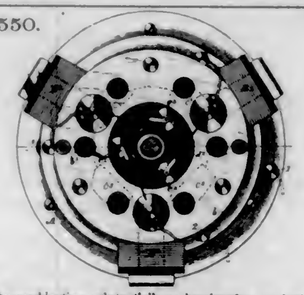
298,548. PRUNING-SHEARS. JOHN G. BURACH, Princeton, Ill. Filed Feb. 19, 1884. (No model.)

Claim.—The combination, in a pair of pruning-shears, of the handles A A, circular rubber spring or ring D, adjustable sleeves or keepers E, and set-screws F, for fixing the same in their adjusted position upon the handles, substantially as set forth.

298,549. TAG-FASTENER. GEORGE N. BUSH, Mattoon, Ill. Filed Oct. 2, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 286,112, dated October 2, 1883.

Claim.—1. A tag-fastener having two prongs provided with a loop or eye arranged longitudinally with respect to the prongs, as distinguished from transversely, and having their ends bent transversely out of the plane of the prongs, substantially as shown and described.

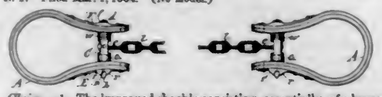


2. A tag-fastener having two prongs provided with a loop or eye arranged longitudinally with respect to the prongs and bent or twisted in a plane intersecting the plane of the prongs, and having their ends bent transversely out of the plane of the prongs, substantially as shown and described.

298,550. REGULATOR FOR ELECTRIC MOTORS. CHAS. G. BURKE, Richmond Hill, N. Y. Filed Nov. 22, 1883. (No model.)

Claim.—1. The combination, substantially as hereinbefore set forth, of a revolving armature, a series of electro-magnets, a circuit-controlling device for transmitting electric currents to said electro-magnets in the proper succession to actuate said armature, and a second circuit-controlling device for modifying the duration of the electric currents thus transmitted.

2. The combination, substantially as hereinbefore set forth, with an electric motor, of an independent circuit-controlling device, whereby the duration of the electric currents transmitted through the coils of said motor may be modified.



298,550.

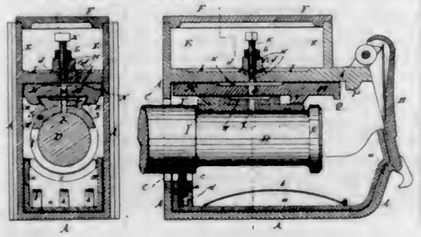
3. The combination, substantially as hereinbefore set forth, with a series of electro-magnets, an armature common to all of said magnets, a battery, and means, substantially such as described, for transmitting electric impulses from said battery through said electro-magnets in succession, of a second battery and an adjustable circuit-controlling device, whereby electric currents may be transmitted from the last-named battery through said electro-magnets coincident with the first currents, but of less duration.

4. The hereinbefore-described method of regulating the speed of electric motors, which consists in vitalizing the actuating electro-magnets through the agency of electric currents of determinate duration, and simultaneously supplying controlling-currents of less duration.

298,551. FETTER FOR ANIMALS. MILES E. BURLINGAME, Willett, N. Y. Filed Mar. 1, 1884. (No model.)

Claim.—1. The improved shackle consisting, essentially, of a bowed spring-band, an elastic facing or cover applied to said band, and the removable coupling for drawing the ends of the bow toward each other, substantially as set forth.

2. The combination, with the flexible bow A, of the plates E F the coupling-bar, C, swiveled on one of said plates and detachably connected with the other plate, and a hobble connected with said coupling-bar, substantially as set forth.



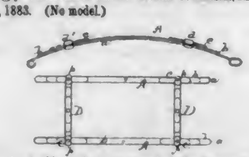
3. In combination with the bow A, the plate E, provided with the longitudinal slot *a* and transverse notches *n*, and the coupling-bar C, formed with the T end *b*, substantially as shown and described.

4. In combination with the bow A, the plate E, provided with the slot *a* and transverse notches *n*, the coupling-bar C, having a T end, *b*, and central hub, *c*, and a spring interposed between said hub and adjacent side of the bow, substantially as described and shown.

5. In combination with the bow A, the plates E F, secured to the exterior of the ends of the bow, the coupling-bar C, swiveled on the plate F, and detachably connected with the plate E, and formed with a central hub, *c*, a hook or eye, *e*, swiveled on the hub, and a spring, G, interposed between the hub and adjacent side of the bow, substantially as described and shown.

6. In combination with the bow A, the plate F, provided with the eye *f*, the plate E, provided with the slot *a* and transverse notches *n*, the coupling-bar C, formed with the central hub, *c*, journal *d*, entering the eye of plate F, and terminating with the upsetting end *g*, and T end *b*, engaging the plate E, and the adjusting-washers *w* and spring G, respectively at opposite ends of the hub, and a hook or eye, *e*, connected with the hub, all constructed and combined substantially in the manner shown and set forth.

298,552. CAR-AXLE BOX. MILTON R. CAREY, Marsh Chunk, Pa. Filed Jan. 25, 1884. (No model.)

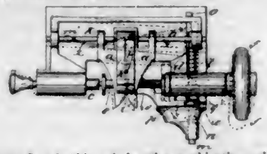


Claim.—1. In a journal-box, the combination, with the housing A and the journal D, of the wedge M, having recess N and perforation O, and provided with dovetailed flanges R, and a stop-flange, V, and the brass U, having dovetailed projection T, and provided with a recess, W, and perforation X, substantially as herein shown and described, whereby the said wedge and brass can have the necessary play, and will conduct oil to the journal D, as set forth.

2. In a journal-box, the combination, with the top of the housing A and the recessed and perforated wedge and brass, of the oil-chamber E, having projection G, perforations H J, and the adjustable screw K, substantially as herein shown and described, whereby oil in any desired quantity can be introduced continuously to the wedge, brass, and journal, as set forth.

3. In a journal-box, the combination, with the housing A, provided with the door B, of the cellar-box *a*, fitting within the said housing and having a closed bottom, and the springs *b*, secured at one end to said cellar-box and having their free ends resting on the bottom of the same, substantially as herein shown and described.

4. In a journal-box, the combination, with the housing A, of the cellar-box *a*, fitting within the housing and having a double wall at its inner end, the plate *c*, the springs *d* under the plate *c*, and the springs *b*, substantially as herein shown and described.



298,553. VEHICLE-SPRING. ROBERT P. CARTER, Arcade, N. Y. Filed Aug. 22, 1883. (No model.)

Claim.—1. A side spring composed of the foundation-leaf *a*, reaching from one end support to the other, one or more long leaves, *b*, and the short leaves, *c*, provided at each clip *d d'*, and said clips *d d'*, one of which is attached to one leaf or more, and the other one to one or more different leaves of the spring, the long springs being united in the center, substantially as set forth, and for the purpose described.

2. The beveled-top saddle-clip B, constructed as described, and in combination with the side springs, A A, or side springs and cross-springs, as and for the purpose set forth.

298,554. BOBBIN-WINDER. GEORGE W. CLAFF, Allemance, N. C. Filed Aug. 4, 1883. (Model.)

Claim.—1. In a bobbin-winder, the combination, with a traverse guide-block having a knife-edge, of a tension-spring for the thread on said guide-block, substantially as herein shown and described, whereby the knife-edge will be pressed upon the bobbin by the thread, as set forth.

2. In a bobbin-winder, the combination, with the base-plate *k*, carrying the bobbin-holding devices, of the traverse-block *a*, pivoted loosely on the rod *d*, and provided with the knife-edge *g* and the guide-notch *i'*, the tension-spring *h*, and the adjusting-screw *h'*, substantially as herein shown and described.

3. In a bobbin-winder, the combination, with the bed-plate *l*, provided with the bracket *n* and stop *o*, the base-plate *k*, pivoted to said bed-plate, and the spring *x*, of the push-rod *m*, provided with shoulder *q*, the spring *t*, surrounding said rod, the latch *p*, having arm *w*, and the springs *u*, substantially as herein shown and described.

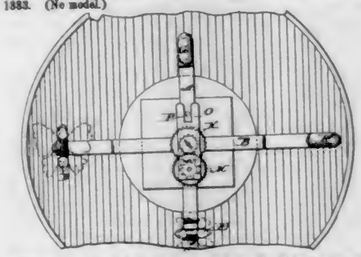
298,555. PIN-TAG. OSCAR J. COHN, New York, N. Y. Filed Mar. 14, 1884. (No model.)

Claim.—1. As an improved article of manufacture, the tag-fastener B, formed with the penetrating-arms *a*, the right-angled loops *b*, and the face portion *c*, the said face portion being bent slightly toward

the ends of the arms, as set forth.

2. The fastener B, bent to form the loops *b b*, penetrating-arms *a a*, and U-shaped face portion *c*, bent slightly backward, so as to have a spring action, in combination with the card A, adapted to have the arms *a* passed through it and to rest in the loops *b*, substantially as described.

298,556. HORSE-TOOTH CUTTER. JOHN H. DANCER, Orange, N. J. Filed Dec. 5, 1883. (No model.)



Claim.—1. In a tooth-cutter, the section *a'*, having the turned extremity provided with the co-operating edge *n*, the sliding cutter *b*, the gage *c*, and mechanism to operate the cutter, all combined substantially as shown and described.

2. In combination, in a tooth-cutter, the section *a*, having the angular rest *f*, provided with the concavity *g*, to receive the bar back of the animal's tooth, the cutter, and means to operate the same, substantially as shown.

3. In combination with the section *a'*, having the rest *f*, a cutter having both extremities sharpened, and mechanism to operate the same.

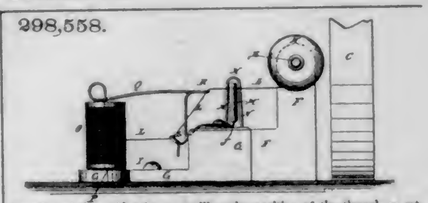
298,557. CLOCK. SANTERRE DIOLOT, New York, N. Y. Filed June 7, 1883. (No model.)

Claim.—1. A clock or time-piece containing the following elements, operated in combination, namely: an ordinary dial and clock mechanism, hour and minute hands worked by said mechanism, arranged behind the dial, provided with magnets that are adapted to attract and hold suitable devices in position in contact with the face of the dial, and cause said devices to slide on the face of the dial to indicate the time, all substantially as herein shown and described.

2. In a clock or time-piece, the combination, with the dial, of devices that slide upon the front face thereof, and of magnets that are revolved behind the dial by the clock mechanism, substantially as herein shown and described, whereby the time will be indicated upon the face of the dial by the shifting of the sliding devices, as set forth.

3. In a clock or time-piece, the sliding devices R S, adapted to slide on the face of the dial and to be moved thereon, so as to indicate the time by means of magnets operated by clock-work behind the dial, substantially as shown and described.

4. In a clock or time-piece, the combination, with the clock mechanism and the back of the dial, of the U-shaped hands or bars arranged one within the other, each bar or hand carrying a magnet and operated as described, whereby two independent sets of devices are made to slide and travel upon the face of the dial in concentric circles of different diameter, to indicate the hours and minutes, as set forth.



5. In a clock, the combination, with the works and the dial, of the shaft C, the hands A B, having the ends bent, and of the magnets D E, and the balancing-pieces F G on the ends of the hands, substantially as herein shown and described.

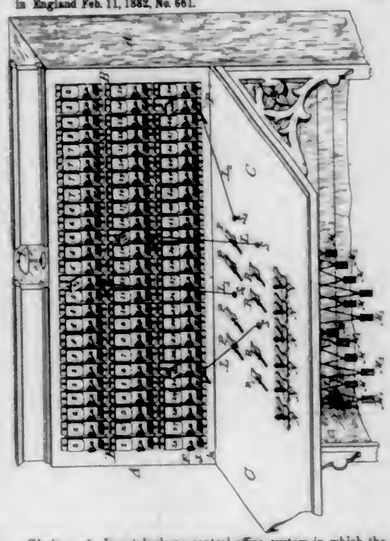
6. In a clock, the combination, with the works and dial-plate, of the shaft C, the hands A B, carrying magnets and balancing-pieces on the ends, the collar J, provided with a cog-wheel, K, the pinion L, the cog-wheel M, and the pinion N, the plate O, and the pin P on the under side of the dial, substantially as herein shown and described, and for the purpose set forth.

298,558. BOBBIN-WINDER FOR SEWING-MACHINES. HENRY M DIXON, New York, N. Y. Filed Sept. 4, 1883. (No model.)

Claim.—1. A bobbin-winder constructed substantially as herein shown and described, and consisting of the wheel and spindle for carrying the bobbin, the knife-holder, knife, sheath, and spring for cutting the

298,558.

thread, and the guides for controlling the position of the thread, as set forth.



2. In a bobbin-winder, the combination, with the wheel and spindle D E and the guides S R, of the knife K, the recessed knife-holder J, and the spring N, substantially as herein shown and described, whereby the thread will be cut automatically when the bobbin becomes full, as set forth.

3. In a bobbin-winder, the combination, with the knife K, the recessed knife-holder J, and the spring N, of the recessed sheath M, substantially as herein shown and described.

4. The combination, with the stand G, knife K, and sheath M, of the U-shaped spring N, inclined to bring its bend above the upper forward corner of the sheath and exert the proper tension on the thread, as described.

5. In a bobbin-winder, the combination, with the knife K, of the adjustable sheath M, having notch *m*, to gage the point at which the thread shall come in contact with the knife-edge, and the device adapted to wind bobbins of varying size by adjusting the sheath, substantially as described.

298,559. TELEPHONE-EXCHANGE APPARATUS. THOMAS E. DOOLITTLE, Bridgeport, Conn. Filed Sept. 16, 1881. (No model.) Patented in England Feb. 11, 1882, No. 661.

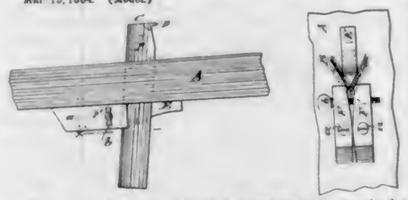
Claim.—1. In a telephone central-office system in which the incoming lines are connected in groups with a series of sectional switch-boards, the combination, with the said sectional switch-boards, of a series of connecting-conductors extending between the switch-boards, and provided at each terminal with devices for transmitting and receiving signals, and with connecting devices whereby call-signals or communications may be electrically exchanged between any two switch-boards or between sub-stations connected by main lines with any two switch-boards.

2. The combination, substantially as hereinbefore described, of a series of sectional switch-boards, a series of main lines divided into groups between the said switch-boards, a series of independent connecting-conductors extending between each switch-board and every other switch-board, each of the said conductors being provided at each terminal thereof with signaling devices and circuit-connections, and a series of local connectors at each switch-board, each provided with a circuit-changer, whereby a telephone common to the series may be connected in circuit

with any one of the series, whereby each switch-board is enabled to signal and communicate with every other switch-board, and whereby a line terminating at one switch-board may be interconnected with a line terminating at another switch-board, for the purposes specified.

3. The combination, substantially as hereinbefore set forth, of a visual signal, an electro-magnet for causing the same to be actuated or exhibited, a key provided with a resting and a working contact, a spring-jack having one of its terminals connected directly to a line-wire and its other terminal to the lever of said key, a connection from the resting-contact of said key to the earth, which includes said electro-magnet, and a connection from the working-contact of said key to one pole of an electric generator whose remaining pole is connected to the earth.

4. The improved spring-jack, constructed substantially as hereinbefore set forth, consisting of a yielding metallic bar which normally rests in a non-conducting seat, a contact-point which forms an electrical connection with said bar while it rests in said seat, and a tapering metallic switch-pin which, when inserted between the yielding bar and its non-conducting seat, forms an electrical connection with the said bar, and at the same time lifts it from the contact-point.



5. The combination, substantially as hereinbefore set forth, of a non-conducting base, a metallic thimble inserted in said base and electrically connected with the earth, a flexible conductor provided with a non-conducting envelope passing through said thimble, a metallic switch-pin or connector attached to and forming one terminal of said flexible conductor, and a weight attached to or acting upon said flexible conductor, tending to keep said terminal normally in electrical contact with said metallic thimble.

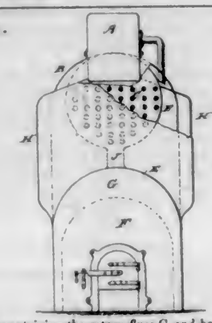
6. The combination, substantially as hereinbefore set forth, of a metallic thimble electrically connected with the earth, a flexible conductor provided with a non-conducting envelope passing through said thimble, a metallic switch-pin or connector attached to and forming one terminal of said flexible conductor, and a weight attached to or acting upon said flexible conductor, tending to keep said terminal normally in electrical contact with said metallic thimble.

7. The combination, substantially as hereinbefore set forth, of two metallic thimbles electrically connected with each other and with the earth, two flexible conductors with non-conducting envelopes, said conductors passing through said thimbles, respectively, metallic switch-pins or connectors forming one terminal of each of said flexible conductors, a telephone and a circuit-changer for connecting the remaining terminals of said flexible conductors together, either directly or through said telephone.

8. The combination, substantially as hereinbefore set forth, of a metallic thimble, a flexible conductor provided with a non-conducting envelope passing through said thimble, and a metallic switch-pin or connector attached to and forming one terminal of said flexible conductor, which terminal is larger than the opening of the thimble, whereby the terminal is prevented from being drawn through the thimble by the tension of the conductor.

298,560. BENCH-DOG. RILEY DOTY, Leonardsburg, Ohio. Filed Mar. 15, 1884. (Model.)

Claim.—1. An improved bench-dog consisting of an angular bar provided with a longitudinal channel or channels, and having teeth on the upper forward edges of the sides of the said channel or channels, substantially as herein shown and described.



2. The combination, with a top having V-shaped mortises, of a dog V-shaped in cross-section, and means for clamping the dog in the mortises, substantially as herein shown and described.

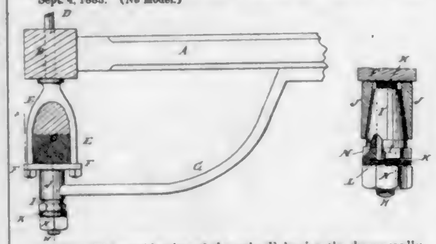
3. The combination, with the bench-top A, having V-shaped mortises, of the V-shaped dog B, the braces E, and a clamp formed of the pivoted arms F and the thumb-screw *b*, substantially as herein shown and described.

298,561. STEAM-BOILER. PATRICK FRANCIS DUNDON, San Francisco, Cal. Filed Jan. 11, 1884. (No model.)

Claim.—In a steam-boiler of the described class, the construction, combination, and arrangement, as hereinbefore described, of the lower shell, E, having water-space G, surrounding the furnace in whole or in part, the furnace F, communicating with the combustion-chamber D, the

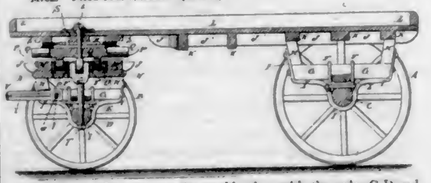
298,561.

upper shell, B, containing the return-flues C, and having pipes or openings J J, communicating with the top of the lower shell, the steam-dome or superheater A, and the flame-jacket H H', the whole constructed, combined, and arranged substantially in the manner and for the purpose shown and set forth.



298,562. END-CAP FOR PAPER ROLLS. FREDERICK W. DUNNELL, Tompkinsville, N. Y. Filed Mar. 4, 1884. (No model.)

Claim.—1. An end-cap for paper rolls, made substantially as herein shown and described, and consisting of a sheet-metal cylindrical band having inwardly-projecting scalloped edge, and provided with an end-fastening to adapt the cap to be applied to the end of a paper roll, as set forth.



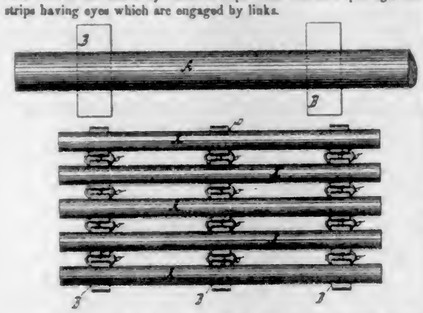
2. The combination, with the paper roll E and its cover F, of a sheet-metal cap, A, substantially as herein shown and described, whereby the end of the said roll is protected from injury, as set forth.

298,563. ADJUSTABLE NUT-BEARING. GEORGE EDMONDS, Brooklyn, assignor to himself and William J. McGinn, New York, N. Y. Filed Sept. 4, 1883. (No model.)

Claim.—The combination of the yoke F, having the downwardly-extended screw-bolt H, the externally-tapered nut I, and the drop-stay G, having the conical socket J, as and for the purpose described.

298,564. WAGON RUNNING-GEAR. WILLIAM H. FANNING, Lapeer, Mich. Filed Jan. 7, 1884. (Model.)

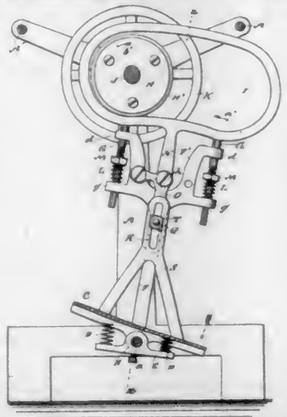
Claim.—1. In a wagon, the combination, with the axles C D and the sand-boards E, of the body-supporting frame consisting of the bars G, secured to the ends of the sand-boards, the inclined bars H, secured



to the bars G, and the brace-bars I, passing around the axles and having their ends secured to said bars G H, substantially as herein shown and described, and for the purpose set forth.

2. In a wagon, the rear frames, G H J, made with a forward extension, J', of their top bars, substantially as herein shown and described, whereby the wagon-body will receive a firm support, as set forth.

3. In a wagon, the combination, with the front frame, G H I, the platform-bars M, and the body L, of the plate N, having grooved blocks O, the plate Q, having rounded blocks P, the fifth-wheel S, and the jointed king-bolt T and its long pivot U, substantially as herein shown and described, whereby the forward and rear parts of the running-gearing can rock independently and without straining the wagon-body, as set forth.



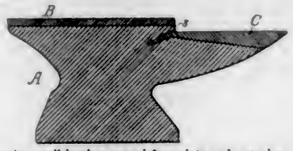
298,565. FLOOR-MAT. FRIEDRICH FASTENRATH, New York, N. Y. Filed Nov. 16, 1883. (No model.)

Brief.—Parallel slats with openings at points entirely within the ends thereof are united by metallic strips fitted into said openings, the strips having eyes which are engaged by links.

Claim.—As an improvement in floor-mats, the combination of the parallel slats A, having the described holes or openings at points entirely within the ends thereof, the metallic strips B, fitted into said openings of the slats and constructed with eyes *e* at both ends, and the links *o*, engaging said eyes of the metallic strips, for connecting the slats, substantially as shown and described.

298,566. FOOT-POWER. HENRY FIELD, JR., New Bedford, Mass. Filed Feb. 21, 1884. (No model.)

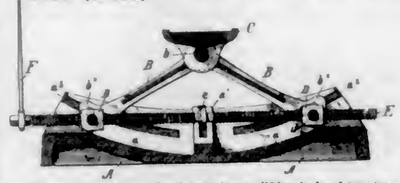
Claim.—1. The combination, with a pulley or wheel, of a rocking frame surrounding it, an elbow-lever connected with the frame, and with a rocking standard, and of a rocking arm for holding the frame surrounding the wheel, substantially as herein shown and described.



2. The combination, with a pulley or wheel, of a rocking frame surrounding it, a rocking arm on which the frame is held in such a manner that it can have a slight vertical movement, and an elbow-lever pivoted to the frame, to the arm holding the frame, and to a rocking standard, substantially as herein shown and described.

3. The combination, with the wheel H, of the rocking frame I, surrounding it, and provided with downwardly-projecting rods G, the rocking arm F on the shaft B, the fork F', formed on the upper end of the arm F, in the prongs of which fork the rods G are held, the standard S on the rocking foot-plate C, and of the angle-lever O, pivoted to the lower end of an arm, N, of the frame I, to the fork F', and to the standard S, substantially as herein shown and described.

4. The combination, with the wheel H, of the frame I, having the downwardly-projecting rods G, and the arm N, the rocking arm F on the shaft B, the fork F' on the upper end of the arm F, the springs L, the nuts M on the rods G, the angle-lever O, and the standard S on a rocking foot-plate, substantially as herein shown and described.



5. The combination, with the rocking foot-plate C, of the cross-bar E, held on the shaft B and below the plate C, and of the springs D, interposed between the foot-plate C and the bar E, substantially as herein shown and described.

298,567. ANVIL. CLARK FISHER, Trenton, N. J. Filed Dec. 20, 1883. (No model.)

Claim.—An anvil having a steel face-plate and a steel or wrought-iron plate covering the horn, the union being effected by casting the iron body on the plates, in which the adjacent extremities of the horn-piece and face-plate are one above the other, and out of contact with each other, and in which the cast metal extends under the entire surface of the face-plate, and between the end thereof nearest to the horn and the horn piece or plate, substantially as and for the purposes set forth.

298,568. LIFTING-JACK. CLARK FISHER, Trenton, N. J. Filed Feb. 16, 1884. (No model.)

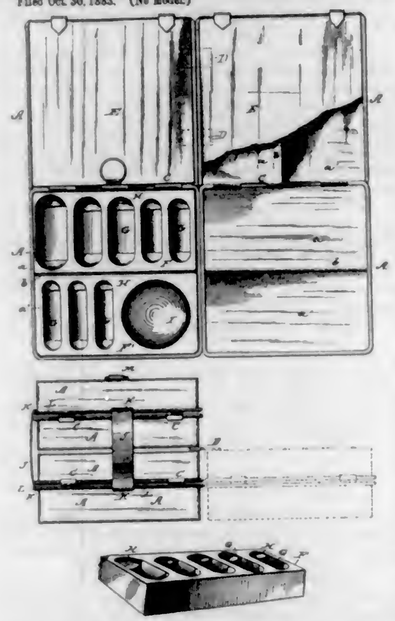
Claim.—1. The combination, to form a lifting-jack, of two toggle-bars, the upper extremities of which are connected and adapted to carry the load, a bed-frame upon which the feet or lower extremities of said toggle-bars rest and travel, and a right-and-left-handed screw-shaft adapted conveniently, by means of trunnioned nuts, to act against the lower extremities of said toggle-bars and cause their approach upon said bed-frame, substantially as described.

2. The combination, to form a lifting-jack, of two toggle-bars, the upper extremities of which are connected and adapted to carry the load, a bed-frame upon which the feet or lower extremities of said toggle-bars rest and travel, a right-and-left-handed screw-shaft adapted conveniently, by means of trunnioned nuts, to act against the lower extremities of said toggle-bars and cause their approach or recession upon said bed-frame, and means for preventing the axial movement of said screw-shaft, substantially as described.

3. The combination, to form a lifting-jack, of two toggle-bars connected at their upper extremities by a toggle-pin, and as to said upper extremities equipped with a lifting-head, a lifting-head, a bed-plate upon which the lower extremities of said toggle-bars rest and travel, and a right-and-left-handed screw-shaft which is adapted to said toggle-bars in such manner that upon its rotation in one direction it causes the approach of the lower extremities of said toggle-bars, or in the opposite direction their recession, and when not rotated retains said bars fixedly in a given position, substantially as set forth.

4. In a lifting-jack of the class herein recited, the combination of a bed-frame containing or embodying segmental toggle-ways, two toggle-bars connected as to their upper extremities, adapted as to said upper extremities to sustain the load, and as to their lower extremities adapted to travel in said segmental toggle-ways, and a screw-shaft or kindred device housed in the bed-plate, and adapted to occasion the approach or recession of the lower extremities of said toggle-bars, substantially as set forth.

5. The combination, to form a lifting-jack of the class herein recited, of the bed-frame provided with segmental toggle-ways, the toggle-bars provided as to their upper extremities with a lifting-head, and as to their lower extremities with trunnioned nuts, nuts applied to said toggle-bars and mounted upon a right-and-left-handed screw-shaft, a right-and-left-handed screw-shaft provided with a collar or kindred retaining device housed in the bed-plate, and means for occasioning the rotation of said shaft, substantially as set forth.



6. The bed-frame hereinbefore described, provided with segmental toggle-ways and with the central collar-socket.

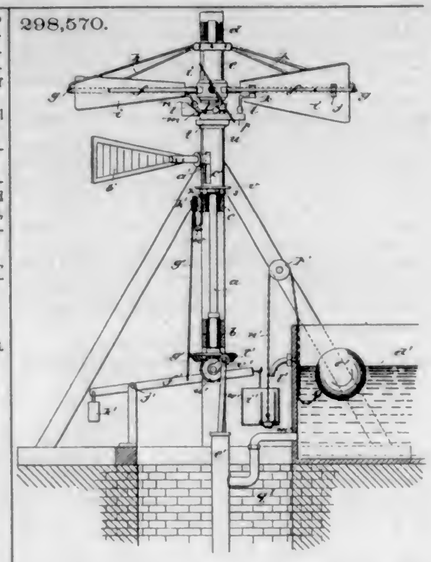
7. The bed-frame hereinbefore described, provided with the segmental toggle-ways, the collar-socket, and the guideways.

8. In combination with a bed-plate upon which the feet of the toggle-bars rest and travel, toggle-bars provided with feet which rest and travel upon said bed-plate, and also provided with bearings in said feet, and nuts equipped with trunnions adapted to said toggle-feet, substantially as and for the purpose set forth.

9. In combination with the bed-frame provided with guideways, the toggle-bars provided with studs adapted to said guideways, substantially as set forth.

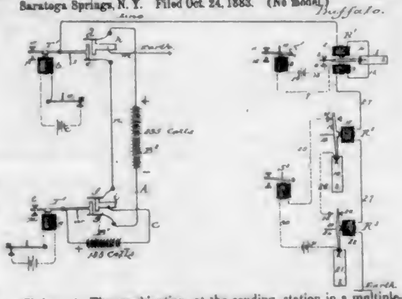
298,569. FOLDING CASH-BOX. BENJAMIN C. FOSTER, Baltimore, Md. Filed Oct. 30, 1883. (No model.)

Claim.—1. The combination of the four boxes A, arranged in pairs, the hinges C, connecting the two boxes of each pair together at their upper edges, the said hinges being arranged in alignment with each other, and the hinges D, connecting one box of one pair with one box of another pair at their lower edges or bottoms, substantially as shown and described, and for the purpose specified.



2. The combination of the boxes A, hinged together as described, and having beads L, and the clamps J, having flanges K at their ends, substantially as shown and described.

298,570. WINDMILL. JAMES B. FOSTER, Parsons, Kans., assignor of one-half to Charles G. Wallace, same place. Filed Oct. 22, 1883. (No model.)



Claim.—1. The cam *m*, plate *n*, sleeve *q*, plate *p*, sleeve *u*, and the regulating-vane *b'*, in combination with the fans *i*, pivoted eccentrically to the arms *f* of the wheel, and having the trailing arms *l*, substantially as described.

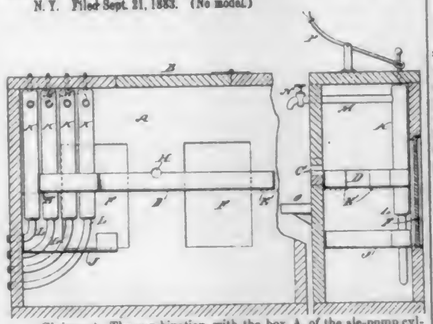
2. The lever *f'*, cord *g'*, guide-pulleys *h'*, yoke *w*, and ring *v*, in combination with the sleeve *u*, plate *p*, and the fans *i*, said fans being pivoted eccentrically to the arms of the fan-wheel, and having trailing arms *l*, substantially as described.

298,570.

298,571. QUADRUPLEX TELEGRAPH. GEORGE W. GARDANIER, Saratoga Springs, N. Y. Filed Oct. 24, 1883. (No model.)

Claim.—1. The combination, at the sending-station in a multiple-telegraph system, of a main line, two keys or transmitters, a main battery divided into two sections, and branch circuits, one section of the battery having a greater electro-motive force than the other, the entire battery being always in the same continuous circuit, one of the keys or transmitters alone controlling the potential of the current by reversing the poles of the smaller section of the main battery with respect to the poles of the larger section thereof, and the other key having absolute control of the polarity of the current, substantially as set forth.

2. The combination, at the sending-station in a multiple-telegraph system, of a key or transmitter connected with the main line and playing between two circuit-contacts, a second key or transmitter playing between two circuit-contacts, a conductor connecting the lower contact of the first key or transmitter with the upper contact of the second key or transmitter, a conductor connecting the upper contact of the first key with the lower contact of the second key and including a section of the main battery, and a branch passing from the second key or transmitter to the stationary contact located between the two circuit-contacts of said key and including another section of the main battery, both sections of the battery being always in the same continuous circuit, substantially as set forth.



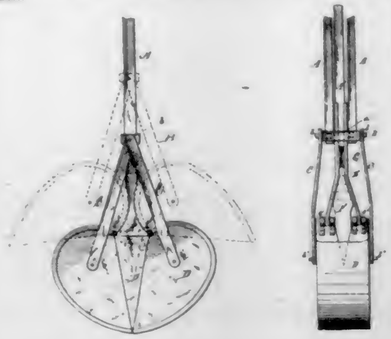
3. The combination, at the receiving-station in a multiple-telegraph system, of a main-line relay the armature of which is actuated by a current of either polarity from the distant station, a second main-line relay which responds to an increase in potential of a positive current only, and a third main-line relay which responds to an increase in potential of a negative current only, the second and third relays operating jointly to receive one set of signals, substantially as set forth.

4. The combination, at the receiving-station in a multiple-telegraph

system, of a main line, a main-line relay and a sounder, the armature of the relay being without retractile spring, and hence repeating signals by a reversal of the polarity of the current to the line at the distant station, with a second and third main-line relays operating jointly to receive one set of signals, a second sounder and branch wires, the second relay responding to an increase in the potential of a positive current only, and the third relay responding to an increase in the potential of a negative current only, substantially as set forth.

5. In a multiple-telegraph system, the combination, at the sending-station, of a main line, two keys or transmitters, a main battery divided into two sections, and branch circuits, both sections of the battery being always in continuous circuit, one key controlling the potential of the current and the other the polarity, with three main-line relays and two sounders with local branches at the receiving-station, the first sounder responding to signals made by the reversing of the polarity of the current to the line at the distant station, the second relay repeating signals into the second sounder when a strong positive current from distant station is decreased, and the third relay repeating signals into said second sounder when a strong negative current from distant station is decreased, substantially as set forth.

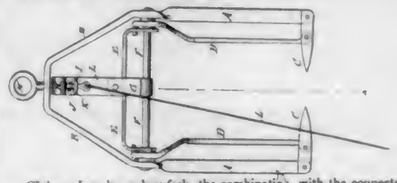
298,572. ALE-PUMP AND ICE-BOX. WILLIAM GARDNER, New York, N. Y. Filed Sept. 21, 1883. (No model.)



Claim.—1. The combination, with the box A, of the ale-pump cylinders K, secured to one side of the box, and provided with the pipes L at the lower ends, and the pipes M at their upper ends, projecting through the box, and having faucets N, and the lever P, pivoted in suitable supports on the top of the box, and connected to the pump-pistons, substantially as herein shown and described.

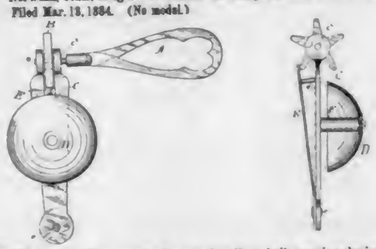
2. The combination, with the box A, provided with the ice-tray D, having openings E, and slides E', of the pump-cylinders K, provided with the pipes L at their lower ends, and the pipes M at their upper ends, projecting through the box, and having faucets N, and the lever P, connected to the pistons of said pumps, substantially as herein shown and described.

298,573. DREDGER. DANIEL J. GILCHRIST, Pittsburg, Pa. Filed June 28, 1883. (No model.)



Brief.—Clam-shell buckets are pivoted at their upper edges on pintles passing the upper corners of interposed wedge-shaped pieces, against which the bucket-edges close, and through a wedge-shaped inner block secured to straps depending from a central pole, which plays through a cross-head carried by outer poles and pivotally connected by links to the buckets.

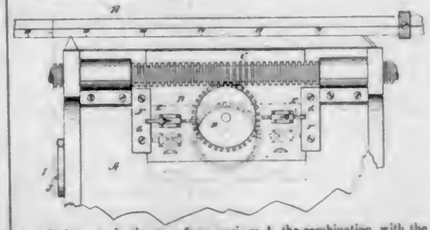
Claim.—1. In a dredging apparatus or bucket, the scoops D D, hinged at their upper end to central wedge-shaped side pieces, D' D', and connected to a movable pole, A', by straps or connections E E, and to poles A by the pivoted links C C, substantially as shown, and for the purpose set forth.



2. In a dredging apparatus, the poles A A A', carrying the scoops D D, having side pieces, D' D', links C C, and wedge-shaped portion F, connecting an operating means, the parts being combined and organized substantially as shown.

298,574. HORSE HAY-FORK. JOSEPH SEIFERT GOSHNAUER, Abbottstown, Pa. Filed Sept. 25, 1883. (No model.)

Claim.—In a horse hay-fork, the combination, with the connected side bars, A, provided with the hinged tines C and the rod F, of the lever-frame E, pivoted upon the connecting-rod F, the connecting-rods D, pivoted to the tines and to the lever-frame E at one side of the pivotal point of said frame, the lever G, fastened to the frame E and pivoted upon the connecting-rod F, the upper end of said lever G having a spring-bolt adapted to engage with the upper connection of the side bars, and means for tripping or withdrawing said bolt, substantially as and for the purpose set forth.

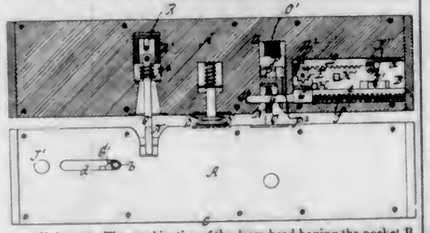


298,575. TOY REVOLVING BELL. WILLIAM GOODFELLOW, South Norwalk, Conn., assignor of one-half to Henry Hoffman, Jr., same place. Filed Mar. 13, 1884. (No model.)

Claim.—1. The combination of a handle, a bell-carrying device, as described, a spring-striker, and mechanism, substantially as described, whereby the spring-striker is made to strike the bell a succession of blows as the body is revolved on the handle, as set forth.

2. The handle A, having spindle a and star-wheel thereon, the body C, slotted as described, and swiveled on said spindle, the bell D, and the spring-striker E e', arranged as described, so that the striker shall act through the slot and strike the edge of the bell when actuated by the star-wheel, all in combination, substantially as described.

298,576. TYPE-WRITING MACHINE. EMIL JULIAN HALL, Alexandria, Va., assignor of one-half to William W. Granger, Washington, D. C. Filed Dec. 8, 1883. (No model.)

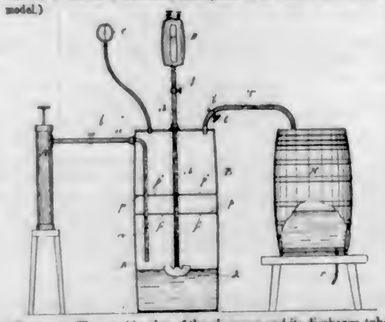


Claim.—1. In the type-form carriage A, the combination, with the toothed drum B, of a movable support therefor, which is fitted on the carriage, and means, substantially as described, for holding the drum from rotation under the action of its inclosed spring while being moved with said support, substantially as shown and described.

2. In the type-form carriage A, the combination, with the toothed drum B, of a movable support therefor, and a locking device, substantially as described, for holding the drum, and for securing the said support when in its normal position in turn, substantially as shown and described.

3. In the type-form carriage A, the combination, with the toothed drum B, of the sliding support or plate D, the notched cleats F, in which the said plate is adapted to move, and the sliding pins E, supported on said plate, and adapted to engage with the teeth of the drum and the notches of the cleats, substantially as shown and described.

298,577. CAR-COUPLING. EMIL HUGO ADOLPH HAUPT, Dolgeville, N. Y. Filed Oct. 18, 1883. (No model.)

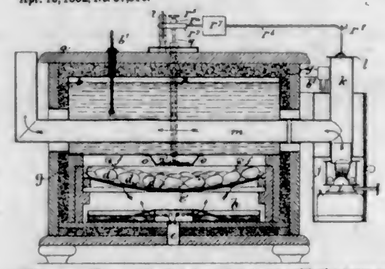


Claim.—1. The combination of the draw-head having the pocket B, the rack-bar D, arranged between stops in said pocket, the return-spring of the rack-bar, the spring-impelled bolt having the lateral projection G', the pinion E, arranged in said projection of the bolt to engage the rack-bar, the axial spindle of the pinion, the bolt-catches C C', and means, substantially such as hereinbefore described, for retracting said catches.

2. The combination of the draw-head having the pocket B, the rack-bar D, arranged between stops in said pocket, the return-spring of the rack-bar, the spring-impelled bolt having the lateral projection G', the pinion E, arranged in said projection of the bolt to engage the rack-bar, the axial spindle of the pinion, the catches C C', the retracting-lever I, engaging the catch C and connecting with the rack-bar, the retracting-lever I', engaging the catch C', and the posh-bar J', acting on the lever last mentioned.

3. The combination of the draw-head having the pockets B Q, the mouth or link-receptacle N, and the bolt-passage G², the rack-bar D, arranged between stops in the pocket B, the return-spring of the rack-bar, the spring-impelled bolt having the lateral projection G', the pinion E, arranged in said projection of the bolt to engage the rack-bar, the axial spindle of the pinion, the catches C C', means, substantially as herein described, for retracting the catches, and the tumbler P, working in the pocket Q, and having projections I'' I''—one arranged in the link-receptacle, and the other arranged to intersect the bolt-passage.

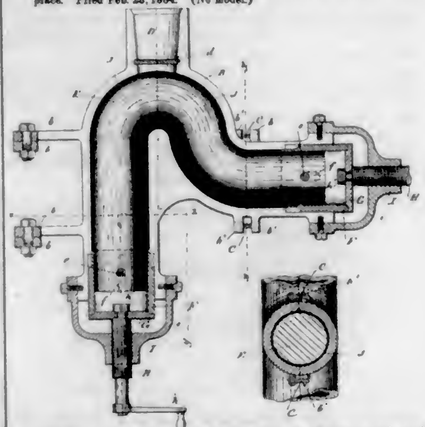
4. The combination, with the draw-head having the mouth or link-receptacle N, and coupling mechanism, substantially such as herein described, of the slide R, the spring acting on the slide, and the link pivoted to the slide at the inner end.



298,578. APPARATUS FOR PRESERVING BEER AND OTHER ALCOHOLIC LIQUORS. CORNELIUS E. HAYNES, Boston, Mass., assignor of one-half to Daniel C. Knowlton, same place. Filed Dec. 10, 1883. (No model.)

Claim.—1. The combination of the air-pump and its discharge-tube, the receiver B, the alcohol-supply vessel D, the discharge-tube *d*, provided with a float-valve, and a pipe for connecting the receiver with a vessel containing the liquor to be preserved, substantially as set forth.

2. The combination as a whole, consisting of the air-pump and its discharge-tube, the receiver provided with the perforated partitions *p p*, and the alcohol-supply vessel and its discharge-tube, provided with the float-valve *k* and the connecting-pipe T, by which the apparatus is connected with the keg, substantially as described and shown.

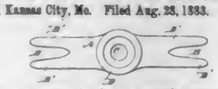


298,579. APPARATUS FOR HATCHING EGGS BY ARTIFICIAL HEAT. CHARLES E. HEARSON, 115 Southwark Street, County of Surrey, England. Filed July 2, 1883. (No model.) Patented in England Nov. 24, 1881, No. 5,141; in France Mar. 8, 1882, No. 147,775, and in Belgium Apr. 15, 1882, No. 57,516.

Claim.—1. The combination, in an incubator, with the water-tank and heating means, of the expansible and collapsible capsule for regulating the supply of heat, the same comprising thin sheets of metal hermetically joined together and inclosing between them a piece of fabric—such as blotting-paper—saturated with a liquid which boils at the temperature desired to be maintained in the apparatus, substantially as described.

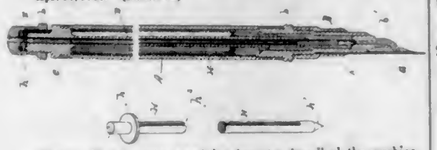
2. The combination, with the hot-air flue and damper, of the capsule consisting of thin plates hermetically closed about a piece of fabric saturated with gasoline or other liquid which boils at a temperature of about 103° Fahrenheit, and connections whereby the expansion and collapse of said capsule operate to open and close said damper, substantially as described.

298,580. MACHINE FOR CASTING PLUMBERS' TRAPS. CHARLES E. HESS, Chicago, Ill., assignor of one-half to James N. Raymond, same place. Filed Feb. 28, 1884. (No model.)



Claim.—1. A mold for casting plumbers' traps, having an enlarged inner diameter at its ends, a core extending into the enlarged cavity at each end, a sleeve at each end, arranged to move back and forth on the core, and having an inner portion of thickness suitable to fit around the core in the smallest part of the mold, and an outer portion of thickness to fit in the enlarged part of the mold and support the core, and mechanism whereby pressure may be applied to the sleeves, to force them inward, all in combination, substantially as and for the purpose described.

2. The mold B, in combination with the core E, the sleeves F, provided with slots *f*, and the pins *e*, substantially as and for the purposes set forth.



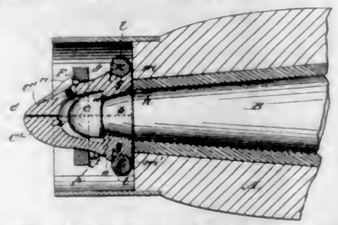
3. The mold B, in combination with the core E, the sleeves F, the follower G, the screw H, and a suitable fixed bearing for the screw, substantially as and for the purposes set forth.

298,581. ENVELOPE-OPENER AND PAPER-CUTTER. CHARLES E. HOCHSTETLER, Kansas City, Mo. Filed Aug. 25, 1883. (Model.)

Claim.—A paper-cutter having a central aperture, C, surrounded on the opposite sides by raised rings D, beveled inwardly to form a thumb or finger cavity on each side, and provided at both ends with a fork integral therewith and sharpened to produce four cutting-edges at each end of the blade, as shown and described.

298,582. FOUNTAIN-PEN. JOHN HOLLAND, Cincinnati, Ohio. Filed Apr. 16, 1883. (No model.)

Claim.—In a fountain-pen of the character described, the combination, substantially as before set forth, of the reservoir-holder provided at the top with a plug having a centrally-arranged tubular extension reaching to near the lower end of the holder, the point-section provided with a valve-seat, the air-cap, and a grooved valve-rod fitting snugly within the plug and its tubular extension and secured to the air-cap, whereby the valve may be lowered to or raised from its seat by the lowering or raising of the air-cap.



298,583. PENCIL CASE AND LEAD. JOHN HOLLAND, Cincinnati, Ohio. Filed Oct. 16, 1883. (No model.)

Claim.—1. The combination, substantially as specified, of a pencil-case provided with suitable mechanism to move a lead-carrier back and forth within said case, with the point-section, lead A, and lead-grasping fingers or tube B, the said tube or fingers being of a size to pass through the point-section opening when grasping the lead, and the lead having its end reduced to permit the fingers to grasp and hold it without projecting beyond the lead, so that the fingers holding the lead may be protruded beyond the point-section, and the lead may be held firmly against lateral play when the fingers are retracted within the case.

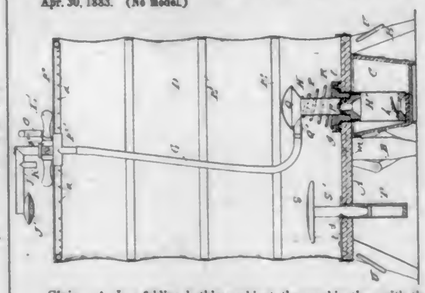
2. A lead having one end reduced, whereby it is adapted to closely fit the opening in the point of an ever-point pencil, and be grasped by the tubular end of the lead-carrier adapted to pass through said opening, substantially as specified.

298,584. HUB-ATTACHING DEVICE. GEORGE H. HOMBACH, St. Ignace, Mich. Filed Mar. 1, 1884. (No model.)

Claim.—1. The combination, with an axle having an annular groove formed in its outer end, of a cap formed in two sections, and having a recess for receiving the end of the axle, and an internal annular ridge, and provided with means for holding the two cap-sections together, substantially as specified.

2. The combination, with an axle having an annular groove formed in its outer end, of a tapering cap divided into two sections, and having an annular internal ridge, the two sections being grooved at their wider inner ends to be passed within a ring for holding the said inner ends together, and being held together at their outer ends by a ring fitting upon the said ends, substantially as specified.

3. The combination, with the axle B, having a groove, *e*, of the divided cap C, having the recess D and ridge *f*, and with means for locking the cap-sections together, substantially as specified.



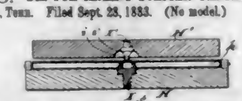
4. In a device for securing wheels upon axles, the cap C, having a recess, D, and an internal ridge, *f*, and being divided into two sections, C′ and C², in combination with the rings E and F, substantially as specified.

5. In a device for securing wheels upon axles, the combination, with the two sections C′ and C², of the cap C, of the ring E, to which the said cap-sections are hinged, of the ring F, hinged to the section C², and of the catch *n* in the section C′, substantially as specified.

6. The combination, with the axle B, having the groove *e*, of the ring E, the two cap-sections C′ C², hinged to the ring E, and adapted to engage with the groove in the axle, the ring F, hinged to the cap-section C² and the spring-catch *n* in the cap-section C′, substantially as specified.

7. The combination, in a device for securing wheels upon axles, with the ring E, of cap-sections C′ C², having a groove near their wider ends, and the two sections being cut away outside the groove, leaving the portions *m m′*, and the cap-section C² being cut away at *h*, and of the ring F, substantially as specified.

298,585. FOLDING BATHING-CABINET. ROBERT ALLEN HORNING, Lanark, Ill., assignor to himself and Charles S. Dame, same place. Filed Apr. 30, 1883. (No model.)

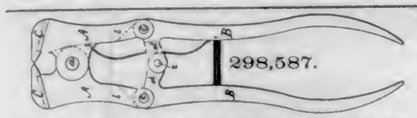


Claim.—1. In a folding bathing-cabinet, the combination, with the base A, folding tube or sack D, having its lower end secured thereto, and means, substantially as described, for raising and lowering said tube and locking it in any desired position, of the tubular perforated ring F, attached to the inside of the mouth of the tube D, and serving the double purpose of a sprinkler and means for distending the mouth of the tube D, substantially as shown and described.

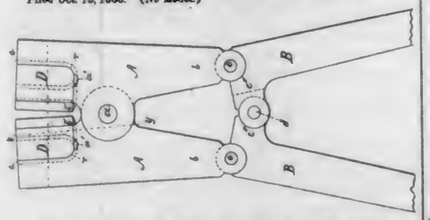
2. In a folding bathing-cabinet, the combination, with the base A, folding tube or sack D, having its lower end secured thereto, tubular perforated ring F, attached to the inside of the mouth of the tube D, and means, substantially as described, for raising and lowering the tube D and locking it in any desired position, of a foot-pump provided with a hollow piston, and tube G, connecting the pump with the perforated tubular ring F, substantially as shown and described.

3. In a folding bathing-cabinet, the combination, with the base A, of the folding sack or tube D, attached to the same, the lazy-tongs M, attached to the base and to the top of the tube, and of the notched locking-lever O, substantially as herein shown and described, and for the purpose set forth.

4. In a folding bathing-cabinet, the combination, with the base A and the folding sack or tube D, of the lazy-tongs M, attached to the base and to the top of the tube, the guide-bar N, provided with the loop B′, and the notched locking-lever O, substantially as herein shown and described, and for the purpose set forth.



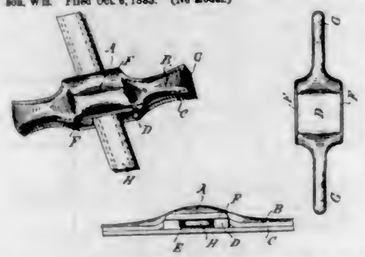
298,586. DIE FOR MAKING BOLSTER-PLATES. HENRY JAMES, Memphis, Tenn. Filed Sept. 28, 1883. (No model.)



Claim.—The combination of the upper die having a concavity in its lower surface, into which extends a punch provided with a shank, with the lower die carrying rolls mounted upon its sides and extending parallel to but upon a higher plane than the top of the die, and also carrying a hollow punch to force the metal into the concavity in the upper die, and to receive the punch attached thereto, substantially as described.

298,587. CUTTING-PLIERS. JOHN H. JENCKS, Waterbury, Conn. Filed Oct. 15, 1883. (No model.)

Claim.—In a cutting-pliers, the jaws A, having at their outer ends the spline A′, of dovetailed form at its sides and inner ends, in combination with the detachable edge or cutting portion C, having sockets *f*, corresponding in shape to the spline A′, all substantially as and for the purpose herein set forth.



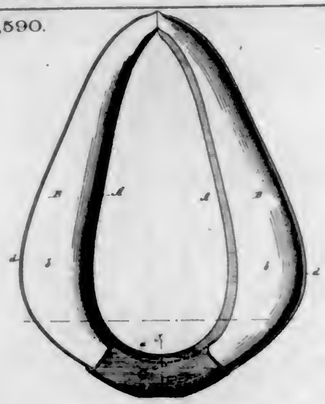
298,588. CUTTING-PLIERS. JOHN H. JENCKS, Waterbury, Conn. Filed Oct. 15, 1883. (No model.)

Claim.—1. In a cutting-pliers, the jaws A, having the longitudinal dovetailed chambers C, cut away at the inner edges of the jaws *a′*, in combination with the edge or cutting portions D, fitting into the said chambers, and there retained with their edges *m* projected inwardly beyond the inner edges of the jaws, all substantially as and for the purpose herein set forth.

2. In a cutting-pliers, the combination of the jaws A, having chambers formed with the dovetailed sides *e g*, and dovetailed inner end, *f*, the jaw being cut away at *a′*, as shown, in combination with the edge or cutting portions D, having correspondingly-shaped parts fitting longitudinally into the said chambers and there retained, with the cutting-edges *n* resting upon the surface of the cut-away portion *a′*, and projecting inward beyond the inner edges of the jaws, all substantially as and for the purpose herein set forth.

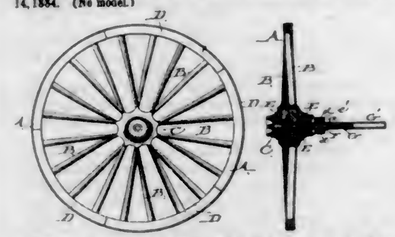
298,589. HIP-STRAP LOOP FOR HARNESS. ALBERT KARRAS, Hudson, Wis. Filed Oct. 6, 1883. (No model.)

Claim.—1. A lining for the loop for the hip-strap in the back-strap in harness, consisting of a plate having a transverse perforation, upwardly-projecting flanges at the ends of the said perforation, and longitudinal wings or extensions, as and for the purpose shown and set forth.



2. The combination of the back-strap consisting of two layers stitched together at their edges and forming a loop, a lining consisting of a plate having a transverse perforation, upwardly-projecting flanges at the ends of the perforation, and longitudinal wings or extensions, and a hip-strap passing through the perforation in the lining, as and for the purpose shown and set forth.

298,590. HARNESS. CHARLES KIPER, Atchison, Kans. Filed Jan. 26, 1884. (No model.)

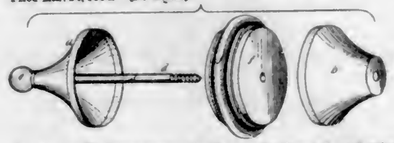


Claim.—1. A horse-collar having the rim and shoulder-pads made of separate pieces, and the throat-section C made in one and the same piece with the rim, substantially as shown and described.

2. The rim A of a horse-collar, having a throat-piece, C, made in one piece therewith, in combination with the shoulder-pads, the said throat-piece being bent over and around the lower ends of the shoulder-pads, and having its free edge secured beneath the lower edge of the rim by the same row of stitching that connects the rim to the shoulder-pads, substantially as and for the purpose described.

298,590.

298,591. VEHICLE-WHEEL. FREDERICK L. KIRKBRIDE, Wyandotte, Kans., assignor of one-half to W. C. Duvall, Kansas City, Mo. Filed Feb. 14, 1884. (No model.)

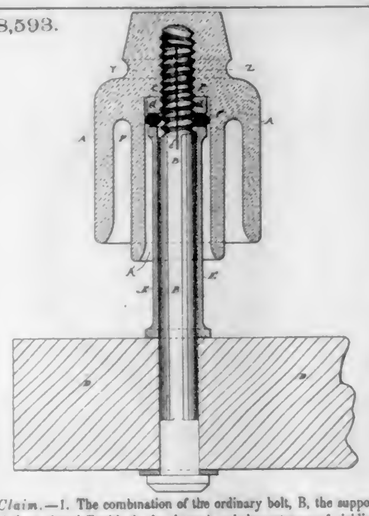


Claim.—1. In a vehicle-wheel, the hub C, having a circle of mortises and a series of spokes, arranged as shown, in combination with an axle, F, provided with a collar, *a*, a shoulder, *b*, having grooves adapted to receive springs *d*, and a cap, *e*, provided with studs *f*, and a perforation, *e′*, substantially as herein set forth.

2. A tubular vehicle-axle adapted to receive the threaded end G of an axle, F, which is provided with a collar, and a shoulder having grooves for the reception of springs, and a cap, *e*, provided with lugs, substantially as set forth.

3. The axle F, provided with the collar *a*, in combination with the grooved shoulder *b*, the springs *d*, and cap *e*, provided with the studs *f*, all constructed to operate substantially as and for the purpose set forth.

298,592. CURTAIN-POLE TIP. JOHN KRODER, New York, N. Y. Filed Mar. 24, 1884. (No model.)



Claim.—1. The improvement in the construction and application of curtain-pole tips which consists of the combination of two detached metal cap-pieces, a central retaining-screw, and a detached central molding composed of one or more pieces of wood, the whole secured to the end of a curtain-pole, and the tip completed by means of the retaining-screw, which is passed centrally through the other parts and screwed into the end of the pole, substantially as set forth.

2. In combination, two metal cap-pieces, a central retaining-screw, and a wooden molding so formed as to fit on the screw and be embraced by the adjacent edges of the cap-pieces, constituting a curtain-pole tip by being held together by means of the screw when it is screwed in the end of the curtain-pole, substantially as hereinbefore set forth.

298,593. INSULATOR. JOSEPH SLATER LEWIS, Birkenhead, County of Chester, assignor of one-half to William Phillips Thompson, Liverpool, England. Filed Aug. 10, 1883. (No model.)

298,593.

Claim.—1. The combination of the ordinary bolt, B, the support D, and the pedestal E with the insulator A and the water-proof yielding washer F, substantially as and for the purposes specified.

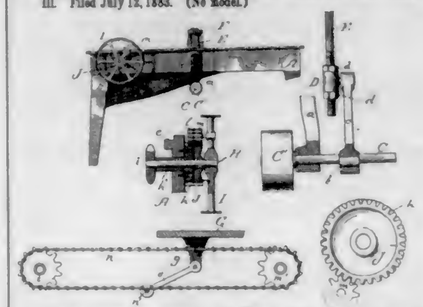
2. The combination of the arm or support D with the bolt B, passing up through the same, pedestal E, and nut G, holding all tight, and the screwed end of the bolt exposed for attaching an insulator to, substantially as described.

3. The combination of the ordinary bolt, B, provided with the head and feather to keep it from turning in the support, the insulator A, having chamber A', the support D, and the nut G with the water-proof or yielding washer F, filling the entire area of said internal chamber, substantially as and for the purposes specified.

4. The combination, with the insulator A, formed with the groove P, of a yielding washer, F, adapted to fit into said groove, the bolt B, and pedestal E, substantially as described.

5. The combination, substantially as hereinbefore set forth, of the insulator A, the bolt B, the nut G, and the pedestal or sleeve E.

298,594. TERMINAL INSULATOR. JOSEPH SLATER LEWIS, Birkenhead, County of Chester, assignor of one-half to William Phillips Thompson, Liverpool, England. Filed Aug. 10, 1883. (No model.)



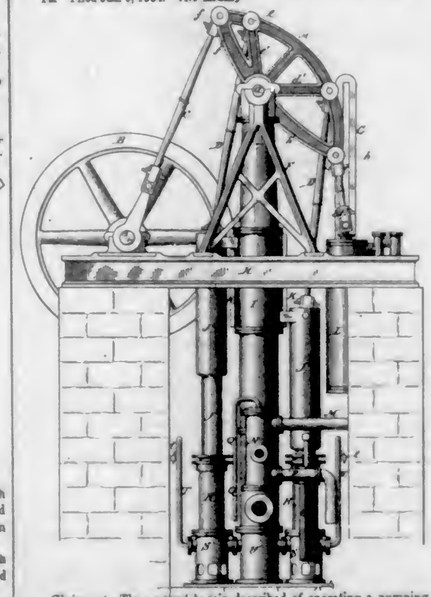
Claim.—1. A terminal insulator having a central vertical hole with rounded ends for the line-wire to be looped into, and insulating-lips placed above and below the vertical center of the insulator, with a groove in the center for attachment, substantially as described.

2. In combination with a terminal insulator, A, a shackle, C, with its ends bent in two contrary directions, (like the letters S or Z,) and fitting into a hole in support D, substantially as described.

3. In combination with a terminal insulator, A, shackle C, held in place by the weight of the line-wire and shackle, with and having their ends hooked into the upper side of the support D, and bearing as a fulcrum upon the end of D while held tight against the under surface of the support, substantially as described.

4. The combination of the terminal insulator A, the two shackle-straps C, the binding H, holding the two ends tight, and the support D, clasping the other two ends, substantially as described.

298,595. BLACK-LEADING MACHINE. GEORGE E. LLOYD, Chicago, Ill. Filed July 12, 1883. (No model.)



Claim.—1. The combination of the brush, the vertically-reciprocating rods, the lower ends of which are threaded, with the sleeve placed thereon, having a laterally-projecting stud, two nuts placed, respectively, above and below said sleeve, the connecting-rods pivoted to said stud, and eccentrics actuating said connecting-rods.

2. The combination of the bed-plate, the link-chain, and the means described for reducing the speed of the drive-shaft, consisting of shaft H, pinion A, and sleeve A', pinion J, pulley I, and pinions *l* and *m*, substantially as set forth.

3. In a black-leading machine, the vibrating brush and means for operating the same, consisting of the drive-shaft, eccentrics thereon, and connecting rods or links, in combination with the reciprocating bed-plate and means for operating the same, consisting of the endless chain and pitman, and devices, as described, for reducing the speed of the drive-shaft and imparting the same to said endless chain, substantially as set forth.

298,596. STEAM PUMPING-ENGINE. JOSEPH L. LOWRY, Pittsburg, Pa. Filed Jan. 9, 1884. (No model.)

Claim.—1. The method herein described of operating a pumping-engine, which consists in weighting the pump-plungers in excess of the weight required to discharge a column of water at a given level, and transferring said excess of weight of the descending plunger to the motive-power cylinder, to assist in raising the ascending plunger, substantially as described.

2. The method herein described of operating a pumping-engine, which consists in weighting the pump-plungers in excess of the weight required to raise a column of water to a given level, transferring said excess of weight of the descending plunger to the motive-power cylinder, and storing a supplementary power by the descent of the plunger, which shall assist in raising the same in its turn.

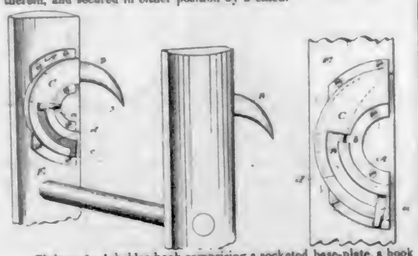
3. In a steam pumping-engine, the combination of two pump-plungers weighted in excess of the weight required to raise the column of water to a predetermined level, means, substantially as described, for transferring the excess of weight of the descending plunger to the motive-power cylinder, to assist in raising the ascending plunger, substantially as described.

4. In a steam pumping-engine, the combination of two pump-plungers weighted in excess of the weight required to raise a column of water to a predetermined level, a motive-power cylinder, and a beam provided with rods attached to the plungers and piston, connected so that the change of leverage of said rods and beam shall transfer the excess of weight of the descending plunger to the motive-power cylinder, to assist in raising the ascending plunger, substantially as described.

5. In a steam pumping-engine, the combination of two pump-plungers weighted in excess of the weight required to raise a column of water to a predetermined level, means, substantially as described, for transferring the excess of weight of the descending plunger to the motive-power cylinder, to assist in raising the ascending plunger, and a chamber in which is stored, by the descent of the plunger, a supplementary power to assist in raising the plunger in its turn, substantially as shown.

6. The method of operating a steam-engine which consists in loading the engine above the normal load at the beginning of the power-stroke of the piston, when the steam is at its greatest pressure, gradually diminishing said load as the pressure decreases by the expansion of the steam, and finally applying the excess of load to assist the piston in its next power-stroke, substantially as described.

7. In a pumping-engine, the combination of the motive-power cylinder, beam, plungers, weighted as described, and connections between the beam, plungers, and piston, arranged so that the changing leverages in the beam will cause a reduction of the work imposed on the engine in proportion to the reduction of the working-pressure in the cylinder, due to the expansion of the steam after it is cut off, substantially as described.



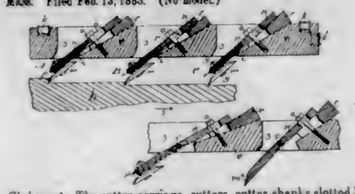
8. The combination of the two coacting weighted plungers, and an engine for operating the same, with a working-beam of elliptic form, the connections of which are arranged in such manner that the beam-pin of the piston-rod travels an equal distance above and below the center of the beam-shaft, and the beam-pins to which the plunger-rods are connected shall not travel below the center of said beam-shaft, substantially as described, for the purpose specified.

9. The combination of the hollow plungers, and an engine for operating the same, with a working-beam of elliptical form, constructed with four arms differing in length and standing at different angles, the piston, plunger, and crank-connections, and the loading-weights N' of the plungers, substantially as described, for the purpose specified.

10. In combination, in a steam pumping-engine, the loaded plungers J J, the engine L, the elliptic working-beam A, having arms of different length, the working-connections, and an air-cushion, T, connected with the valve-chamber S, all constructed for operation substantially as described.

298,597. LADDER-HOOK. JOHN F. MANARAN, Lowell, MASS. Filed Apr. 11, 1884. (No model.)

Brief.—A curved socketed base-plate having a curved hook to slide therein, and secured in either position by a catch.



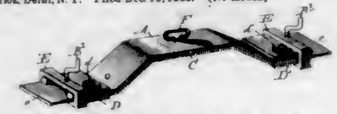
Claim.—1. A ladder-hook comprising a socketed base-plate, a hook proper movable in said socket, and a lock or catch by which said hook is secured in place in said socket, substantially as hereinbefore set forth.

2. The combination of a socketed base-plate, a hook proper arranged to slide in said socket so as to be projected or retracted, as desired, and a lock or catch for securing it in either position, substantially as hereinbefore set forth.

3. The base-plate and curved socket thereon, in combination with the correspondingly-curved and sliding hook proper, and a lock or catch for securing said hook in position in the socket, substantially as hereinbefore set forth.

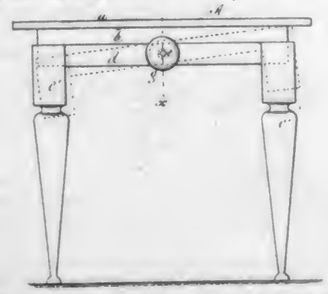
298,598. STONE-DRESSING MACHINE. JONATHAN MANN, Milton, MASS. Filed Feb. 13, 1883. (No model.)

Claim.—1. The cutter-carriage, cutters, cutter-shanks slotted longitudinally, and pivots for such shanks, on which they may be rocked and moved longitudinally, combined with the fastening-bolts for such shanks, and the wedge-shaped followers beneath such shanks, whereby the angular position of the cutters and their depth below the carriage may be adjusted, substantially as shown and described.



2. The combination, substantially as shown and described, of the cutter-carriage, the cutters, the longitudinally-slotted shanks therefor, the pivots for such shanks, upon which they receive a longitudinal and rocking movement, the wedge-shaped followers for fixing the shanks in their rocking movement, and the fastening-bolts for fixing them in their longitudinal movement, as set forth.

298,599. BOOT OR SHOE. HOWARD T. MARSHALL, Brockton, Mass. Filed June 17, 1882. (No model.)

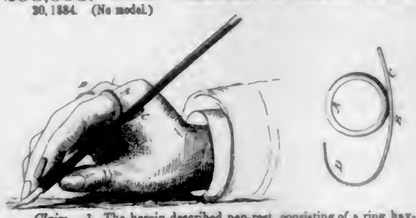


Claim.—As an improved article of manufacture, a boot or shoe made with a slitted opening in its vamp or upper arranged to be connected by a lacing cord or cords for adjusting the boot to fit the instep and around the ankle of the wearer, and having an elastic goring or gorings, and formed, all substantially as set forth, so that the boot can be adjusted to the foot and taken off and put on without disturbing the fastenings.

298,600. GAGE FOR CUTTING CAR-BRACES. CHRISTOPHER MATTICE, Delhi, N. Y. Filed Dec. 10, 1883. (No model.)

Claim.—The combination, with the gage A, having strap-guards D D' and set-screws B B', of the clamps E, having set-screws B^2 B^2, as and for the purpose set forth.

298,601. TABLE. STEPHEN W. MAXSON, Dassel, MINN. Filed Aug. 16, 1883. (No model.)

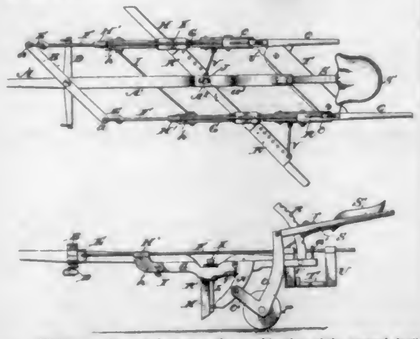


Claim.—The pivoted bar *d* and legs *c'*, fixed to the bar, combined with a table having fixed legs opposite to the side or end where the bar is attached, substantially as described.

298,602. BOILER OR VESSEL EMPLOYED IN THE TREATMENT OF FIBROUS MATERIALS FOR THE MANUFACTURE OF PAPER-PULP AND FOR OTHER PURPOSES. ISAAC SHIMWELL MCDOUGALL, Manchester, County of Lancaster, England. Filed Feb. 12, 1884. (No model.) Patented in England June 30, 1883, No. 3,257.

Claim.—A vessel or boiler for treating fibrous materials and for other purposes, composed of an outer shell and a lead lining secured together by means of bolts and nuts, substantially as and for the purposes described.

298,603. PEN-REST. CAMERON MCKENZIE, Midway, Ala. Filed Mar. 20, 1884. (No model.)



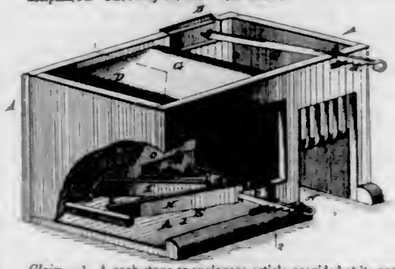
Claim.—1. The herein-described pen-rest, consisting of a ring having a piece of wire or strip of metal fastened to its under side, said strip or wire having one projecting straight end forming the pen-rest, and having its other end bent to form a hook adapted to pass under and around the second finger of the writer, substantially as set forth.

2. The combination, in a pen-rest, of the ring, the piece of wire or strip of metal, bent to form a hook at one end, and the set-screw for fastening the wire and adjusting it upon the ring, substantially as set forth.

298,604. ROAD-SCRAPER. CLARENDON MENDENHALL, Wilmington, Del. Filed Mar. 1, 1884. (No model.)

Brief.—Pivoted on a tongue extending rearwardly in a beam is a cross-beam. So connected to its ends as to enable the scraper to be diagonally adjusted either end forward are rods on which are side beams perforated for round tenons on the scraper, which has a central pivot on the tongue or central beam. The side beams are adjustably connected to perforated plates on the scraper and to each other by a foot-board pivoted to each. Supporting-stocks on the side beams are secured to the scraper by clasps embracing rounded parts of standards on the scraper-back. Hangers pivoted to the stocks carry bearing-wheels, and are depressed to lift the scraper.

Claim.—1. In a road-scraper, the combination of the central draft pole or beam, the pivoted cross-bar, the longitudinal rods or bars connected with the latter, the parallel shiftable side beams, and the scraper-board pivotally connected with the central and side beams, substantially as described.



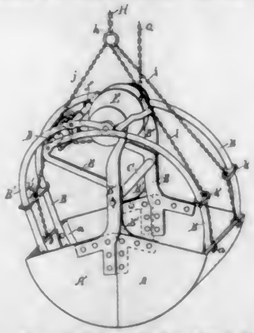
2. In a road-scraper, the combination of the scraper-board having upwardly-projecting round tenons and rear posts or standards provided with rounded portions, and the inclined stocks having clasps encircling said rounded portions, with the parallel shiftable side beams and the central beam or draft-pole, substantially as described.

3. In a road-scraper, the combination of the pivoted foot-board or rear platform and the shiftable side beams having brackets or hangers for supporting said foot-board, with the central beam, a draft-pole, and the scraper-board pivotally connected to the side and central beams, substantially as described.

4. In a road-scraper, the combination of the pivoted hangers and bearing-wheels journaled therein, and the levers or lifting devices connected with said hangers, with the shiftable side beams, the central beam or draft-pole, and the scraper-board pivotally connected therewith, substantially as described.

5. In a road-scraper, the combination of the scraper-board having perforated catch-plates, and the shiftable side beam carrying hooked rods adapted to engage with said catch-plates, with the central beam and second shiftable side beam pivotally connected with the scraper-board, substantially as described.

298,605. STOVE, RANGE, FURNACE, &c. WILLIAM MOGHTT, Philadelphia, Pa. Filed May 19, 1883. (No model.)



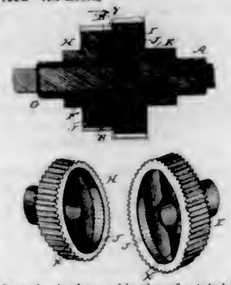
Claim.—1. A cook-stove or analogous article provided at its upper portion with a damper to regulate the passage of hot air or products of combustion from the source of supply to the part to be heated, a vertical side flue to convey said heating medium to the desired position, a hot-air chamber having a series of strips or dividing-plates, each having a vent-opening at the top edge of one end, and a damper for the purpose of releasing the spent heated air, substantially as and for the purpose set forth.

2. In a stove, furnace, or equivalent heating device, the combination, with a suitable flue connected at one end with the source of heat-supply, and at the other end with a hot-air reservoir, of a hot-air reservoir having a series of dividing-strips, each having at one end a vent opening or notch, a plate adapted to rest against the upper edges of said dividing-strips, and a damper and vent-opening, through which the heated air is discharged after use, substantially as set forth.

3. A cook-stove or analogous article having damper B and notched rod C above the furnace, vertical flue D, calorie-reservoirs 1 2 3 4, and damper M, and notched rod N, substantially as and for the purpose set forth.

298,606. HOISTING-BUCKET. GEORGE H. MILLER and CARMER GOTNER, Pawtucket, R. I. Filed Mar. 13, 1884. (No model.)

Claim.—1. The combination, with the bucket A A', of the standards B B', carrying the drum and pulleys, the chains G H *j*, and the chains *l l*, connecting the drum with the pulleys, such parts being arranged to operate substantially as set forth.



2. The combination, with the bucket, of the standards carrying the drum and pulleys and the adjustable guides *k k'*, and the chains G, H, *i*, *j*, and *l*, substantially as and for the purposes set forth.

298,607. BUTTON-HOLE SEWING-MACHINE. DANIEL MILLS, Philadelphia, Pa., assignor to the United States Automatic Buttonhole Sewing Machine Company, of New Jersey. Filed June 14, 1883. (No model.)

Claim.—The combination of a rotating shaft and a slide having projections with a stop-cam carried by said shaft and made in two adjustable sections, a spring or springs interposed to permit the said sections to yield toward each other, and a wedge or taper screw to bring the sections together against the action of the springs, substantially as specified.

298,608. CLUTCH MECHANISM. B. FRANK MOHR, Mifflinburg, Pa. Filed Apr. 5, 1884. (No model.)

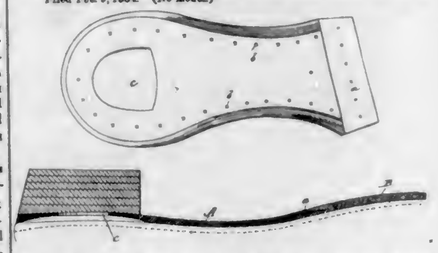
Claim.—1. In a clutch, the combination of a tubular shaft having a longitudinal slot, a longitudinally-sliding rod having a transverse key moving with the rod in the said slot, and wheels or pinions mounted loosely upon the said tubular shaft, and having grooves or recesses in their inner sides adapted to receive and engage the said key, substantially as set forth.

2. In a clutch, the combination, with a tubular shaft having a fixed diametrically slotted disk or its equivalent, and a longitudinal slot extending entirely through the disk, of a longitudinally-movable rod having a transverse key moving in said slot, and of a width equal to the width of the disk, and a pair of wheels or pinions mounted loosely upon the said shaft, and having recesses in their inner adjoining sides, adapted to accommodate the disk, and provided with diametrical grooves in said recesses adapted to receive and engage the movable key, substantially as and for the purpose set forth.

3. The combination of the tubular shaft having the fixed disk or its equivalent, and a slot extending entirely through the same, said slot extending through the tubular shaft farther on one side of the fixed disk than on the other, a longitudinally-movable rod inserted through the tubular shaft and having a transverse slot, a key fitted in the said slot and moving in the longitudinal slot of the tubular shaft, a pin passing transversely through the longitudinal rod to limit the movement of the same, and the wheels or pinions mounted loosely upon the tubular shaft and provided in their inner adjoining sides with circular recesses and diametrical grooves at the bottom of the latter, substantially as and for the purpose herein set forth.

298,609. CULTIVATOR. GILPIN MOORE, Rock Island, Ill., assignor to Deere & Company, same place. Filed Nov. 9, 1883. (No model.)

Claim.—1. In a cultivator, in combination, a central part or yoke, A, a wheel and draft-plate hinged to each end of said yoke, and adapted to swing relatively thereto, substantially as described, plow-gangs, a pole hinged in front of the yoke to swing laterally in reference thereto and independently of the wheels, and adapted to sustain the yoke in an elevated position, and springs connected at the forward ends with the yoke A or a projection in front of the yoke, which projection is connected rigidly to the yoke, and at their rear ends connected with the plow-gangs and adapted to exert an upward force thereon, substantially as and for the purpose specified.

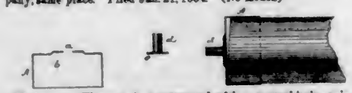


2. In combination, the yoke A, wheels C, hinged to the yoke A, draft-plates D, plow-gangs E, bars F and H, said bar H rigidly connected with the bar F, springs I, and pivoted pole J, substantially as and for the purpose specified.

3. In combination with the yoke A, formed of two parts, *a a'*, and the wheels and draft-plates hinged thereto, the bar F, and pole J, hinged to the bar F, and its rear end supported between the bars *a a'*, substantially as and for the purpose specified.

298,609.

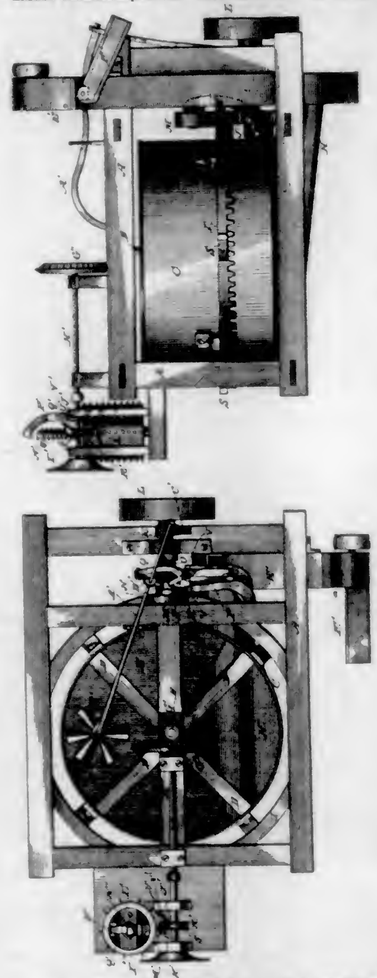
298,610. BOOT OR SHOE SOLE. AARON JAMES MOTT, Fulton, Kans. Filed Feb. 9, 1884. (No model.)



Claim.—1. A metal shank for a shoe, having a heel-base formed therewith, which base is of greater thickness at its edge than it is in the center, as described.

2. A metal shank for a shoe, having a heel-base formed therewith, with a hole, *c*, in the center, as and for the purpose described.

3. The combination, with the leather sole B, of the metal shank A, having scarfed edge *a*, and a heel-base, with a hole *c*, therein, and a leather heel fastened upon the heel-base, substantially as shown and described.



298,611. GUDGEON FOR WINDOW-SHADE ROLLERS. JOSEPH MUNGER, Waterbury, Conn., assignor to the Scovill Manufacturing Company, same place. Filed Jan. 21, 1884. (No model.)

Claim.—1. The cup A, constructed with a central hole, *a*, in its bottom, combined with the flanged gudgeon *d*, secured to said cup through said central hole, substantially as described.

2. The cup A, constructed with the central recess, *b*, upon the inner side of its bottom, and with a central hole, *a*, therein, combined with the flanged gudgeon *d*, introduced through the said central hole, *a*, to bring its flange into said recess, and there secured, substantially as described.

298,612. GRAIN-MEASURING MACHINE. JOSEPH NAFZIGER and ANDREW NAFZIGER, Hopedale, Ill. Filed Jan. 31, 1884. (No model.)

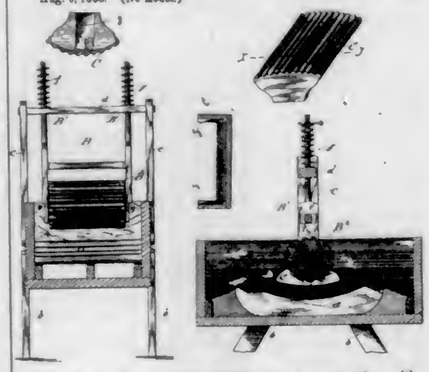
Claim.—1. The combination, with the measuring-cylinder having a toothed ring secured around the same, and projections secured to the said ring at given distances apart, of the shaft having a loose pinion thereon gearing with said ring, the clutch on the said shaft adapted to engage the pinion, and the arm pivoted to the clutch-fork, and having a catch adapted to engage the lugs on the said ring, substantially as shown and described.

2. The combination of the toothed ring carrying the measuring-cylinder, and provided with lugs having inclines T and lips U, the shaft having the loose pinion gearing with the ring, the spring-actuated clutch feathered on said shaft and adapted to engage the pinion, the clutch-fork supporting the clutch, and the arm pivoted to the clutch-fork and arranged between lugs thereon, and having a catch adapted to be engaged by the lugs on the ring, whereby the clutch shall be thrown out of engagement with the pinion before the ring is stopped by the catch, substantially as specified.

3. The combination of the toothed ring carrying the measuring-cylinder, and provided with lugs having inclines T and lips U, the shaft having the loose pinion gearing with the ring, the spring-actuated clutch feathered on said shaft and adapted to engage the pinion, the clutch-fork supporting the clutch, the arm pivoted to the clutch-fork and arranged between lugs thereon, and having a catch adapted to be engaged by the lugs on the ring, the grain-packer and its supporting-lever, the eccentric and connecting rod for oscillating said lever, and the rod connecting the said pivoted arm with the said lever, substantially as shown and described, and for the purpose set forth.

4. The combination, with the measuring-cylinder, of the grain-packer consisting of a radially-slitted disk, (or equivalent device,) the lever carrying the said packer, and means for oscillating said lever, substantially as shown and described.

5. The combination of the oscillatory lever of the grain-packer, the clutch-fork, the oscillatory arm pivoted to said clutch-fork, and the rod connecting the said arm with the said lever, and serving as a fulcrum for said lever, substantially as shown and described, whereby the lifting of the lever by the contact of the grain with the packer shall lift the said arm, and thereby allow the clutch to act, as specified.



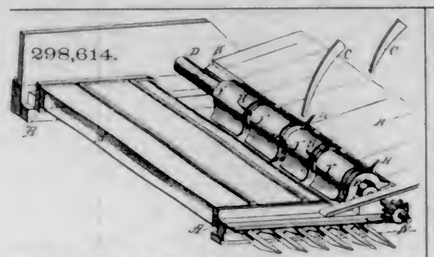
6. The combination, with the measuring-cylinder, made open at both ends, and having the ring secured around the same, and adapted to rotate on a base, of the roller supported above the said ring and in contact therewith, substantially as shown and described.

7. The combination, with the measuring-cylinder and its vertical supporting-shaft, of the registering device, comprising the rotary dial-plate, the feed-screw, and the drum having pegs in its outer surface arranged in spiral order around the same and in vertical rows, substantially as shown and described.

8. The combination of the dial-plate having numbers marked thereon, the feed-screw mounted on the shaft of the dial-plate, and the pegged drum supported on a vertical post and connected to a thread on said post, and having the pegs arranged in spiral order and in vertical rows, and having numbers corresponding to the pegs, substantially as shown and described.

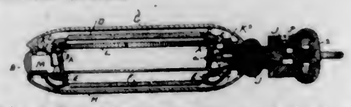
9. The combination of the drum, the post supporting the same and having a spiral thread thereon, and the dog supported in standards in the upper end of the drum, and having a notch in its lower end which engages said thread, and having its upper end extended over the upper end of said post, substantially as shown and described, whereby the fall of the drum when it runs off the upper end of the thread shall cause the dog to re-engage the thread, as set forth.

298,613. WASHING-MACHINE. JESSE NEWMAN, Atlanta, Ill. Filed Aug. 6, 1883. (No model.)



Claim.—1. In a washing-machine, the principal rubber, with a fluted or corrugated surface, a supporting-frame for the same, having its side bars or standards provided with downward-extended projections below the said rubber, in combination with the supplementary rubber, with its side bars provided with grooves or recesses and its convex side finely corrugated or fluted, substantially as and for the purpose set forth.

2. In a washing-machine, the combination of the rubber B, the supporting-frame for the same, having recessed side bars *e*, springs *f*, shaft *d*, receptacle A, having corrugated bottom *a*, and supplementary rubber C, having recessed side bars Z, substantially as shown, and for the purpose described.



298,614. GRAIN-CONVEYER FOR HARVESTERS AND BINDERS. JOHN D. NIX, Milwaukee, Wis. Filed July 24, 1882. (No model.)

Claim.—1. The combination, with the cylinder D, of finger-disks G G, having flanges G′, and fingers H, pivoted to said disks, having projections A, which extend into curved slots in said disks, substantially as set forth.

2. The brackets E, having cams *e*, the shields F, supported by said brackets, the rotating cylinder having finger-disks, and the fingers pivoted to said disks, as described, so as to be engaged by the cams and projected through the spaces between the shields, all in combination, substantially as described.

298,615. WATCH-CASE. DANIEL O'HARA, Waltham, Mass. Filed Dec. 31, 1883. (No model.)

Claim.—1. In a watch-case, a movement ring or band, A, in combination with a recessed or chambered central shell or body, B, the two together constituting one piece, and the latter constructed for the attachment of the other parts to complete the case, substantially as described, for the purpose specified.

2. In a watch-case, a movement ring or band, A, and a recessed or chambered central shell or body, B, the two together constituting one piece, and the latter constructed for the attachment of the other parts to complete the case, in combination with case-springs K K², arranged in the recess of said central shell, and with a front cap or cover of the case hinged to the front of said shell, and otherwise arranged in relation to said springs, and with a back cap or cover applied to the back of said shell, substantially as described, for the purposes specified.

3. In a watch-case, a movement band or ring, A, surrounded by case-springs K K², for a hinged front cap or cover, G, which springs are confined in a recess or chamber, M, of a central body or shell, B, that of itself is constructed for said springs to be inserted in and removed from said recess at the outside thereof, and substantially as described, for the purpose specified.

4. In a watch-case, a movement band or ring, A, surrounded by case-springs K K², for a hinged front cap or cover, G, which springs are confined in a recess or chamber, M, of a central body or shell, B, that of itself is constructed for said springs to be inserted in and removed from said recess at the outside thereof, and for receiving a ring, T, to cover said springs, and substantially as described, for the purpose specified.

5. In a watch-case, a movement band or ring, A, in combination with a recessed or chambered central body or shell, B, the two together constituting one piece, and the latter constructed to open and close its said recess at the outside thereof, and for the attachment of the other parts to complete the case, substantially as described, for the purpose specified.

6. In a watch-case, a front bezel or crystal-cap, G, having a flange, *d*, in combination with a riser, *f*, at the front of the central shell or body, B, the two adapted for the cap to be entered into and secured to the riser, and in relation to the dial-plate of the movement, substantially as described, for the purpose specified.

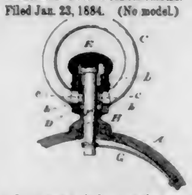
7. In a watch-case, a plate or cap, G H, having a shoulder, *m*, at its outer edge, *l*, all made of one piece, substantially as and for the purpose described.

8. In a watch-case, a recessed central shell or body, B, in one piece with a ring or band, A, containing the watch-movement, which at its front and back is protected, substantially as described.

9. In a watch-case, a recessed central shell or body, B, in one piece with a ring or band, A, containing the watch-movement, in combination with springs K K² within the recess of said shell, and with a hinged front cap, G, and bezel-ring C, having crystal at the front of said shell, and said shell at its back protected, all substantially as described.

10. In a watch-case, a recessed central shell or body, B, in one piece with a ring or band, A, containing the watch-movement, in combination with bezel-rings—one at the front and the other at the back of said shell—substantially as described.

11. In a watch-case, a recessed central shell or body, B, in one piece with a ring or band, A, containing the watch-movement, in combination with bezel-rings at the front and back of said central shell, each having a crystal, and with a back cap or plate, H, substantially as described.



12. In a watch-case, a recessed central shell or body, B, in one piece with a ring or band, A, containing the watch-movement, in combination with springs K K² within the recess of said shell, with a hinged front cap, G, a back cap, H, and front and back bezel-rings, C E, of said central shell, each provided with a crystal, substantially as described.

13. In a watch-case, the combination of the movement-ring A, the angular winding-arbor *a*, the arbor *g*, connected with arbor *a*, and closing the opening in the movement-ring A for the arbor *a*, and a stem, *y*, adapted to engage with the arbor *g*, and to turn from the outside of the case and be moved in and out, substantially as and for the purpose set forth.

14. In a watch-case, the combination of the movement-ring A, the angular winding-arbor *a*, the arbor *g*, connected with arbor *a*, and closing the opening in the movement-ring A for the arbor *a*, a stem, *y*, adapted to engage with the arbor *g*, and the catch-spring for the front cap or plate, G, substantially as and for the purpose set forth.

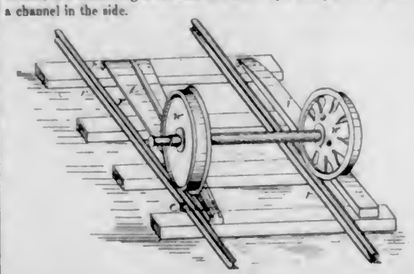
15. In a watch-case, the combination, with the square-shaped arbor *a* of the watch-movement, of a square-shaped socket or sleeve arbor, *g*, engaged therewith, and interlocked by a collar, *u*, with and turning in a bearing, *v*, of the movement-ring A, of a stem, *y*, engaged with said arbor *g*, and turning within and adapted to be moved in and out of the pendant J of the watch-case, and of a catch-spring, K³, for the front cap or plate, G, substantially as and for the purposes described.

298,616. PENDANT FOR WATCH-CASES. DANIEL O'HARA, Waltham, Mass. Filed Jan. 23, 1884. (No model.)

Claim.—1. In a stem-winder watch-case, the combination of the tapering pendant B and the binding cup-formed winder-stem crown E, substantially as set forth.

2. In a stem-winder watch-case, the combination, with tapering pendant B and the binding stem-crown E, of the spring G, pressing outwardly against the winder-stem F, in the manner and for the purpose set forth.

298,617. METHOD OF TREATING COTTON-SEED. JAMES F. O'SHAUGHNESSY, New York, N. Y., assignor to the United States Cotton Seed Company, same place. Filed Oct. 13, 1883. (No specimens.)

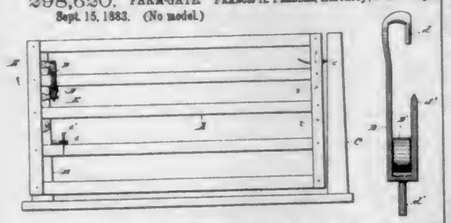


Claim.—The herein-described method of treating cotton-seed, consisting in taking the hull separated from the kernel and grinding it, in removing the fiber therefrom, and then mixing the ground hull with the crushed and pressed kernel, all substantially as described.

298,618. PROCESS OF TREATING COTTON-SEED. JAMES F. O'SHAUGHNESSY, New York, N. Y., assignor to the United States Cotton Seed Company, same place. Filed Dec. 17, 1883. (No specimens.)

Claim.—The hereinbefore-described process of removing the fiber of the hulls of cotton-seed by first heating said hulls after the kernels have been removed from them, then crushing or grinding the hulls, and finally separating the fiber from the pulverized hulls, substantially as described.

298,619. WRECKING-FROG. ALLEN H. PALMERTON, Indianapolis, Ind. Filed Dec. 21, 1883. (No model.)

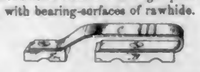


Brief.—A car-replacer consisting of an outside and inside frog, the latter being made with a central flange for the guidance of the derailed wheels, and which frog is fastened to the rail by a clamp which fits into a channel in the side.

Claim.—1. The frog-plate F, provided with the central flange, *f*, in combination with the rail *r* and the clamp C, substantially as described.

2. The frog-plate F, provided with the central flange, *f*, the clamp C, the rails *r*, and the inclined bar *i*, all combined substantially as described.

298,620. FARM-GATE. FRANCIS A. PEEBLES, Hinckley, Ohio. Filed Sept. 15, 1883. (No model.)

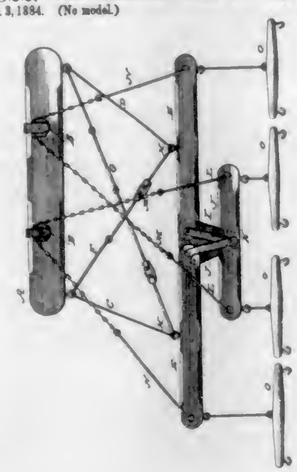


Claim.—1. The combination, with a gate-post provided with brackets, and a gate, of the hanger D, constructed substantially as described, and pivotally secured to the brackets, and the arm *e*, and peg *e'*, substantially as set forth.

2. The combination, with gate-posts and a gate, of the brackets secured to one of the posts, the removable hanger D, the staple secured to the other post, and the vertically-adjustable hook F, all of the above parts being combined as described.

298,621. SADDLE FOR THE TOP ROLLS OF SPINNING-MACHINES. HORATIO L. PIERCE, Providence, R. I. Filed Mar. 27, 1883. Renewed Apr 10, 1884. (No model.)

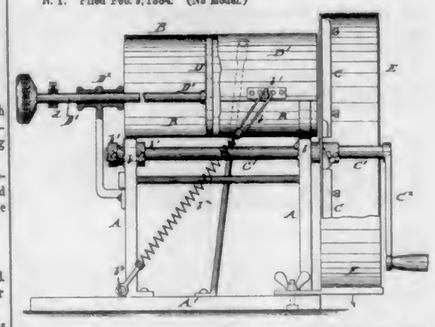
Brief.—The saddle is formed of a single piece of metal bent so as to form a spring, with bearing-surfaces of rawhide.



Claim.—1. A saddle for the top rolls of spinning-machines, which is formed from a single piece of material, which is bent so as to form a spring, substantially as shown.

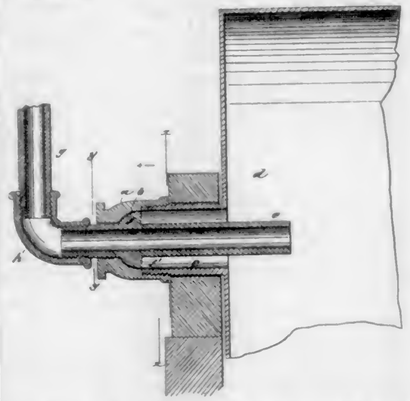
2. A saddle for the top rolls of spinning-machines, formed from a single piece of elastic material, which is bent so as to form a spring, and which has a bearing-piece attached to each of its ends, substantially as described.

3. A saddle formed from a single piece of metal, and bent so as to have its ends separated a suitable distance from each other, and a suitable bearing attached to each end, substantially as set forth.



4. In a saddle, the combination of a single piece of metal, which is bent, as shown, so as to form a spring, with pieces of rawhide, which are attached to the ends of the spring, substantially as specified.

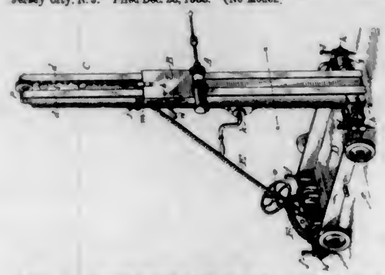
298,622. DRAFT-EQUALIZER. SAMUEL RAY, Oregon, Ill. Filed Mar. 3, 1884. (No model.)



Claim.—In a four-horse draft-equalizer, the combination of the cross-bar attached to the vehicle, and having two pulleys upon its side, the oblique rods hinged to the ends of the cross-bar, the oblique rods attached to the ends of the cross-bar and crossing each other, the inner double-trees hinged or pivoted upon the ends of the oblique bars, the triangular plate and the arms hinged to the inner ends of the inner double-trees, the forward double-tree hinged upon the forward point of the triangular plate and upon the ends of the arms, the chains and rods attached to the outer ends of the inner double-trees and to the ends of the forward double-tree, and the single-trees attached to the ends of the double-trees, all constructed and arranged as and for the purpose shown and set forth.

298,623. VEGETABLE-SLICER. MATHIAS REICHERT, New York, N. Y. Filed Feb. 9, 1884. (No model.)

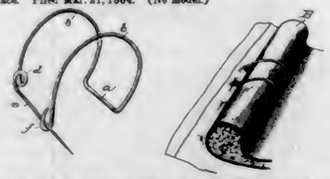
Claim.—The combination of a horizontal guide-shell having a hinged lid and means for fastening the lid, a horizontally-guided follower, a rotating cutter-disk arranged at one end of the guide-shell, the horizontal shaft of which is supported in bearings below the guide-shell, a crank-handle, secured detachably to the outer end of the shaft, and a guard-frame or hood extending around the cutter-disk, and being detachably connected to the supporting-frame of the machine, substantially as and for the purpose set forth.



298,624. STEAM-PIPE JOINT FOR ROTARY PAPER-DRYING CYLINDERS, &c. MICHAEL J. ROACH, Lockport, N. Y. Filed Jan. 4, 1884. (No model.)

Claim.—1. In a steam-pipe joint for a hollow revolving journal, the gland *a*, attached to the journal *c*, and having a conical, oval, or equivalent valve-seat, *b*, in combination with a valve, *f*, of corresponding form, on the steam-pipe *e*, substantially as described.

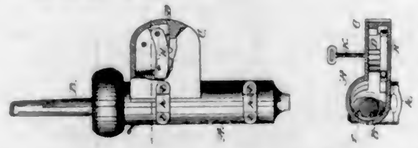
2. The combination, with the journal of a hollow revolving cylinder having its end partly closed to form a valve-seat, of a steam-pipe passing into said journal, and having a valve formed upon it, fitting the valve-seat on the end of the journal, and said valve having a rear surface of sufficient area to insure its being seated by the steam-pressure, substantially as described.



298,625. CARRIAGE FOR ROCK-DRILLS. WILLIAM L. SAUNDERS Jersey City, N. J. Filed Dec. 26, 1883. (No model.)

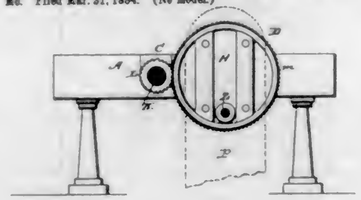
Claim.—1. The combination of the rock-drill A, saddle B, supporting said drill, and standard C, carrying said saddle, with means for raising and lowering said saddle and drill upon the standard, and the gib *m* and pinion-arm *n* for locking the saddle in place, substantially as and for the purposes set forth.

2. The combination of the standard C, having the longitudinal guides *d*, with the saddle B, having the drill A fixed thereto, the screw E, hand-wheel *e*, and yoke F for adjusting the standard C, and the gib *m* and pinion-arm *n* for locking the saddle in place, substantially as and for the purposes set forth.



298,626. PAD-FASTENING FOR HORSE-COLLARS. JOHN SCHERLING, Dubuque, Iowa, assignor of one-half to L. D. Randall & Co., same place. Filed Mar. 21, 1884. (No model.)

Claim.—1. The described safety pin and hook, formed of wire, consisting of the bows *b b* and the part *a*, connecting the bows with suitable integral devices for attachment to the collars formed upon the ends of the bows, substantially as described.



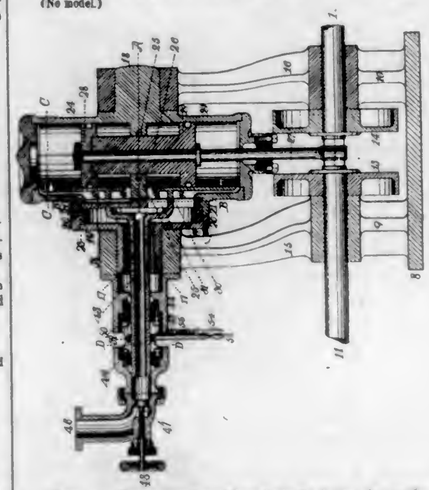
2. In combination with the pad A and the collar B, a safety pin and hook, consisting of the bows *b b a*, formed of wires, the pins *e*, and the hook *f*, substantially as described.

298,627. WHIP-HOLDER. HOWARD SCHONY, Plain City, Ohio. Filed Jan. 14, 1884. (No model.)

Claim.—The combination of the whip-socket A, lock-case C, having therein the lock-bolt D, with the curved end, and the ward H, all as shown, and operating as described.

298,628. MECHANICAL POWER. JACOB C. SELLERS, Marshfield, Mo. Filed Mar. 31, 1884. (No model.)

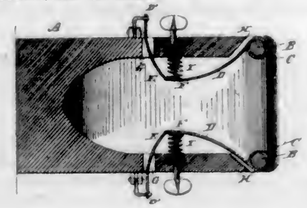
Claim.—The combination, with the lateral parallel gear-wheels centered on the same axial line, and having in their opposed faces slot-bearings at right-angles to each other, of a double-pinion shaft parallel to the axial line of said gear-wheels, which are respectively engaged by the pinions of said shaft, and a pitman working between said gear-wheels, and having rollers on its opposite sides linearly distant from each other and respectively engaging the slots of the gear-wheels, substantially as specified.



298,629. TAG-FASTENER. SAMUEL S. SENGENBAUGH, Aurora, Ill. Filed Mar. 7, 1884. (No model.)

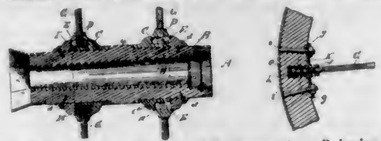
Claim.—1. A tag-fastener consisting of a wire or piece of metal duplicated or turned upon itself, so as to form two shanks or arms, each of said shanks or arms terminating in a hook turned outward and downward, substantially as shown, from the shank or arm, as set forth.

2. A tag-fastener, constructed substantially as described, having two plain hooks turned by one turn outward and downward from the shanks or arms, in opposite directions, and substantially in the same plane, and so constructed as that, being turned at an angle to the plane in which the hooks are first applied, they will engage opposite to each other in the substance from which the tag or label is to be suspended.



298,630. COMPOUND STEAM-ENGINE. WILBUR L. SHEPARD, Hartford, assignor to Morgan W. Beach, Bristol, Conn. Filed Jan. 30, 1884. (No model.)

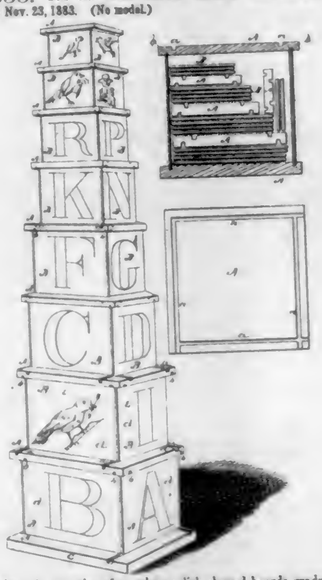
Claim.—1. The combination of the cylinder 24, having the annular partition 25, with the piston 26, having the piston-heads 28 and 29, and with the valve-seat 22, having the ports 39, 40, 41, and 42, and with the valve 23, having the ports 30, 31, 32, 33, 37, and 38.



2. The combination of the valve-seat 22, having the ports 39, 40, 41, and 42, with the valve 23, having the ports 30, 31, 32, 33, 37, and 38.

298,631. CAR-COUPLING. KENADA SMITH, West Manchester, Ohio. Filed Feb. 11, 1884. (No model.)

Claim.—The combination, in an automatic car-coupling of the described class, of the draw-head having beveled sides H H and posts B B at the front end, and side slots, G G, bent plates D E F, having sleeves C working on the posts and projecting with their free ends through the slotted sides, and the coiled side springs, I I, the whole constructed in the manner and for the purpose herein shown and specified.



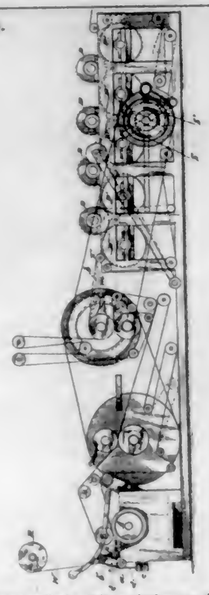
298,632. VEHICLE-WHEEL. MELVIN L. SMITH, Lockport, assignor of one-third to Jonas Terry, Batavia, N. Y. Filed Jan. 9, 1884. (No model.)

Claim.—1. The axle-box A, and the wooden sleeve B, having a flange, *a*, in combination with the collars C C, having the flanges D D, and annular inner flanges, E E, slotted at *b*, and forming the annular spaces F F, the nuts H, spokes G, and collars I I, substantially as and for the purpose shown and described.

2. The spokes G, having the heads *e*, in combination with the spoke-socket K, having the socket *f* and clip-sides *g*, and the felly having the holes *h* bored deeper than the socket and spoke-head, substantially as and for the purpose shown and described.

298,633. TOY BUILDING-BLOCK. EZRA H. SNOW, Orange, N. J. Filed Nov. 23, 1883. (No model.)

Claim.—1. A series of angular or disk shaped boards graduated in size, with grooves *a* and *b* on their two sides, in combination with a series of thin graduated sections, B, constructed to fit into said grooves, as and for the purpose described.

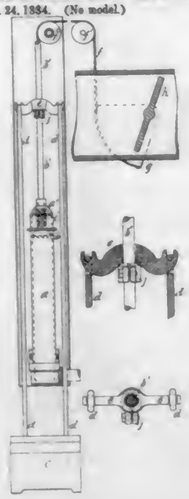


2. In combination, a series of boards, A, with grooves *a* and *b* formed therein, the grooves *a* being nearer the edges of the boards than the grooves *b*, as and for the purpose described.

298,634. PAPER-MACHINE. THOMAS STEWART, Philadelphia, Pa. Filed Oct. 20, 1883. (No model.)

Brief.—Improvement on Letters Patent No. 265,884, dated October 10, 1882, to same inventor.

Claim.—1. The process of embedding a re-enforcing fabric, whether a connected web or a number of parallel threads, in paper during the process of its manufacture, which consists in feeding the re-enforcing fabric to and embedding it in the paper while in a pulpy state, and then adjusting the speed of the drying-cylinders to the same speed as the press-rolls and forming-cylinder or its equivalent, or slower, substantially as and for the purpose shown and set forth.

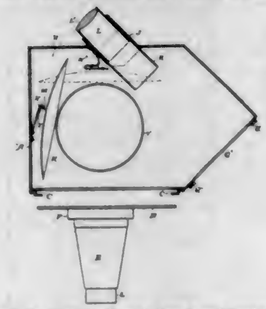


298,634.

2. A machine for the manufacture of textile paper or paper re-enforced by a web or separate threads embodied into the paper fabric while in a pulpy state, provided with an expansion-pulley or its equivalent, whereby the speed of the drying-cylinders may be adjusted to the same speed as the press-rolls and forming-cylinder or its equivalent, or slower, substantially as and for the purpose shown and set forth.

3. In a machine for the manufacture of textile paper, or paper re-enforced by a web or separate threads embodied into the paper while in a pulpy state, an adjustable tension-frame provided with tension-rolls and with weights for regulating the pressure or purchase of the rolls against the re-enforcing fabric, whereby the stretch or tension of said fabric may be regulated in conformity to the speed of the drying-cylinders which take the fabric embodied into the paper from the press-rolls, substantially as and for the purpose shown and set forth.

298,635. DAMPER-REGULATOR. FRANK THOMPSON, New York, N. Y. Filed Jan. 24, 1884. (No model.)



Claim.—1. In a damper-regulator, in combination, the weight *c* the rods *d d*, the yoke *e*, the cylinder *a*, the piston *b*, the piston-rod *b'*, fitted loosely through the yoke *e*, the adjustable collar *j*, clamped on the piston-rod *b'*, and supporting the yoke *e* and weight *c*, and the damper *h*, connected to the free ends of the piston-rod, thus providing means for adjusting the piston in the cylinder after the apparatus is in position, substantially as and for the purpose set forth.

2. In a damper-regulator, the vertically-arranged cylinder *a* and piston *b*, in combination with the weighted yoke *e*, supported by means of a spherical bearing on the collar *j*, secured to the piston-rod *b'*, substantially as set forth.

3. In combination, the cylinder *a*, piston *b*, spring *i*, piston-rod *b'*, collar *j*, yoke *e*, rods *d d*, and weight *c*, substantially as and for the purpose hereinbefore set forth.

298,636. MAGIC LANTERN AND WONDER CAMERA COMBINED. JAMES R. UPHAM, Boston, Mass. Filed Feb. 2, 1884. (No model.)

Claim.—1. In a combined magic lantern and wonder camera, a box having projecting tube E and aperture G', provided with means for retaining opaque pictures thereat, in combination with the cylinder J, having lens-tube L therein, a lamp, D, and a concave mirror, R, having means whereby it may be shifted in position to reflect the lamp-light upon a picture held at said opening G' or to the said projecting tube E, substantially as described.

2. The pentagonal box A, having opening G', and means for holding pictures thereat, in combination with the cylinder J, lens-tube L, hooks N N', concave mirror R, having eye M, and the lamp D, substantially as and for the purpose specified.

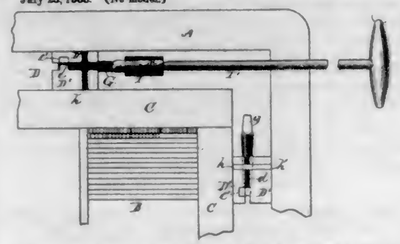
3. The box A, having opening G', springs *g*, and ring V, in combination with the cylinder J, cylinder K, lens-tube L, and concave mirror R, substantially as and for the purpose set forth.

4. The box A, having opening G', springs *g*, cylinder J, cylinder K, lens-tube L, and hooks N N', in combination with the mirror, having eye M, ring V, lamp D, side B, removable in the channels C, and having projecting tube E, as shown and described.

298,637. SEAM FOR BOOTS AND SHOES. GEORGE VALIANT, Toronto, Ontario, Canada. Filed Sept. 28, 1883. (No model.) Patented in Canada Oct. 15, 1883, No. 17,882.

Claim.—1. A seam formed from two pieces of material by first folding in the edges of each piece upon itself, then uniting the two pieces by a line of stitches passing through the doubled or folded portions, and leaving outer projecting beads, substantially as set forth.

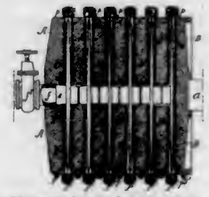
2. A seam formed from two pieces of material by first passing a line of stitches laterally through the two folded edges, leaving outer projecting beads, then passing a vertical line of stitches through each projecting bead, thus forming a stay covering the first line of stitches, substantially as set forth.



298,638. BOOT. GEORGE VALIANT, Toronto, Ontario, Canada. Filed Sept. 28, 1883. (No model.) Patented in Canada Oct. 16, 1883, No. 17,896.

Claim.—A boot having the edge of its fly of the upper serrated or scalloped, in combination with a piece of material sewed to the said edge and having eyelets or button-holes stamped out of it, substantially as and for the purpose specified

298,638.



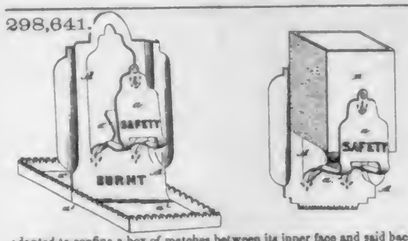
298,639. PRINTER'S QUOIN. CHRISTIAN A. R. L. VER GENUS, Galesburg, Ill., assignor of one-half to Gustave A. Ver Genus, same place. Filed July 23, 1883. (No model.)

Claim.—A printer's quoin formed of blocks D' with horizontal screw-threaded grooves in their adjacent faces, in combination with a conical screw-threaded bolt fitting and working in said horizontal groove, substantially as described.

298,640. SEPARATING LIQUID FROM SOLID MATTER, AND MECHANISM THEREFOR. HENRY WARDEN, Philadelphia, Pa., assignor to the Atlantic Refining Company, same place. Filed May 24, 1883. (No model.)

Claim.—1. The mode herein described of separating solid matter from oil and other liquids, the said mode consisting in compressing supply after supply of the liquid between filtering fabrics, and thereby lodging between the same layer after layer in succession of solid matter, one layer being incorporated with previous layers until a comparatively thick cake composed of the several layers is produced, substantially as described.

2. A filtering-press in which are combined the following elements, namely: first, rings I I'; second, disks of filtering fabric; third, devices for confining the said disks between the rings, and, fourth, grooved plates fitted to the said rings, so as to slide therein, all substantially as set forth.



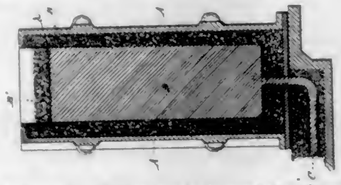
3. The combination, in a filtering-press, of two bags, H, two grooved plates, between which are two filtering-disks, one forming part of one bag and the other part of the adjoining bag, and two rings, one attached to one filtering-disk and the other to the other filtering-disk, one ring overlapping one grooved plate and the other overlapping the other grooved plate, and devices for securing the rings, all substantially as described.

4. The combination of the grooved plates and the beveled rings I I', confining filtering-disks, with a contractible band, P, carrying blocks *p*, adapted to the said rings, substantially as specified.

298,641. MATCH-BOX HOLDER. WILLIAM N. WHEDEN, New Bedford, Mass. Filed Sept. 10, 1883. (No model.)

Claim.—1. A match-box holder composed of a back adapted to receive the rear face of the box and hold said box from side movement, and a spring-clamp which forms part of or is secured to the same, and is

298,641.

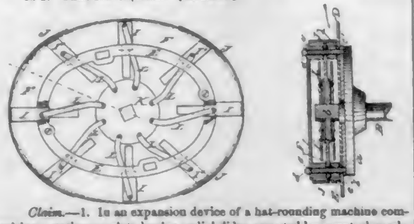


adapted to confine a box of matches between its inner face and said back, substantially as and for the purpose specified.

2. A match-box holder composed of a back, a spring-clamp which is adapted to confine in place upon said back an interposed box of matches, and a stop that is arranged to engage with the lower end of such box and to limit its downward motion, substantially as and for the purpose shown.

3. As an article of manufacture, a match-box holder composed of a back, a spring-clamp for confining in place a match-box, and a stop for limiting the downward motion of such box, and provided with a receptacle for burnt matches, substantially as and for the purpose set forth.

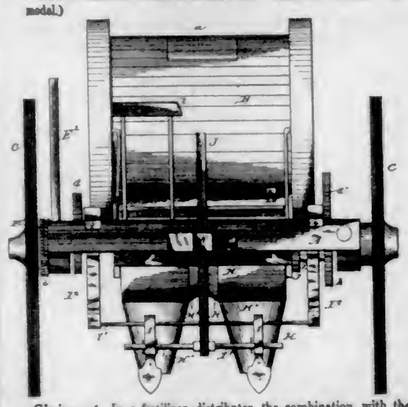
4. A match-box holder composed of a back, a spring-clamp for confining in place a match-box, a stop for limiting the downward motion of said box, and a base for supporting the device in a vertical position, substantially as and for the purpose shown and described.



298,642. MANUFACTURING WROUGHT-STEEL. SAMUEL T. WELLMAN, Cleveland, Ohio. Filed Apr. 20, 1883. (No model.)

Claim.—1. As an improvement in the manufacture of wrought-steel, the method herein described, consisting in casting the ingot in a mold made of some good non-conducting material, thereby insuring a slow radiation of heat and a homogeneous temperature to the ingot, and allowing the ingot to remain in the mold until it has been sufficiently reduced in temperature for rolling or hammering, and then removing the mold from the ingot, substantially as set forth.

2. As an improvement in the manufacture of wrought-steel, the method herein described, consisting in casting the ingot in a mold made of some good non-conducting material—as silica, for instance—and covering the top of the metal of the ingot with non-conducting material, and allowing the ingot to remain in the mold until it has been sufficiently reduced in temperature for rolling or hammering, and then removing the mold from the ingot, substantially as set forth.



298,643. HAT-ROUNDING MACHINE. JOHN WINSTROM, Brooklyn, N. Y. Filed Dec. 19, 1882. (No model.)

Claim.—1. In an expansion device of a hat-rounding machine comprising a stationary plate having radial slides operated by a central crank-disk, the combination, with the axial slides I, having their links L pivoted at *u* equidistant apart, in the same circle-line, Q, on the said crank-disk, of the oblique slides I', having their links L pivoted at *r* to the said crank-disk, at the same angular distances, M N O P, from the forward pivots, *u*, respectively, as the angles M' N' O' P', which are formed by the center line of each respective oblique slide I' and that of the next preceding axial slide I, substantially as and for the purpose hereinbefore set forth.

2. In an expansion device of a hat-rounding machine comprising a stationary plate having radial slides operated by a central crank-disk, the combination, with the axial slides I, having their links L pivoted at *u* equidistant apart, in the same circle-line, Q, on the said crank-disk, of the oblique slides I', having their links L pivoted at *r* to the said crank-disk, at the same angular distances, M N O P, from the forward pivots, *u*, respectively, as the angles M' N' O' P', which are formed by the center line of each respective oblique slide I' and that of the next preceding axial slide I, the latter pivots or crank-pins *r* being located outside of the circle Q, to increase the throw of the oblique slides I', substantially as and for the purpose hereinbefore set forth.

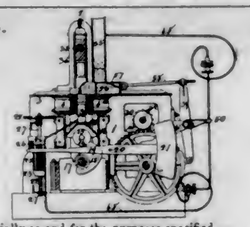
298,644. COMBINED SEEDER AND FERTILIZER-DISTRIBUTER. GEORGE WASHINGTON WHITE, Belle Mina, Ala. Filed Nov. 16, 1883. (No model.)

Claim.—1. In a fertilizer-distributer, the combination, with the agitator, with its shaft provided with a pinion, of the driving-wheel having a pinion, the supplementary shaft having at one end a pinion, and at its other end an angular surface, the sliding sleeve having an angular bore and a pinion, and the shifting-lever, substantially as and for the purpose set forth.

2. In a fertilizer-distributer, the combination, with the agitator, with its shaft provided with pinions at both ends, and the comminuting or pulverizing rolls, with their shafts provided with intergearing pinions and a separate pinion gearing with one of the pinions of the agitator-shaft, of the supplementary shaft having a pinion at one end and an angular surface at its other end, and a sliding sleeve having a pinion and an angular bore, substantially as and for the purpose set forth.

3. In a fertilizer-distributer, the combination, with the comminuting-roll case affixed to the machine-frame, of the spouts with their upper semicircular portions pivoted and provided with tapering telescoped sections, substantially as and for the purpose set forth.

298,645. BALE-TIE. JOSEPH WHITE, Cleveland, Ohio, assignor to the Tyler Bale-Tie Company, same place. Filed Mar. 21, 1884. (No model.)



Claim.—A bale-tie with ends provided with a succession of similar curves or bends adapted to interlock when twisted or passed around each other, and adapted to be reduced in length by more or less overlapping the ends, substantially as set forth.

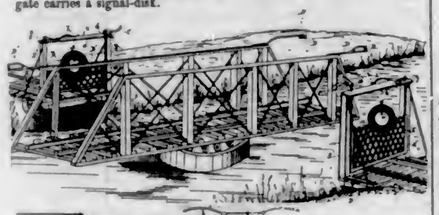
298,646. PRESS FOR MAKING BRICKS, TILES, &c. THOS. WHITTAKER, Accrington, County of Lancaster, England. Filed Mar. 13, 1884. (No model.)

Claim.—1. In a press for manufacturing brick, tile, &c., the combination of two adjustable side sections or mold-tables adapted to slide to and from each other, a separable septum, and detachable end pieces, whereby the size of the mold-cavity may be changed at will, substantially as and for the purposes specified.

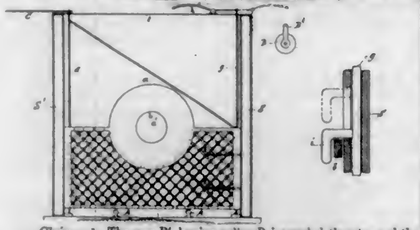
2. In a press for the manufacture of brick, tile, &c., the combination, with a mold and a plunger adapted to project beyond the mold, of a feed-box having an inwardly-swinging door or gate which permits the feed-box to be pushed past the projecting plunger and over the mold-

298,646.

cavity, substantially as and for the purposes specified.



3. In a press for the manufacture of brick, tile, &c., the combination, with an adjustable mold, of a drop-box arranged below the mold and provided with guard-plates, and a hollow bottom plunger detachable from the drop-box, whereby the plunger may be changed to suit the size to which the mold is adjusted, substantially as and for the purposes specified.



4. In a press for manufacturing brick, tiles, &c., the combination of the twin molds and the hollow twin plungers, one of said plungers having a steam-inlet and the other an outlet-pipe, and the two pistons connected by a dip-pipe, substantially as and for the purposes specified.

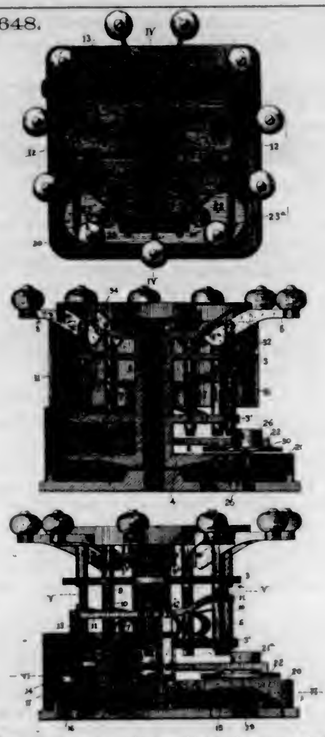
5. In a press for manufacturing brick, tiles, &c., the combination of an adjustable mold, a bottom plunger having a separable head, a stop mechanism for limiting the drop of the plunger, and a feed-box having an inwardly-swinging door or gate which permits the feed-box to pass over the projecting head of the plunger, substantially as and for the purposes specified.

298,647. DRAW-BRIDGE SIGNAL. JAS. N. WILLIAMS, Mobile, Ala. Filed Feb. 23, 1884. (No model.)

Brief.—A friction-roller in a forked arm on a swing-bridge frame operates a forked lever on the end of a rod upon which a swinging gate is mounted. A second friction-roller on an arm of the bridge-frame operates a lever pivoted on the cross-bar of a frame in which the gate rests when closed, said lever being connected to a vertically-reciprocating rod. The latter carries hooks engaging catches on the gate. The swinging gate carries a signal-disk.

Claim.—1. The arm B', having roller B journaled thereto, and the upper frame of a draw-bridge, in combination with lever A, rod *g*, having latching mechanism, and gate E, substantially as described, and for the purposes set forth.

2. The forked lever C, rod *d*, and gate E, in combination with the forked arm D', having roller D journaled thereto, substantially as described, and for the purposes set forth.



3. In a draw-bridge gate, the lever A, in combination with the rod *g*, having hooks *i*, as described, and for the purposes set forth.

4. In a draw-bridge, the gate E, having signal *a*, in combination with rod *d* and forked lever C, and forked arm D', having roller D, substantially as described, and for the purposes set forth.

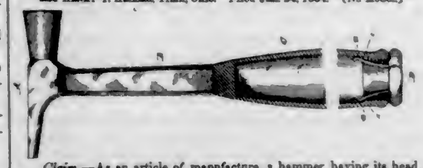
5. In a draw-bridge, the posts S S', the cross-bar *t*, the rod *g*, having hooks *i*, in combination with gate E, having catches *b b*, substantially as described, and for the purposes set forth.

298,648. CHECK-PUNCHING MACHINE. JOHN N. WILLIAMS, St. Paul, Minn. Filed Sept. 21, 1883. (No model.)

298,648.

Claim.—1. A check-punching machine having a rotary hub, a circular series of punches supported thereon, and separate hand-levers pivoted to the said punches and fulcrumed on the rotary hub, so as to have liberty of endwise movement.

2. A check-punching machine having a revolving series of punches with two lugs or shoulders on their faces, in combination with an oscillating feed-lever adapted to be engaged by both of said lugs or shoulders when either of the punches is brought into position for use, so as to be positively actuated by said punches in both directions of their movement, for the purpose set forth.

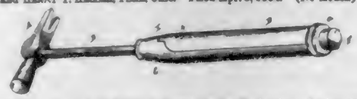


3. The combination of the series of punches 6, bow-shaped lever 11, staff 13, clutch or ratchet movement 14 16 17, feed-shaft 15, and feed-wheel 19, as set forth.

4. The combination of a rotary series of punches, an oscillating feed-lever common to all, a feed-table having feed and guide rollers, and a hinged holding and stripping plate having idle-rollers located above the rollers in the feed-table on both sides of the punch, for the purpose set forth.

5. In a check-punching machine, the combination, with a rotary series of punches and a plate having corresponding matrices, of a hinged plate perforated for the passage of the punch and serving as a holder and stripper.

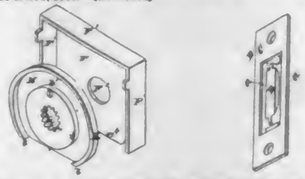
6. In a check-punching machine, flanged rotary hub-cap 34, shouldered bolts 35, and bar or handle 33, for the purpose set forth.



298,649. TACK-HAMMER. GEORGE S. YINGLING, ALBERT L. FLACK, and HENRY T. HELLER, Tiffin, Ohio. Filed Jan. 24, 1884. (No model.)

Claim.—As an article of manufacture, a hammer having its head, shank, and handle all of one piece, the handle being hollow and open at its outer end, and there provided with the shoulders *x x*, for retaining the

springs *e e* of the stopper, thus forming a receptacle for holding tacks, all being arranged substantially as described.



298,650. TACK-HAMMER. GEORGE S. TINGLEY, ALBERT L. PLACE, and HENRY T. HELLER, Tiffin, Ohio. Filed Apr. 3, 1884. (No model.)

Claim.—1. A tack-hammer having its head, shank, and a longitudinal portion of the handle all cast in one piece, the other portion being cast separately and secured thereto, forming, completed, a hammer having an open-ended receptive handle adapted to receive and hold tacks, and to be closed by a suitable stopper, as set forth.

2. A tack-hammer having its head, shank, and a longitudinal portion of the handle and the recessed ring on the end of the said handle all cast in one piece, the other portion being cast separately and secured thereto by the ring at one end and a rivet at the other, the handle being open-ended and internally concave, and adapted to receive and retain tacks, and to be closed by a suitable stopper, as set forth.

298,651. PERMUTATION-LOCK. JAMES W. ALLEN, St. Louis, Mo. Filed Nov. 2, 1883. (No model.)

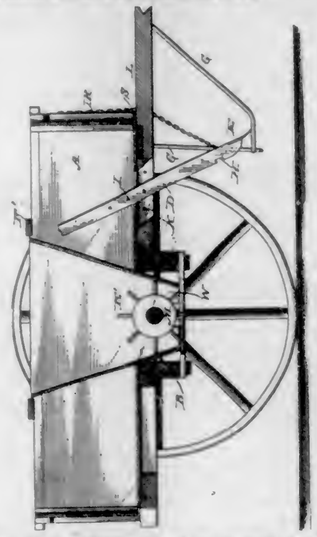
Claim.—1. In a combination-lock, two or more locking-disks having a limited movement independent of each other, with peripheral flanges L, projecting beyond the face of the lock, substantially as and for the purpose set forth.

2. In a combination-lock, the combination of two independently-movable disks provided with peripheral flanges having segments removed and projecting toward each other, a spindle by which a disk can be rotated to adjust the other disk, and a locking-plate having an orifice, and a bar spanning the orifice, having flanges engaged by the disk-flanges, as set forth.

3. The combination, in a desk-lock, of rotary disks with flanges L, a lock-plate engaged by said disks, and lips *d' d²* upon the lock, entering the recess of the lock-plate, for the purposes set forth.

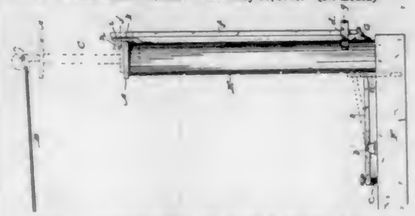
4. The combination, with the locking-disk H, having a pin or stud, A', of the movable division-plate J, with an orifice, J', and a notch, J^2, engaging on said pin when the lock is lifted from the table, for the purpose set forth.

298,652. ROAD-CART. DANIEL ABSTERBERRY, Troy, Ohio. Filed Sept. 17, 1883. (No model.)



Claim.—1. In a road-cart, the double semi-elliptic springs secured directly to the axle and the side bars, and connected in pairs at their rear ends by wrist-bolts, washers, and securing-nuts, and at their front ends by a connecting-rod, washer, and securing end nuts, substantially as specified.

2. In a road-cart, the combination, with the connecting-rod *k* at the front ends of the springs, of the link *l*, connecting the lateral arm *m* on the inside of one of the shafts, to prevent the body from tilting backward or forward in case of the breakage of the axle-connection with the springs, substantially as specified.



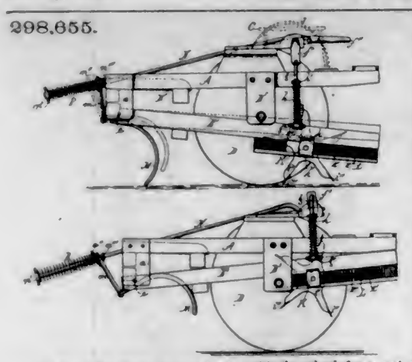
3. The combination, with the semi-elliptic springs connected to the axle and at their front and rear ends, as described, of the side bars and connecting-bars *o o*, provided with the transverse slots *p*, whereby the cart-body may be secured thereto by bolts and nuts, and adjusted back and forth, substantially as and for the purposes specified.

298,653. COMBINED RIDING-CART, COTTON AND CORN PLANTER, AND MANURE-DISTRIBUTER. ANDREW J. ARRINGTON, Epes Station, Ala. Filed Aug. 21, 1883. (No model.)

Claim.—In a cotton and corn planter and manure-distributer, the slotted tongue A, the adjustable plow-standard D, working in and through pendent guide-braces G, in combination with the detachable and interchangeable hoppers A', having inclined bottom B', slot C', through which works the pocketed seed-wheel D', or a series of arms, E', and the coverer H', substantially as set forth.

298,654. ELEVATOR FOR CASH AND PARCEL CARRIERS. ABEL T. ATHERTON, Lowell, Mass. Filed July 23, 1883. (No model.)

Claim.—1. The combination, with the carrier-elevator, the elevator-actuating piston, and its containing-cylinder, of an exhaust or escape valve arranged and operating to automatically open at or near the time the elevator completes its upward movement, substantially as and for the purposes hereinbefore set forth.



2. The combination, with the carrier-elevator, the elevator-actuating piston, and its containing-cylinder, of an exhaust or escape valve, and valve-operating mechanism actuated by the elevator, or some part moving in unison therewith, to open and close said exhaust-valve at the times and in the manner substantially as hereinbefore set forth.

3. The combination of the carrier-elevator, the elevator-actuating piston, its containing-cylinder, the spring-controlled admission-valve, the exhaust-valve, and exhaust-valve-operating mechanism, actuated by the elevator, or some part moving in unison therewith, at or near its extremes of movement to open and close said exhaust-valve, the combination being and acting substantially as hereinbefore set forth.

298,655. CORNSTALK-CUTTER. JAMES W. ATKINSON and BYRON PHELPS, Moline, Ill., assignors to Deere & Mansur Company, same place. Filed Jan. 12, 1883. (No model.)

Claim.—1. In a stalk-cutter, in combination with a frame, E, adapted to be dragged by one end, and a cylinder of cutters journaled in said frame and adapted to slide back and forth with reference to said frame, springs adapted to operate substantially as and for the purpose specified.

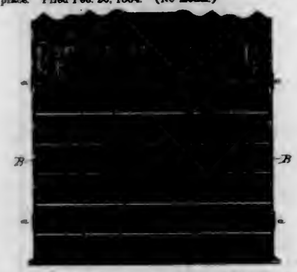
298,655.

2. In a stalk-cutter, in combination with the wheel-frame and a swinging frame hinged thereto, a cylinder of cutters journaled to the swinging frame in bearings which permit it to slide back and forth in said swinging frame, substantially as and for the purpose specified.

3. In a stalk-cutter, in combination with the wheel-frame, a swinging frame hinged thereto, and a cylinder of cutters journaled to the swinging frame in bearings which permit it to slide back and forth with reference to said swinging frame, springs adapted to act on the cylinder of cutters, substantially as and for the purpose specified.

4. In combination with the frame E, having slots *e'*, the cylinder of cutters I, journaled in blocks K, which slide back and forth in the slots *e'*, and the springs L, located in the slots *e'*, and adapted to act on the cylinder of cutters, substantially as and for the purpose specified.

5. In combination with the frame A and the swinging frame E, hinged thereto, and having slots *e'*, the cylinder of cutters I, journaled in blocks K, which slide back and forth in the slots *e'*, and the springs L, located in the slots *e'*, in rear of the blocks K, and adapted to act on the cylinder of cutters, substantially as and for the purpose specified.

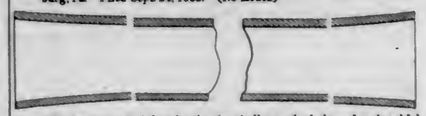


6. In combination with the frame A, swinging frame E, having slots *e'*, cylinder of cutters journaled in blocks which slide in the slots *e'*, and springs L, the crank-shaft F, connected with the frame E by a rod, *g*, and spring A, substantially as and for the purpose specified.

7. In a stalk-cutter, in combination with the frame, rod N, and drag-hooks hinged to the frame, the spring P, adapted to hold the drag-hooks in contact with the ground with a yielding force, substantially as and for the purpose specified.

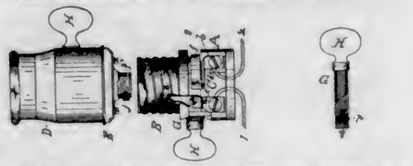
8. In a stalk-cutter, in combination with the frame and drag-hooks hinged thereto, and rod N, adapted to raise the drags off the ground, a spring, P, adapted to hold the drag-hooks in contact with the ground and to yield to permit said hooks to rise independently of the rod N, substantially as and for the purpose specified.

9. In combination with the wheel-frame and swinging frame, shaft F, and rods *g* and N, adapted to raise the swinging frame and drag-hooks simultaneously, the spring P, adapted to operate substantially as and for the purpose specified.



298,656. PAPER, TWINE, AND SACK CASE FOR GROCERS, &c. JAMES F. BARR, Ashland, Ohio, assignor of one-half to Andrew Brubaker, same place. Filed Feb. 20, 1884. (No model.)

Claim.—1. The case for twine, paper, and bags, hereinbefore described, consisting of the back and ends, the shelves C, twine-box E, and compartment F, the box being supplied with a cover, and having at each end a receptacle for a single ball of twine, substantially as set forth.



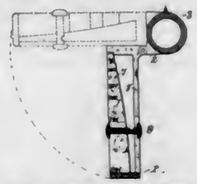
2. The case for twine, paper, and bags, hereinbefore described, consisting of the back A, ends B, hinged thereto, twine-box E, bag-compartment F, and detachable shelves C, substantially as set forth.

298,657. STRAIGHT WATER-PIPE. JOHN FRANCIS BENNETT, Pittsburg, Pa. Filed Sept. 24, 1883. (No model.)

Claim.—A straight pipe having bell-mouthed-shaped ends which have, respectively, an area equal to twice that of the main body, the length of frustum of cone forming the entrances being equal to two diameters of the main body of the pipe, for the purpose herein fully set forth.

298,658. SOCKET FOR INCANDESCENT ELECTRIC LAMPS. SIGMUND BERGMANN, New York, N. Y. Filed Oct. 9, 1882. (Model.)

Claim.—1. The combination, in a turning circuit-controlling key, of a metal thumb-piece, a metal circuit-controlling tip, and a section of insulating material interposed between said metal portions, the parts having engaging screw-threaded portions, by which they are secured together, substantially as set forth.



2. In a circuit-controller, the combination, with contiguous metal plates forming circuit-terminals, of a turning circuit-controlling key having a metal tip which bridges the space between said plates to complete the circuit, said key also having a metal thumb-piece insulated from said tip, substantially as set forth.

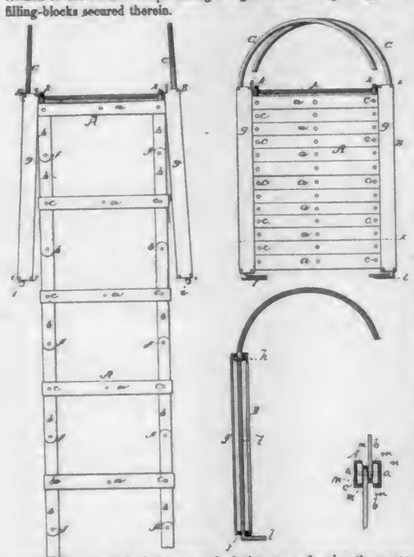
3. The combination, in a circuit-controller, of contiguous metal plates forming circuit-terminals, a turning circuit-controlling key having a metal tip for bridging the space between the plates, and a metal thumb-piece insulated from said tip, a cam for forcing said key forward to close circuit, and a spring for retracting the key to break circuit, substantially as set forth.

4. In an incandescing-electric-lamp socket, the combination, with the insulating-block A, and circuit-terminals carried thereby, to which run the circuit-wires, of an inclosing metal casing, D E, and the internally-screw-threaded sleeve F, attached to the part E, and provided with the set-screw *j*, or equivalent device, substantially as set forth.

5. In an incandescing-electric-lamp socket, the combination, with the cylindrical block of insulation, of the metal plates attached thereto and continued upward, one to the screw-threaded sleeve, which receives one terminal of the lamp, the other through a circuit-controller to a plate, which makes contact with the other lamp-terminal, substantially as set forth.

298,659. SIGHT FOR FIRE-ARMS. EDWARD L. BERTSOUD, Golden, Colo. Filed Nov. 24, 1883. (No model.)

Claim.—1. The combination, with the barrel of a rifle or cannon, of the stadia-sight secured adjacent to the muzzle, and constructed with the variable opening formed by a straight side and a curved side, and a slide on said sight for indicating in the variable opening that part of the said opening which exactly includes the height of the object aimed at, together with the exact elevation of the muzzle required to strike the object, substantially as described.



2. The combination, with the barrel of a rifle or cannon, of the stadia-sight hinged adjacent to the muzzle, to be adjusted either to a horizontal or a vertical position, as described, and constructed with the variable opening formed by a straight side and a curved side, and a slide on said sight for indicating in the variable opening that part of the said opening which exactly includes the height of the object aimed at, together with the exact elevation of the muzzle required to strike the ob-

ject substantially as described.

3. The combination, with the barrel of a rifle or cannon, of a stadia-sight hinged adjacent to the muzzle, and constructed with an opening variable in width throughout its length, and a slide on said sight, whereby when the latter is turned to a horizontal position the adjustment of the slide will indicate in the variable opening that part of said opening which exactly includes the height of the object aimed at, and when the sight is turned downward to a vertical position the exact elevation of the muzzle will be indicated for striking the object, substantially as described.

298,660. PORTABLE LADDER. VITAL BISSELL, New York, N. Y., assignor of one-half to Henry A. Robbins, Washington, D. C. Filed Jan. 12, 1884. (No model.)

Brief.—A portable frame having hooks for holding the folded ladder therein and bails or hooks at the upper end. The ladder-rungs are formed of sheet-metal strips having flanges turned at right angles and filling-blocks secured therein.

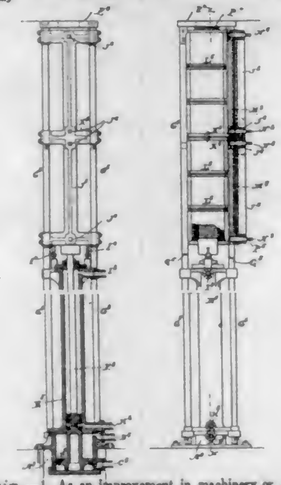
Claim.—1. A ladder composed of plates *a a*, forming the rounds, and connecting-links *b b*, pivoted to the rounds and to one another, the rounds being provided with stops *c c*, to prevent the folding outward and compel the folding inward of the links behind the rounds, substantially as and for the purpose herein specified.

2. The ladder-rounds *a a*, having their ends bent backward to form both stops *c c* and projecting stays, substantially as herein specified.

3. The combination of a folding ladder, A, composed of plates *a a*, forming the rounds, and connecting-links *b b*, pivoted to the rounds and to one another, and a portable frame, B, provided with sides *g g*, adapted to embrace and sustain the ends of the ladder-rounds, and with means for carrying and suspending the ladder, substantially as and for the purpose herein specified.

4. A ladder-frame, B, formed of side pieces, *g g*, adapted to embrace and sustain the folded ladder, and a top piece, *h*, the said side pieces being connected with the top piece by movable joints, whereby they may be swung outward at the lower ends to set free the ladder and allow it to unfold, substantially as herein specified.

5. Swinging hooks C C, in combination with the ladder-frame B, substantially as and for the purpose herein specified.

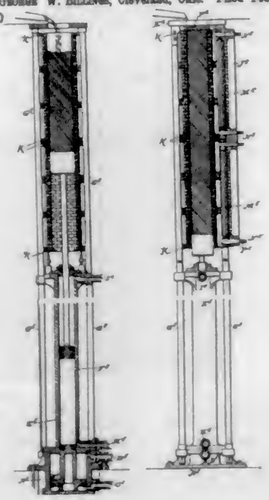


6. Hooks C C, turning on vertical extensions *i i*, pivoted in the sides of the ladder-frame B, the said extensions being provided with lateral projections *l l*, in combination with the folding ladder A, substantially as and for the purpose herein specified.

7. A ladder-round formed of flanged metallic plates, substantially as and for the purpose herein specified.

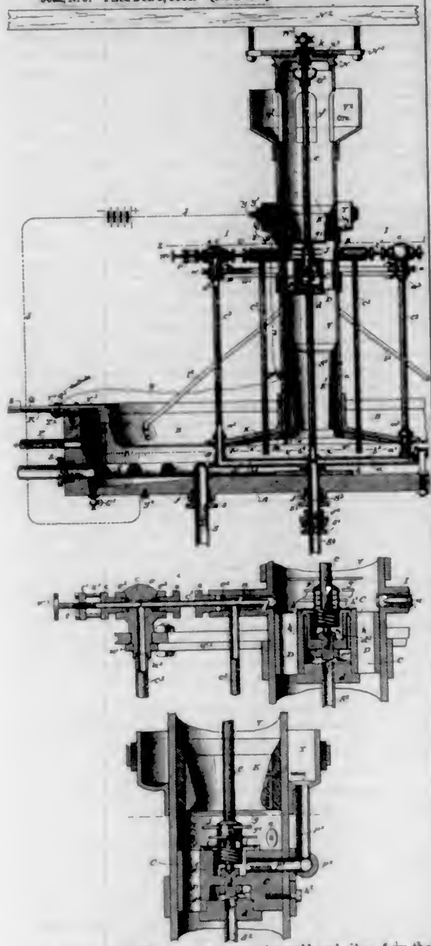
8. A portable ladder composed of a folding or collapsible ladder, A, and holding-frame B, provided with a carrying and suspending bail or hooks, C C, substantially as and for the purpose herein specified.

9. Ladder rounds or rungs formed of sheet-metal strips having flanges *m m* turned at right angles to the body, and provided with blocks or plates *n n*, filling the spaces between the flanges of the stripe, substantially as and for the purpose herein specified.



298,661. COMPRESSION APPARATUS FOR CASTING STEEL INGOTS. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Jan. 16, 1884. (No model.)

Claim.—1. As an improvement in machinery or apparatus for casting compressed ingots of considerable length, the combination, with suitable means for securely holding in place a long removable mold, of two cylinders arranged axially in line with the mold (when the latter is held in place) and secured together, one of the said cylinders having a piston that works always within the mold and acts directly on the contents thereof, and the other of said cylinders having a piston which acts directly upon the piston of the other cylinder, all substantially in the manner and for the purposes hereinbefore described.



2. As an improved contrivance for making compressed ingots of great length, a machine composed of two stationary cylinders arranged axially in line (one being of longer stroke than the other) together with their respective pistons, and means for holding in proper relative position therewith an ingot-mold, the construction and arrangement of these parts being such, as described, that the piston of longer stroke descends within the mold during the pouring, and is thereafter suddenly forced upwardly within the mold by the action upon it of the other (and more powerful) piston, all in the manner and for the purposes described.

298,662. METHOD OF POURING AND COMPRESSING STEEL INGOTS. GEORGE W. BILLINGS, Cleveland, Ohio. Filed Feb. 29, 1884. (No model.)

Claim.—As an improvement in the manufacture of compressed ingots of great length, pouring the liquid metal into a mold having a descending bottom, (so that the fall of the stream is always slight,) and then immediately subjecting the liquid contents of the mold to severe and sudden compression, all substantially as set forth.

298,663. PROCESS OF AND APPARATUS FOR EXTRACTING GOLD AND SILVER FROM THEIR ORES. CHARLES P. BONNETT, Elizabeth, N. J. Filed Dec. 3, 1883. (No model.)

Claim.—1. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, which consists in forcing mercury, either hot or cold, in the form of very fine globules or spray, into the water containing the ore, sand, &c., causing currents of electricity to traverse the water while the mercury is still in a fine state of division, and collecting the amalgam in a suitable vessel, substantially as and for the purposes specified.

2. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting in forcing mercury, either hot or cold, in the form of very fine globules or spray, into a column of water containing the ore, sand, &c., descending with a constant velocity, causing currents of electricity to traverse the descending column, and collecting the amalgam in any suitable vessel, substantially as and for the purposes specified.

3. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting in forcing mercury, either hot or cold, in the form of very fine globules or spray, into a column of water containing the ore, sand, &c., descending with a constant velocity, thoroughly mixing the globules of mercury with the particles of ore, sand, &c., in the descending column of water, causing currents of electricity to traverse the descending column and collecting the amalgam and mercury in any suitable vessel, substantially as and for the purposes specified.

4. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting in forcing mercury, either hot or cold, in the form of very fine globules or spray, into a column of water containing the ore, sand, &c., descending with a constant velocity, thoroughly mixing the globules of mercury with the particles of ore, sand, &c., in the descending columns of water, causing currents of electricity to traverse the descending column, collecting the amalgam in any suitable vessel, and causing the column of water on emerging from the vessel in which the admixture takes place to pass in a thin stream between an electrified copper plate and an electrified surface of mercury, substantially as described, and for the purposes specified.

5. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting in forcing mercury, either hot or cold, in the form of very fine globules or spray, into a column of water containing the ore, sand, &c., descending with a constant velocity, thoroughly mixing the globules of mercury with the particles of ore, sand, &c., in the descending column of water, passing currents of electricity through the descending column, collecting the amalgam in any suitable vessel, causing the water or slime, on emerging from the apparatus in which the admixture takes place, to pass in a thin stream between an electrified copper plate and an electrified surface of mercury, and subjecting the same to further treatment with electrified mercury upon copper plates, substantially as described, and for the purposes specified.

6. The process of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting in forcing mercury, either hot or cold, in the form of very fine globules or spray, into a column of water containing the ore, sand, &c., descending with a constant velocity, thoroughly mixing the globules of mercury with the particles of ore, sand, &c., held in suspension in the descending column of water, passing currents of electricity through the descending column, collecting the amalgam in any suitable vessel, causing the water or slime on emerging from the apparatus in which the admixture takes place to pass in a thin stream between an electrified copper plate and an electrified surface of mercury, subjecting the same to further treatment with electrified mercury upon copper plates, and collecting the residue contained in the water by the combined action of a copper plate and a mechanical collecting-blanket.

7. The process hereinbefore described of extracting gold and silver from their ores by the combined action of mercury, electricity, and water, consisting, first, in forcing any quantity of mercury, either hot or cold, in excess of what is necessary to amalgamate the precious metals contained in the ore, in the form of very fine globules or spray, into a column of water containing ore, sand, &c., descending with a constant velocity, thoroughly mixing the globules of mercury with the particles of ore, sand, &c., held in suspension in the descending column of water, passing currents of electricity through the descending column, and collecting the amalgam in any suitable vessel; second, in causing the water or slime, after passing out of the apparatus in which the first step of the process is carried on, to pass in a thin stream between an electrified copper plate and an electrified surface of mercury, and subjecting the same to further treatment with electrified mercury upon copper plates; third, in collecting the residue contained in the water by means of the combined action of a copper plate and a mechanical collecting-blanket; and, fourth, in collecting the excess of mercury used in the process, and repeating the steps, with or without the addition of new mercury, as often as may be deemed advisable.

8. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, consisting of a revolving vertical mixing chamber or reservoir, a series of injectors or atomizers, whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator provided with a series of stirring-arms, and one or more sets of anodes or cathodes within said chamber, means, substantially as described, for insulating the same, a flanged copper plate or disk secured to and revolving with said chamber, an annular insulating-disk secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges and over which said copper disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel; a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, a wheel supporting said disk and chamber, through the spokes and hub of which steam is supplied to said atomizers, a bearing within said mercury-vessel upon which said wheel, disk, and mixing-chamber revolve, and means, substantially as described, for revolving the same, an annular copper overflow-plate attached to the upper surface of the side walls of said mercury-vessel, a series of annular amalgamating riffles or troughs containing mercury formed within said plate, through which a current of

electricity can be passed, a series of annular anodes respectively placed above and in proximity to said riffles, and revolving with said copper disk, means, substantially as described, for insulating said anodes from said revolving disk, and an annular collecting-blanket surrounding the anodes and revolving with the same above the surface of said annular overflow-plate and outside of said riffles.

9. In an apparatus for the extraction of gold and silver from their ores, the combination, with the revolving mixing-chamber, of a cylindrical chamber-head, a friction-bearing, *k*, and a ball-bearing, *z'*, substantially as shown and described, for the purposes specified.

10. In an apparatus for the extraction of gold and silver from their ores, the combination, with the revolving mixing-chamber V, of a cylindrical chamber-head, N, a friction-bearing, *k*, a ball-bearing, *z'*, and a cross-head, *N'*, bolted to the cross-beam U', as shown and described.

11. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of an injector or atomizer situated in its hollow interior and supported within the same, substantially as shown and described.

12. In an apparatus for extracting gold and silver from their ores, the combination, with the mixing-chamber in its hollow interior, of an injector, consisting of the casting *c*, having vertical perforations, and the series of mercury injectors or atomizers, substantially as shown and described.

13. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber in its hollow interior, of an injector having a steam-supply pipe, a series of steam-escape vents, a mercury-chamber, and means, substantially as described, for causing the mercury overflowing from said chamber to pass above said vents, substantially as shown and described.

14. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of the vertical injector or atomizer C, with the steam-pipes s^2, the packing-box *d*, the mercury-chamber d^3, the steam-chamber d^2, the steam-vents *h h*, and the injection-ports *h' h'*, as shown and described.

15. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of an injector or atomizer supported within the same, and serving as an agitator-bearing, substantially as shown and described.

16. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of the vertical injector or atomizer C, with the steam-pipes s^2, the packing-box *d*, the mercury-chamber d^3, the steam-chamber d^2, the steam-vents *h h*, the injection-ports *h' h'*, the spindle-bearing *d'*, and the capstan-screw d^4, substantially as shown and described.

17. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber and injector or atomizer supported within the same, of the revolving agitator-spindle, supported by said injector or atomizer, and revolving in a bearing in the head of said mixing-chamber, means, substantially as described, for revolving the same, and one or more series of stirring-arms, as shown and described.

18. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber and injector or atomizer supported within the same, of an agitator-spindle supported by said injector or atomizer and revolving in a bearing in the head of said mixing-chamber, means, substantially as described, for revolving the same, one or more series of stirring-arms, a hollow mercury-cylinder surrounding the agitator-spindle and revolving within the same, and having a series of discharge-holes, one or more spiral tubes for supplying mercury to said cylinder, substantially as shown and specified.

19. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-cylinder and an injector or atomizer supported in the same, of a cylindrical mercury-reservoir in said injector or atomizer, a spindle revolving within said mixing-chamber, a hollow mercury-cylinder having a series of discharge-holes surrounding and revolving with said spindle, one or more spiral tubes for conveying mercury from said reservoir to said hollow mercury-cylinder, substantially as shown and described.

20. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of an injector or atomizer supported within the same and serving as an electrode, substantially as shown and described.

21. In an apparatus for the extraction of gold and silver from their ores, the hereinbefore-described combination, with the mixing-chamber, of a series of mercury injectors or atomizers introduced into the side walls of the same, having each the nozzle or mercury-chamber *n*, means, substantially as described, for attaching the same to said side walls, the hollow cross-head *c* with a cylindrical inner surface, the hollow steam-spindle *c'*, closed at one end and open at the other, having one or more steam-ports, *o*, in its side walls passing through said cross-head and extending into said nozzle, means, substantially as described, for horizontally regulating and supporting the same in said nozzle and cross-head, and for preventing the escape of steam and mercury through the space around said spindle, pipes for supplying mercury and steam to said nozzle and cross-head, respectively, and means, substantially as described, for supporting and regulating said series of atomizers or injectors.

22. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of a series of injectors or atomizers introduced into the side walls of the same, having each a nozzle or mercury-chamber, *n*, means, substantially as described, for securing the same to said walls, a hollow steam-spindle, *c'*, extending into said nozzle, means, substantially as described, for regulating and supporting the same and preventing the escape of mercury through the space around said spindle, and a pipe for supplying mercury to said nozzle, substantially as shown and described.

23. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber, of a series of mercury-injectors introduced into the side walls of the same, having each a hollow cross-head, *c*, a hollow steam-spindle, *c'*, passing through said cross-head, and having one or more steam-ports, *o*, in its side walls, means, substantially as described, for regulating and supporting the same and preventing the escape of steam from the space around it, and a pipe for supplying steam to said cross-head, substantially as shown and described.

24. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mixing-chamber V, of the vulcanite insulating-cylinder *u*, as shown and described, and for the purposes specified.

25. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical revolving mixing chamber or reservoir, a series of atomizers or injectors whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, one or more sets of anodes or cathodes, and means, substantially as described, for insulating the same within said chamber, and a cylindrical mercury-vessel for collecting the mercury and amalgam from said chamber, substantially as shown and described, and for the purposes specified.

26. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes or cathodes, and means, substantially as described, for insulating the same within said chamber, a flanged copper plate secured to and revolving with said chamber, and a cylindrical mercury-vessel in which said disk and mixing-chamber revolve, all substantially as shown and described, and for the purposes specified.

27. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mercury-vessel A, of a copper overflow-plate surrounding and attached to the upper surfaces of the same provided with a series of amalgamating-riffles, through which an electrical current may be passed, as shown and described.

28. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mercury-vessel A, of the flanged wheel U, with the spokes *b'*, and the hollow standards *a'*, revolving horizontally in said vessel, as shown and described.

29. In an apparatus for the extraction of gold and silver from their ores, the combination, with the mercury-vessel A, of the wheel U, the ball-bearing *z*, and the vertical pillar *l*, with the rollers *l' l'*, as shown and described.

30. In an apparatus for the extraction of gold and silver from their ores, the combination, with the flanged copper plate B, of the insulating-disk *v*, with the mortised bead-collar *m*, as shown and described, and for the purposes specified.

31. In an apparatus for the extraction of gold and silver from their ores, the combination, with the flanged copper plate or disk B, of a series of anodes, and means for insulating them from said copper plate, substantially as shown and described.

32. In an apparatus for the extraction of gold and silver from their ores, the hereinbefore set forth combination, consisting of the mixing chamber or reservoir, a series of injectors or atomisers in the side walls of the same whereby mercury may be forced into the same in the form of very fine globules or spray, a mercury-vessel into which said chamber discharges, and a series of tubes for taking mercury from said vessel and supplying it back to said injectors, as shown and described

33. In an apparatus for the extraction of gold and silver from their ores, the combination, hereinbefore set forth, of the revolving mixing chamber or reservoir, a series of injectors or atomizers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a mercury-vessel into which said mixing-chamber discharges, and a pump connected therewith for retransferring the contents of said vessel to said mixing-chamber.

34. In an apparatus for the extraction of gold and silver from their ores, the combination, hereinbefore described, of a revolving mixing chamber or reservoir, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of very fine globules or spray, a mercury-vessel into which said mixing-chamber discharges, a series of tubes for supplying mercury to said injectors, and a pump connected therewith for retransferring the contents of said vessel to said mixing-chamber.

35. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, one or more sets of anodes and cathodes, and means, substantially as described, for insulating the same within said chamber, a flanged copper plate or disk secured to and revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges and in which said disk and mixing-chamber revolve, substantially as shown and described.

36. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical mixing chamber or reservoir, a series of injectors or atomizers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, one or more sets of anodes and cathodes within said chamber, and means, substantially as described, for insulating the same, a flanged copper plate or disk revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, a bearing-wheel supporting said disk and chamber, through the spokes and hub of which steam is supplied to said injectors or atomizers, a bearing within said mercury-vessel, upon which said wheel, disk, and mixing-chamber revolve, and means, substantially as described, for revolving the same, and an annular copper plate attached to the upper surface of the side walls of said mercury-vessel, substantially as shown and described.

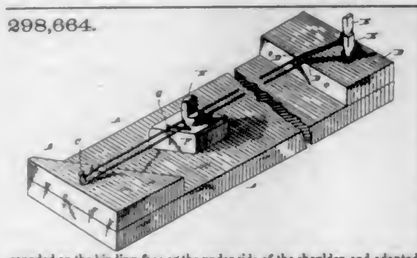
37. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical revolving mixing chamber or reservoir, a series of injectors or atomisers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, one or more sets of anodes and cathodes within said chamber, means, substantially as described, for insulating the same, a flanged copper plate or disk secured to and revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, and a series of tubes for supplying mercury to said injectors, substantially as shown and described.

38. In an apparatus for the extraction of gold and silver from their ores, the combination of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby mercury may be forced into said chamber in the form of very fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, one or more sets of anodes and cathodes, and means, substantially as described, for insulating the same within said chamber, a flanged copper plate or disk secured to and revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, and a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, all substantially as shown and described.

39. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes and cathodes within said chamber, means, substantially as shown, for insulating the same, a flanged copper plate secured to and revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, and a coil of steam-heating pipes placed in the interior of said vessel, substantially as shown and described.

40. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes and cathodes within said chamber, and means, substantially as described, for insulating the same, a flanged copper plate secured to and revolving with said chamber, an annular insulating-disk, substantially as shown, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injector, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, and an annular copper overflow-plate attached to the upper surface of the side walls of said mercury-vessel, substantially as shown and described.

41. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, of a vertical revolving mixing chamber or reservoir through which the water or slimes containing the ore to be treated are passed, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes and cathodes within said chamber, and means, substantially as described, for insulating the same, a flanged copper plate secured to and revolving with said chamber, an annular insulating-disk, substantially as described, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said chamber discharges and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, a bearing-wheel supporting said disk and chamber, through the spokes and hub of which steam is supplied to said injectors or atomizers, a bearing within said mercury-vessel, upon which said wheel, disk, and mixing-chamber revolve, and means, substantially as described, for revolving the same, and an annular copper plate attached to the upper surface of the side walls of said mercury-vessel, substantially as shown and described.



42. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, of a vertical revolving mixing chamber or reservoir, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes and cathodes within said chamber, a flanged copper plate secured to and revolving with said chamber, an annular insulating-disk, substantially as described, secured to the lower surface of said copper plate or disk, a cylindrical mercury-vessel into which said mixing-chamber discharges, and over which said disk and mixing-chamber revolve, means, substantially as described, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, a wheel-bearing supporting said disk and chamber, through the spokes and hub of which steam is supplied to said atomizer, a bearing within said mercury-vessel, upon which said wheel, disk, and mixing-chamber revolve, and means, substantially as described, for revolving the same, an annular copper overflow-plate attached to the upper surface of the side walls of said mercury-vessel, and a series of annular amalgamating riffles or troughs for containing mercury formed within said plate, through which a current of electricity may be passed, substantially as shown and described.

43. In an apparatus for the extraction of gold and silver from their ores, the combination, as hereinbefore set forth, of a vertical revolving mixing chamber or reservoir through which the water or slimes containing the ore to be treated are passed, a series of injectors or atomizers whereby the mercury may be forced into said chamber in the form of fine globules or spray, a revolving agitator within said chamber provided with a series of stirring-arms, and one or more sets of anodes and cathodes within said chamber, a flanged copper plate secured to and revolving with said chamber, an annular insulating-disk, substantially as described, secured to the lower surface of said copper disk or plate, a cylindrical mercury-vessel into which said mixing-chamber discharges and over which said disk and mixing-chamber revolve, means, substantially as shown, for electrifying said copper plate and the mercury in said mercury-vessel, a series of tubes for supplying mercury to said injectors, a pump connected therewith for the purpose of retransferring the contents of said vessel to said mixing-chamber, a coil of steam-heating pipes placed in the interior of said vessel, a wheel-bearing supporting said disk and chamber, through the spokes and hub of which steam is supplied to said atomizers, a bearing within said mercury-vessel, upon which said wheel, disk, and mixing-chamber revolve, and means, substantially as described, for revolving the same, an annular copper overflow-plate attached to the upper surface of the side walls of said mercury-vessel, a series of annular amalgamating riffles or troughs for containing mercury formed within said plate, through which a current of electricity may be passed, and a series of annular anodes respectively placed above and in proximity to said riffles, and revolving with said copper disk, and means, substantially as described, for insulating said anodes from said revolving disk, substantially as shown and described.

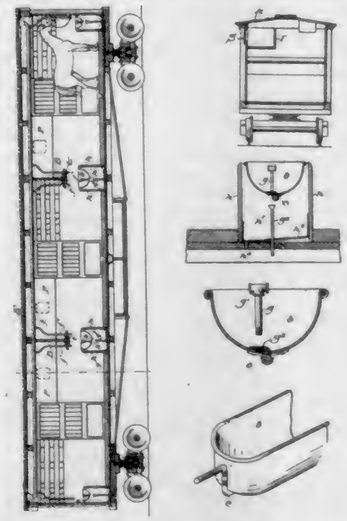
298,664. AGRAFFE FOR PIANO SOUNDING-BOARDS. CHARLES WILLIAM BREWER, Racine, Wis. Filed Apr. 6, 1883. (No model.)

Claim.—An agraffe for piano-fortes, consisting of two parallel frets applied to the bridge of the sounding-board, and the shouldered screw

298,664.

rounded on the binding-face or the under side of the shoulder, and adapted to bear upon the wires between the frets, substantially as and for the purposes specified.

298,665. LEAD-AND-WIRE SEAL. EDWD. J. BROOKS, East Orange N. J., assignor to E. J. Brooks & Co., New York, N. Y. Filed Mar. 5, 1884. (No model.)



Claim.—1. In combination with a seal-disk, a shackle of single wire, flat in cross-section, provided with notches in its respective edges and with sharp-pointed teeth formed of the metal from said notches, said teeth projecting rigidly from its edges, and having their point ends directed toward the middle of the shackle, substantially as herein specified.

2. In a lead-and-wire seal, the combination of a shackle of flat wire, having its threading end or ends toothed, and provided with one or more detector enlargements at or near each extremity, and a seal-disk having threading-holes to receive said threading end or ends, substantially as herein specified, for the purposes set forth.

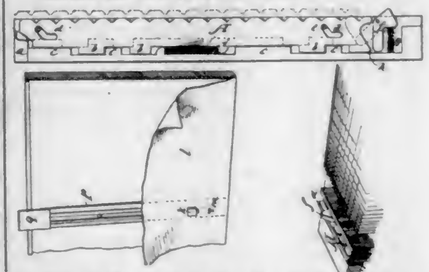
3. The combination, in a lead-and-wire seal, of a shackle of flat wire, having both ends notched and toothed, substantially as herein specified, and a seal-disk adapted to cross said shackle ends at its middle at the threading operation, as described, for the purposes set forth.

4. In combination with a shackle-wire, a seal-disk composed of a thin central portion of the required face-outline and diameter, and two cylindrical or semi-cylindrical portions, each having a concentric longitudinal threading-hole, and projecting equally on the respective sides of said central portion, substantially as shown, for the purpose set forth.

298,666. STOCK-CAR. GEO. D. BURTON, New Ipswich, N. H. Filed Jan. 14, 1884. (No model.)

Claim.—1. The pivoted feed-trough *b*, provided with the overflow-pipe *g*, and the trough-supporting shaft *c*, having its pivoting portion *c'* provided with a hand-wheel, *c²*, and ratchet *d*, to be held by a pawl on the car, all substantially as shown, and for the purpose described.

2. The pivoted feed-trough *b*, combined with the boxes *h'*, having the inclined bottom *h²* and the outlet *h³*, all substantially as shown, and for the purpose described.



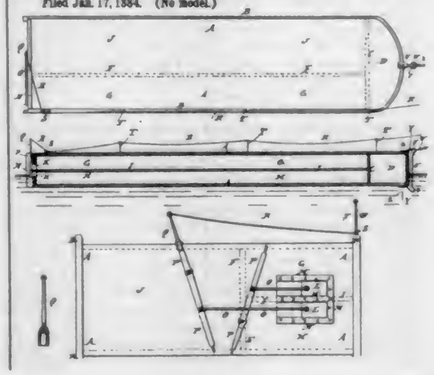
3. The car A, having transverse partitions extending part way from the top to the bottom of the car, strengthened at their lower ends by means of the transverse beams *i*, combined with feed-troughs pivoted beneath the said partitions, and extending into the compartments at either side thereof, substantially as described.

4. The feed-trough *b* and supporting-shafts *c c'* therefor, combined with the hand-wheels *c²*, and ratchet and pawl co-operating with the said shaft, substantially as described.

5. In a stock-car, the pivoted troughs *b* and operating devices therefor, combined with the boxes *h'* beneath them, and the doors *i*, affording access to the said troughs and boxes from the outside of the car, substantially as described.

6. The combination, with the feed and water trough having a threaded outlet-passage, of the hollow plug threaded at one end to enter said passage, and provided with a T-fitting at its other end, constituting a handle for said plug, which operates as an overflow for the trough, substantially as described.

298,667. PAPER-PERFORATING DEVICE. CORTLAND CARLTON, Kalamazoo, Mich. Filed Apr. 13, 1883. (Model.)



Claim.—1. The lever *f* and spring *g*, in combination with the cutter-bar A, having offsets *b*, slots *d*, point *h*, and a curved recess above the point, the spring *i*, adapted to force the bar down, and the holder-plates *a a*, having the offsets *e* and pins *c*, as and for the purpose specified.

2. In paper-perforators, the combination of bar A, formed with offsets *b*, holder B, having offsets or rests *c*, and means for causing an upward and endwise movement of the bar, substantially as shown and described.

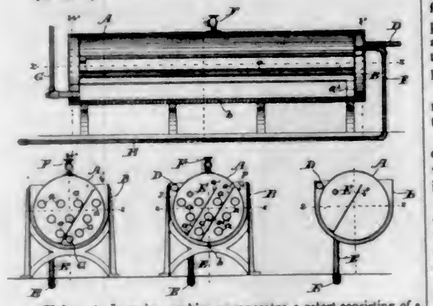
3. The combination of frame *p* and counter *o*, of soft metal, provided with tapes *q*, with a perforator and press-plates, substantially as described.

4. The block *k*, formed with prong *m* and points *n*, in combination with a paper-perforator and tympan-sheet of a press-platen, substantially as described.

298,668. DUMPING-BOAT. MICHAEL S. COLEMAN, New York, N. Y. Filed Jan. 17, 1884. (No model.)

Claim.—1. A dumping-boat in which are constructed on but one side of its longitudinal axis upper and lower water-tight compartments provided with openings which are closed by lever-operated gates, substantially as herein shown and described.

2. In a dumping-boat, the combination, with the boat A and the gate-opening lever P, of the separable eye-standards T and the trip-line R, substantially as herein shown and described, whereby the said lever can be readily operated from the tug to open the gate and dump the load, and the said lever-sections, standards, and trip-line will be automatically detached from the boat and saved, as set forth.



3. In a dumping-boat, the combination, with the bow of the boat, of the draw-bar U, having upper and lower loops, V, and the separable pin Y and its connecting-chain Z, substantially as herein shown and described, whereby the tow-line ring will be released automatically when the boat turns over, and can be readily raised into and secured in the upper loop without disconnecting the said tow-line, as set forth.

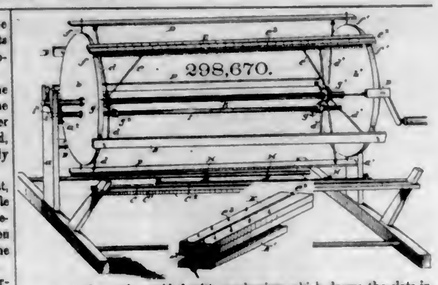
4. The combination, with a dumping-boat constructed with water-tight compartments having openings to admit and discharge the water for tilting or capsizing the boat, of a frame, M, provided with a tapering groove, and of a tapered gate, L, substantially as shown and described.

5. The combination, with a dumping-boat constructed with water-tight compartments having openings, of a frame, M, provided with packing N, a tapered gate, L, working in a correspondingly-tapered groove, and a lever, P, for operating said gate, substantially as shown and described.

6. The combination, with a dumping-boat, of a gate-operating lever, P, a separable lever-section, Q, and the trip-line R, substantially as herein shown and described.

298,669. RETORT FOR AMMONIA ICE-MAKING APPARATUS. MAHLON S. CONLY, Indianapolis, Ind., assignor of two-thirds to Thomas H. Butler and Orange R. Weaver, both of same place. Filed Aug. 10, 1883. (No model.)

Claim.—1. In an ice machine or apparatus, a retort consisting of a shell having tubes or pipes extending through from end to end, and partitions alternately extending from one end to near the other, in combination with the hot-water, aqua-ammonia, and gas pipes, substantially as set forth.



2. In a retort for generating ammonia-gas, a series of pipes and partitions whereby the aqua-ammonia is caused to flow in one direction through the retort, and the hot water is caused to flow in the other direction, thus subjecting the aqua-ammonia to a constantly-increasing heat, substantially as set forth.

3. In a retort for generating ammonia-gas, a series of pipes connecting with a hot-water inlet at one end, and arranged to secure several passages of the water through the retort before passing out at the other, and a series of partitions forming compartments connected with an aqua-ammonia inlet at a point near the hot-water outlet, and arranged to secure several passages of the aqua-ammonia through the retort in contact with the hot-water pipes before passing out at a point near the hot-water inlet, thereby subjecting the aqua-ammonia to a constantly-increasing heat and greatly increasing the amount of gas generated by the process, substantially as set forth.

4. The combination of the shell A, having pipes *a* and partitions *a' a²*, the casing B, surrounding the shell A, and having the spaces between itself and said shell divided into compartments by partitions, a hot-water-inflow pipe, C, a hot-water outflow, D, an aqua-ammonia inflow, E, an ammonia-gas outflow, F, and a weak-ammonia-liquor outflow, G, said several parts being arranged and operating substantially as shown and specified.

298,670. CLOTH MEASURING AND CUTTING MACHINE. EDWIN LODESKI CROSBY, Plymouth, Wis. Filed Mar. 8, 1884. (No model.)

Claim.—1. A contracting reel which contracts as the material is wound upon it, substantially as and for the purpose set forth.

2. A slat reel provided with mechanism which draws the slats in as the reel is revolved, substantially as and for the purpose set forth.

3. The combination, in a reel, of the slats D, collars *g g'*, sliding on the shaft of the reel, the ribs *d d'*, and feed-screw I, operating substantially as described, and for the purpose set forth.

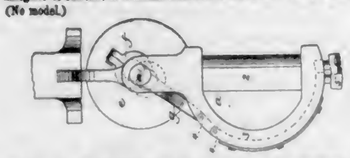
4. In a cloth measuring and cutting machine, the slats D, in combination with a marking-bar, E, the former being adapted to draw inward, and the latter having pins which are pushed outward from the bar as the material is wound upon the reel.

5. In a cloth measuring and cutting machine, the marking-bar E, having two rows of pins and an intermediate knife-groove, substantially as and for the purpose set forth.

6. In combination with the reel of a cloth measuring and cutting machine, the marking-bar E, having several sets of diverging rows of pins, one set for each strip of cloth, and an intermediate knife-groove, substantially as and for the purpose set forth.

7. In a cloth measuring and cutting machine, the marking-bar formed of an adjustable strip and a fixed strip, one of the bars carrying pins which project through holes in the other bar, together with mechanism, substantially as shown, which gradually and continually advances the pins as the cloth is wound upon the reel, substantially as and for the purpose set forth.

8. In combination with the reel of a cloth measuring and cutting machine, the marking-bar having two diverging rows of pins and an intermediate knife-groove, substantially as and for the purpose set forth.



9. In a cloth measuring and cutting machine, a reel having a cloth-cutting knife, M, in combination with mechanism, substantially as shown, which gradually and continually projects the knife outward as the reel is rotated, substantially as and for the purpose set forth.

10. In a cloth measuring and cutting machine, the marking and cutting bar formed of an adjustable strip and a fixed strip, one of the bars carrying pins and a knife-blade, which can be gradually and continually projected through openings in the other bar as the cloth is wound upon the reel, substantially as and for the purpose set forth.

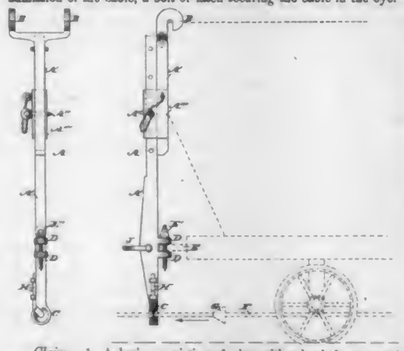
11. The combination, in a reel, of the slats D, the marking-bar provided with rows of pins and formed of a fixed and movable section, the collars *g g'*, sliding on the shaft of the reel, the ribs connecting the collars with the slats and the movable member of the marking-bar, and the feed-screw I, all operating substantially as described, and for the purpose set forth.

12. In a cloth measuring and cutting machine, the feed-screw I, which actuates reel, and contracting and expanding mechanism having a spur-pinion, *i*, in combination with a stud, *a²*, substantially as and for the purpose set forth.

298,671. MECHANICAL MOVEMENT. J. WESLEY DODGE, Malden, assignor of one-half to William Gordon, Boston, Mass. Filed Mar. 7, 1884. (No model.)

Claim.—1. The improved mechanical movement composed of the flexibly-supported stock *a*, adapted to be grasped by the operator's hand, and having two segmental guides, two segmental slides adapted to reciprocate in said guides, and provided with operating-tools, and mechanism for reciprocating said slides simultaneously in opposite directions, as set forth.

2. The combination of the stock having the handle portion and the segmental guides, the segmental slides 4 4, adapted to reciprocate in said guides, and provided with tools, as 5 5, the arbor *e*, journaled in the stock, and provided with two oppositely-projecting eccentrics and rods, *g g*, connecting said eccentrics with the slides 4 4, as set forth.

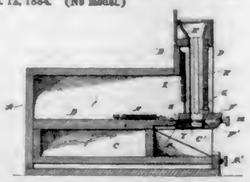


298,672. APPARATUS FOR TRANSMITTING POWER. PROSPER ACHILLE DOHM, Paris, France. Filed July 30, 1883. (No model.)

Claim.—The improvement in the means or apparatus for transmitting motion to machinery, the treadles A B, spring R, segment friction-clutch T T', acting alternately on wheels r r', to wind the spring R, which spring acts to revolve the driving-wheel E, acting to give motion, through the train of wheels P P' and pinions p p', to the wheel D, upon which the transmission-wheel V is carried, with or without brake F, and handle *m*, constructed and operating as and for the purpose herein set forth, and shown in the drawings as applied to a sewing-machine.

298,673. DEVICE FOR COUPLING CARS WITH CABLES. JOHN C. DOLAN, Houtzdale, Pa. Filed July 27, 1883. (No model.)

Brief.—An adjustable traction-bar having a hook for attachment to top of car, eyes for coupling it to the draw-links, and an open eye for admission of the cable, a bolt or latch securing the cable in the eye.



Claim.—1. A device consisting of a bar with a hook for connection with the body of a car, an eye for engagement with a traveling cable, and eyes for coupling with the draw-bar of the car, substantially as and for the purpose described.

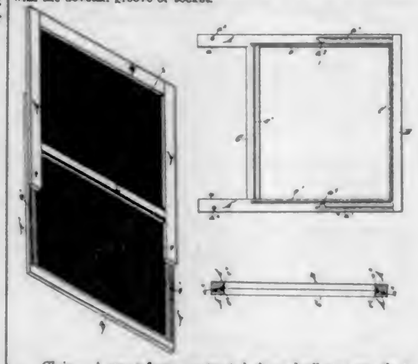
2. A bar, A, formed of two pieces adjustably fitted together, one piece having a hook, and the other having an eye at bottom, and eyes near the bottom, substantially as and for the purpose described.

3. A bar with a hook at top, eyes near the bottom, and an open eye at the bottom, in combination with a bolt or latch for closing said open eye, substantially as and for the purpose set forth.

4. The bar with top hook, coupling-eyes, and cable-eye, in combination with a coupling-eye, J, substantially as set forth.

298,674. COIN HOLDER AND DELIVERER. JAMES L. DONNELLY, New York, N. Y., assignor of one-third to J. L. Townsley, Vincennes, Ind. Filed Jan. 12, 1884. (No model.)

Claim.—1. The combination, with the box, of the drawer arranged therein, the transverse shaft, the alarm, and mechanism for operating the same, the plates secured to the shaft, and the lever locking device connected to a crank on the transverse shaft by a rod, and extending through a slot in the back of the box and engaging with the back of the drawer to lock the same, all the parts being arranged to operate substantially as described.



2. The combination, with the vertical holders and horizontal partition at the base of the same, of the slides provided with circular openings, and having semicircular plates secured to their under sides, the operating push-bars extending through the partition, the lever connecting them to the plates, the spring connected to the lever, the stationary plates secured to the partition, the transverse shaft, and the plates secured thereto, all operating as and for the purpose specified.

3. The combination, with the coin-receptacles, of the slides and mechanism for operating the same, and the transverse shaft and locking devices, and the plates for closing the coin-receptacles, substantially as specified.

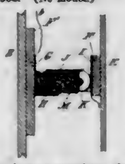
4. The combination, with the locking devices and the transverse shaft operating the same, and the plates secured to the shaft, of the alarm consisting of a ratchet-wheel having a part only of its periphery serrated and being secured on the transverse shaft, a pawl secured to the hammer-lever and operating the same, and a bell secured to the box, all operating to lock the device and to give a definite number of alarms when the same is unlocked, substantially as described.

298,675. WINDOW-SCREEN. THOMAS W. DOWLDS, Detroit, Mich. Filed Nov. 13, 1883. (No model.)

Brief.—A window-screen consisting of two duplicate parts. The top and bottom rails are grooved and provided with dovetail sockets and tenons. The frames are readily united on one side, and the opposite side is united by springing the frames sufficiently to engage the dovetail tenon with the dovetail groove or socket.

Claim.—A screen-frame constructed of two duplicate parts, the top and bottom pieces of said parts being each provided with a dovetail socket at one end and a dovetail tenon at the other end, said socket being limited in extension to the length to which the frames may be extended, and having a side orifice, a^2, communicating therewith at one extremity, the construction being such that the two frames may be readily united upon one side, and the opposite sides be united by springing the same sufficiently to engage the dovetail tenon of the one with the dovetail socket of the other, substantially as described.

298,676. TELEPHONE-TRANSMITTER. DANIEL DRAWBAUGH, Eberly's Mill, Pa., assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.) Patented in Belgium Jan. 10, 1884, No. 63,802.

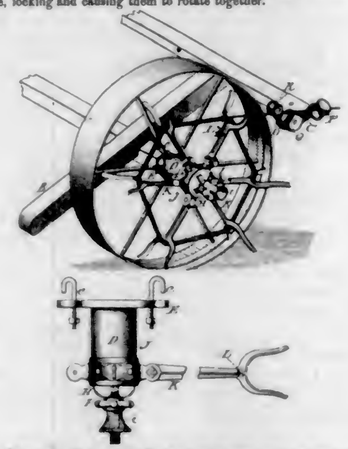


Claim.—1. In a telephone-transmitter, a box or case consisting, substantially, of a block of heavy metal, in combination with resistance-varying electrodes and circuit-connections contained in recesses or openings formed in said block, a back or base board, a means of supporting the box or case thereon, and pieces or blocks of elastic material inserted between said case and the base-board, substantially as described.

2. In a telephone-transmitter, the combination of a back or base board, a box or case containing resistance-varying electrodes, and one or more blocks or pieces of elastic material interposed between the base or back board, the box or case being sustained wholly by said elastic supports, substantially as described.

3. In a telephone, the combination of the box B, elastic blocks C, back board, A, and screws D, substantially as described.

298,677. TELEPHONE-TRANSMITTER. GEORGE W. DRAWBAUGH, Eberly's Mill, Pa. assignor to the People's Telephone Company, of New York. Filed Nov. 12, 1883. (No model.)



Claim.—1. In a telephone-transmitter, the combination of a diaphragm, an electrode inclined or having an inclined face placed at an angle, preferably forty-five degrees, the said electrode being pivoted or hinged to said diaphragm, and a second electrode inclined or having an inclined face to correspond to the inclination or to the inclined face of the first-mentioned electrode, the said second electrode being rigidly secured to a support and receiving upon its inclined face the inclined face of the first-mentioned electrode, which rests upon it by gravity, substantially as described.

2. In a telephone, two electrodes inclined or having faces inclined at an angle, preferably, of forty-five degrees, one electrode being rigidly fixed and the other electrode hinged or pivoted, the last-mentioned electrode resting, by gravity, with its inclined side or face upon the inclined side or face of the fixed electrode, one of said electrodes being attached to the diaphragm and the other electrode being rigidly held in a support, substantially as described.

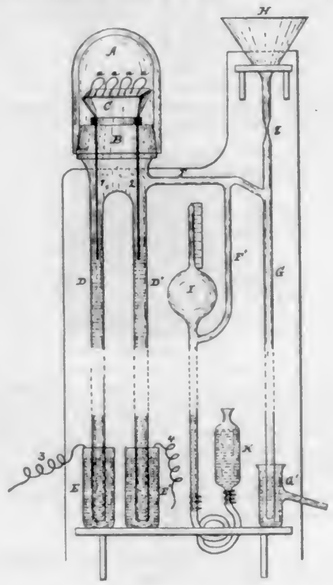
3. The combination of the diaphragm E, carbon H, carbon M, bracket G, bracket J, bracket I, a means of hinging or pivoting said brackets I and J, and a support, B, substantially as described.

298,678. REEL FOR CHECK-ROW CORN-PLANTERS. JOHN C. DUPEE and CHARLES P. HOUSUM, Decatur, assignors to Lewis E. Waterman, Mason City, Ill. Filed Dec. 1, 1880. Renewed Mar. 2, 1883. (Model.)

Brief.—The spindle carrying the pivoted forked arms is sleeved onto a hub that is removably attached to the hub and spokes of the transporting-wheel. In paying out the cord the spindle, with its arms, is by a nut and spring-washer frictionally clamped to the hub, which admits of a rotation independent of said hub, and is controlled to prevent unwinding. In taking up the rope a key is passed through the hub and spindle, locking and causing them to rotate together.

Claim.—1. In a reel for laying a check-row wire, a sleeve, D, secured to the wheel A, and having its outer end formed into a spindle, *d*, with a conical part, *d'*, substantially as described, the hub G', with reel-arms, spring-disk H, and nuts I *i*, substantially as and for the purpose set forth.

2. In a reel for laying a check-row wire or cord, in combination, the spindle *d*, fixed to the wheel A, to rotate therewith, and hub G', provided with reel-arms, and friction spring or disk, to control the motion of the reel, substantially as and for the purpose specified.



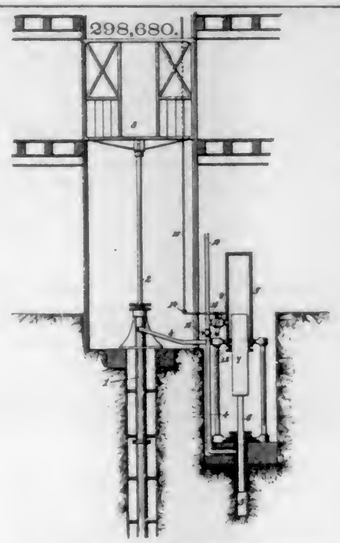
3. A reel constructed substantially as described, attached to the wheel of a corn-planter for laying and for taking up the check-row wire or cord, said reel adapted to rotate in the same or in opposite directions from the direction of rotation of the wheels of the planter, the latter motion being controlled by friction devices and the former motion controlled by a lock connecting it with the wheel, substantially as and for the purpose specified.

4. The hub G', with its forked and hinged arms K, in combination with the wheel of a corn-planter, as and for the purpose specified.

5. In combination with the fixed axle A', wheel A, journaled thereon, and a spindle fixed to said wheel, a reel journaled on said spindle, and its rotation thereon controlled by friction devices, whereby the tension of the check-row wire or rope may be regulated in laying it, substantially as and for the purpose specified.

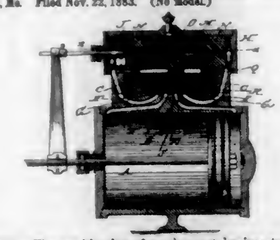
6. In combination with the fixed axle A', wheel A, journaled thereon, and a spindle fixed to said wheel, a reel the hub of which is journaled on said spindle, and its rotation thereon controlled by a friction-disk, H, and nut I, adapted to force the reel-hub endwise into frictional contact with a surface on said spindle, substantially as and for the purpose specified.

298,679. METHOD OF TREATING CARBONS FOR ELECTRIC LIGHTS. THOS. A. EDISON, Menlo Park, N. J., assignor to the Edison Electric Light Company, New York, N. Y. Filed July 3, 1880. (No model.)



Claim.—1. The method of preparing carbons for incandescing electric lamps having broad or enlarged ends, consisting in first carbonizing the filament, converting its body into carbon, and then subjecting the broad ends or enlarged portions to the action of heat *in vacuo*, substantially as set forth.

2. The combination of a vacuum-chamber, a platform therein for the carbons, an exhausting apparatus, and means for imparting a high heat to the broad ends of the carbons while *in vacuo*, substantially as shown and described.



298,680. HYDRAULIC ELEVATOR. EDWD. B. ELLINGTON, Chester, County of Chester, England. Filed July 16, 1881. (No model.) Patented in England Dec. 9, 1880, No. 5,149, and in France Apr. 5, 1881, No. 142,135.

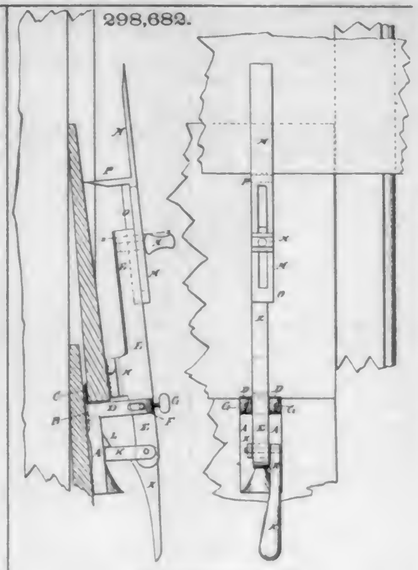
Claim.—The combination of a vertical water-tube, a receiver, and a differential piston interposed between the cylinder of a hydraulic lift and the source of water-supply, whereby the column of water acting on the said piston increases proportionally to the protrusion of the plunger from the lift-cylinder, substantially as described.

298,680.

298,681. STEAM-ACTUATED VALVE. GEORGE EDMUND ELLIOTT, Calais, Me. Filed Nov. 22, 1883. (No model.)

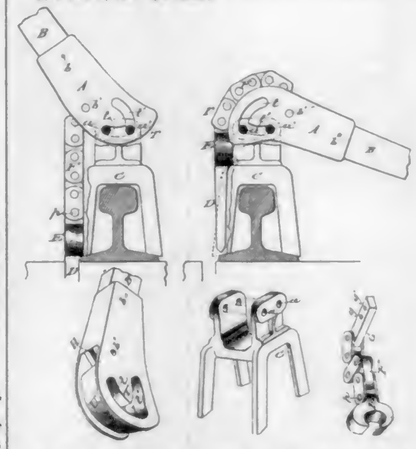
Claim.—The combination of a valve-seat having steam-channels opening at the center and exhaust-channels opening at the sides of the steam-channels, and extending upward, a steam-chest forming a cylinder at its upper end, having ports at its ends connecting with the lower exhaust-channels, and ports opening into the upper exhaust-pipes, and having the live-steam pipe entering at its side, a double-headed piston sliding in the cylindrical portion of the steam-chest, and having a longitudinally-slotted central portion, and a slide-valve consisting of two cups connected by a yoke extending up into a lug projecting into the slot in the piston, as and for the purpose shown and set forth.

298,682. WEATHER-BOARD GAGE. DWIGHT H. FINCH, Aurelia, Iowa. Filed Sept. 23, 1883. (No model.)



Claim.—1. The combination of a gage-board having at its lower part the toothed bar A, roughened on the lower part of the forward side, rabbeted and provided with the slotted stud D, the steel plate or weather-board B, fastened in the rabbet of bar A, and having spurs C C on its forward end, the adjustable bar E, pivoted in the slot of said stud, and having on its forward side a jaw, H, at the upper side of said stud, and the pivot-pin F, all substantially as shown and described.

2. In a weather-board gage, the combination, with the weather-board having spurs C C, and the bar E, having jaw H, of the elbow-lever K, having an arm resting against said jaw and operating as a cam upon bar E, whereby the weather-board may be clamped between the jaw and spurs, as described.



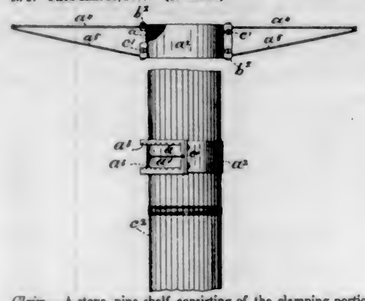
3. In a weather-board gage, the combination, with the jaw H, having tapered dovetailed groove, of the rubber plate J, having tapered dovetailed rib, substantially as herein shown and described, whereby the said jaw is kept from marring the weather-boards, as set forth.

298,682.

298,683. NAIL-EXTRACTOR. HERVEY W. FOWLER, Chicago, Ill. Filed Feb. 11, 1884. (No model.)

Claim.—1. The lever-bar socket A, having a continuous bifurcated slot, T, and which, turning upon and around the stationary axes *a* and *a'*, in combination with them, turns upon two separate fulcrums without breaking in its motion a point of contact between the periphery of the drum-face U and an imaginary perpendicular line touching it when at rest, substantially as specified.

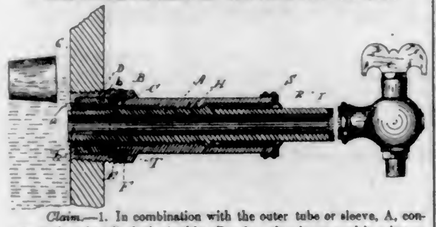
2. In a spike or nail extractor, the combination of the jointed claw-shaft F and the drum-faced and slotted lever-bar socket A with the stand C, having the stationary axes *a* and *a'*, all substantially as and for the purpose specified.



298,684. PRESERVING THE AROMA OF COFFEE. MOSES FIELD FOWLER, Boston, Mass. Filed June 11, 1883. (No specimens.)

Claim.—1. In the treatment of coffee to preserve its aroma and obviate its injurious properties, the improvement consisting in immersing the coffee in an infusion or decoction of flaxseed and then drying, substantially as described.

2. The process of treating coffee, consisting in steeping or macerating flaxseed in water to form an infusion or decoction, immersing the roasted coffee-berry while hot therein, and drying, substantially as described.

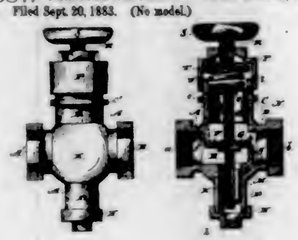


3. As a new article, coffee impregnated with an extract or decoction of flaxseed, substantially as described.

298,685. STOVE-PIPE SHELF. FREDERICK A. GARDNER, Buffalo, N. Y. Filed Mar. 16, 1883. (No model.)

Claim.—A stove-pipe shelf consisting of the clamping portions *a* *a'* a^2, the semicircular wire *b*, and rods a^4 a^5, having their ends terminating in hooks and connected to the part *a* by being passed through the notches a^3 and then through perforations, substantially as specified.

298,686. FAUCET FOR DRAWING BEER AND OTHER LIQUORS. PETER GARDNER, San Rafael, Cal. Filed Oct. 10, 1883. (No model.)



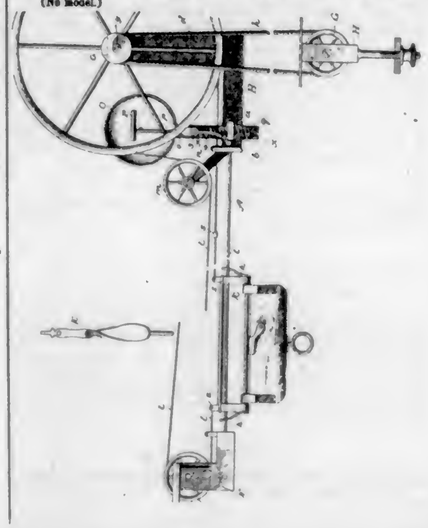
Claim.—1. In combination with the outer tube or sleeve, A, constructed as described, the bushing D, adapted to be secured in a keg or vessel, the internal tube, I, screw-threaded externally, and the screw-threaded annulus adapted to be secured in the internally-threaded bushing D, substantially as and for the purposes specified.

2. In a faucet, the combination, with the bushing D, having its exterior threaded and provided with the inner annular flange, *a*, and the internally-threaded offset at its forward end, and the tube I, substantially as shown, of the sleeve A, having the internal threads, H, the externally-threaded forward extension to engage the threaded annulus T in the bushing D, and the lining *b*, all adapted to operate substantially as and for the purposes specified.

3. In a faucet, the combination, with a vessel having an externally-threaded bushing, of the sleeve A, having its forward and rear ends respectively provided with external threads, the draft-tube I, the gland R, and internally-threaded cap S, with suitably-interposed packing between the gland-cap and tube to form a fluid-tight joint between the sleeve and the draft-tube, substantially as specified.

298,687. PRESSURE-REGULATOR. JOHN F. GODDING, New Haven, Conn. Filed Sept. 20, 1883. (No model.)

Claim.—1. In a pressure-regulator, the high and low pressure chambers, the dividing-partition provided with a connecting-opening, the hollow valve-rod passing through the opening and provided with a valve-head to close said opening on the high-pressure side of the dividing-partition, the piston or equivalent device attached to the rod acted upon by the pressure in the high-pressure chamber alone, and forced outward thereby with a force equal to that exerted by said pressure upon the valve-head to force it and the rod inward to close the valve, the piston or equivalent device on the other end of the rod, adapted to be acted upon by the pressure in the low-pressure chamber to move the valve-rod so as to close the valve, and an adjustable spring device or its equivalent adapted to exert a yielding force upon the rod to move it so as to open the valve, substantially as and for the purpose set forth.



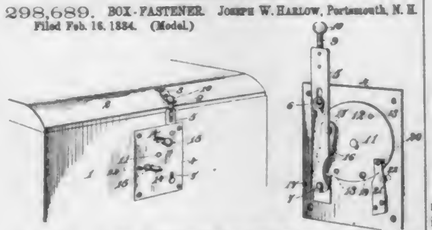
2. In a pressure-regulator, the high and low pressure chambers, the dividing-partition F, the valve-opening therein, the valve-rod provided with a longitudinal passage, the valve-head thereon acting on the high-pressure side of the partition, the piston on the outer end of the rod working in a cylinder open to the air beyond the piston, and having an area equal to that of the portion of the valve-head upon which the contents of the high-pressure chamber exert an inward pressure to close the valve, the piston on the other end of the rod working in a closed cylinder and adapted to be pressed outward by the pressure in the low-pressure chamber, so as to close the valve, and adjustable means for exerting a yielding pressure upon the valve-rod to move it so as to open the valve, all combined and operating substantially as shown and described.

3. The combination of the casing having the central valve-chamber divided into the high and low pressure chambers and the upper and lower hollow cylindrical portions connected therewith, the valve-rod carrying at each end a piston-head working in one of the cylindrical portions, and provided with a longitudinal passage opening at each end into the space beyond the piston-head and outside of the valve-chamber, the cap closing the end of the upper cylindrical portion of the casing, and adjustable means for exerting a yielding downward pressure on the valve-rod to open the valve against the action of the pressure in the pipes, substantially as and for the purpose described.

4. The combination of the casing having the central valve-chamber divided into the high and low pressure portions and having the upper and lower cylindrical chambers, the pistons working in the latter, the cap on the upper cylinder, the hand-screw working through the cap, the follower thereon within said cap, the spring between follower and the top of the piston, and the valve-rod attached at each end to one of the pistons, and provided with a longitudinal passage opening into the space beyond the pistons and outside of the valve-chamber, substantially as and for the purpose set forth.

5. In combination with the valve, its operating-piston working in a suitable cylinder, the cap upon the cylinder for inclosing and holding the pressure-spring and its adjusting mechanism in place, and the valve-rod provided with a longitudinal passage opening into the space above the piston and into the open air below and outside of the valve-chamber, substantially as and for the purpose set forth.

298,688. CASH-CARRIER. RICHARD GORNALL, Baltimore, Md., assignor of one-half to George A. Dubreuil, same place. Filed Apr. 3, 1884. (No model.)



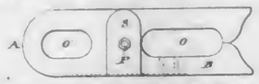
Claim.—1. The endless cord or wire, combined with the driving-wheel at one end and a supporting-wheel at the other, a frame adapted to support the car or pouch included in the endless wire or cord, the wheels and cord or wire being adapted to move freely, and freely-moving devices connected to the driving-wheel and pulley G, arranged within reach of the salesman, whereby the car or pouch may be propelled in either direction, substantially as described.

2. The endless cord or wire, combined with the driving-wheel at one end and a supporting-wheel at the other, a frame adapted to support the car or pouch included in the endless wire or cord, the wheels and cord or wire being adapted to move freely, and freely-moving devices connected to the driving-wheel and pulley G, arranged within reach of the salesman, whereby the car or pouch may be propelled in either direction, and a bell provided with a lever adapted to be operated by the bead upon the wire, substantially as described.

3. The endless cord or wire, combined with the driving-wheel at one end and a supporting-wheel at the other, a frame adapted to support the car or pouch included in the endless wire or cord, the wheels and cord or wire being adapted to move freely, and freely-moving devices connected to the driving-wheel and pulley G, arranged within reach of the salesman, whereby the car or pouch may be propelled in either direction, and a wire or band, *l'*, substantially as described.

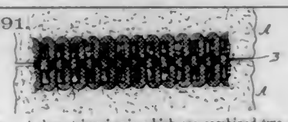
4. In combination, the cord or wire *l*, its supporting and driving wheel, a bell mounted upon the bracket near the driving-wheel, and a bead upon the cord or wire *l*, adapted to operate the bell through the slotted arm 4, all substantially as described.

298,689. BOX-FASTENER. JOSEPH W. HARLOW, Portsmouth, N. H. Filed Feb. 16, 1884. (Model.)



Claim.—1. The combination of an elastic or spring sliding plate, a rigid locking-head secured thereto, a rotating disk, an arm connecting the disk and sliding plate and pivoted to both to slide it longitudinally for engaging or disengaging the rigid locking-head from a catch on a lid or cover, and a knob connected to the disk to rotate it, substantially as described.

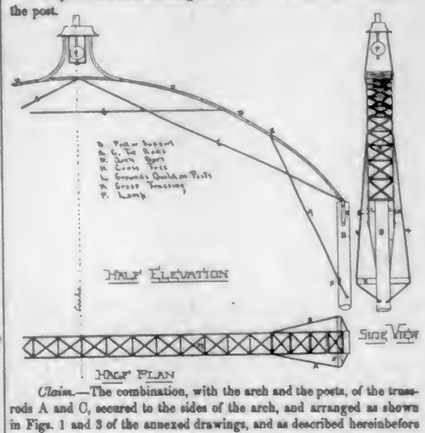
2. The combination of a catch consisting of a claw or fork adapted to receive a shank, and having a recess at and around the union of the arms forming the claw or fork, a rigid locking-head adapted to fit the recess, attached to a shank adapted to pass into the claw or fork, a spring or elastic plate carrying the shank and head, a rotating disk, and an arm connecting and pivoted to the disk and plate, whereby rotation of the disk causes reciprocation of the plate to permit the engagement or disengagement of the catch and locking-head, substantially as described.



3. The combination, with a catch on the box-lid, of a spring or elastic sliding plate carrying a rigid locking-head and capable of springing laterally to engage and disengage the locking-head and the catch on the lid, a rotating disk, an arm connecting and pivoted to the disk and plate, a spring-catch for holding the disk against rotation, and a knob or handle to rotate the disk for drawing the plate downward when its locking-head engages the catch on the lid to clamp the lid on the box, substantially as described.

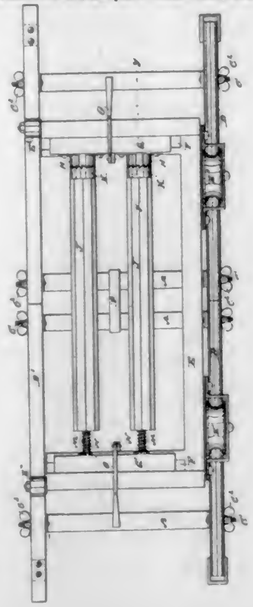
298,690. CAR-COUPLING LINK. DANIEL HAYES, Cambridgeport, Mass. Filed Sept. 24, 1883. (No model.)

Claim.—The herein-described coupling-link, having slots in each end for coupling-pins, and a hooked jaw pivoted upon the body of the link opposite to a corresponding jaw in the body of the link, against which its free end is pressed by a spring forming one of the slots, (the other slot being formed in the body of the link,) said jaws being so formed as to be opened by the pressure of the coupling-pin in entering the slot, substantially as described.



298,691. DRESS-TRIMMING. ADOLPH HIRSCH, New York, N. Y. Filed Feb. 21, 1884. (No model.)

Claim.—A dress-trimming in which are combined two strips of fur and a strip of braid united to both fur strips, substantially as and for the purpose described.

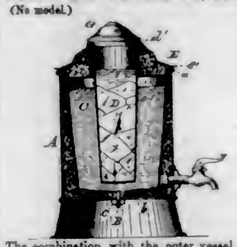


298,692. SKELETON ARCH FOR THE SUPPORT OF ELECTRIC WIRES. GEORGE M. HOAG, Evansville, Ind. Filed Sept. 24, 1883. (No model.)

Brief.—Truss-rods crossing each other are secured to the arch and the post.

Claim.—The combination, with the arch and the posts, of the truss-rods A and C, secured to the sides of the arch, and arranged as shown in Figs. 1 and 3 of the annexed drawings, and as described hereinbefore in this specification.

298,693. QUILTING ATTACHMENT FOR SEWING-MACHINES. GEORGE O. HOUCK and CHARLES SMITH, Springfield, Ohio, assignors of one-third to Richard H. Houck, same place. Filed Oct. 13, 1883. (No model.)

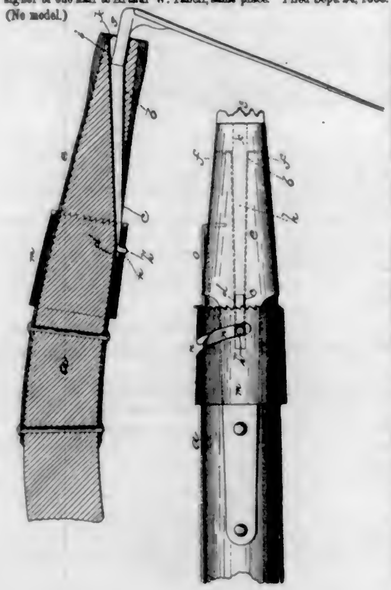


Claim.—1. In a quilting attachment for sewing-machines, the combination, with the rails D D', of the frame E, the rollers E' E', the sliding bars G G', held in the end bars of the frame, the clamps O, pivoted to the bars G, the rollers J, the ratchets H and K, and the springs N, substantially as herein shown and described.

2. In a quilting attachment for sewing-machines, the combination, with the rails D D', of the frame E, the bars G G', sliding in the end pieces of the frame, the rollers J J, and of the clamp O, pivoted to the bars G G', for holding the said bars G G' to the end pieces of the frame E, substantially as herein shown and described.

3. The combination, with the cross-bars A, supported by legs A', of the longitudinally-slotted clips B, secured to the ends of the bars A, the sliding plates C, the bolts C', the winged nuts C', the track-rails D D', a carriage resting on the track-rails D D', and of rollers held in the carriage, to which rollers the quilt can be fastened, substantially as herein shown and described.

4. The combination, with the cross-bars A, supported by legs A', of the longitudinally-slotted clips B, having flanges B', the sliding plates C, the bolts C', the winged nuts C', the track-rails D D', a carriage resting on the track-rails D D', and rollers held in the carriage, to which rollers the quilt can be fastened, substantially as herein shown and described.



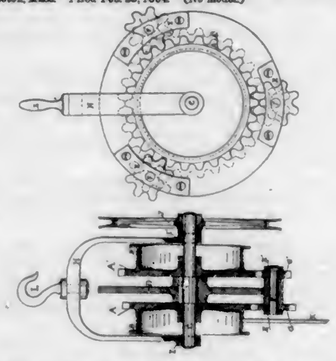
298,694. WATER-COOLER. EDGAR B. JEWETT, Buffalo, N. Y. Filed Mar. 5, 1884. (No model.)

Claim.—1. The combination, with the outer vessel, A, having the water-receptacle seated therein, of the lid E, having the receptacle D rigidly secured thereto, substantially as specified.

2. In a water-cooler, the combination, with the outer vessel, A, having the receptacle C seated therein and secured to the bottom portion thereof, of the lid E, having a central opening for the passage of the receptacle D, provided with a lid, G, substantially as specified.

298,695. TOOL-HANDLE. JAMES P. JOHNSON, Washington, D. C., assignor of one-half to Arthur W. Tancil, same place. Filed Sept. 24, 1883. (No model.)

Claim.—1. The combination, in a handle for farm or garden tools, with the inclined tang-seat and metal socket having the recesses *f f* and registering terminating slots and inclined seat in its ferrule end, of the tang having the head provided with an inclined lug to fit the inclined recess or seat, and a toe, A, at its point, and the slotted ratcheted sleeve engaging the toe by its slot and a retaining-spring by its ratchet to hold the tool in place, substantially as specified.



2. The combination, with the handle and the tang seated in an inclined tang-seat, and provided with a toe at its point, of the retaining-spring and the ratcheted slotted sleeve, substantially as specified.

298,696. CARTRIDGE-SHELL. GEORGE KYNOCH, Witton, near Birmingham, County of Stafford, England. Filed Jan. 9, 1882. (No model.) Patented in England Nov. 1, 1881, No. 4,776.

Claim.—The improvement in the art of manufacturing cartridge-shells, which consists in making the shell or tube with a complete bottom having a central recess and applying thereto an external flanged head provided with an inwardly-projecting nipple, forming the percussion-chamber, and then subjecting the parts thus connected to a drawing and heading pressure, whereby the cap is made to closely fit the configuration of the bottom of the tube or shell and the two parts are intimately united with each other, substantially as described.

298,697. DIFFERENTIAL GEARING. RICHARD LAVERY, South Boston, Mass. Filed Feb. 23, 1884. (No model.)

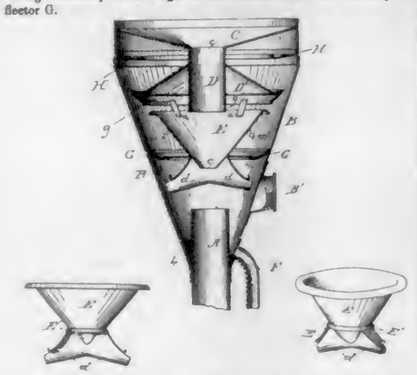
Claim.—1. The combination of two external toothed gears of equal diameters and number of teeth, mounted and free to revolve upon a central axis, with one or more sets of coupled pinions of unequal diameters and number of teeth, free to revolve and carried upon bearings secured to the rim of a central wheel, said pinions rolling around and gearing into the two external toothed gears, for the purpose specified.

2. The combination of two external toothed gears of unequal diameters and number of teeth, mounted and free to revolve upon a central axis, with one or more sets of coupled pinions of equal diameters and number of teeth, free to revolve and carried upon bearings secured to the rim of a central wheel, said pinions rolling around and gearing into the two external toothed gears, for the purpose specified.

3. The combination of two external toothed gears of unequal diameters and number of teeth, mounted and free to revolve upon a central axis, with one or more sets of coupled pinions of unequal diameters and number of teeth, free to revolve and carried upon bearings secured to the rim of a central wheel, said pinions rolling around and gearing into the two external toothed gears, for the purpose specified.

4. The combination of the two central external toothed gears, A A', with the coupled pinions G G', G G', G G', shafts F F F, outside bearings, E E', E E', E E', the wheel D, central shaft, C, bearings I I', and hanger H, substantially as shown, and for the purpose specified.

5. The outside bearings, E E', E E', E E', in combination with the wheel D, shafts F F F, coupled pinions G G', G G', G G', gears A A', drums B B', and shaft C, substantially as shown and specified, and for the purpose set forth.



6. The combination of the two drums B B' with the gears A A', coupled pinions G G', G G', G G', bearings E E', E E', E E', shafts F F F, wheel D, and the central shaft, C, supported as described, substantially as shown, and for the purpose set forth.

7. The chambered hook M, swivel or otherwise, containing soft-metal or other packing for the protection of the rope or hoisting-rigging, substantially as shown.

298,698. CONDENSER-HEAD FOR EXHAUST-PIPES OF STEAM-ENGINES. WILFRED C. LYMAN, Chicago, Ill. Filed Sept. 10, 1883. (No model.)

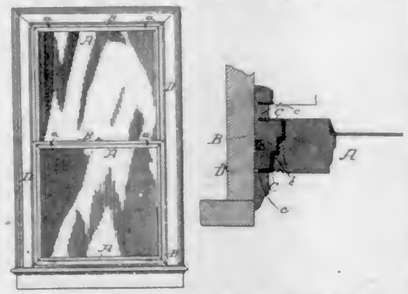
Claim.—1. The combination of the deflector E, sub-deflector E', and the shell B, substantially as set forth.

2. In an exhaust-head, the combination of the shell B, deflector having outwardly-flared edges E, sub-deflector E', and auxiliary deflector G.

3. In an exhaust-head, the combination of the shell B and deflectors D' and E with the auxiliary deflector G, as set forth.

4. The combination of the shell B and the upper deflector provided with the sub-deflector *g*, the lower edges of which are slightly flared outward, with the lower deflector, substantially in the manner set forth.

5. The combination, in a condensing-head for steam-exhaust pipes, of the shell B, the upper deflector provided with the sub-deflector *g*, as described, the lower deflector provided with the sub-deflector E', and the auxiliary deflector G.



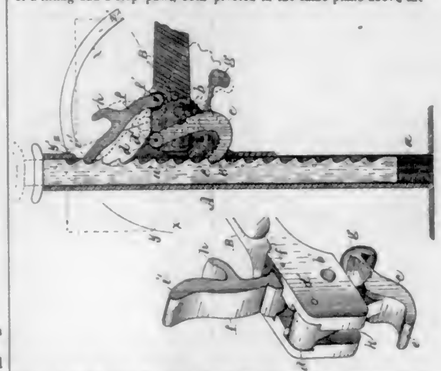
6. The combination, in a condensing-head for exhaust-steam pipes, of the shell B, upper deflector provided with the sub-deflector *g*, the lower deflector provided with the sub-deflector E', and the auxiliary deflectors G and H.

7. In an exhaust-head, the combination of the upper deflector, the lower deflector, E, provided with a sub-deflector, E', and the shell B, as hereinbefore described.

8. In an exhaust-head, the combination of the shell B, the upper deflector, the lower deflector, and the auxiliary deflector H, substantially as specified.

298,699. WINDOW. ANTON MATUSKA, Chicago, Ill. Filed Oct. 20, 1883. (No model.)

Brief.—A sliding window-sash consisting of rabbeted outer frame and sash, the former covered with a sheet-metal covering or casing which comes short of the outer edge, to permit the fitting of the same.



Claim.—1. In a window, as described, the outer frame having its inner edges provided with a series of inverse rabbets, which latter, together with the sides thereof, are covered with a sheet-metal casing, in combination with the inner window-sash, the outer surfaces of which are provided with a corresponding series of rabbets, substantially as set forth.

2. A sliding window-frame, the sides and inner surfaces thereof which are contiguous to an inner frame being provided with a sheet-metal covering coming short of the outer edges of said sliding frame, so as to permit the fitting of the same in position.

298,700. LIFTING-JACK. OLIVER K. MCINTIRE, Springfield, Ohio. Filed Mar. 15, 1884. (No model.)

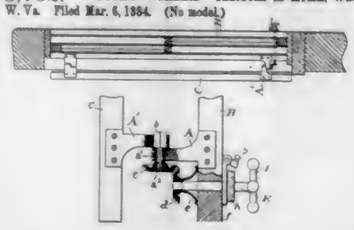
Claim.—1. In a lifting-jack, the combination, with the lifting-bar and lever, of a lifting and a stop pawl, both pivoted in the same plane of said lever above the fulcrum of the same, the lifting-pawl being suspended below said lever, and having its pivotal end thrown outward over the fulcrum of the latter when operated, whereby the power necessary to operate in lifting is decreased toward the end of the throw of the lever, substantially as set forth.

2. In a lifting-jack, the combination, with the lever and lifting-bar, of a lifting and a stop pawl, both pivoted in the same plane above the

fulcrum of said lever, the pivot of the lifting-pawl being about one-half greater distance from the fulcrum-pin than the pivot of the stop-pawl, whereby said lifting-pawl is caused to lift twice the vertical height of the latter in operating the same, as set forth.

3. The combination and arrangement, with the lever and lifting-bar, of the two pawls pivoted in substantially the same plane of the lever, the lower or lifting pawl being pivoted at the upper angle of the end of said lever, suspended through a slot therein below the same, and provided with a weighted knob extending therefrom, to disengage it from the lifting-bar and to aid it by its gravity in engaging therewith, substantially as set forth.

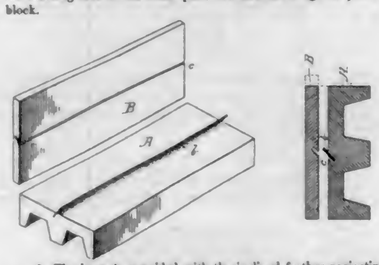
4. In a lifting-jack, the combination, with standard *a*, lifting-bar *a'*, and lever B, with slot *k*, of pawls *c* and *f*, pivoted to the latter, as described, said pawl *c* being suspended below said lever and provided with a weighted knob, and adapted to be operated substantially as set forth.



298,701. PITMAN. LEBBEUS BALDWIN MILLER and PHILIP DUHEL, Elizabeth, N. J. Filed Dec. 8, 1883. (No model.)

Claim.—1. In a pitman, the combination of an opening, a fixed nut formed separate from the pitman, a block adapted to slide in said opening, and a regulating-screw provided with a thread engaging said nut, and with an extension attached to said sliding block, substantially as and for the purpose described.

2. The combination, with a pitman having an elongated opening, a nut fixed in said opening, and a block free to slide therein, of an adjusting-screw passing through the head of said pitman and engaging said nut, and provided with an extension entering said sliding block and holding it firmly in position and against lateral motion, substantially as described.

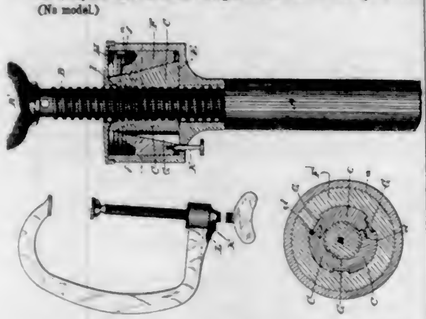


298,702. SHUTTER-WORKER. THEODORE A. MYERS, Wheeling, W. Va. Filed Mar. 6, 1884. (No model.)

Claim.—A shutter-worker having a hinge part, A, for the window-frame, with a round hole, *a*, for the pintle, a pintle having its lower part round, to fit the said hole, and its upper end, *b*, square and larger than the round part, a hinge part, A', for the shutter, having a square hole, *b'*, a bevel-gear on the round part of the pintle, another gear meshing therewith and mounted on a shaft to extend through the frame or wall, and means on the inner end of the shaft to hold it from turning, as set forth.

298,703. MEANS FOR MOUNTING STEREOTYPE OR ELECTROTYPE PLATES. ROBERT W. NELSON, Chicago, Ill., assignor to the American Press Association, same place. Filed Aug. 7, 1882. (Model.)

Claim.—1. A base-block and a stereotype-plate, the two parts meeting each other on one plane, in combination with an inclined key or lug extending from the meeting face of one part into an inclined recess in the meeting face of the other part, and thus securing the plate to the block.



2. The base A, provided with the inclined feather projecting from the upper side thereof, which side otherwise is a plain surface, substantially as described.

3. The plate B, having a plain under side, provided with an inclined groove in said side for the reception of a feather.

4. The combination of the base with feather *b*, the latter removably inserted in an inclined groove in the upper side of and projecting above said base.

5. The combination of base A, having an inclined groove in its upper side, the feather *b*, and the plate B, provided in its under side with an inclined groove.

298,704. SCREW-JACK. DANIEL W. NORRIS, Elgin, Ill., and MICHAEL NEIL, Dayton, Ohio; said Norris assignor to said Neil. Filed Apr. 4, 1884. (No model.)

Claim.—1. The combination, with a screw-shaft, of a divided conical nut and a sliding ring or sleeve for holding the parts of the nut together and in engagement with the screw-shaft, substantially as described.

2. The combination, with a screw-shaft, of a divided conical nut and an inclosing ring or sleeve provided with inclines for opening the parts of the nut, so as to release the shaft.

3. The combination of a screw-shaft, a divided conical nut having wedge-shaped recesses, substantially such as described, and an inclosing ring or sleeve operating normally to keep the nut-sections in engagement with the shaft, and provided with projections, substantially such as described, for opening the parts of the nut when the ring or sleeve is moved longitudinally, substantially as described.

4. The combination of the screw-shaft, a divided conical nut, an inclosing ring or sleeve for keeping the parts of the nut together and in engagement with the shaft, and a spring for holding the sleeve in position.

5. The combination of a screw-shaft, a divided conical nut having the wedge-shaped recesses, the inclosing-sleeve having the wedge-shaped projections, and the spring.

6. The combination of the screw-shaft, a divided conical nut, the inclosing-ring, and means, substantially as described, for sliding the said inclosing ring or sleeve.

7. The combination of the screw-shaft, a divided conical nut, the inclosing-sleeve and the push-pin for sliding said sleeve, and the spring, substantially as described.

8. The combination, with the casing or frame of a screw jack or clamp, of a screw-shaft, a divided conical nut, and an inclosing ring or sleeve, all arranged within the casing substantially as described.

9. The combination, with the casing or frame of a screw jack or clamp, of a screw-shaft, a divided conical nut, an inclosing ring or sleeve for forcing the parts of the nut together, a spring for holding the sleeve in position, and means, substantially as described, for moving the sleeve against the tension of the spring.

10. The combination, in a screw jack or clamp, of a screw-shaft, a frame or casing having its inner lateral walls parallel, a screw-shaft, a divided conical nut, and a ring or sleeve having its interior made conical to correspond to the divided nut, and its exterior formed to correspond to the parallel walls of the casing, substantially as described.

11. The combination, in a screw jack or clamp, of a screw-shaft, a frame or casing having its inner lateral walls parallel, a divided conical nut, and a ring or sleeve having its interior made conical to correspond to the divided nut, and its exterior formed to correspond to the parallel walls of the casing, a spring operating upon the inclosing-ring, and the push-pin for moving said ring against the tension of the spring.

12. The combination of a screw-shaft, a divided nut, a casing or holder within which the divided nut is arranged, and a spring operating to force the parts of the nut together and into engagement with the screw-shaft.

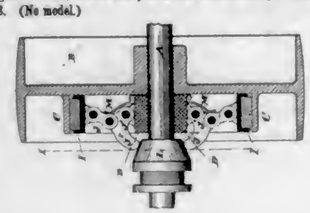
13. The combination, with a screw-shaft, of a divided nut and a ring provided with one or more wedges for separating the parts of the nut, so as to disengage them from the shaft, substantially as described.

298,705. WATCH-CHAIN CHARM. FRANK T. PEARCE, Providence, R. I., assignor to Pearce & Heagland, same place. Filed June 9, 1883. (No model.)

Claim.—1. The combination, with a hollow cylindrical bar closed at one end by a cap, of the pencil-case D, provided with the watch-key E, and the sliding cap F, substantially as and for the purposes set forth.

2. The combination, with the watch-chain bar A, provided with the central ring, B, and the fixed head C, of the telescopic pencil-case D, provided with the watch-key E, and the sliding head F, constructed to cover the key and form a watch-chain bar, as described.

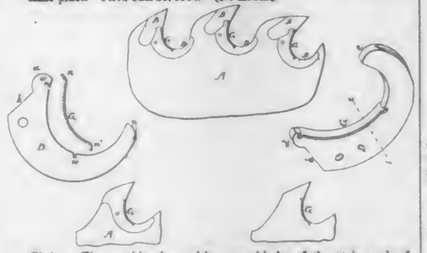
298,706. LINIMENT. SOPHIA POTTER, Clementsvale, Nova Scotia, Canada. Filed Apr. 19, 1883. Renewed Feb. 5, 1884. (No specimens.)



Claim.—The hereinbefore-described medical compound or liniment, composed of spirits of camphor, decoction of the leaves of the pitcher-plant, (*Nepenthe distillatoria*,) saltpeter, porpoise-oil, turpentine, laudanum, and spirits of ammonia, mixed in about the proportions set forth.

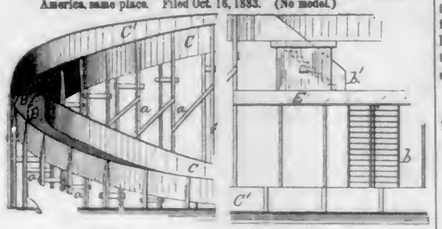
298,707. EYELET. WILLIAM H. ROCK, Baltimore, Md. Filed Feb. 11, 1884. (No model.)

Claim.—As an improved article, an eyelet of annular shape, with a lateral extension of reduced width, formed of a continuous strip of sheet metal, with two flanges set at a right angle, substantially as specified.

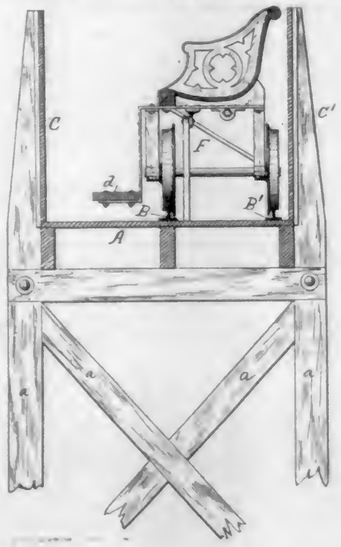


298,708. FRICTION-CLUTCH. ROBERT N. ROSS, Jeffersonville, Ind., assignor of one-fourth to Henry H. Keller, Louisville, Ky. Filed Sept. 19, 1883. (No model.)

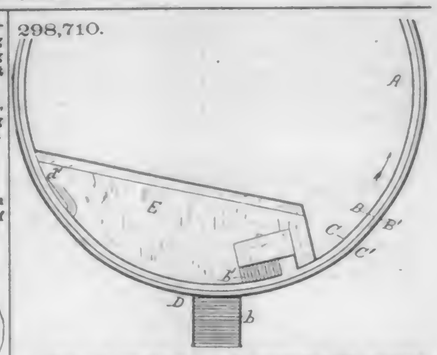
Claim.—1. In a friction-pulley, the combination, with a flange between its rim and hub, of a collar, radially-sliding block, toggle hinging the collar and block together, having a projection to bear on a sliding collar on the shaft, and a spring to press the projection outwardly, as set forth.



2. The combination of shaft A, pulley B, having flange C, blocks I, tight collar D, toggle-links J J' J², springs M, and sliding collar L, having a conical inner end, all substantially as shown and described, for the purpose set forth.



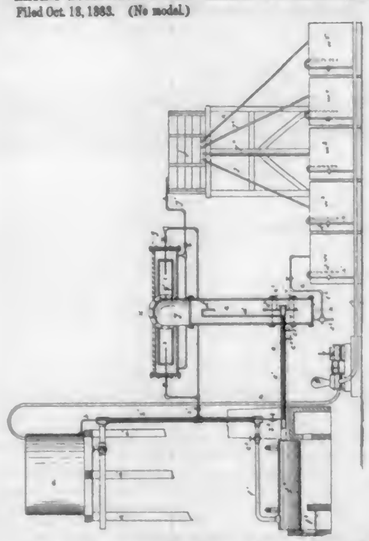
298,709. SAW. JOHN SMITH, Philadelphia, Pa., assignor to Hamilton Disston, Horace C. Disston, William Disston, and Jacob S. Disston, all of same place. Filed Jan. 23, 1884. (No model.)



Claim.—The combination, with a saw-blade, of the strip or kerf-clearer G, adapted to the throat of a tooth, and fitted at each end into a slot in the blade, or in any of the within-described attachments thereto, substantially as set forth.

298,710. ROLLER COASTING DEVICE. PHILO M. STEVENS, Chicago, Ill., assignor, by mesne assignments, to the Roller Coaster Company of America, same place. Filed Oct. 16, 1883. (No model.)

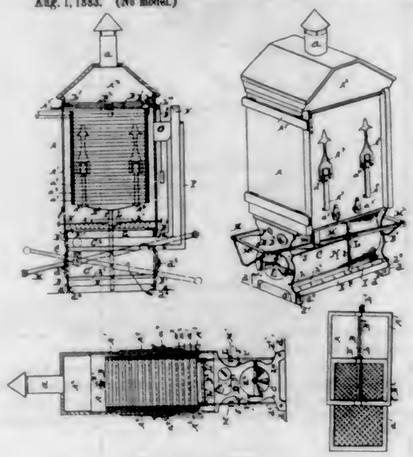
298,710.



Claim.—In a coasting structure, the combination, with a continuous circular track having a part thereof at an elevation, of the trestle-work *a*, the curbing C C', the car F, and the platform E, substantially as and for the purpose set forth.

298,711. TAG. JOHN C. ST. JOHN, New York, N. Y., assignor of one-half to Fisher M. Clarke, same place. Filed Dec. 31, 1883. (No model.)

Claim.—A tag or price-ticket consisting of the card, the staple having its ends B C bent at right angles to the back A thereof into and through the card, to bring such back upon the face of the card, and the film D of adhesive material applied to the under side of the card in the line of the staple, thereby uniting the latter to the card by flowing into the perforations of the card produced by the ends of the staple, and also stiffening the card.



298,712. APPARATUS FOR REDUCING, REFINING, AND SEPARATING HYDROCARBON OILS. EBENEZER W. STRAIN, Allegheny, Pa. Filed Oct. 18, 1883. (No model.)

Claim.—1. In apparatus for refining, reducing, and separating hydrocarbon and other oils, a separator consisting of a series of cylinders, each having an interior pipe open at one or both ends, the interior pipe of one cylinder communicating with the shell of the next cylinder, traps leading from the bottom of the cylinders, and steam-jet pipes opening into the open end or ends of the interior pipes, substantially as and for purpose specified.

2. In apparatus for refining, reducing, and separating hydrocarbon oils, a separator consisting of a series of cylinders, each having an interior open-ended cylinder which communicates with the shell of the next cylinder, and trap-pipes leading from the several cylinders, substantially as and for the purposes specified.

298,713. FRUIT-DRIER. JEROME E. SWEETLAND, Pontiac, Mich. Filed Aug. 1, 1883. (No model.)

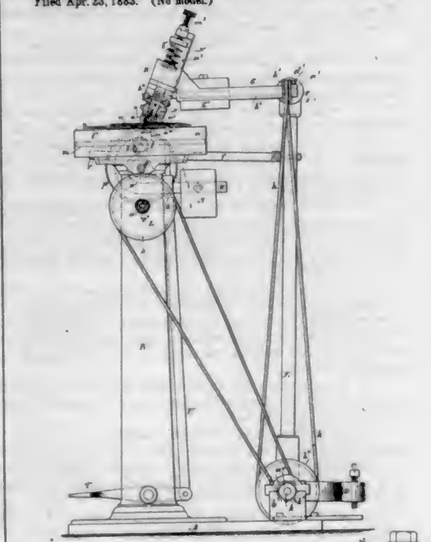
Claim.—1. In a fruit-drier, the combination, with the drying-chamber constructed to receive a series of trays, of the guide-rod B, a sleeve sliding on said rod, and provided with a downwardly-extending arm, and a cord connected with said sleeve to move the same forward, substantially as described.

2. In a fruit-drier, the combination, with the drying-ceamber, of the guide-rod B, the sleeve sliding on said rod, and provided with a downwardly-extending arm adapted to engage with a tray, means for moving said sleeve forward, and means for retracting the sleeve after it has been moved forward, substantially as described.

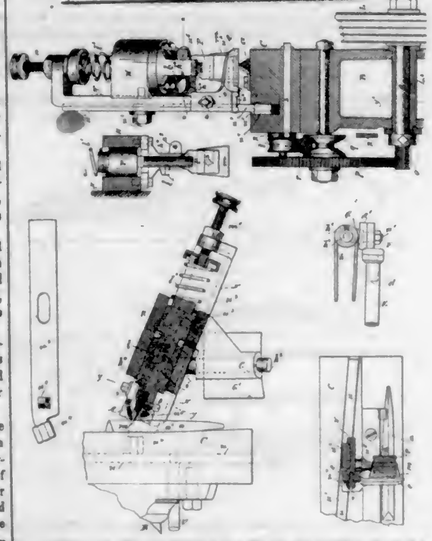
3. In a fruit-drier, the deflector and distributer composed of the diaphragm, in combination with the two sections of slats, and means for moving the two sections of slats in opposite directions to each other, substantially as described.

4. In a fruit-drier, the combination, with the furnace, of the end plates, D D', said plates constructed in duplicate, and provided with supporting-legs integral therewith, said legs constructed with flanges d^1, adapted to receive and support suitable connecting-girts, substantially as described.

5. In a fruit-drier, the combination, with the furnace, of the end plates, D D', said plates constructed in duplicate, and provided with suitable orifices, suitable coverings for said orifices, legs *d d'*, integral with said plates, said legs constructed with flanges d^1 and foot d^2, whereby the legs may be connected to a suitable base, substantially as described.



6. In a fruit-drier, the combination of the furnace, the vertically-moving yoke provided with supporting-arms at its upper end, the levers connected intermediate of their length to the yoke, and extending beyond both ends of the furnace, and means for operating said levers from either end of the furnace by hand or other power, substantially as described.



7. In a fruit-drier having a drying-chamber, a furnace below the chamber, and an escape-flue at the top of the chamber, the combination of a smoke-flue leading from the furnace outside thereof, a jacket surrounding said flue and perforated at its lower end for the admission of air, a flue connecting the jacket with the interior of the drying-chamber at its upper end for introducing heated air into the upper part of said chamber, and a series of slats for regulating and directing the entrance of heat into the lower part of the chamber, whereby dry heat is introduced into the chamber, both from its lower and upper portion, and the moisture permitted to escape through the top of the chamber, substantially as described.

8. In a fruit-drier, the combination, with the furnace, of the end plates, the girts connecting the plates, the side plate terminating above the girts, so as to form an intervening air-inlet, and the base-plate extending from one girt to the other under the furnace, substantially as described.

9. In a fruit-drier, the combination of a drying-chamber, a deflector and distributer, composed of sections of slats adapted to be moved in opposite directions to regulate and direct the entrance of heat into the chamber, spring-supports A^3, to hold trays above said slats, and the elevating-yoke to lift said trays up onto the spring-supports, whereby said trays are gradually removed from the heat-directing slats, substantially as described.

298,714. FILE-CUTTING MACHINE. CHARLES VOGEL, Fort Lee, N. J. Filed Apr. 23, 1883. (No model.)

Claim.—1. The combination, in a file-cutting machine, of a bed for the file, a cutter and cutter-head, an arm carrying the cutter-head, a shaft and cam supported by the arm, and a radius-bar connected to one end of said arm, substantially as set forth.

2. The radius-bar, a yoke at the lower end thereof, tubular journals for the same, a driving-shaft passing through the tubular journals, pulleys and belts, a cutter and cutter-head, and mechanism for moving the cutter, substantially as set forth.

3. The combination, in a file-cutting machine, of a bed to support the file, a continuously-rotating feed-pulley, a feed-bar, and a lever acting to press the feed-bar into contact with the pulley, substantially as set forth.

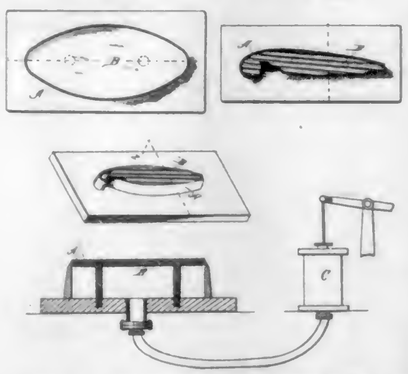
4. The combination, in a file-cutting machine, of the cutter-stock, cutter, and head in which the cutter-stock slides, and a rest upon the file to support the cutter-head, and mechanism for actuating the cutter and for moving the cutter-head along over the file-blank, substantially as set forth.

5. In combination with a cutter and cutter-stock, a revolving cam to raise the cutter-stock, and an adjustable rest to regulate the action of the cutter by varying the position of the cam in relation to the cutter-stock, substantially as set forth.

6. The combination, with the cutter-head, actuating-cam, and cutter, of a file-bed with guide-groove in the same, and a bar connected with the cutter-head, running in said groove to guide the cutter-head, substantially as set forth.

7. In a file-cutting machine, the combination, with the cutter, cutter-stock, and means for actuating the same, of a cutter-head, an arm carrying the same, a bed for the file-blank, and means, substantially as specified, for moving the cutter progressively and for changing the place at which the cutting-edge comes into contact with the file-blank, substantially as set forth.

8. The combination, with the grooved bed for the file-blank, of the feed mechanism, the treadle and lever actuated by the same to stop the feed, the lifter-bar in the groove, the lifter, and the cutter and cutter-head, whereby the feed is stopped simultaneously with the lifting of the cutter, substantially as set forth.

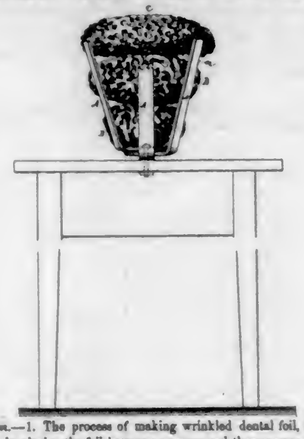


9. In a file-cutting machine, the combination, with the grooved feed-roller, of a feed-bar, a weighted lever and roller acting upon the same, mechanism for moving the feed-roller, a lifter for raising the weighted lever, a cutter-head, a radius-bar connected to the feed-bar, and an arm hinged to the radius-bar and connected with the cutter-head, substantially as set forth.

10. In combination with the cutter-head and feed-bar *r*, the feed-wheel *q*, gear-wheel *p*, changeable pinion *o'*, shaft *o*, and eccentric bushing o^2, substantially as set forth.

11. The combination, in a file-cutting machine, of a continuously-revolving cam, a cutter and stock acted upon by such cam, and adjustable mechanism for sustaining the cam and varying its position in relation to the cutter, to give greater or less motion to the cutter, substantially as set forth.

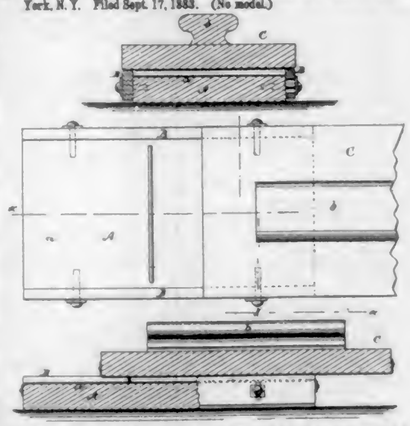
12. In a file-cutting machine, the combination, with the file-bed, of a radius-bar, an arm jointed at one end to the radius-bar, a cutter-head at the other end of the arm, a cutter and cutter-stock, and a shaft and cam sustained by the arm, and a weight upon such arm, substantially as set forth.



298,715. COMBINED PNEUMATIC HOLDER AND CUTTER. JOHN R. WILLIAMS, Newark, N. J. Filed Jan. 15, 1884. (No model.)

Claim.—1. The combination of an unperforated holding-platen, a cutter surrounding said platen, as shown and described, the platen being so located within the cutter that a space is left between the two, and exhaust mechanism, substantially as described.

2. The combination of an unperforated grooved platen, a cutter inclosing the same, and means for exhausting the air from between the material to be cut and the upper surface of the grooved platen, the grooves of the platen leading to a space or spaces between its outer edge and the surrounding cutter, substantially as described.

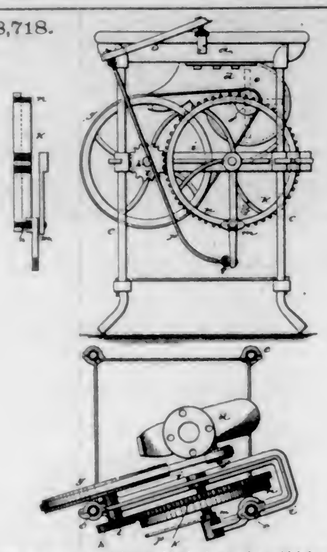


298,716. PROCESS OF WRINKLING GOLD DENTAL FOIL. RICHD. S. WILLIAMS, New York, N. Y. Filed Sept. 17, 1883. (No model.)

Claim.—1. The process of making wrinkled dental foil, the same consisting in placing the foil between sponges and then compressing the sponges vertically and laterally, thereby causing the foil to follow the wrinkled surface of the sponges, substantially as described.

2. A series of fingers or arms secured at their lower ends and diverging upward, combined with sponges confined therein and compressed laterally by the said arms as the sponges are pressed down into or between said arms, substantially as described, and for the purpose specified.

298,717. DENTAL-FOIL CONDENSER. RICHD. S. WILLIAMS, New York, N. Y. Filed Sept. 17, 1883. (No model.)



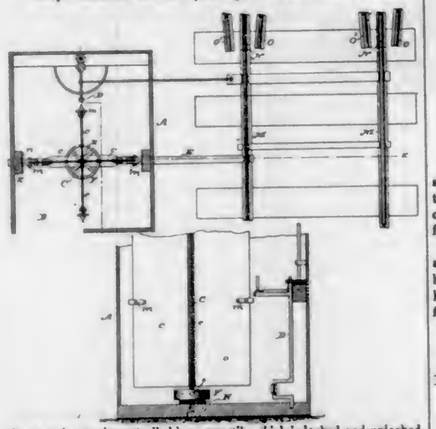
Claim.—The device hereinbefore described for rolling up dental foil, consisting of a bed, A, with adjustable guides B and a platen, C, as and for the purpose described.

298,718. FORGE. JAS. F. WINCHELL, Springfield, Ohio. Filed Sept 7, 1883. (No model.)

Claim.—1. In a forge, the combination, with the fan and its shaft, of the band-wheel and belt connecting said wheel with the fan-shaft, the pinion *i*, journaled in the adjustable bracket *i*, and the rim-flanged gear-wheel, with mechanism for operating the same, substantially as specified.

2. In a forge, substantially as shown and described, the combination, with the rim-flanged gear-wheel *k*, of the grip-clutch *m*, consisting of an arm journaled to the axle of said gear-wheel, and extending downward to the periphery thereof, where it is pivotally connected with a swinging arm provided at its upper end with inwardly-projecting jaws for gripping the flange, and at its lower end with a slot for connecting,

298,718.



by means of the knuckle-joint *q*, with the bent rod *p*, which is connected with the lever *o*, whereby motion may be communicated to mechanism for operating the fan, as and for the purpose set forth.

REISSUES.

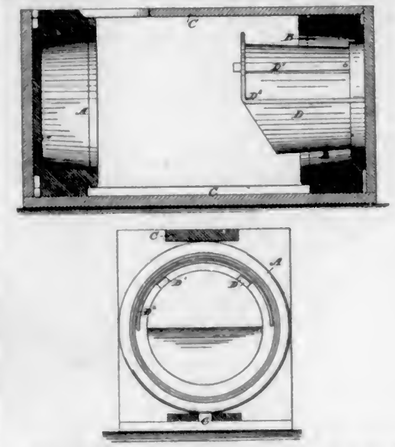
10,478. SAFETY-SWITCH GUARD. HENRY HARMER, Southampton, assignor to Frederick Broughton, Hamilton, Ontario, Canada. Filed Apr. 18, 1884. Original No. 289,254, dated Nov. 27, 1883. Patented in Canada Aug. 22, 1874. No. 3,770; extended Aug. 20, 1879, No. 10,375.

Brief.—Access to the hand-operating switch-lever, which is mounted

in an inclosure, is controlled by a turnstile which is locked and unlocked by the movement of the switch-rails, bolts fixed on an extended tie-bar of the switch-rails being adapted to holes in the hub of the shaft of the turnstile, whereby the movement of the turnstile to permit entrance or departure of the switchman is prevented except when the switch-rails are at the main or other predetermined position.

Claim.—1. In a safety-switch guard, the combination, with an independently-rotating turnstile and a switch box or house, of locking mechanism actuated by the movement of the switch or throw rails, to control said turnstile, all substantially as shown and described.

2. In a safety-switch guard, the combination, with a box or house containing switch-operating mechanism and an independently-rotating turnstile, of locking mechanism actuated by the movement of the switch-rails, whereby to control the turnstile, so as to prevent the egress of the switchman until the switch has been placed in line with the main-line rails, all substantially as shown and described.

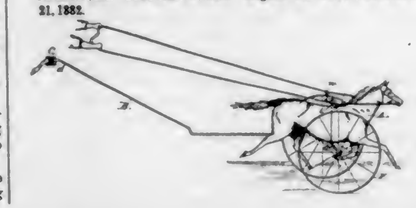


3. In a safety-switch guard, an independently-rotating turnstile having a locking disk or hub, a switch box or house containing switch-operating mechanism and locking mechanism actuated by the movement of the switch-rails to lock or unlock said turnstile, the several parts being combined to operate substantially as and for the purpose set forth.

4. The combination, with the switch and its operating mechanism, of the house A, the turnstile C, with its shaft Z and attached locking hub or wheel F, and the slide-bar E, connected with the switch, and arranged to engage with said wheel or hub when the switch is open or in connection with the siding, substantially as specified.

5. In a safety-switch guard, the combination, with the switch and its operating mechanism, house A, turnstile C, shaft Z, locking wheel or hub F, and engaging slide-bar E, connected with the switch, of the automatically-engaging catches or fastenings *m*, and one or more keepers, *n*, arranged to hold the turnstile in locked position with the slide-bar, substantially as herein described.

10,479. MACHINE FOR TRUSSING BARRELS. JOHN REID, Allegheny City, Pa. Filed Nov. 15, 1881. Original No. 132,601, dated Oct. 29, 1872.



Brief.—The staves are built up between springs and carved external guides, there being a spring for each stave. The hoops are then driven on by cones which advance toward each other from opposite ends of the barrel.

Claim.—1. The mode of building barrels, consisting in placing the staves around springs and a curved bar, and then moving or converging two cones or their equals with truss-hoops toward each other simultaneously, or in one operation, and finally withdrawing the same from the finished article, substantially as set forth.

2. A machine for trussing barrels, having two cones moved toward and from each other by suitable mechanism, said cones containing the binding or truss hoops, in combination with springs and a carved bar holding the staves in position, substantially as herein shown and described, for the purposes set forth.

10,480. TRUNDLING TOY HORSE. ELIJAH J. R. WHITAKER, New York, N. Y., assignor to George W. Whitaker and William T. Whitaker, Baltimore, Md. Filed Mar. 24, 1884. Original No. 255,367, dated Mar. 21, 1882.

Claim.—1. The combination, with a flexible push tongue or rod, adapted to be sustained at one end upon or against the body of a child, of an axle and pair of wheels swiveled to the opposite end of said flexible push tongue or rod, and of lines adapted to turn and steady the axle, substantially in the manner and for the purpose herein set forth.

2. The combination, with an axle and pair of wheels swiveled to a push tongue or rod adapted to the propulsion thereof, guide-lines for steadying and steering the same, and a device representing an animal supported and carried thereby, of rings or terrets *n*, elevated over the figure of the animal and above the top of the wheels, to carry and support the guide-lines clear of entanglement with the wheels in turning, substantially in the manner and for the purpose herein set forth.

3. The combination of the axle provided with an upright steering-post, a device representing an animal loosely swiveled on the steering-post, a cross-bar rigidly attached to the steering-post above the back of the animal, and guide-lines connected to the cross-bar, as set forth.

4. A toy consisting of a device representing an animal provided with a push-tongue rigidly attached to the animal, an axle of a pair of wheels swiveled below and independent of the animal, and lines to turn the axle independent of the animal, as set forth.

5. In a trundling toy, the combination of a pair of wheels, an axle connecting the wheels, provided with an upright steering-post, a device representing an animal loosely swiveled on the steering-post and having a hole through its mouth, a cross-bar rigidly attached to the steering-post, and guide-lines connected to the cross-bar, and extending from one end thereof to and freely through the hole in the animal's mouth, and thence back to the other end of the cross-bar, as set forth.

PHOTO-LITH. NORRIS PETERS WASHINGTON D.C.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF UNITED STATES COURTS IN PATENT CASES.

DECISIONS OF THE U. S. COURTS.

Supreme Court of the District of Columbia.

UNITED STATES, EX REL. JAMES S. GORTON, v. BENJAMIN BUTTERWORTH, COMMISSIONER OF PATENTS.

Decided April 14, 1884.

1. The question whether an appeal from the decision of the Primary Examiner, requiring a division of an application, should be heard by the Examiners-in-Chief or by the Commissioner, is a matter of administrative discrimination, and is not within the control or supervision of the Court, but belongs to the administrative part of the Government.
2. It is doubtful whether claims to the process and to the instrumentalities of the process constitute two subjects of patents. It would seem that the process is not patentable at all.

Before Chief Justice Cartter and Justices Cox and MacArthur.

Mr. A. Pollok for the relator.
Mr. Frank T. Brown for the Commissioner.

Chief Justice CARTTER delivered the opinion of the court.

In the matter of the United States on the relation of James S. Gorton v. Benjamin Butterworth, Commissioner of Patents, which is another application for a mandamus, a great deal of learning has been expended upon it; but after all it needed more to enlighten the court to induce them to the issuing of a mandamus. There was just enough learning and there were just enough facts exhibited to leave the court in doubt whether it ought to interfere at all. The case presented in the mandamus is a conflict or a confusion, whichever it may be entitled, between the exercise of judicial and administrative power in the Patent Office. The court has held repeatedly, and has held to-day in the case we have just decided, (*Hoe & Co.* v. *The Commissioner of Patents*,) that the Patent Office has administrative supervision of the business of that Office in its economies, its police, and its direction, and of necessity must have, and that authority is directly granted, and that as far as their administrative duties are concerned this court has nothing to do with them save by appeal, and then only in the discharge of their judicial act going into judgment. Here is a case where, to say the most of it, the case made by the relator presents a doubtful question between a juridical subject and an administrative subject. The relator complains that the Commissioner of Patents refuses, after a second rejection by the Primary Examiner, to send the case to the Examiners-in-Chief in appeal as in law entitled. The Commissioner of Patents says "Yes, I do not do it, and I do not propose to do it," upon the report of the Primary Examiner, on a second examination, who finds that the subject of the application is an application for two distinctive patents representing two distinctive rights if any. The rule of the Office under the administration of its ministerial and administrative management is, that patents shall not be granted one patent for two inventions; but where the Office finds that condition of things they will draw the surgeon's knife between them and send the party back to the administration of two distinctive subjects. And the Commissioner of Patents informs us in his return that he has, under the light of a report of the Primary Examiner, taken the subject under consideration, and, without the exercise of any judgment or having formed any opinion with reference to it, is now deliberating over it, while the party is in this court applying for a mandamus to make him deliberate faster and better. Now, if we should entertain this application it will be seen at a single glance that the administration of the Patent Office would be resolved into this court-room, and there would be there an end of that business or of the other business that pertains to this jurisdiction. We are not fond enough of this kind of practice to borrow a case or entertain one that is not clearly chargeable upon our duty. There is another thing about it. In the disclosures, as far as we are permitted to examine this case, (for we are not invited to a judicial examination of it at all; we are merely invited to the question of the propriety of practice in the Office and the duty of the administrator to the Office,) enough of the case is made apparent in its history to render it very doubtful with us whether there are two subjects of patents here. We think the Office has taken fully as liberal a view of the subject as the law allows, whether there are or not. One application is for the process and the other is an application for the instrumentalities of the process. And this process is about as indefinite in expression as the English language could well make it when it is not enlightened with something that can explain it. Now, we have just got through determining a case in appeal where we pronounced that the process was not patentable at all, and from very clear authority and clear reasoning. I mean the Brinkerhoff case. In that case a party wanted to get a patent for a form and arrangement of a speculum, a very ingenius device for doing certain kind of work, and he got it. He got two or three patents for it. Then he came back and applied for a patent for the process of applying it. We rejected it. We could not see it, although he had his speculum for us to look into it; but we could not see it at all. This looks to us very much like another case of that sort. It may not be, however. Whether so or not, we are not permitted in this process to look into it to define the judgment of the court whether it is a matter of judicial discrimination or a matter of administrative

discrimination. Apparently, it is a matter of administrative jurisdiction which, we have held all the time, and at no time more emphatically than in the case that we determined here to-day, is not within our control or supervision in any way, and ought not to be, but belongs to the administrative part of the Government.

We have concluded that under these circumstances we cannot issue this writ, but must deny it.

U. S. Circuit Court—Southern District of New York.

MUNDY *v.* LIDGERWOOD MANUFACTURING COMPANY.

Decided April 23, 1884.

1. When an inventor merely brings an old element into his machine, he makes no invention; but where he does more—dispenses with certain parts, duplicates others, rearranges, and simplifies the machine—he must be held to have made an invention.
2. When a patent is for a combination, one element of which is a gear-wheel with a cone supported in a peculiar manner, and the defendant uses the gear-wheel with the cone, but the latter is supported differently, though the elements employed by the defendant are the equivalents of those of the complainant in the patented combination, *Held* that the defendant takes the complainant's combination and infringes his patent.
3. Reissue Letters Patent No. 9,289, July 13, 1880, construed and held to cover a novel and patentable invention.

Mr. Ernest C. Webb, *Mr. Edwin H. Brown*, and *Mr. Frederic H. Betts* for the orator.

Mr. Livingston Gifford for the defendant.

WHEELER, *J.*:

This suit is brought upon Reissue Letters Patent No. 9,289, dated July 13, 1880, the original of which was No. 158,967, dated January 19, 1875, granted to the orator for an improvement in friction-drums for pile-drivers and hoisting-machines. The original had one claim. The reissue has three others and this one, which is made the fourth, and is the only one relied upon. The defenses are lack of novelty and denial of infringement. The object of these inventions is to have a drum for the hoisting-rope, which can be made to engage with, closely or loosely, and be released from gearing in constant motion, so as to be started promptly but moderately, and made to move rapidly or slowly, and to stop gradually or quickly, and be left to turn the other way, at the pleasure of the operator. The orator accomplished this by providing a conical projection on the side of the gear-wheel next to the drum, of nearly the same diameter, made of wedge-shaped pieces of wood with the broad ends outward, forming a tapering friction-surface on the ends of the wood, and a circular flange projecting from the circumference of the drum loose on the same shaft, to fit tightly over the friction-surface on the wheel when pressed toward it, and a spring coiled about the shaft between the wheel and the drum to separate the surfaces. The specification mentions a shell or flange on the side of the gear-wheel supporting the wood, and describes mechanism for pressing the drum toward the wheel and bringing the surfaces together. The claim is for the combination of the drum loose, and the gear-wheel having the friction-cone and side flange to support it and spring to repel it fast, upon the shaft, for this purpose. The defendant makes friction-drums like these in all respects, except that the wedge-shaped pieces of wood are bolted to the gear-wheel. Loose friction-drums connecting with fast gear-wheels on the same shaft, with springs coiled about the shaft to repel them, and friction-surfaces—one of metal and the other of the ends of wood—for use for other purposes, were old and well known; and Letters Patent No. 150,755, dated May 12, 1874, were granted to John Knowlson, Jr., for improvements in similar apparatus, showing a gear-wheel with similar wedge-shaped pieces of wood, separated by radiating flanges on the side of the gear-wheel, presenting friction-surfaces composed of the ends of the wood of each piece, and a drum with a similar projecting flange at each end to fit over the friction-surfaces, and a wheel revolving with but sliding along the shaft at the other end of the drum, having a similar friction-surface, with mechanism for pushing back along the shaft and bringing its friction-surface in contact with that on that end of the drum, and thereby pressing the drum along and bringing the friction-surfaces at the other end of the drum to a bearing, but without any springs to repel the friction-surfaces.

There is some contest as to which invention was first, Knowlson's or the orator's; but from the whole evidence it appears that Knowlson's was first accomplished.

It is strongly urged for the defendant that Knowlson's friction-surfaces are substantially the same as the orator's; that there was no invention in putting the spring to the same purpose in the orator's devices that it had accomplished in prior similar devices, and that the orator really invented nothing but the shell or flange on the wheel for supporting the wood of the friction-cone, which the defendants do not use. Apart from the mode of fastening the wood to the wheel, the friction-cones of Knowlson perform the same function in substantially the same way as those of the orator and of the defendant, although, perhaps, they would not wear so well as either. Each, however, may be considered for this purpose to be the mechanical equivalent of the other. Then the orator is not entitled to a monopoly of this friction-surface in such machines. It is said that beyond this he did nothing but to bring the spring of former machines into Knowlson's, which could be accomplished by the skill of good workmanship. Had this been all, the arguments would be well founded. But he did more. One spring would not have answered to repel the friction surfaces in that machine. Two would have been necessary, and of different power, one to repel the cone on the wheel not geared, and another and stronger to repel the drum, and that from the gear-wheel. The orator dispensed with one of Knowlson's friction-cones and flanges, rearranged and simplified the machine, and put the spring where it was needed or where he wanted it. This appears, after it was done, to have been easy to do; but no one did it before, and it makes a more compact, economical, and useful machine. (*Loom Co.* v. *Higgins*, 105 U. S., 580.) The patent is for the new combination. It is further strenuously urged that the gear-wheel with the cone supported in the orator's peculiar manner is one element of the combination, and that, as the defendant does not use that element, it does not infringe that combination. But the gear-wheel and friction-cone of the defendant are the equivalent in the combination to those of the orator, and by the use of them the defendant takes the orator's patented combination.

Let there be a decree for the orator for an injunction and an account, with costs.

U. S. Circuit Court—District of Indiana.

WESTCOTT *et al. v.* RUDE *et al.*

Decided April 1, 1884.

1. In an account before a master, evidence of payments for past infringement, for the purpose of ascertaining the amount which should be paid by the defendant, is incompetent. To admit it is contrary to the maxim "*Inter alios acta*," &c.
2. When the sale of licenses by the patentee has been sufficient to establish a price for such licenses, that price should be the measure of his damages against an infringer; but a royalty or license-fee, to be binding on a stranger to the licenses which established it, must be uniform.
3. Proof of a single license is not sufficient to establish a market-price.
4. In respect to two or more claims in a patent, each of value, and distinct from the other, one cannot equal all in value any more than in mathematics a part can equal the whole. A licensee may, if he choose, bind himself to pay the same price whether he use the entire invention or a part only, but at the same time he acquires the right to use all, and so his agreement may not be unreasonable; but if as against an infringer such a license can have any force, reasonably it must be in the way only of establishing a royalty for the entire invention.

Mr. H. C. Fox and *Messrs. Wood & Boyd* for the complainants.

Messrs. Stem & Peck for the defendants.

WOODS, *J.*:

The exceptions filed are numerous, but passing by others, the court will consider only those which bring into question the measure of the damages assessed. Upon this point the master says: "Plaintiffs waive all claims for profits and rely upon the proofs produced as establishing a fixed license or royalty as the measure of damages," and after giving an abstract of the testimony of the four witnesses who were examined upon the point, the report proceeds to say:

It is very difficult to determine from this evidence whether it makes proof of such an established royalty or license-fee as furnishes a criterion upon which to estimate the complainants' damages. The owner of a patent is granted a monopoly. He may choose to reserve the right to use his invention exclusively to himself and to make and sell machines, keeping all other manufacturers out of competition. He may enjoin infringers. He has the right to fix a reasonable license-fee or royalty to be paid by manufacturers who use his invention in making machines, and if fixed and reasonable, and paid by those who use the invention, such fee or royalty is a criterion upon which a computation or assessment of damages may be based. It is proved that the Wayne Agricultural Company paid the royalty of one dollar for one-horse machines and two dollars for two-horse machines for four years, a sum which, in the absence of evidence to the contrary, may be regarded as reasonable. Mast & Co. paid between two thousand dollars and three thousand dollars in cash, and conceded privileges which Westcott estimates to have been worth as much more, for infringement. It is true Westcott threatened suit, and when money is paid under threat of suit merely as the price of peace, it furnishes no evidence of the amount or value of the real claim in dispute; but the settlement made shows that Westcott was paid something substantial for the infringement, and that the fear of litigation was a small element of the settlement itself. Westcott says that he arrived at the amount by his estimate of the number of machines made by Mast & Co. and other considerations which are explained in Mast's deposition. Mast says that no estimate was made of the number of machines. Westcott says he gave licenses like the one attached to his deposition to Mast & Co. and to English & Over. Mast was examined, but not interrogated on that point. Mr. English, the active man in the firm of English & Over, says he does not recollect whether they took a license or not.

It is with considerable reluctance that I have come to the conclusion that the evidence furnishes proof of a license-fee which may be taken as a basis for damages. The defendants have undoubtedly infringed complainant's invention, and the machines made by them which are mentioned in the evidence were all made after this suit was brought. As to the point made that the evidence does not show how many of the machines made by defendants infringed one, and how many infringed both claims of plaintiffs, the master is of the opinion that the terms of the license were the same in either case, and the same fee was charged whether one or more claims were infringed. I therefore report and find that the defendants have made and sold eight hundred infringing one-horse machines, and that plaintiffs' damages on that account are eight hundred dollars, and that defendants have made and sold eight hundred infringing two-horse machines, and that plaintiffs' damages on that account are sixteen hundred dollars, making twenty-four hundred dollars his damages in full.

The clause in the license referred to by the master is of the following tenor:

Third. The party of the second part agrees to pay two dollars as a license-fee upon any two-horse drill or seeder, and the sum of one dollar on every one-horse drill or seeder, manufactured by said party of the second part, containing any of the patented improvements; provided that if the said fee be paid upon the days provided herein for semi-annual returns, or within ten days thereafter, a discount of fifty per cent. shall be made from said fee for prompt payment.

There is probably no reason to question the general principles enunciated by the master in respect to the rights of patentees in their inventions, but the court does not concur in all respects with the master's application of them in this case, nor with the conclusion reached. Some of the facts found are not, in the judgment of the court, supported by the evidence. Some items of evidence were considered by the master which, in the opinion of the court, were not admissible, and which therefore should have been allowed no weight whatever.

In respect to the royalty paid by the Wayne Agricultural Company, Westcott, the only witness to the point, testified this:

The licensees to whom these licenses were given paid the fees as stipulated. The Wayne Agricultural Company paid for four years, since which time they have paid nothing, their excuse being that they claimed to have bought an interest in the patent. We sued them in court, and the court decided that they had no title to the patent, and then they agreed to arbitrate with us, and the suit was dismissed.

This evidence does not show the payment of fees as stated by the master. It is left uncertain whether or not the fees paid "for four years" were at the rate of one and two dollars for a machine or fifty per cent. of those sums. The fair inference, perhaps, is that the Wayne Agricultural Company did for four years manufacture drills under the license, though it is not entirely clear that the license was not issued after or near the close of that period, so as to make the transaction in reality a settlement for infringements. This is certainly so in respect to the other parties named, who, if they received licenses at all, which is doubtful, received them as evidence of settlements, and these settlements, it is shown, were made either express threats or the fear of suits for infringement. If for a time the Wayne Agricultural Company made the drills under a license, the manufacture was afterward continued under a different claim or right, and when that claim had been overruled by the court, instead of settling for the infringement on the terms of the license, the company obtained an arbitration, the result of which has not been shown.

The first inquiry is whether the proof in respect to payments for infringements was admissible or ought to have been considered by the master at all. I know of no case in which it has been decided that such evidence is competent, and upon principle I am not able to see how it can be. On the contrary, it seems to me clear that it ought not to be received. Proof of license-fees charged and paid before use for the right to use an invention is admissible upon the same theory that proof of sales in open market of any marketable commodity is competent, because it shows or tends to show a market price; but settlements for past use of an invention cannot be brought within the rule, because inconsistent with the principle on which the rule rests. The infringer, or one who is accused of infringement, is, from the necessity of the situation, under compulsion of making compensation as demanded, or of taking the risk of a suit, and how much his action in a particular case of

settlement may have been influenced by this or other special considerations it is impossible for the master or court to determine, and therefore the inquiry should not be entered upon. The only way to escape the inquiry is to exclude the evidence. To admit it is contrary to the maxim "*Inter alios acta*," &c. It involves an attempt to resolve one doubt or difficulty by another. *Litem lite solvit.* There are doubtless reported cases in which it appears that such evidence was received and considered, but generally this has been done without objection, and uniformly (so far as I know) without a judicial declaration or decision that it was proper.

In the opinion of the court in *Packet Company* v. *Sickles* (19 Wall., 611) the rule is reaffirmed, as laid down in *Seymour* v. *McCormick*, (16 How., 480,) "that in suits at law for infringement of patents, when the sale of licenses by the patentee has been sufficient to establish a price for such licenses, that price should be taken as the measure of his damages against the infringer." "The rule thus declared," it is added, "has remained the established criterion of damages in cases to which it was applicable ever since;" and further on in the opinion it is said, and it affords a clear interpretation of the rule in respect to the point now mooted, "in such a case nothing is more reasonable than that the price fixed by the patentee for the use of his invention in his dealings with others and submitted to by them before using it should govern." This, it is true, is the rule of law; but the complainants waiving their right in equity to claim an account of profits have invoked the same rule here, and must abide by it as it is. See also *Black* v. *Munson*, (14 Blatch., 208;) *Greenleaf* v. *Yale Lock Manufacturing Co.*, (17 Id., 253;) *Matthews* v. *Spanyenbery*, (14 Fed. Rep., 350; 30 Southerland Damages, pp. 601, 607; 1 Greenleaf Evidence, sec. 174; Wharton Evidence, sec. 1199; Abbots Trial Evidence, 188, 189.)

It follows that the proof of damages made in this case, excepting that in reference to the license granted to the Wayne Agricultural Company, must be rejected, and should have been disregarded by the master; and this being done does there remain evidence sufficient to support the master's conclusion? It seems probable that the master himself would have thought not; as it was he came to that conclusion "with considerable reluctance."

The rule, as already stated, requires "a sale of licenses sufficient to establish a price for such licenses." "A royalty, in order to be binding on a stranger to the licenses which established it, must be a uniform royalty." (Walker on Patents, 390.) These and the like expressions and definitions found in the cases and text-books imply that proof of a single license is not sufficient; and if under some circumstances such proof might be deemed adequate, that in this instance is not of such clear and unequivocal character as to give it such weight. (*Proctor* v. *Brill*, 4 Fed. Rep., 415; *Judson* v. *Bradford*, 3 Ban. & Ar., 539; *Black* v. *Munson*, 2 B. & Gordon, 623.)

It is true in a sense, doubtless, that the owner of an invention has a right to fix his price upon it, but to constitute evidence against an infringer he must have fixed it "in his dealings with others," and not merely as a form of license which he was willing to grant. It is, as it appears to me, entirely inadmissible in law or in equity, that a patentee may, by inserting in his licenses a claim for a certain royalty, with a proviso that half that sum will be received in full in case of prompt payment, acquire a right to demand the entire sum of an infringer. If he can arbitrarily make such a discrimination, he may as well make the ratio three to one or any other proportion. The question is what is a reasonable royalty. The laws of the land fix the rates of interest for the forbearance of money, and if it be possible to make a discrimination against infringers of patents over prompt paying licensees greater than lawful interest, (except as may be done by the courts under the statutory provision for treble damages,) it must be done, as it seems to me, upon some competent evidence other than an arbitrary clause in a license or licenses, however many of them may have been issued. The same may be said in reference to the clause in the license which requires that the specified royalty shall be paid for every drill "containing any of the patented improvements." This, as it seems to me, affords no proof, certainly not conclusive proof, against an infringer that he should pay the entire royalty named in the license for infringing only one of two or more claims of a patent, unless the one infringed be shown to be the only claim which has or had any value, or that the different claims were substantially the same.

In respect to two or more claims in a patent, each of value and distinct from the other, one cannot equal all in value any more than in mathematics a part can equal the whole. The licensee may, if he choose, bind himself to pay the same price, whether he use the entire invention or a part only, but at the same time he acquires the right to use all, and so his agreement may not be unreasonable; but if as against an infringer such a license can have any force reasonably, it must be in the way only of establishing a royalty for the entire invention. This view is in accordance with authority.

In *Birdsall* v. *Cooledge* (93 U. S., 64) it appears that the alleged infringement was of one only of three claims in the letters patent, and the court says:

> Still it is obvious that there cannot be any one rule of damages prescribed which will apply in all cases, even when it is conceded that the finding must be limited to actual damages. Where the patented improvement has been used only to a limited extent and for a short time, the jury should find less than the amount of the license-fee.

See also *Proctor* v. *Brill*, *supra*; *Woosten* v. *Simonson*, (16 Fed. Rep., 680;) *Ruggles* v. *Eddy*, (2 Ban. & Arden, 627.)

Without further evidence, the plaintiff is entitled to nominal damages; but that there may not be a failure of justice, the case is remanded to the master, with direction to admit further evidence by each party if offered, and to report the same and his conclusions.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 15, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that Roland H. Thorn, of Lexington, Tennessee, be not recognized from and after this date as an attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,
GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE SECRETARY,
Washington, D. C., May 15, 1884.

SIR: I am directed by the Secretary to inform you that he has ordered that William H. Matthews, of Cincinnati, Ohio, be not recognized from and after this date as an attorney in the prosecution of any claim or other matter before the Department of the Interior or any bureau thereof.

I am, sir, very respectfully, your obedient servant,
GEO. M. LOCKWOOD,
Chief Clerk.

The Commissioner of Patents.

The Official Gazette.

The OFFICIAL GAZETTE is published every Tuesday, simultaneously with the weekly issue of patents. From January 1, 1872, (the commencement of its publication,) to June 30, 1883, it was published and bound in semi-annual volumes; since July 1, 1883, in quarterly volumes. All subscriptions must commence with the beginning of a volume; none taken for less than three months. Terms: To all subscribers within the United States and Canada, $5 per annum; to foreign subscribers, $7; single copies, 10 cents; bound semi-annual volumes, (prior to June 30, 1883,) full sheep, $4 per volume; bound quarterly volumes, (subsequent to July 1, 1883,) full sheep, $2.75 per volume. No club rates. *Payment in advance.* All orders should be addressed to "The Commissioner of Patents, Washington, D. C."

Issue of May 20, 1884.

DESIGNS.

15,003.—SLEEVE-BUTTON.—*Frederick F. Bioren* and *James C. Bioren*, Newark, N. J. Application filed February 16, 1884. Term of patent 7 years.

15,004.—PRINTING-TYPE.—*Henry Brehmer*, New York, N. Y., assignor to *David Wolfe Bruce*, same place. Application filed April 10, 1884. Term of patent 14 years.

15,005.—ORNAMENTATION OF SEWING-MACHINES.—*William Haehnel*, New York, N. Y., assignor to *Palm & Fechteler*, same place. Application filed March 28, 1884. Term of patent 7 years.

15,006.—BISCUIT-CRACKER.—*Josephus Hartman*, Philadelphia, Pa. Application filed September 10, 1883. Term of patent 14 years.

15,007.—ORGAN-CASE.—*Thomas Hill*, Chicago, Ill. Application filed March 25, 1884. Term of patent 3½ years.

15,008.—FIRE-PLACE HEATER.—*William H. Jackson* and *John H. Hankinson*, New York, N. Y. Application filed February 11, 1884. Term of patent 7 years.

15,009.—COAL-OIL STOVE.—*Robert Shaw Oliver*, Albany, N. Y. Application filed March 13, 1884. Term of patent 3½ years.

15,010.—NOTE-PAPER.—*William A. Pike*, Bridgeport, Conn., assignor to *Bradley A. Hard* and *Samuel Parsons*, New York, N. Y. Application filed July 7, 1883. Term of patent 7 years.

15,011.—CAPITAL LETTERS.—*Charles Schafer*, New York, N. Y. Application filed March 26, 1884. Term of patent 7 years.

15,012.—HINGE.—*William E. Sparks*, New Britain, Conn., assignor to *The Nashua Lock Company*, Nashua, N. H. Application filed February 4, 1884. Term of patent 14 years.

15,013.—ACTOR'S SHIELD.—*Charles F. Waldron*, Boston, Mass. Application filed October 27, 1883. Term of patent 14 years.

TRADE-MARKS.

[Certificates of registration of Trade-Marks numbered 8,191 and upward are registered under the act of March 3, 1881.]

11,188.—MATCHES.—*Actiengesellschaft Union Vereinigte Zündholz- und Wichse-Fabriken*, Angsburg, Germany. Application filed November 13, 1883.

"The arbitrary symbol of a cimeter, upon the blade of which the words 'TRADE MARK' are placed."

11,189.—SOAP-POWDER OR POWDERED SOAP.—*Fisk Manufacturing Company*, Springfield, Mass. Application filed February 23, 1884.

"The word 'JAPINE.'"

11,190.—VARNISHES AND LIQUID DRIERS.—*D. Rosenberg & Sons*. New York, N. Y. Application filed March 4, 1884.

"The word 'SECHINE.'"

11,191.—LEAD-PENCILS, PENCIL-HOLDERS, PEN-HOLDERS, AND OTHER LIKE ARTICLES.—*Rudolph Weissenborn*, Jersey City, N. J. Application filed February 29, 1884.

"The words 'TORTOISE SHELL.'"

11,192.—WARDROBE-BEDSTEADS.—*Spiegel & Co.*, Chicago, Ill. Application filed March 19, 1884.

"The word 'PERRLESS.'"

11,193.—PLUG AND SMOKING TOBACCO AND CIGARS.—*S. W. Venable & Co.*, Petersburg, Va. Application filed April 11, 1884.

"The words 'BLUE JEANS.'"

LABELS.

4,119.—Title: "CHAPPAQUA" (FOR SHOES.)—*Henry W. Bischof*, Chappaqua, N. Y. Application filed April 25, 1884.

4,120.—Title: "BOWERS' INFALLIBLE COUGH REMEDY."—*Isaac Bowers*, Barnsborough, N. J. Application filed April 25, 1884.

4,121.—Title: "SILVER LAKE." (FOR CANNED TOMATOES.)—*T. C. Davenport*, Philadelphia, Pa. Application filed April 8, 1884.

4,122.—Title: "A VEGETABLE CURE FOR CANCER, TUMOR AND ULCER."—*F. D. French*, Flint, Mich. Application filed April 28, 1884.

4,123.—Title: "DERMATINE" (FOR A PREPARATION FOR THE SKIN.)—*Richard Ince*, Detroit, Mich. Application filed April 22, 1884.

4,124.—Title: "WHEAT BAKING POWDER."—*Martin Kalbfleisch's Sons*, New York, N. Y. Application filed April 19, 1884.

4,125.—Title: "TEN CENT OR DIME CORN CURE."—*John E. Potter*, Providence, R. I. Application filed April 11, 1884.

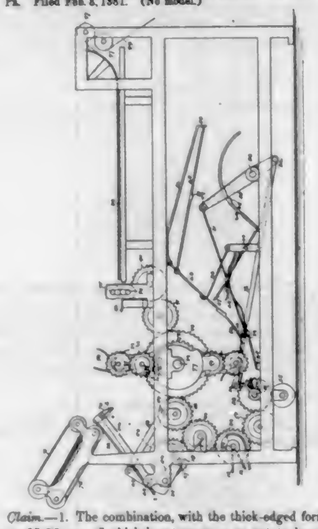
4,126.—Title: "TOBACCO CURER."—*Samuel Ragendorf*, Cincinnati, Ohio. Application filed April 4, 1884.

DISCLAIMER.

8,781. (Reissue.)—*Abel Barker*, assignor to *Edward M. Lang*, Wyoming, Pa. Reissued letters patent issued July 1, 1879. IMPROVEMENT IN SOLDERING DEVICES. Disclaimer filed May 14, 1884, by the present assignees, *McMurray, Lang & Burnham*.

Enter their disclaimer to all parts of the thing patented which are or may be construed to be broader or more comprehensive than the invention as described and claimed in the original patent issued to Abel Barker on the 17th of May, 1870, and numbered 103,125, and they therefore hereby disclaim the words "rotated about or" from line 34 of the printed specification of said Reissued Letters Patent No. 8,781; and they further hereby disclaim the following claims of said reissued patent:

1. In a soldering-machine, a rod adapted to hold the can cap or lid in place, in combination with a soldering-iron mounted upon and arranged to be rotated about said rod, substantially as described.



2. In a soldering-machine, a rod adapted to hold the can cap or lid in place, in combination with a soldering-iron sliding upon said rod and adapted to be rotated about it, as set forth.

3. In combination with a soldering tool or die, the rod D, passing through said tool or die to hold the can cap or lid in the process of soldering, substantially as described.

PATENTS

GRANTED MAY 20, 1884.

298,719. PAPER-BAG MACHINE. OSCAR W. ALLISON, Rochester, N. Y., assignor to the Union Paper Bag Machine Company, Philadelphia, Pa. Filed Feb. 8, 1881. (No model.)

Claim.—1. The combination, with the thick-edged former, of feed-rolls, as 95 96, one of which is cut away, so as not to break down the edges of the tube, the revolving head which grasps the tube to carry it to the diamond-fold-forming mechanism, and mechanism operating independently of said head to form the diamond fold, all substantially as described.

2. The combination, with the revolving arms or carriers 87, of the revolving heads carried thereby, and co-operating mechanism for forming the diamond fold operating independently of said carriers, all substantially as described.

3. The combination, with the revolving arms or carriers 87, of the revolving heads carried thereby, and co-operating opening, pasting, creasing, and folding mechanism, all substantially as described.

4. The combination, with the revolving arms or carriers 87, of the revolving heads carried thereby, and co-operating opening, pasting, creasing, and folding mechanism, and mechanism for removing the completed bag, all substantially as described.

5. The combination, with the revolving arms or carriers 87, of the jaws 92 93, carried thereby, and the holding-jaws and nippers, operated independently of said carriers, for opening the diamond fold, substantially as described.

6. The combination, with the revolving arms or carriers 87, of the jaws 92 93, carried thereby, the jaws 26 27, grippers 73, and pressers 50, substantially as described.

7. The combination, with the revolving arms 87 and the revolving jaws 92 93, carried thereby, of the creasing-blades 16, substantially as described.

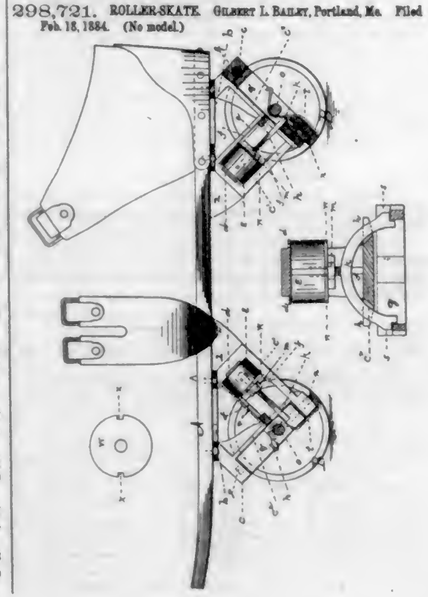
8. The combination, with the revolving arms 87 and the revolving jaws 92 93, carried thereby, of the revolving creasing-blades 16, substantially as described.

9. The combination, with the revolving arms 87, of the jaws 92 93 and the folding-blades 21, carried thereby, and arranged to reciprocate across the faces of said jaws, all substantially as described.

10. The combination, with the revolving arms or carriers 87, of the revolving heads carried thereby, the carrying-tapes 71 72, and the oscillating grippers 70, for taking the completed bags from said heads and delivering them to said tapes, substantially as described.

11. The combination, with the revolving arms 87, of the jaws 92 93 and the tucking-blade 18, substantially as described.

12. The combination, with the revolving arms 87, of the jaws 92 93, the tucking-blade 18, and the grippers 70, substantially as described.

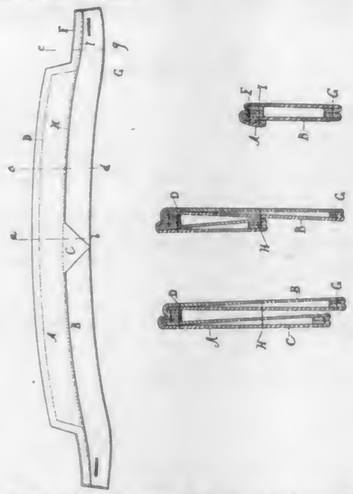


298,720. CAPSULE. LAWRENCE A. ANDERSON, Hamilton, Ohio. Filed Feb. 14, 1884. (No model.)

Claim.—1. The combination, in an improved capsule for vaginal and similar applications, with the capsule, of a filling or packing contained within the capsule and carrying the medicament by absorption, whereby when the capsule is dissolved the medicament will be retained by the said filling or packing in direct contact with the diseased parts until it is absorbed, substantially as set forth.

2. As an improved article of manufacture, a capsule for vaginal and similar applications, comprising a body adapted to receive a packing and a cap, and having a perforation in the body portion adapted for the passage of a string or cord attached to the packing, substantially as and for the purpose set forth.

298,721. ROLLER-SKATE. GILBERT L. BAILEY, Portland, Me. Filed Feb. 18, 1884. (No model.)



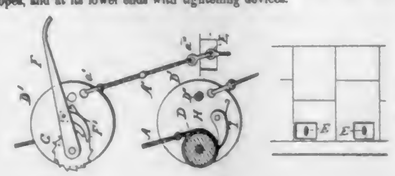
Claim.—1. In a roller-skate, the combination of plate *b*, fastened to foot-piece A, arms *c c'*, longitudinally-inclined frame, roller-carrier *g*, carrying axle *o*, having rollers mounted thereon, pivoted thereto, bar *c²*, having stops *h h* projecting laterally therefrom above said roller-carrier and adapted to strike upon the upper portion thereof, and graduating-spring E, acting thereon through the intermediate yoke, *k*, substantially as shown and described.

2. In a roller-skate, a carrier consisting of frame *q*, substantially as shown, adapted to be pivoted to the arms of a hanger and having notches cut in its sides opposite each other, in combination with an axle upon which rollers are mounted, transversely supported thereon in such a position that its longitudinal center, the pivotal center of said carrier, and the bottom of said notches will be upon the same plane, substantially as and for the purpose herein set forth.

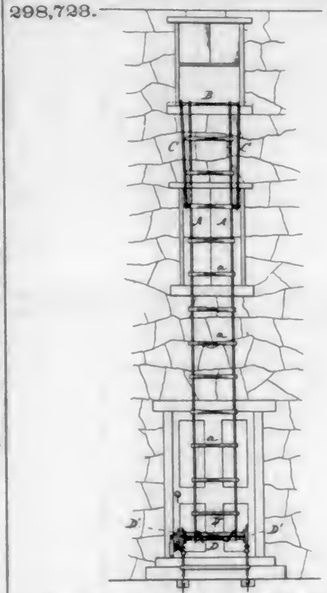
3. In a roller-skate having a swiveling roller-carrier, a spring acting on said carrier through an intermediate yoke adapted to bear upon each side of its center of oscillation, said yoke having an adjustable screw-threaded nut and being held in its proper line of travel by a notched follower working on guides against said spring, substantially as and for the purpose herein set forth.

4. In a roller-skate, plate *b*, fastened to foot-piece A, arms *c c'*, roller-carrier *q*, supporting-axle *o*, having rollers mounted thereon and swiveled to said arms, spring-seat *d*, spring E, notched follower W in contact with said spring, guides *f f*, and yoke *k*, carrying screw-threaded nut *m*, combined and operating substantially as herein described.

298,722. COLLAR. FREDRIK BIEBERSTEIN, Jr., Troy, N. Y. Filed May 23, 1883. (No model.)



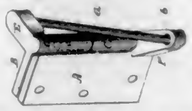
Claim.—1. In a collar composed of body and band parts, a facing integral with the body part extending along and stitched to the upper edge of the projecting band ends, substantially as and for the purposes set forth.



2. The improved collar having a facing integral with the body part, extending along and stitched to the upper edge of the projecting ends of the band, and the rear tab suspended over the band part of the collar, substantially as described.

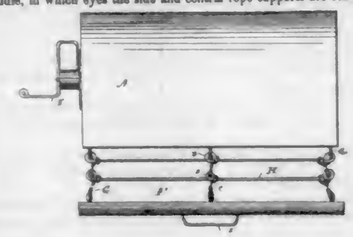
298,723. FIRE-ESCAPE. SAMUEL BELTZ, Wilmington, Del. Filed Dec. 19, 1883. (No model.)

Brief.—The flexible ladder is provided at its upper end with guard-ropes, and at its lower ends with tightening devices.



298,723.

Claim.—The adjustable fire-escape described, consisting of a rope ladder provided at one end with a cross-bar, B, and guard-ropes C, to attach and hold the same in position, and the opposite ends of the side ropes supplied with fastening and tightening devices having hooks *a''*, which engage eyes E, secured in the pavement in the manner described, and the reel D, with the lever F, and means whereby the reel can be operated, substantially as described.

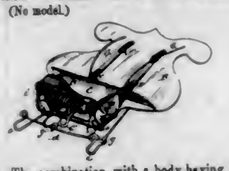


298,724. HINGE. AMOS S. BLAKE, Waterbury, Conn. Filed MAR. 3, 1884. (No model.)

Claim.—A slip-joint hinge having the one part constructed with an arm, E, extending diagonally therefrom, the other part with a corresponding part, F, extending diagonally therefrom in the opposite direction to the arm E, each of said arms constructed with a cavity, *b*, combined with the rod G, one end seated in the cavity of one arm, the other in the cavity of the opposite arm, and so that the said rod, when the hinge is in its closed position, stands diagonally across the plane of the pintle, substantially as described.

298,725. FIRE-ESCAPE. JOSEPH HENRY BOWLBY, Marengo, Ill. Filed Feb. 16, 1884. (No model.)

Brief.—The rungs are formed into eyes at both ends and in the middle, in which eyes the side and central rope supports are secured.



298,725.

Claim.—1. The combination, with a suitable box or casing provided with a shaft having bearing in the sides thereof, of a ladder consisting of the side ropes, G, and central rope, *c*, and rounds or rods bent at their center and ends to form loops, said ropes being secured in said loops by first passing the ropes through the loops, back under, and then over the round, and then passing the rope through the turned-under portion of the same, substantially as shown.

2. The herein-described flexible ladder consisting of the side ropes and central rope and rounds formed at their center and ends with loops, said ropes being secured in said loops, substantially as shown, and for the purpose set forth.

298,726. MUSIC-HOLDER. GEO. BURT, Fort Madison, Iowa. Filed Apr. 3, 1883. (No model.)

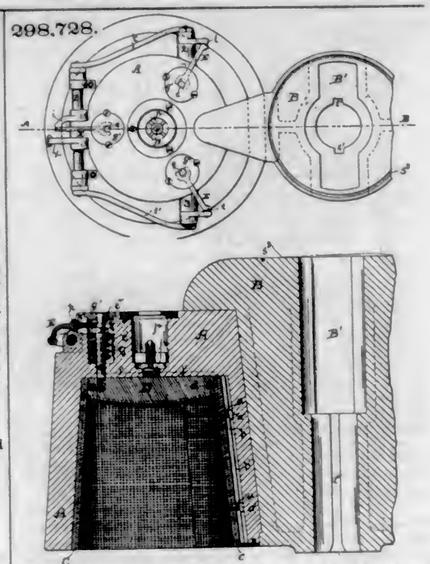
Claim.—1. The combination, with a body having bent-up hinge-ears, a sheet-metal clamp pivoted thereto, and a spring actuating said clamp to close its edge upon said body, the clamp having two slots in it, of a spring-wire secured to the body, and passing its two ends out through the two slots aforesaid to press independently of each other upon the upper portion of the body on opposite sides of a central vertical line, for the purpose described.

2. The combination, with a body having bent-up hinge-ears, a slotted sheet-metal clamp and a pivot-pin joining the two, of a spring, constructed and located substantially as described, to force the clamp down upon the body, and two spring-fingers attached to the device, substantially as described, to project through the slots in the clamp and press upon the upper part of the body, as and for the purpose specified.

3. The combination, with a music-holder constructed substantially as described, of means for holding the same to a drum, substantially as follows: a spring-wire, D, having double or reverse hooks *g* at its two ends, similar reverse hooks *e* each side of its middle, and the cross portion *d* connecting its two arms, said arms secured to the body of the music-holder and coiled, forming springs A, as shown and described.

4. A music-holder having a punctured sheet-metal body, and the portions between the punctures indented on opposite sides, in combination with a spring-wire provided with hooks, as set forth, the two arms of said wire passing through said punctures and firmly clamped by the indented portions, as shown and described.

298,727. COMPOUND TO PREVENT THE FUSION OF CINDER. WESLEY CASE, Topeka, Kans., assignor to the Coal Economizing Company, same place. Filed Sept. 27, 1883. (No specimens.)



Claim.—The compound for preventing clinkers herein described, consisting of bicarbonate of ammonia, saltpeter, bicarbonate of soda, rosin, Epsom salts, common salt, and a base for preventing the mass from cementing together, all in or about the proportions described.

298,728. APPARATUS FOR FORMING OR MOLDING ARTICLES FROM PULP. WILLIAM L. CHASE, Portland, Me. Filed Sept. 19, 1883. (No model.)

Claim.—1. The combination, with the die having an outwardly-flaring shell-receiving recess, of a sectional shell or lining composed of two or more sections or staves adapted to fit together within the die, so as to present an unbroken inner surface of the shape to be imparted to the molded pulp article, and movable longitudinally upon the flaring inner walls of the die, so as to spread apart or draw together, according to the direction of said longitudinal movement, substantially as and for the purposes hereinbefore set forth.

2. The combination of the die formed with a flaring shell-receiving recess, a sectional shell or lining composed of two or more staves or sections movable longitudinally upon the flaring inner walls of the die, and mechanism for imparting simultaneous movement to all the staves or sections, the combination being and acting substantially as hereinbefore set forth.

298,728.

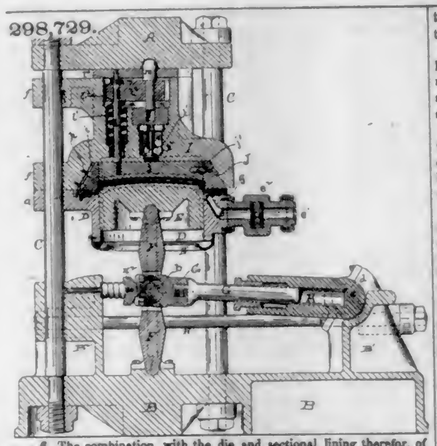
3. The combination of the die formed with a flaring shell-receiving recess, or sectional shell or lining composed of two or more staves or sections movable longitudinally upon the flaring inner walls of the die, retracting-springs which maintain said sections in their normal or closed position, and discharging mechanism whereby said staves or sections may be moved longitudinally against the stress of their retracting-springs in the direction in which they will be caused to open or spread apart, substantially as hereinbefore set forth.

4. The combination, with the die provided with a flaring shell-receiving recess, of a sectional shell or lining composed of two or more sections or staves longitudinally movable upon the flaring inner walls of the die, so as to spread apart or draw together, according to the direction of said movement, a false bottom longitudinally movable with said staves, and mechanism for imparting said longitudinal movement, substantially as and for the purposes hereinbefore set forth.

5. The combination, with the die and the sectional lining thereof capable of combined lengthwise and lateral movement, of a false bottom connected with the lining-sections, so as to participate only in the lengthwise movement of the latter, substantially as hereinbefore set forth.

298,729. APPARATUS FOR MOLDING ARTICLES FROM PULP. WILLIAM L. CHASE, Portland, Me. Filed Sept. 19, 1883. (No model.)

Claim.—1. In a machine for molding articles from pulp, the combination, with the piston or plunger for delivering pressure upon the article, of toggle-arms and a hydraulic ram, these elements being arranged and adapted to co-operate substantially in the manner and for the purposes hereinbefore set forth.

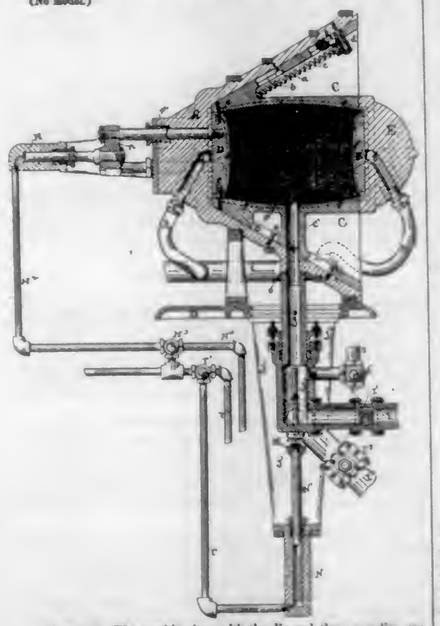


2. The combination, substantially as hereinbefore set forth, of the pressure-delivering piston or plunger, the toggle-arms, the hydraulic ram, and the spring-buffer.

3. The hydraulic ram provided with safety-valve for regulating pressure in the hydraulic cylinder, in combination with the toggle-arms and pressure-delivering piston or plunger, substantially as hereinbefore set forth.

4. The combination of the pressure-delivering piston or plunger, the toggle-arms, and the hydraulic ram hung so as to be capable of oscillatory movement, substantially as and for the purposes set forth.

5. The die provided with a sectional lining, substantially as hereinbefore described, and movable to and from the cylinder or other part with which it co-operates in forming the pulp article, in combination with mechanism whereby the sectional lining, when moved away from said cylinder or other co-operating part, is caused automatically to expand or spread apart for the purpose of loosening or detaching the molded article, substantially as hereinbefore set forth.



298,729.

6. The combination, with the die and sectional lining therefor, of the upholding-pins and their retracting-springs, the depressible yoke to which said pins are attached, and the discharging-pin, substantially as hereinbefore set forth.

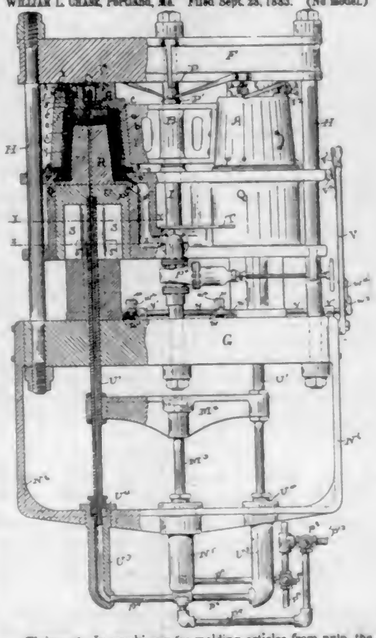
7. The die provided with sectional lining and hinge, or pivoted to the machine-frame so as to swing toward and away from the part with which it co-operates in the operation of forming the article, in combination with the upholding-pins and their retracting-springs, the depressible yoke attached to said springs, the discharging-pin, and a wiper or stop to co-operate with said discharging-pin, substantially as and for the purposes set forth.

298,730. MACHINERY FOR FORMING OR MOLDING ARTICLES FROM PULP. WILLIAM L. CHASE, Portland, Me. Filed Sept. 25, 1883. (No model.)

Claim.—1. The combination, with the die and the expanding sectional lining longitudinally movable therein, of the head-plate arranged to close the open end of the die and to form one head or end of the mold, and movable away from said end of the die, for the purpose of permitting the outward longitudinal movement of the sectional lining, substantially as and for the purposes set forth.

2. The die and its expansible and longitudinally-movable sectional lining, in combination with the hinged head-plate forming part of the mold, and movable on its hinge, so as to close or open the die, as desired, and means for locking said head-plate in its closed position, substantially as and for the purposes hereinbefore set forth.

3. The hinged or movable head-plate provided with a head-piece forming part of the mold-surface, grooved or channeled for the passage of water only, and communicating with a waste pipe or conduit, in combination with the die and its expansible and longitudinally-movable sectional lining, substantially as and for the purposes hereinbefore set forth.



4. The combination, with the die and its longitudinally-movable sectional lining, of the telescopic feed pipe or conduit composed of two or more sections which telescope into one another, so as to permit the pipe to be projected into or withdrawn from the interior of the die through the sectional lining, substantially as and for the purposes hereinbefore set forth.

5. The combination, with the die and its sectional lining, of the feed-pipe composed of tubes K J^3 J, and means for moving tube J^3 back and forth in tube or cylinder J, substantially as and for the purposes hereinbefore set forth.

6. The combination, with the die, the sectional lining, and the false bottom, of the discharging-pins connected to the false bottom, and the hydraulic ram attached to and adapted to operate said discharging-pins, substantially as and for the purposes hereinbefore set forth.

7. The combination, with the die and its sectional lining, of the sliding or longitudinally-movable tube-pipe having its inner end adapted to project into the interior of the die, so that its lateral discharge aperture or apertures shall be beyond the film of pulp to be deposited, substantially as and for the purposes set forth.

298,731. MACHINERY FOR MOLDING ARTICLES FROM PULP. WILLIAM L. CHASE, Portland, Me. Filed Sept. 25, 1883. (No model.)

Claim.—1. In machinery for molding articles from pulp, the combination of dies rotatable upon a common axis with discharging or disengaging mechanism, whereby the formed articles are loosened or disengaged from the dies, and means, substantially as described, whereby said disengaging mechanism is automatically operated during the rotary movement of the dies to effect the loosening of the formed article or articles, substantially as hereinbefore set forth.

2. The combination, with dies rotatable upon a common axis, of mouth-pieces or their equivalents, which co-operate with the die in the operation of forming or pressing the article, said mouth-pieces and dies being movable relatively to one another in the direction of the length of the dies so as to permit the two to separate far enough to allow the revolution of the dies, substantially as and for the purposes hereinbefore set forth.

3. In machinery for molding articles from pulp, the combination, with dies or mold-blocks rotatable upon a common axis, of mechanism for locking the same in operative position, and also for unlocking them so as to leave them free to be revolved, substantially as and for the purposes hereinbefore set forth.

4. In machinery for molding articles from pulp, the combination, with dies or mold-blocks rotatable upon a common axis, of mechanism for locking them in operative position, and also for unlocking them so as to leave them free to be revolved, and means whereby the formed or molded articles are automatically loosened or disengaged during the rotary movement of the same, substantially as and for the purposes hereinbefore set forth.

5. The combination of the rotatable dies, the reciprocatory piston-blocks and flexible bags carried by the same, and means for actuating said parts and for locking and releasing the same, substantially as hereinbefore described with reference to Figs. 2 and 3 of the accompanying drawings.

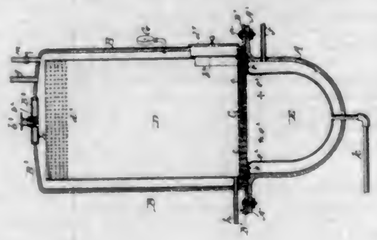
6. The combination, with the reciprocatory piston-blocks and the flexible bags carried by the same, of the hollow piston-rods for supporting the same, and means whereby air or hydraulic pressure can be introduced into the flexible bags through said hollow piston-rods.

298,732. WOOD-RIM PULLEY. ALFRED CLARKE, Lowell, Mass. Filed Nov. 5, 1883. (No model.)

Claim.—1. The combination of a metallic spider and a flat annular metallic rim-foundation, and means of securing said rim-foundation to the outer ends of the arms of said spider, as and for the purpose specified.

2. The combination of a metallic spider having the outer ends of its arms provided with rabbets, as herein described, and a flat metallic ring secured in said rabbets, as and for the purpose specified.

3. A pulley having a metallic spider, a flat metallic ring secured to the outer ends of the arms of said spider, and wooden fellies secured to said ring, as and for the purpose specified.



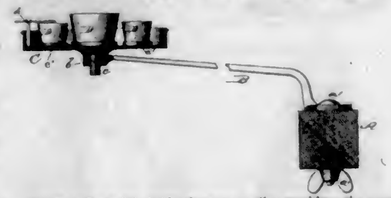
4. A pulley having a metallic spider, a metallic ring secured to the outer ends of the arms of said spider, and wooden fellies or lags secured to said ring, the innermost fellies being rabbeted and overlying the outer edge of said ring, as and for the purpose specified.

298,733. LETTER-BOX. ABNER S. COOK, Burlington, Iowa. Filed Feb. 14, 1884. (No model.)

Claim.—A letter-box, A, provided with window W, perforated top T, lid L, and bottom B, hinged by strong springs, substantially as and for the purpose described.

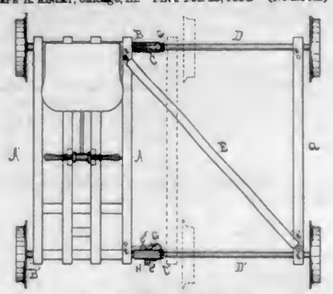
298,734. APPARATUS FOR REDUCING SULPHUR. FERDINAND DICKERT, Salt Lake City, Utah. Filed Jan. 26, 1884. (No model.)

298,734.



Claim.—1. A sulphur-reducing apparatus consisting of a double-wall bottom receiver having its upper end flanged, a vertical double-wall cylinder resting upon the flange of the former, a strainer between the two receivers, and steam-pipes to admit steam between the walls of each receiver, substantially as and for the purpose described.

2. The combination of the bottom receiver, A, having steam-pipe *f* leading therein, the inner receiver, E, having perforations e^2 adjoining the upper end, the upper cylinder, B, having steam-pipe *g*, the inner cylinder, D, open at both ends, and strainer C under the latter, substantially as and for the purpose described.

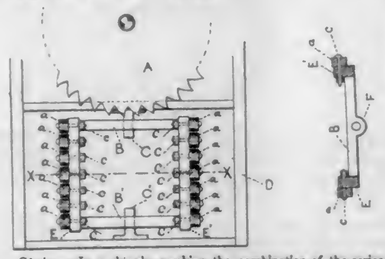


3. The combination of the double-wall bottom receivers, A E, perforated plate C thereon, upper cylinder, B, having upper opening, B^3, and side opening, b^4, with inner cylinder, D, having perforations d^3 in the sides thereof, substantially as and for the purpose described.

298,735. INK-RESERVOIR FOR PAPER-RULING MACHINES. EDWARD P. DONNELL, Chicago, Ill. Filed Nov. 3, 1882. (No model.)

Claim.—In an ink-holder for paper-ruling machines, the combination of the pan C, provided with sockets *c'*, the forked posts *d d*, and the receptacles D, substantially as shown and described, and for the purpose set forth.

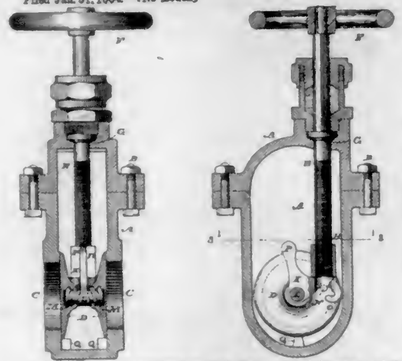
298,736. HAND-CAR. WARREN DUNBAR, Minneapolis, Minn., and JOSEPH R. KINLEY, Chicago, Ill. Filed Feb. 23, 1884. (No model.)



Claim.—1. A hand-car provided with telescoping axles, one part of each axle being suitably journaled to the main hand-car frame, while the other part is suitably journaled to a supplemental frame-work, which moves laterally as the two parts of the axle move the one within the other, substantially as described, and for the purpose of convenience in handling.

2. In a hand-car, the combination of the telescoping axles, one part of each axle being journaled to the main hand-car frame, while the other part is journaled to a supplemental frame-work, with retaining devices which hold the two parts in fixed positions, substantially as and for the purposes set forth.

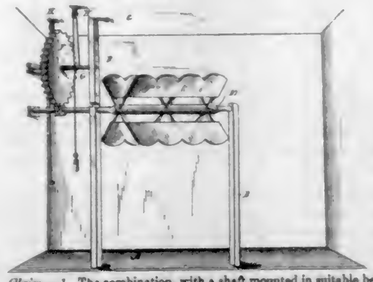
3. In a hand-car provided with telescoping axles and a main and supplemental frame-work, the combination, with the main frame and supplemental frame-work, of a box attached thereto as a brace, substantially as described.



4. In a hand-car provided with telescoping axles and a main and supplemental frame-work, the combination, with the main and supplemental frame-work, of a brace, E, or its equivalent, for the purposes herein set forth.

298,737. SHINGLE-SAWING MACHINE. GORDON EARL, Pierson, Mich. Filed Apr. 8, 1884. (No model.)

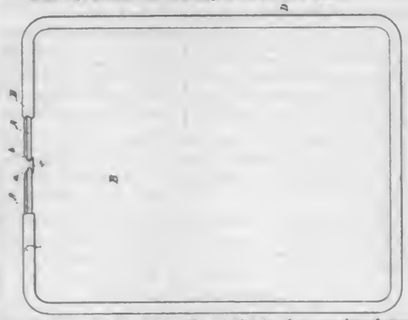
Claim.—In a shingle-machine, the combination of the series of friction-rollers *a a a a*, turning on journals *c c c c*, the side pieces, E and E', end pieces, B and B', and journals C and C', all substantially as and for the purpose described.



298,738. VALVE MECHANISM. DAVID T. ELLIS, Bridgeport, Conn., assignor of one-half to the Belknap Manufacturing Company, same place. Filed Jan. 31, 1884. (No model.)

Claim.—1. The combination, with the shell and its ports, of the screw-rod, the sleeve-nut, the hook-lever, the right and left screw, and the sliding valves, substantially as set forth.

2. The combination, in a valve mechanism, of sliding screw-threaded valves, and a right and left screw engaging therewith, with suitable means for operating the screw to loosen the valves and to slide them away from the ports, substantially as set forth.



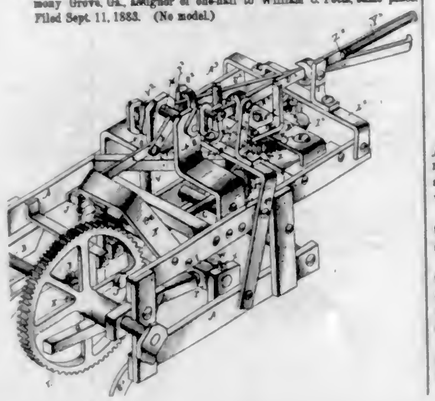
298,739. MECHANICAL POWER. JAMES W. ELLIS, Cameron, Tex. Filed Mar. 6, 1884. (No model.)

Claim.—1. The combination, with a shaft mounted in suitable bearings and provided with a pinion, of a gear-wheel suitably mounted in bearings and adapted to mesh with said pinion, cords oppositely arranged upon the shaft of said gear-wheel and passing through pulleys, and a weight for operating the mechanism, substantially as set forth.

2. The combination, with a shaft provided with a pinion and suitably-arranged fan, of a gear-wheel adapted to mesh therewith, and cords oppositely arranged upon the shaft of the gear-wheel, and adapted to pass through pulleys, said cords being provided at their ends with rings for the attachment of a weight, substantially as set forth.

298,740. MUFFLER FOR SLATES AND SLATE-FRAMES. JOHN D. ENACK, Baldwin, N. Y. Filed Apr. 14, 1884. (No model.)

Claim.—An improved muffling device for slates or slate-frames, composed of a frame-work, A, formed of spring metal, over which is stretched a fibrous or textile material, D, substantially as and for the purposes specified.



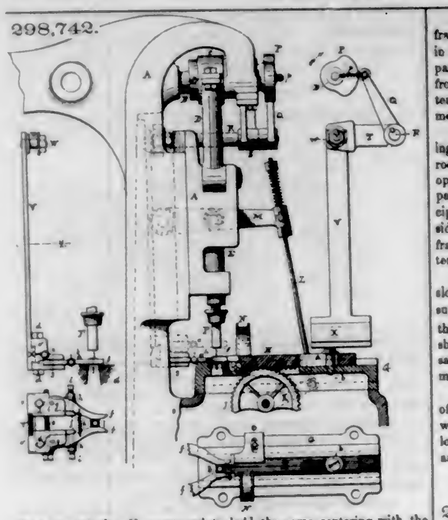
298,741. DITCHING AND GRADING ATTACHMENT FOR PLOWS. JOHN WILLIAM ESTES, Keytesville, Mo. Filed Dec. 5, 1883. (No model.)

Brief.—A plow is adjusted in a vertical open frame by means of a rod connected to its rear end and to a pivoted lever having a locking-bar, and is connected at its front end to the main frame by a double-clevis arrangement, and delivers onto a transverse belt, the lower section of the frame for which is hinged to a longitudinal bar crossing two transverse beams, which form the space within which such section is raised or lowered by a rock-shaft, arms, chains, operating-lever, and locking-arc.

Claim.—1. In a ditching-machine, the combination, with the main frame having a transverse elevator-space formed between horizontal transverse parallel beams connected about the middle of their lengths by a longitudinal beam, M', of a short rectangular elevator-frame, M, pivoted at its rear end by hangers to the longitudinal connecting-beam M', and flexibly connected near its front end by chains attached to the arms of a rock-shaft, I², provided with a lever, *m*, adapted to engage a holding-rack on the main frame, the endless apron P, its sprocket-chains, and the sprocket-wheel on front shaft, and the operating-shaft, substantially as specified.

2. In a ditching-machine, the combination, with the main frame A, provided with the vertical open frame K at the side thereof, of the plow-beam H, adjustably connected to the frame A at its forward end by the clevises *a* and *b*, and adjustably connected to the main frame A at its rear end by the upright *e*, lever *d*, standard *f*, and rack A, substantially as specified.

298,742. GIN-SAW-FILING MACHINE. ALBERT P. GATEWRIGHT, Harmony Grove, Ga., assignor of one-half to William C. Potts, same place. Filed Sept. 11, 1883. (No model.)



Claim.—1. In a machine for filing gin-saws, the combination of the frame B³, mounted pivotally upon the shaft A², the rotary file mounted in the front part of said frame, means, substantially as described, for imparting a rotary motion to the said file, an arm extending obliquely across from the rear end of the frame B³, a rock-shaft having an upwardly-extending arm or bracket carrying a roller engaging the said arm, and mechanism for operating the said rock-shaft, as herein described.

2. In a machine for filing gin-saws, the combination of the vibrating frame, the revolving file mounted horizontally in the same, the reciprocating files, a spring arranged to force the reciprocating file-holders in opposite directions, so as to hold the files to work against the saw, and a pair of levers having upwardly-extending arms bearing against the reciprocating file-holders, and downwardly-extending studs engaging the sides of the vibrating frame, whereby the movement of the said vibrating frame shall cause the reciprocating file-holders to be forced against the tension of the spring away from the saw, as set forth.

3. The combination of the reciprocating file-holders having vertical slots at their rear ends, the vertically and laterally adjustable guides or supports for the same, a transverse rock-shaft having cranks working in the said slots, an arm extending downwardly from the said rock-shaft, a short transverse shaft having a pinion and a crank, a pitman connecting said crank with the arm upon the rock-shaft, and the main drive-wheel meshing with said pinion, as set forth.

4. In a machine for filing gin-saws, the combination, with the frame, of a supporting-bracket hinged to the rear end of the latter, a set-screw working in the lower end of said bracket, and a securing-plate upon the lower end of said set-screw, substantially as and for the purpose shown and specified.

298,742.

from a nut-feeder, H, a nut, and to hold the same centering with the die, substantially as specified.

2. The combination of the blocks *c c'*, having extensions *j*, the pivoted fingers *f f*, spring *k*, and adjusting-screws *a i i*, substantially as shown.

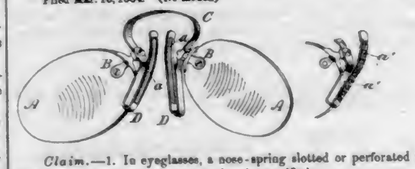
3. The cam P, shafts B R, arms Q T, pin U, and lift-bar V, in combination with a nut-holding device, substantially as and for the purpose specified.

4. The blocks *c c'*, the fingers *f f*, mounted, sprung, and adjustable thereon, as described, and having a vertical reciprocating movement by the lift-bar V, actuated by the levers Q T, shafts B R, and cam P, in combination with a reciprocating plunger, F, operated by the shaft B, eccentric C, pitman D, and socket-bar E, the vertical movements of said fingers *f f* and plunger F being so related in correspondence as to hold a nut centering on the die Y until it is engaged by the plunger F, and then to strip the plunger of waste, substantially as specified.

5. The blocks *c c'*, the fingers *f f*, mounted, sprung, and adjustable on said blocks, as shown, and having the vertical reciprocating movement by the mechanism described, in combination with the nut-feeding device, consisting of the feeder H, having the slot *a* and set-screw *b*, the frame G, the pinion J, arm K, rod L, and lever M, actuated by the main shaft B through its intermediate connections, substantially as and for the purpose specified.

6. The lift-bar V, having a dovetailed projection, X, in combination with the blocks *c c'*, adjustable by the screws *d d e*, and provided with nut-holding fingers, substantially as described.

298,743. GIN-SAW-FILING MACHINE. ALBERT P. GATEWRIGHT, Harmony Grove, Ga., assignor of one-half to William C. Potts, same place. Filed Sept. 11, 1883. (No model.)

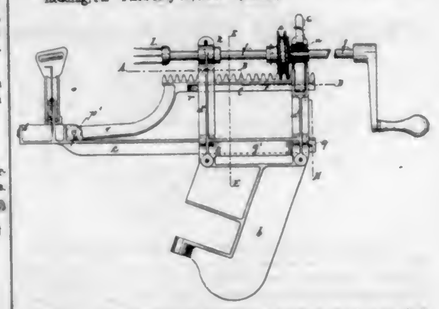


Claim.—1. In a machine for filing gin-saws, the combination of the frame B³, mounted pivotally upon the shaft A², the rotary file mounted in the front part of said frame, means, substantially as described, for imparting a rotary motion to the said file, an arm extending obliquely across from the rear end of the frame B³, a rock-shaft having an upwardly-extending arm or bracket carrying a roller engaging the said arm, and mechanism for operating the said rock-shaft, as herein described.

2. In a machine for filing gin-saws, the combination of the vibrating frame, the revolving file mounted horizontally in the same, the reciprocating files, a spring arranged to force the reciprocating file-holders in opposite directions, so as to hold the files to work against the saw, and a pair of levers having upwardly-extending arms bearing against the reciprocating file-holders, and downwardly-extending studs engaging the sides of the vibrating frame, whereby the movement of the said vibrating frame shall cause the reciprocating file-holders to be forced against the tension of the spring away from the saw, as set forth.

3. The combination of the reciprocating file-holders having vertical slots at their rear ends, the vertically and laterally adjustable guides or supports for the same, a transverse rock-shaft having cranks working in the said slots, an arm extending downwardly from the said rock-shaft, a short transverse shaft having a pinion and a crank, a pitman connecting said crank with the arm upon the rock-shaft, and the main drive-wheel meshing with said pinion, as set forth.

4. In a machine for filing gin-saws, the combination, with the frame, of a supporting-bracket hinged to the rear end of the latter, a set-screw working in the lower end of said bracket, and a securing-plate upon the lower end of said set-screw, substantially as and for the purpose shown and specified.



298,744. EYEGLASSES. ERNEST GOLDBACHER, New York, N. Y. Filed Mar. 10, 1884. (No model.)

Claim.—1. In eyeglasses, a nose-spring slotted or perforated in the portion bearing on the nose, as herein specified.

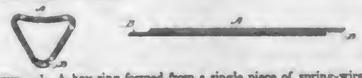
2. In eyeglasses, a serrated nose-spring slotted longitudinally, as herein described, and inclined away from the general plane of the glasses.

298,745. APPLE PARER, CORER, AND SLICER. WM. M. GIBSON, Reading, Pa. Filed May 14, 1883. (Model.)

Claim.—1. In a fruit paring, coring, and slicing machine, the shaft *f*, carrying fork *l*, and the screw *e*, in combination with the knife-carrying frame *c* and hinged dropping rack *r*, and with means, substantially as described, for holding said rack in and throwing it from engagement with said screw, as set forth.

2. The shaft *f*, screw *e*, and bar *c*, combined with the rack *r*, hinged to said bar *c*, and with the spring-hook *s*, whereby the rack is held in and released from engagement with the screw *e*, as set forth.

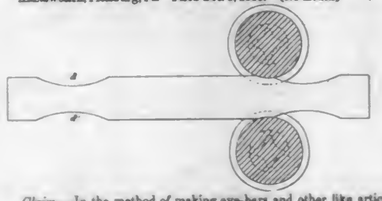
3. The combination, with the spring-hook *s* and hinged rack *r* of the knife-carrying frame, of the incline *r'*, placed upon the rack in such a position as to throw the hook out of connection with the rack at the end of each paring, coring, and slicing operation, whereby the rack is allowed to fall, substantially as set forth.



4. In combination with the stop-lugs *s'*, the bar *c*, and hinged rack *r*, the shaft *f*, hung in stationary bearings and carrying the screw *e*, the lever *m*, spring *n*, and hook *s*, as and for the purposes set forth.

298,746. FIGURE, MAP, AND CHART FOR EDUCATIONAL PURPOSES. MARY E. GUIRET, San Francisco, Cal. Filed Sept. 28, 1883. (No model.)

Claim.—As a new article of manufacture, a figure, map, or chart showing divisional views of the whole or different inner parts of the human body in bas-relief, substantially as described.

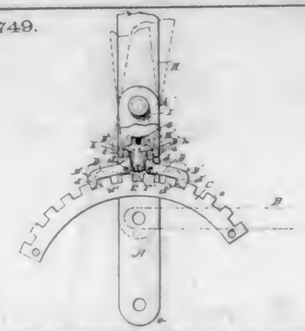


298,747. KEY-RING. EDWARD P. HAFF, New York, N. Y. Filed Feb. 29, 1884. (No model.)

Claim.—1. A key-ring formed from a single piece of spring-wire, having its ends scarfed on opposite sides and bent up into triangular shape, substantially as set forth.

2. A key-ring triangular in shape and with its ends meeting in a scarf-joint at one of the angles, substantially as shown and described.

298,748. METHOD OF MANUFACTURING EYE-BARS. WILLIAM HADSWORTH, Pittsburg, Pa. Filed Dec. 3, 1883. (No model.)



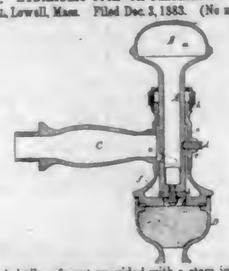
Claim.—In the method of making eye-bars and other like articles, wherein the body portion intermediate between but away from the ends is reduced by successive passes back and forth between rolls, the rolls being reversed while the bar is still engaged by them, and simultaneously the biting and reducing rolls are forced into closer proximity, and as the improvement on said method, notching the metal of the bar near but back of said ends, and at or about the points where, in the movement of the bar, the rolls are to be reversed, and at the ends of the portion to be reduced, substantially as set forth.

298,749. JOINT-LEVER. WILLIAM BUTLER HALL, Duquoin, Ill. Filed Apr. 7, 1884. (No model.)

Claim.—1. As an improvement in joint-levers, the combination, with the double-arm pawls projecting in opposite directions, of an operating-lever having arms projecting over the inner arms of the pawls and bearing against the outer face of the same, as shown, whereby the arms of the lever are adapted to independently operate either pawl, substantially as and for the purpose set forth.

2. As an improvement in joint-levers, the combination of the main

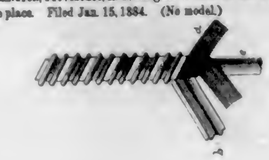
298,749.



lever carrying two oppositely-projecting pawls, the segmental rack, spring mechanism secured upon the lever and acting upon the pawls, and an operating-lever having arms bearing against the outer face of the pawls, so that they will independently operate either pawl without engaging the other, substantially as set forth.

3. As an improvement in joint-levers, the combination, with the segmental rack, of the main lever carrying the bell-crank pawls having their engaging ends projecting in opposite directions, and a double-arm spring disposed between the inner arms of the pawls and acting upon the same, substantially as and for the purpose set forth.

4. As an improvement in joint-levers, the combination of the main lever, the segmental rack, two bell-crank pawls fulcrumed upon the main lever above the rack, and having their engaging arms projecting in opposite directions, the double-arm spring acting upon the pawls, the operating-lever fulcrumed upon the main lever, and provided with an arm projecting at each side and engaging the inner arms of the pawls, and a centrally-disposed stop-pin to limit the movement of the operating-lever in either direction, substantially as set forth.



5. As an improvement in joint-levers, the combination of the main lever, the segmental rack, the bell-crank pawls having their main arms projecting laterally in opposite directions, and provided with the beveled inner faces, the centrally-disposed double-arm spring acting upon the inner arms of both pawls, the centrally-disposed stop-pin arranged above the spring, and the operating-lever fulcrumed upon the main lever, having the central recess in its bottom, and the downwardly-projecting arms at each side of this recess, substantially as and for the purpose set forth.

298,750. HYDRAULIC COCK OR FILTERING-FAUCET. ALBERT HALLOWELL, Lowell, Mass. Filed Dec. 3, 1883. (No model.)

Claim.—A hollow faucet provided with a stem interposed between the induct and the educt, such stem being hollow and having an opening into its interior, such opening leading from the interior of the stem into the water-way of the faucet, whereby when the through flow of water is interrupted the latter passes into the stem, and the air therein, having no vent, acts as a cushion, as set forth.

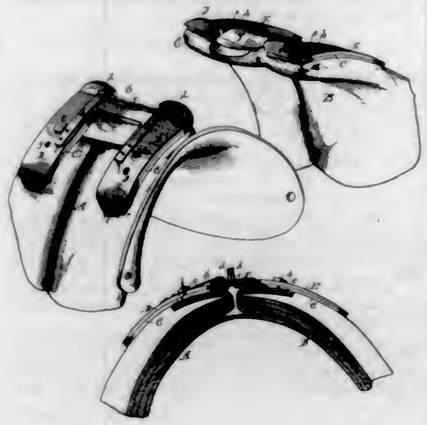
298,751. COVERING FOR ELECTRICAL CONDUCTORS. FRANK S. HARRINGTON, Providence, R. I., assignor to himself and Herbert N. Fenner, same place. Filed Jan. 15, 1884. (No model.)

Claim.—A covering for insulated electrical conductors, consisting of a thin strip of metal corrugated lengthwise in its middle, and wound spirally around the conductor with the edges of the strip overlapping each other, substantially as described, and for the purpose set forth.

298,752. NECKTIE-FASTENER. PETER HENRY HIGGINS, Merced, Cal. Filed Mar. 5, 1884. (No model.)

Claim.—In a necktie-fastener, the plate *a*, of suitable outline, having at its upper edge the integral arms *b b*, bent rearwardly, downwardly, and inwardly, and extending obliquely outward toward the ends of the plate, substantially as specified.

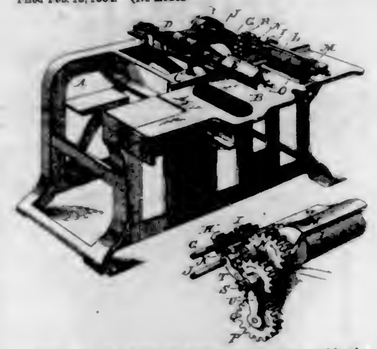
298,753. INSUBLATED TELEGRAPH TIE-WIRE. CHAS. C. HINSDALE, Cleveland, Ohio. Filed Nov. 19, 1883. (No model.)



Claim.—1. The combination, with the main wire, the supporting-insulator, and the tie-wire, of a strip of textile fabric coated with gutta-percha or equivalent material, and wrapped around the tie-wire in superposed convolutions, substantially as and for the purposes set forth.

2. The combination, with the main wire, its supporting-insulator, and the tie-wire, of a strip of textile fabric coated with gutta-percha or its equivalent, and wrapped helically around the tie-wire, substantially as set forth, to have a portion of each coil or convolution thereof lap over or under a portion of each adjacent coil or convolution, as and for the purposes described.

3. The combination, with the main wire, of a tie-wire for supporting the main wire, and an insulating strip or strips of flexible material wrapped around the tie-wire and arranged, substantially as set forth, to have a greater number of convolutions at the point or points receiving the strain, substantially as set forth.

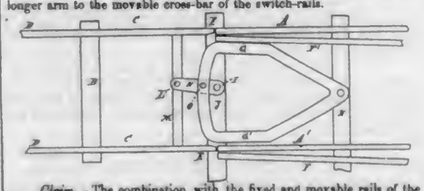


4. The combination, with the main wire and the tie-wire for supporting the main wire, of an insulating-strip of flexible material wrapped helically around the tie-wire, and a second strip of insulating material wrapped upon the outside of the first strip, to increase the thickness of the insulating material at points of wear, substantially as set forth.

298,754. HORSE-COLLAR FASTENING. IVES P. HOYT, Bainbridge, N. Y. Filed Mar. 15, 1884. (No model.)

Claim.—In a horse-collar fastening, the combination, with upper plates provided, respectively, with a suitable tongue, and a spring-catch and pivoted lever for operating it, of lower or base plates, and suitable spurs on either the upper or lower plates, and means for fastening said plates on the collar, substantially as and for the purpose specified.

298,755. PLANING-MACHINE. LEVI HOOSTON, Montgomery, Pa. Filed Feb. 13, 1884. (No model.)



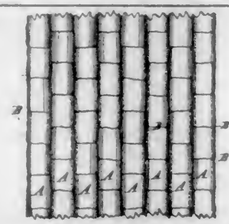
Claim.—1. In a wood-surfacing machine, the combination of a main frame, a vertically-adjustable bed or table, a press-roll overhanging the table and carried by a swinging frame, a feed-roll mounted in bearings carried by the table, gear-wheels secured to the shaft of the press-roll and feed-roll, a driving-pinion meshing with the gear of the press-roll, an intermediate gear-wheel meshing with the driving-pinion and with the gear-wheel of the feed-roll, and means, substantially such as described and shown, for supporting said intermediate gear and permitting it to rise and fall with the table and feed-roll without interfering with its mesh with the other gearing.

2. The combination, substantially as herein described and shown, of main frame A, provided with driving-shaft G, carrying pinion H, gear-wheel I, and elongated pinion K, connected to rotate in unison, press-roll L, provided with gear N, and carried by swinging frame M, having a center of motion concentric with pinion K, (the gear N meshing with said pinion,) vertically-adjustable table B, feed-roll O, mounted in bearings carried by said table, and furnished with a gear, Q, intermediate gear, R, and arms T U, hung upon the pinion-shaft and feed-roll shaft, respectively.

298,756. AUTOMATIC SWITCH. HENRY W. HOWELL, Jr., Elizabeth, N. J. Filed Nov. 12, 1883. (No model.)

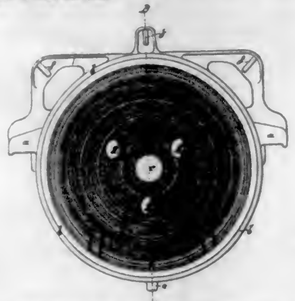
Brief.—Shifting-levers operated by the flanges of the wheels are connected to an intermediate vibrating lever, which is secured by its longer arm to the movable cross-bar of the switch-rails.

Claim.—The combination, with the fixed and movable rails of the switch, of the levers G G', connected together to act in unison, as shown, the lever H, mounted on the fixed fulcrum I, and pivoted to the switch-bar, as at L, the connecting-bar of the levers being pivoted to said lever H, between the fulcrum and the pivot L, substantially as set forth.



298,757. FIRE-PROOF FABRIC. HENRY W. JOHNS, New York, N. Y. Filed May 10, 1881. (No model.)

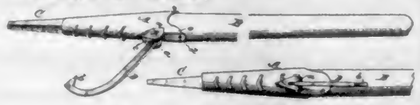
Claim.—1. As a new article of manufacture, a woven fabric consisting of a loose and compressible asbestus cord or rope and a warp of small strands, substantially as specified.



2. The fabric herein described, consisting of the warp and loose and compressible asbestus cord or rope weft, combined as set forth, whereby the faces of the fabric are substantially formed of asbestus and the weft is embedded in the asbestus cord, as specified.

3. The combination of loose and compressible rolls or ropes of asbestus with small strands, as specified, forming a woven fabric, and a coating of sizing, as set forth.

298,757.



298,758. FILTER-PRESS. SAMUEL HENRY JOHNSON, Stratford, County of Essex, England. Filed Jan. 15, 1884. (No model.) Patented in England Mar. 4, 1882, No. 1,043.

Claim.—1. The means by which press-plates are caused the one to support the other, consisting of suitable projections upon their drainage-faces, substantially as described.

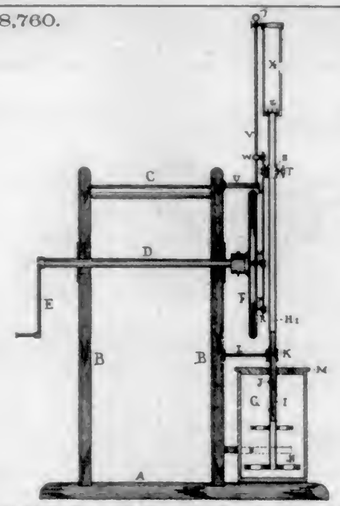
2. The press-plate composed of an interior strong and rigid body of steel or iron, and a covering of metal or composition of metals having the quality of resisting acids—as lead hardened by a small quantity of antimony—substantially as described.

298,759. CANT-HOOK OR DOG. AMOS KENNARD, Clearfield, Pa. Filed Feb. 14, 1884. (No model.)

Claim.—1. A cant-hook or dog having a series of teeth on the arc of a circle V shape in form, or substantially as shown and described, and for the purpose set forth.

2. In a cant-hook or dog, a socket for the handle provided at one end with a pike and at the opposite end with a stop and a series of V-shaped teeth, in combination with a suitable hook pivoted to the socket and provided at its free end with a spur, substantially as and for the purpose described.

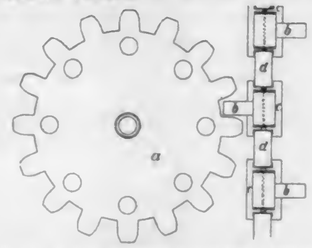
298,760. CHURN. CHARLES J. LE ROY, Chicago, Ill., assignor of two-thirds to George W. Whitson and Howard Wagner, both of St. Louis, Mo. Filed Oct. 25, 1883. (No model.)



Claim.—1. The combination of a churn-cylinder, a dasher-handle having an internal longitudinal bore, and the suitably-supported cylinder X, having perforations Z Z, for the purpose set forth.

2. The combination of a churn-cylinder, a dasher-handle having an internal longitudinal bore, an oxygen-cylinder suitably supported to receive the rising end of the handle, and a trammel-wheel suitably supported and connected to the dasher-handle so as to operate the churn.

3. The combination of a churn-cylinder, a dasher-handle having an internal longitudinal bore and a spiral on its outer surface, an oxygen-cylinder placed so as to receive the end of the dasher-handle as it rises, an internally-spiraled collar inclosing a dasher-handle and suitably supported, and a trammel-wheel connected to the dasher-handle, as described.



4. The combination of the base A, the supports B B, secured thereto, the crank-shaft D, supported on the standards, the trammel-wheel F

298,760.

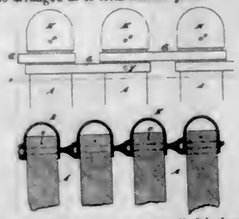
on the end of the shaft, the churn G, dasher H, having bore H' and spiral J, the cylinder X, collar K, and pitman R, connecting the trammel-wheel with the dasher-handle.

298,761. SEEDING DEVICE. EMILE LUD, Hiawatha, Kans. Filed Jan. 31, 1884. (No model.)

Claim.—1. In an attachment for seed-drills, a chain composed of sprocket-links having pivoted reversible lugs attached to the non-bearing or out side, said lugs adapted to be thrown in or out of gear with the teeth of a seed wheel or plate, substantially as described.

2. In a seed-drill attachment, the combination, with the link C, of the reversible lug B and the toothed seed wheel or plate A, substantially as shown, and for the purpose set forth.

298,762. EAR-RING. HERBERT G. MACKINNEY, Providence, R. I. Filed Nov. 16, 1883. (No model.)

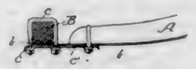


Claim.—1. The bow of an ear-ring, one arm of which is provided with a joint having its axis in the plane of the bow, whereby the lower or movable portion of said arm is made to swing at right angles to said plane.

2. The bow of an ear-ring, provided with a joint, substantially as described, and having stops to limit the movement of the movable portion, for the purpose specified.

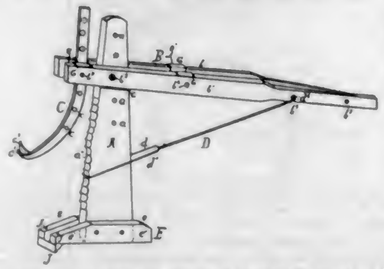
3. The bow of an ear-ring, one arm of which is provided with a joint having its axis in the plane of the bow, whereby the movable portion of said arm is made to swing at right angles to said plane, said joint being composed, substantially, of a tube, in which said movable arm is made to turn.

298,763. MAT. RAFAEL MARTINEZ, New York, N. Y., assignor to Emil Gutmann and Henry Goodman, both of same place. Filed Nov. 10, 1883. (No model.)



Brief.—A series of cylindrical rods connected in pairs through embracing-rings so arranged as to form flexible joints.

Claim.—1. In a floor-mat, a series of cylindrical rods, A, embraced loosely within rings G, connected in pairs, arranged to form flexible joints, substantially as and for the purpose herein specified.

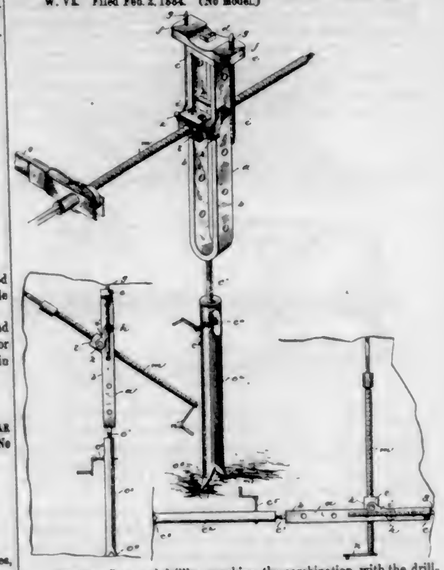


2. In a floor-mat, the parallel rods A, in combination with the end caps, E, two series of loosely-embracing rings G, and means, as *g*, for preventing displacement of the rods endwise, all substantially as herein specified.

298,764. ROAD-CART. ORLANDO J. MCCOLLUM and CARLL OSKAR STRAN, Aurora, Ill. Filed Feb. 3, 1883. Renewed Mar. 15, 1884. (No model.)

Claim.—A vehicle-spring for connecting the shafts to the axles, consisting of an upper and lower leaf, said lower leaf being the shorter, and being independent at that end contiguous to the shaft, said upper and lower leaf having preferably upwardly and downwardly turned end edges, respectively, farthest from the shafts, which bear, respectively, against the axle and contiguous cross-bar of the double clip, by which they are secured to said axle.

298,765. COMBINED CANT-HOOK AND LIFTING-JACK. OBED H. MITCHELL, Springfield, Mo. Filed Mar. 25, 1884. (No model.)



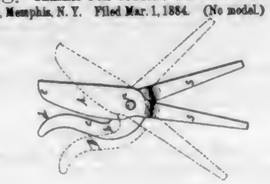
Claim.—1. A lifting-jack composed of a standard, A, having notches *a'*, holes *a*, and a foot, E, composed of two pieces, *e e'*, and having a toe-piece, J, in combination with a lever, B, composed of two pieces, *b b'*, detachably secured to the said standard, and having holes for bolts b^2 b^3 b^4, and a rod, D, which forms a link, *d d'*, and a hook, d^2, and with a hook, C, having holes *c*, and a forked toe, *c' c'*, all arranged and constructed substantially as shown and described.

2. The combination of plates G, having the edge *g'* turned back, with a lever, B, composed of two pieces and having holes for bolts b^2 b^3 b^4, and a supporting-rod, D, which has a link, *d d'*, and a hook, d^2, a hook, C, which has sharp spreading toes *c' c'* and holes *c*, together with a standard, A, having holes *a*, notches *a'*, and a foot-piece, E, which has a toe-piece, J, all substantially as shown and described, for the purpose set forth.

3. The combination of a cant-hook composed of a lever, B, having holes for bolts b^2 b^3 b^4 b^5 b^6, and plates G, to which is detachably secured a hook, C, having holes *c* and toes *c' c'*, with a device composed of a standard, A, having holes *a*, notches *a'*, and a foot, E, composed of two pieces, *e e'*, beneath the front end of which is a toe-piece, J, and a rod, D, having a link, *d d'*, and hook d^2, all arranged and constructed substantially as shown and described.

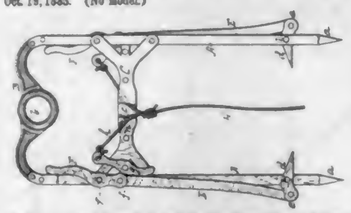
298,766. COAL-DRILLING MACHINE. LEWIS P. MORAN, Handley, W. Va. Filed Feb. 2, 1884. (No model.)

Claim.—In a coal-drilling machine, the combination, with the drill-frame composed of the perforated side bars, *b b*, connected at one end by the short bar *c*, and provided at the other end with the extension-rack, of the head-block *l*, journaled in hangers connected to the drill-frame by a bolt, A, and nut, passed through perforations in the hangers and bars *b b*, and the drill-shaft and lever for operating it, substantially as specified.



298,767. FOUNTAIN PEN-HOLDER. JAS. MORTON, New York, N. Y. Filed Apr. 11, 1883. (No model.)

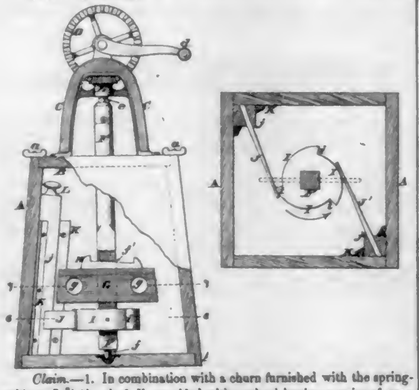
Claim.—1. In a fountain pen-holder, the combination, with the hollow stem A, having the bottom channel, *a*, enlarged to receive the feed-tube and pen, as set forth, of the tube E, fitted with its inner end tightly and with its outer end loosely into the said enlargement, and the pen F, inserted between the said tube and enlargement, the said tube being of the curved and gradually-tapering shape shown, and being also provided with the feed-channel G and air-hole H, and having several times larger area of cross-section at and above the air-hole than across the narrowest part of the feed-channel, as and for the purpose set forth.



2. In a fountain-pen, the combination of the following elements: the hollow stem A, having the bottom channel, *a*, enlarged to receive the feed-tube and pen, the feed-tube and pen E F, fitted in the said enlargement, as described, the valve-rod D, provided at its lower end with the valve *d*, and having at its upper end a threaded enlargement, *c*, and a knob, C, the perforated cap B, having an inside thread, *b'*, to receive the thread *c*, and an outside thread, *b*, by which it is fitted into the upper end of the stem A, and the packing S, fitted in the thread of the stem A, and surrounding tightly the valve-rod D, all constructed substantially as hereinbefore set forth.

298,768. SHEARS FOR CUTTING TOBACCO-PLANTS. CHARLES NAGLEY, Memphis, N. Y. Filed Mar. 1, 1884. (No model.)

Claim.—The improved tobacco-plant cutter, consisting of the blade A, having its cutting-edge curved slightly toward the back from near the pivot to near the end of the blade, and terminating with increased curvature, and the blade B, pivoted to blade A, and having a reversed curved cutting-edge beginning with an abruptly rearward curve, *a*, near the pivot of the blade, continuing with the abrupt reverse curve *b*, thence a tangential portion, *c*, and terminating with the extensive rearward or outward curve *d*, said blades having shanks *s s* bent upward from the plane of the blades, the whole constructed substantially as shown and set forth.

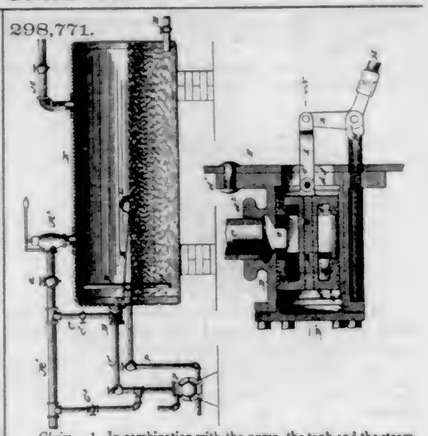


298,769. HORSE HAY-FORK. AARON J. NELLE, Pittsburg, Pa. Filed Oct. 19, 1883. (No model.)

Claim.—1. In a horse hay-fork, the combination of a sheath, a barb pivoted thereon, a hand-lever also pivoted thereon, a connecting-bar pivoted at one end to the barb and at the other to the hand-lever, and a tripping-dog pivoted on the sheath and adapted to act on the connecting-bar to force the same and the hand-lever off their centers, substantially as and for the purposes specified.

2. In a horse hay-fork, the combination of two or more sheaths, each having a hand-lever and a barb both pivoted thereon, a connecting-bar pivoted at one end to the hand-lever and at the other to the barb, and a trip-dog pivoted on the sheath and adapted to act on the connecting-rod to force it and the hand-lever off the center, with a cross or brace bar provided with a central guide-hole to receive the several trip-ropes of the trip-dogs, substantially as and for the purposes specified.

298,770. CHURN. WILLIAM H. NICHOLSON, Mount Washington, assignor of one-half to Robert A. Shannon, Cedar Point, Ohio. Filed Apr. 4, 1883. (No model.)

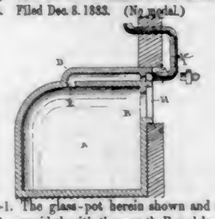


Claim.—1. In combination with a churn furnished with the spring-rubbers J J', the shaft F, provided with a wheel having a series of cam-surfaces, I, with shoulders *i*, that strike the free ends of said spring-rubbers, as herein described, and for the purpose stated.

2. The churn-box A, provided with a shaft, F, armed with a laterally-adjustable dasher, G, and a wheel having cam-surfaces I with shoulders *i*, in combination with the spring-rubbers J J', projecting from detachable uprights *j j'*, situated at the diagonally-opposite corners of box A, the free ends of said rubbers being struck by said cam-surfaces I with shoulders *i*, as and for the purpose herein described.

3. The combination, in a churn, of the detachable uprights *j j'*, spring-rubbers J J', and the cam-wheel carried by the dasher-shaft, substantially as described.

298,771. PUMP-REGULATOR. EUGENE F. OSBORNE, St. Paul, Minn. Filed Apr. 27, 1883. (No model.)



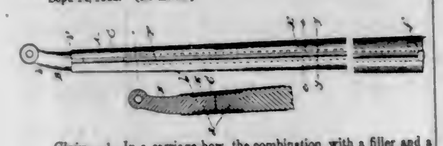
Claim.—1. In combination with the pump, the tank and the steam-pipe of the pump, a valve-chamber provided with ports and constructed in open communication with the tank-interior, a freely-movable valve in said chamber, and a float connected with the valve, substantially as described.

2. In combination with the pump, tank, and float-lever, a valve-chamber, D, in free communication at both ends with the tank-interior, and provided with ports *c* and *c'*, arranged as shown, and the freely-fitted valve E, centrally reduced opposite the port *c*, and a pivotal connection uniting the valve and float lever, substantially as described.

3. The combination, in a steam-distributing system, of a tank connected to receive the water of condensation, the steam-supply pipe of the system communicating with the steam-space of the tank, a pump connected with the water-space of the tank, a steam-supply pipe for the pump, a valve-chamber in open communication with the tank-interior, a freely-moving valve therein, a float riding within the tank, and connections uniting the valve and float, constructed to reciprocate the valve by the rise and fall of the float, substantially as described.

298,772. GLASS-POT. WILLIAM T. OTTO and JOSEPH H. FOX, Wheeling, W. Va. Filed Dec. 8, 1883. (No model.)

Claim.—1. The glass-pot herein shown and described, consisting of the body A, provided with the mouth B and hood C, whereby a recess, H, is formed adapted to receive a stopper, the crown-flue D, communicating with an opening in the pot, as shown, the outer end of said flue being provided with a recess, and the stopper I, in combination with an air-vent extending from the back of the pot along the crown of the same to the front of the pot, and means for regulating the same, substantially as described and for the purposes set forth.

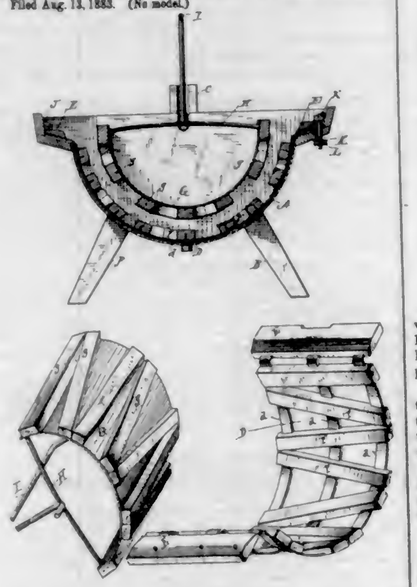


2. The combination, with a glass-pot embodying in its construction an air vent or flue, substantially as herein shown, of a pipe attached to the mouth of the flue, and connected to an exhaust-fan or furnace-stack for the purpose of exhausting the hot air, substantially as herein described.

298,773. DRAFT-EQUALIZER. THOMAS PATES, Alton, Ill., assignor to the Hapgood Plow Company, same place. Filed Feb. 13, 1884. (No model.)

Claim.—The combination of the central double-tree, two triple-trees, bolt *e*, and hasp *g*, one of the said triple-trees pivoted to each end of the said double-tree by means of the said bolt and hasp, as shown, the two single-trees, block-washers *k*, provided with pins *n*, bolts *j*, and hasp *m*, one of the said single-trees pivoted to the short arm of each triple-tree by means of the said bolt *j*, hasp *m*, and two of said block-washers, as shown, and for the purpose specified.

298,774. CARRIAGE-TOP. RUDOLF H. PFAFF, Ashtabula, Ohio. Filed Sept. 14, 1883. (No model.)



Claim.—1. In a carriage-bow, the combination, with a filler and a slat-iron having a stud, of a ferrule, the outer surface of which is flush with the slat-iron, and a metallic case or cover which extends over the slat-iron below its stud and is welded thereto, substantially as and for the purpose described.

2. In a carriage-bow, the combination of the slat-iron, ferrule, filler, and a metallic case or cover with a strip of metal, as and for the purpose set forth.

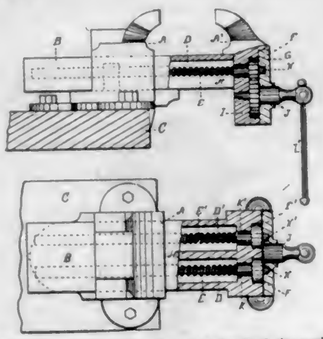
3. In a carriage-bow, the combination of a slat-iron, ferrule, filler, and a metallic case or cover with a strip of metal having an ear which takes upon a shoulder of said filler, whereby the joint between the edges of the case is covered and finished, substantially as shown and described.

4. In a carriage-bow, the combination, with a filler and a slat-iron having a stud, of a ferrule the outer surface of which is flush with the slat-iron, and a metallic case which extends over the slat-iron and is welded thereto, substantially as and for the purpose set forth.

298,775. WASHING-MACHINE. MATTHEW R. POTTORFF, Gilman, Ill. Filed Aug. 13, 1883. (No model.)

Claim.—1. In a washing-machine, the body A, having each end extended, as shown, and provided with a block or ledge, secured to one of its ends, in combination with a false bottom, D, having end pieces, E, at right angles thereto, and resting on the extended ends of the body, one of said end pieces fitting under the block or ledge, and the other end piece being slotted, as shown, and a thumb-screw and nut engaging with the slot of said end piece, as and for the purpose set forth.

2. The false bottom having end pieces nearly at right angles thereto, semicircular metallic strips *d*, connecting the end pieces, and arranged longitudinally, and detachable slats or ribs secured to the strips with their ends adjacent to each other, and forming the letter V alternately from one side to the other, in combination with the box or body A, having ledge J, and a thumb-screw, bolt, and nut, as set forth.

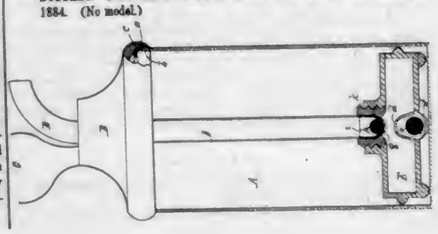


298,776. RAILROAD-RAIL JOINT. RICHARD RAHY, Jr., York, Pa., assignor of two-thirds to Alfred A. Long, same place, and Samuel A. Saroff, Columbia, Pa. Filed Nov. 22, 1883. (No model.)

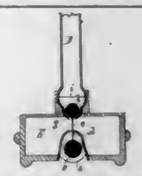
Brief.—Two detachably-hinged sections, each having an upwardly-turned central portion and an extended flat base.

Claim.—The two-part rail-fastening, consisting of the sections having the lateral and upwardly-projecting parts and united by a hinge which permits the sections to be taken apart so as to remove one rail without disturbing the other rail, substantially as described.

298,777. VISE. CALVIN RIGGS, Worcester, Mass. Filed July 12, 1883. (No model.)



Claim.—1. In a parallel bench-vise, as described, the combination, with the movable jaw A' and sliding bar B, of the two actuating-screws E and E', arranged in the same horizontal plane, housed within said bar B, and so geared together as to act simultaneously, as and for the purpose set forth.



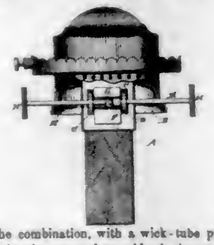
2. The combination, in a parallel bench-vise, as described, of the two actuating-screws E E', arranged in the same horizontal plane within the bar B, and having the tapered ends H H', and a cap-piece, G, with tapered recesses, forming bearings for the tapered ends of the screws, as and for the purpose set forth.

3. In a parallel bench-vise, having the two actuating-screws E and E', housed within the sliding bar B, and both in the same horizontal plane, the chambered sliding bar B, having a central rib, N, as and for the purpose set forth.

298,778. COMBINED LIQUID MEASURE AND REGISTER FOR BOTTLES. EBENEZER H. ROGERS, Jr., New York, N. Y. Filed Feb. 29, 1884. (No model.)

298,778.

Claim.—1. The combination of a bottle or similar vessel, a fluid-measure inserted in the base thereof, provided with operating-valves and a spout for filling and discharging the same, and a registering device mounted upon the bottle-top, for indicating the number of times the measure is filled and discharged, all applied and operating in the manner substantially as herein shown and set forth.



2. The combination of a bottle and a measuring device inserted in the base thereof, such measure being provided with automatic valves for controlling the entry and discharge of the fluid, and a discharging-spout passing through the bottle-top.

3. The combination of a bottle or similar shaped vessel, a metallic top of the same diameter as the vessel-body, carrying a registering device, a spout for delivering the fluid, a fluid-measure depending from the base of such spout, and a locking device for securing the bottle-body and metallic top together, all substantially as and for the purposes as herein shown and set forth.

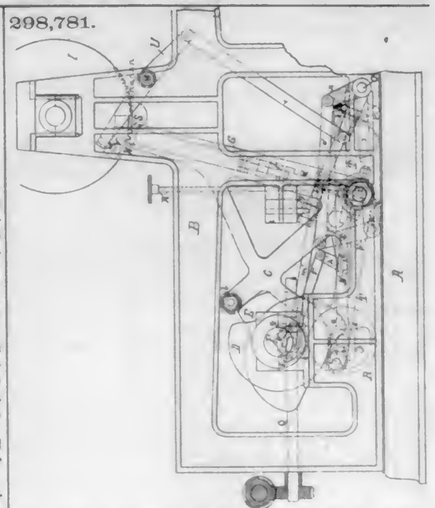
4. The fluid-measure E, depending from the spout D, and provided with valves *d e* and *h g*, applied and operating substantially as and for the purposes as shown and set forth.

5. The combination of the vessel A, metallic top B, having a register, C, pouring-spout D, and liquid-measure E, all arranged, applied, and operating substantially as and for the purposes as herein shown and set forth.

298,779. WICK-RAISER. GEORGE W. SANFORD, Thomaston, Conn., assignor of one-third to Patrick McCain, same place. Filed Jan. 23, 1884. (No model.)

Claim.—The combination, with a wick-tube provided with elongated slots, of a bearing secured to said tube between the slots, shafts passing through the base of the burner, and having their inner ends journaled in said bearing, and toothed disks secured to the shafts and fitting in said slots, substantially as set forth.

298,780. CLUTCH. HERMAN SCHWETTER, Brooklyn, N. Y. Filed Mar. 26, 1884. (No model.)



Claim.—1. The herein-described clutch-block mounted in a curved recess formed in the shaft, and having a curved face for bearing against the wall of the corresponding recess in the hub of the wheel, said block being arranged to be moved from the exterior of the wheel, substantially as shown and described.

2. The wheel provided with the enlarged hub, having the interior curved recess, as explained, the shaft having the elongated bearing for the wheel, the clutch-block curved on both bearing-faces, and mounted in a curved recess formed in the shaft, said recess arranged to accommodate the block while the wheel revolves, the collar, the projection on the clutch-block, by which it may be turned from the exterior down into the recess in the shaft, and the spring, combined and arranged substantially as shown and described.

298,781. PRINTING-MACHINE. WALTER SCOTT, Plainfield, N. J. Filed Aug. 21, 1883. (No model.)

Claim.—1. The combination, with the impression-cylinder, of a

298,781.

lever-arm, as G, a toothed sliding bar, as H, toggle-lever, as L, and a mechanism, substantially as described, for actuating said toggle-lever, substantially as described.

2. The combination, with the impression-cylinder, of a lever-arm, as G, a toothed sliding rod, as H, a toggle-lever, as L, the lower link of which is forked to straddle the hub of the lever C, and a mechanism, substantially as described, for actuating said toggle-lever, substantially as described.

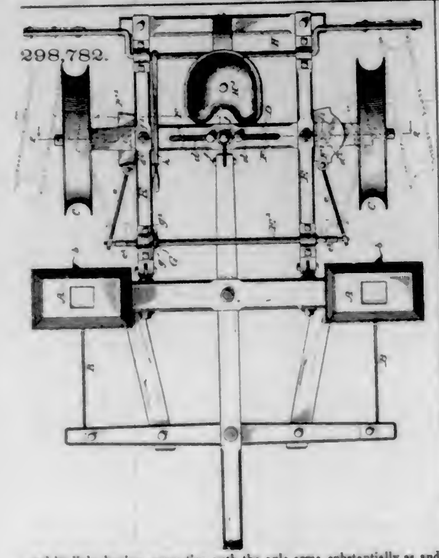
3. The combination, with the impression-cylinder, of a lever-arm, as G, bar, as H, toggle, as L, and its actuating mechanism, substantially as described, a lever, as U, and a mechanism, substantially as described, for operating the parts at every second revolution of the crank-shaft.

4. The combination, with the impression-cylinder, of a lever-arm, as G, bar, as H, toggle, as L, a mechanism, substantially as described, for operating the parts so that the form-bed can be reciprocated any number of times for each impression taken, and a mechanism, substantially as described, for preventing the tripping of the parts except at proper times.

5. The combination, with the impression-cylinder, of a lever-arm, as G, a bar, as H, toggle, as L, lever, as U, and their actuating mechanism, substantially as described, a mechanism, substantially as described, for operating the parts so that the form-bed can be reciprocated any number of times for each impression taken, and a mechanism, substantially as described, for preventing the return of the parts except at proper times, substantially as described.

6. The combination, with the impression-cylinder, of a lever-arm, as G, a sliding rod, as H, a toggle-lever, as L, the lower link of which is a lever of the first order, and a mechanism, substantially as described, for actuating said toggle-lever, substantially as described.

298,782. CORN-PLANTER. LYMAN A. SCOVIL, Williamsport, Ohio. Filed Feb. 12, 1884. (No model.)



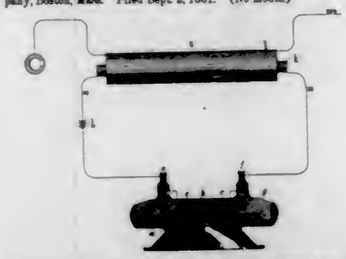
Claim.—1. The combination, substantially as hereinbefore set forth, of the wheel-frame, the axle-beam, the axle-arms having jointed connection with the axle-beam, the adjustable wheels, and means controlled by the attendant for simultaneously and correspondingly inclining the axle-arms, to cause the wheels to move together either inward or outward, whereby they are caused to simultaneously and similarly approach or move away from the central line of draft, for the purpose described.

2. The combination of the trench-openers, the axle-beam in rear thereof, the axle-arms having pivotal connection with the axle-beam, the wheels, the cranked rock-shaft having link-connection with the axle-arms, and its lever and detent devices, substantially as and for the purpose hereinbefore set forth.

3. The combination of the trench-openers, the wheel-frame, the axle-beam, the pivoted axle-arms, the cranked rock-shaft, the adjustable wheels, and the bracket-yokes by which the axle-arms have link-connection with the rock-shaft, substantially as and for the purpose hereinbefore set forth.

4. The combination of the wheel-frame, the axle-beam having longitudinal slots and transverse grooves, the sliding and vibrating axle-arms provided with pivots traversing the longitudinal slots, and guide-lugs working in the transverse grooves, the wheels, the cranked rock-shaft,

298,782.



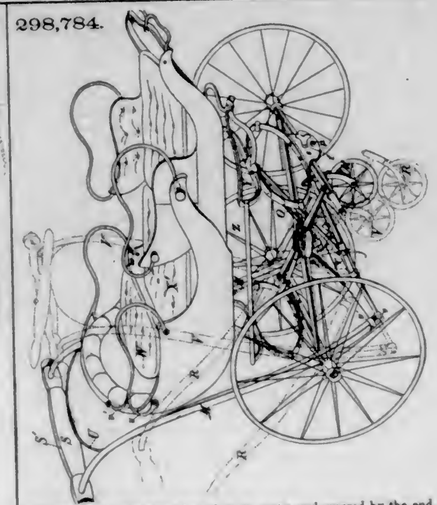
and its links having connection with the axle-arms, substantially as and for the purpose hereinbefore set forth.

5. The combination of the axle-beam, the sliding and vibrating axle-arm, the gear of the supporting-wheel, and the gears supported by connection with the axle-arm, substantially as and for the purpose hereinbefore set forth.

6. The combination of the runners, the teeth at the heels thereof for slightly covering the grain, the wheel-frame, the axle-beam, the axle-arms having jointed connection with the axle-beam, the adjustable wheels, and means controlled by the attendant for simultaneously and correspondingly inclining the axle-arms either to the rear or to the front, to cause the wheels to move together either inward or outward, whereby the grain may be covered by the teeth only, or by them and the wheels, substantially as and for the purpose hereinbefore set forth.

7. The combination of the wheel-frame, the axle-beam, the axle-arms having jointed connection with the axle-beam, the adjustable wheels, means controlled by the attendant for simultaneously and correspondingly inclining the axle-arms either to the front or to the rear, to cause the wheels to move inward or outward, and the series of scrapers for acting on the wheels in their different positions, substantially as and for the purpose hereinbefore set forth.

298,783. RECEIVING-TELEPHONE. CHARLES E. SCRIBNER, Chicago, Ill., assignor, by mesne assignments, to the American Bell Telephone Company, Boston, Mass. Filed Sept. 2, 1881. (No model.)



Claim.—The combination of the coil of the electro-magnet of the telephone with the primary of the induction-coil and the battery, whereby the telephone and induction-coil are rendered magnetic from the same source of electricity, substantially as and for the purpose specified.

298,784. CHILD'S CARRIAGE. HORACE C. SEELY, Philadelphia, Pa. Filed Oct. 14, 1881. (Model.)

Claim.—1. The handle having its uprights M journaled upon the axle and provided with the two-piece push-bar S S' and brace U, said

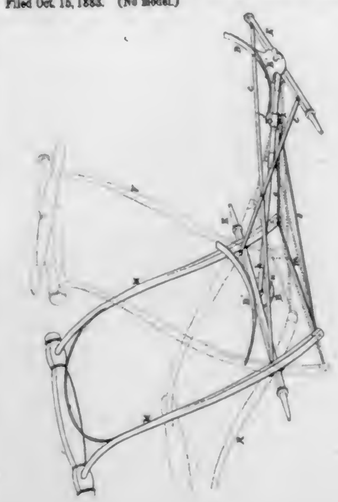
298,784.

two-piece push-bar being pivoted at its center and secured by the end caps, substantially as described.

2. The caster-wheel B and its connections, consisting of the triangle composed of its parts *m n o o*, socket *l*, and provided with the sliding sleeve *i*, with its hinge-lug *k*, set-screw *j*, and hinged to the arm A, the latter connected with the lifting-spring *a*, and front spring, axle, or frame, to actuate the said caster-wheel B through the uprights M of the handle, substantially as described.

3. The sliding sleeve *i*, provided with the set-screw *j*, and combined with the arm A and part *n* of the triangle, to produce an adjustable handle, substantially as described.

4. The combination, with the handle and reach, of the stirrup T and check-strap P, substantially as described.



5. The combination, with the reach and front spring or frame, of the brace-strap O, substantially as described.

6. The rocking device, Fig. 4, combined with the spring by its flange *r* and with the axle through holes *t* and *u*, substantially as described.

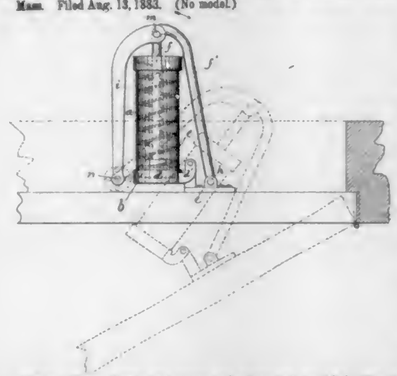
7. The brace-guard, Fig. 6, with its prongs *v v' w*, combined with the carriage-body, substantially as described.

8. The detachable pillow W, to combine with the back or sides of the carriage-body, substantially as described.

298,785. CHILD'S CARRIAGE. HORACE C. SEELY, Philadelphia, Pa. Filed Oct. 15, 1883. (No model.)

Claim.—1. The combination of the handle-bars journaled upon the axle with ends extending below the same, triangular frame *m o o*, sleeve *i*, coupling-rod *h*, and means for securing the same in its adjusted position upon the coupling-rod, all substantially as described.

2. The coupling-rod *h*, journaled to the front or rear axle, and the front spring journaled on the front axle by means of a set-screw through the hole *u* in the rocking device B', said front axle being held in a horizontal position by the spring-reach *o c*, substantially as described.



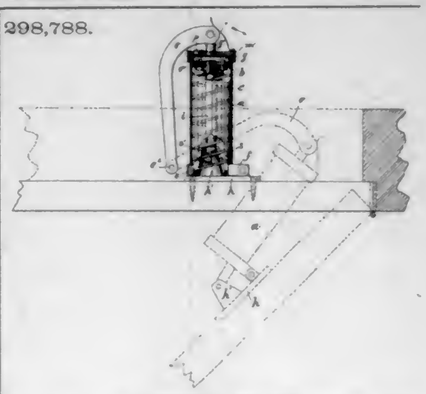
298,786. AUGER. HENRY L. SHALER, Deep River, CONN. Filed Apr. 11, 1884. (No model.)

Claim.—1. An auger or machine bit having the twist thereof constructed on a taper in cross-section, or varying in diameter or circumference throughout a portion of or its entire length, substantially as and for the purpose set forth.

2. An auger or machine bit having its cutting spurs or edges upon the largest diameter of the twist, said twist tapering from the top of the cutting-edges of the spurs back in a true taper designedly the entire length thereof, or sufficiently to form new cutting-edge when worn or broken, and giving clearance to the tool when boring, substantially as and for the purpose specified.

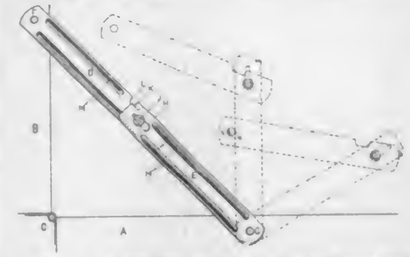
298,787. PNEUMATIC DOOR-CHECK. JOHN A. SHERMAN, Boston, Mass. Filed Aug. 13, 1883. (No model.)

Claim.—The cylinder and piston and piston-rod provided with an extension, combined with the pivot-plate to which the said cylinder and rod-extension are pivoted, the pivotal point of the cylinder being farther from the plate than that of the rod-extension by a distance about equal to that between the said pivots measured parallel with the plate, substantially as and for the purpose set forth.



298,788. PNEUMATIC DOOR-CHECK. JOHN A. SHERMAN, Boston, Mass. Filed Aug. 13, 1883. (No model.)

Claim.—1. The cylinder and its pivot-plate, combined with the piston and its piston-rod extending toward and pivotally connected with the said pivot-plate, and the connecting-bar pivotally connected with the end of the cylinder opposite the pivot-plate, substantially as described.



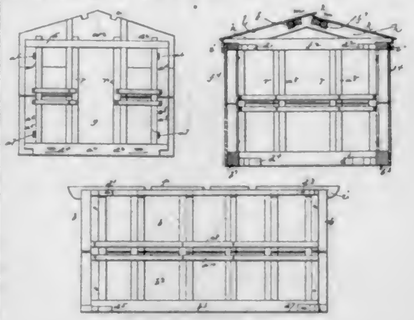
2. In a door-check, the cylinder, piston, piston-rod, and actuating-spring, combined with the connecting-bar and auxiliary spring co-operating therewith, substantially as described.

3. In a door-check, the cylinder and piston, provided with a valve and an orifice and connecting mechanism between them and the door, combined with the regulating-screw controlling the orifice in the said piston and wholly inclosed in the interior of the piston, substantially as described.

298,788.

298,789. TRUNK-STAY. CHARLES D. SIMMER, Annapolis, Md. Filed June 27, 1883. (No model.)

Claim.—1. A trunk-stay provided with a tapered friction-slot adapted to operate substantially as and for the purposes set forth.



2. A trunk-stay composed of two pivoted arms or blades, one of which is provided with a tapered friction-slot, in combination with the pivot working in said slot and adapted to impede or oppose the closing movement of the trunk-lid, substantially as set forth.

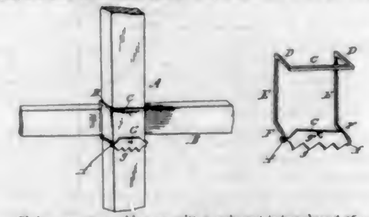
3. A trunk-stay having the blade D, provided with the inclined shoulder L, in combination with the blade E, provided with the lip K, said blades being pivoted together, and adapted to operate substantially as described.

4. A trunk-stay composed of two pivoted arms or blades, the blades of which are provided with one or more guiding ridges or flutes, substantially as set forth.

298,790. PORTABLE BUILDING. JOSEPH SANFORD SIMMONS and ROBERT MARION SIMMONS, Belton, S. C. Filed Mar. 15, 1884. (No model.)

Brief.—Consists of side and end walls made in horizontal sections and detachably connected by angle-irons, hooks, and studs. The roof-sections are supported upon notched rafters, girders, and beams, one section overlying the other at the ridge.

Claim.—1. In a portable building, the combination, with the end walls, made in two horizontal sections, of the side walls, made in two horizontal sections, all of the sections being separable and connected at the corners, sills, and girders by angle-irons, hooks, and studs, substantially as specified.



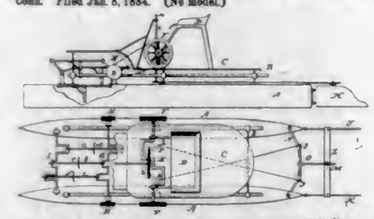
2. In a portable building, the combination, with the sectional side walls and end walls constructed and connected as described, of the notched roofing-girders *h*, secured to the notched tie-beams *f'*, the notched eave-strips *i*, the notched rafters *f f'*, and the roof-sections *k* and *l*, having notched securing-strips *m* on their under faces, substantially as and for the purposes specified.

3. In a portable building, the end wall having the sectional corner-posts and the sectional intermediate studding securely mortised into the sill and girder, and braced by the horizontal laths, in combination with the weather-boarding secured to said sectional corner-posts and studding, and the auxiliary studding loosely tenoned in mortises in the sill and girder of said end wall, substantially as specified.

4. In a portable building, the side wall composed of the sectional studding mortised securely in the side sill and side girder, and braced by the horizontal laths secured to their inner faces, in combination with the weather-boarding and the auxiliary studding tenoned loosely in mortises in the side sill and side girder, substantially as specified.

298,791. BUILDER'S SCAFFOLDING. DANIEL W. SPOONER, Minneapolis, Minn. Filed Aug. 23, 1883. (No model.)

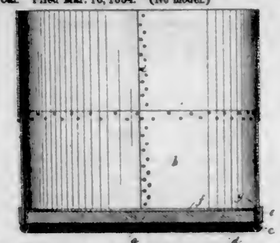
Brief.—A binding-clamp consists of a front horizontal piece, parallel side arms, parallel vertical rear pieces, and lower parallel arms, and a toothed dog pivoted thereto, the whole embracing a post and ledger-board, and held in vertical adjustment by a set-screw in the pivoted dog.



Claim.—1. In combination with a pole and ledger-board of a scaffold, the clamp described, supporting the latter and completely embracing and binding both together against vertical, lateral, and torsional movement, and held firmly in place at any desired point of vertical adjustment by means of the movable dog which engages with said pole, as herein specified.

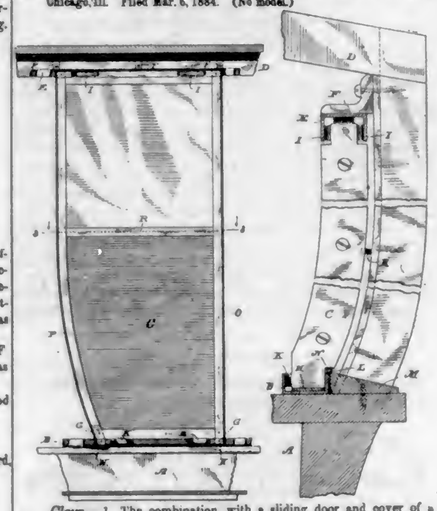
2. The scaffold-binding frame described, having the parts C D E F with the engaging-dog pivoted in the eyes *f f* thereof, substantially as and for the purposes specified.

3. The dog G *g g'*, in combination with the parts C D E F *f*, adapted to serve substantially as herein described.



298,792. WATER-VELOCIPEDE. ELIJAH F. STEELE, Wallingford, Conn. Filed Jan. 8, 1884. (No model.)

Claim.—1. The combination of the two connected hulls A A, the deck C, fixed to but raised above said hulls, seat D, double-crank driving-shaft E, the two crank-shafts G and I, parallel to the said driving-shafts, one of said crank-shafts, G, in connection with the driving-shaft, whereby the revolution of the driving-shaft is communicated to said crank-shaft G, and rods connecting the respective cranks on said shafts G and I, each of said connecting-rods carrying a vertical blade, substantially as described.



2. In a water-velocipede consisting of the two hulls A A, with propellers between them, and means for driving the same, the combination, with said hulls, of two connected rudders, J and K, the T-shaped lever O, hung between the hulls, the leg of the T in connection with said rudders, the vertical shaft *i*, provided with a handle, *k*, and the cross-piece P below the connections from each end of said cross-piece to the opposite ends of the T, substantially as described.

298,793. TANK FOR WINDMILLS. HARRY R. STEVENS, Los Angeles, Cal. Filed Mar. 10, 1884. (No model.)

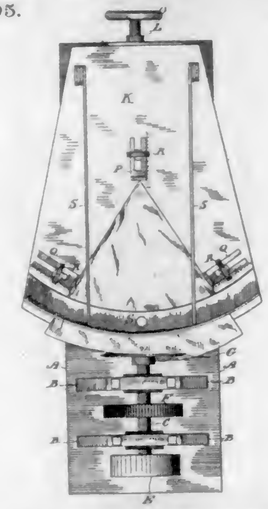
Claim.—The herein-described water-tank, consisting of the body of galvanized sheet-iron bent inwardly and upwardly over a strengthening-wire near its lower edge, the wooden bottom fitting tightly in place over the bead formed at the lower edge of the body of the tank, the encircling hoop fitting tightly over the body directly opposite the edge of the wooden bottom, the metal flange bent downwardly and inwardly over the wooden bottom, and the calking in the space between the body-wall and the vertical portion of the upwardly-bent flange, substantially as specified.

298,794. SLIDING DOOR FOR CARRIAGES. FRANK P. STONE, Chicago, Ill. Filed Mar. 6, 1884. (No model.)

Claim.—1. The combination, with a sliding door and cover of a carriage, of troughs or ways, substantially as set forth, and rubber strips that bear against the jambs and the inner sides of the troughs, whereby the joints are made tight when the door is closed, substantially as set forth.

2. The combination, with a sliding door of a carriage and carriage-cover, of the troughs or ways, and the rubber strips that bear within the troughs, and the anti-rattling spring-bearings, substantially as and for the purpose set forth.

3. The combination, with a sliding door and body of a carriage, of the troughs or ways, the spring-bearings, the inclined sill, the rubber strip arranged in the sill, and the recess in the door in which the rubber strip is seated, substantially as set forth.



4. The combination, with a sliding door and body of a carriage, of the troughs or ways, the rubber strips, the spring-bearings, and the ebony strip that extends across the door at about its middle, substantially as set forth.

298,795. HAT-BODY-ROUNDING MACHINE. ALFRED T. STURDEVANT, Croton Falls, N. Y. Filed Sept. 29, 1883. (No model.)

Claim.—1. In a device for rounding hat-bodies, the combination of means for holding the hat-body flat upon a revolving platform and the cutting mechanism, substantially as set forth.

2. In a device for rounding hat-bodies, means for holding the hat flat in its cone shape upon the platform, and adjustable gages for confin-

298,795.

ing the hat as against horizontal displacement, substantially as set forth.

3. In a device for rounding hat-bodies, the swiveled platform adapted to support the hat, in combination with means for clamping the hat flat in its cone shape against said platform, adjustable gages to prevent horizontal displacement of the hat, and mechanism for cutting the hat-body, substantially as and for the purpose set forth.

4. The table K, swivelly attached to the adjustable block I, and having secured thereto the clamp S and gages P Q, in combination with the cutters G, substantially as shown and described.

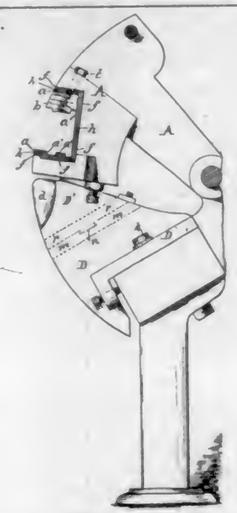
5. The clamp S and gages P Q, attached to the platform, as shown, whereby the hat-body may be held and different sizes accommodated, in combination with means for adjusting said platform and mechanism for cutting the hat-body, substantially as described.

6. The clamp S and gages P Q, attached to the platform, as shown, whereby the hat-body may be held and different sizes accommodated substantially as set forth.

298,796. BUTTON-FASTENER. JAMES F. THAYER, Providence, R. I. Filed Jan. 2, 1884. (No model.)

Claim.—1. As an improved article of manufacture, a prong-deflecting washer or plate having one or more integral bars formed upon its concave side, and also having the edges of the openings therein swaged or elongated, as and for the purpose set forth.

2. The metallic concavo-convex plate A, herein described, provided with the bar *a* upon its concave side, and further provided with the swaged or elongated edge *a'*, the whole formed from a single blank, substantially as shown.



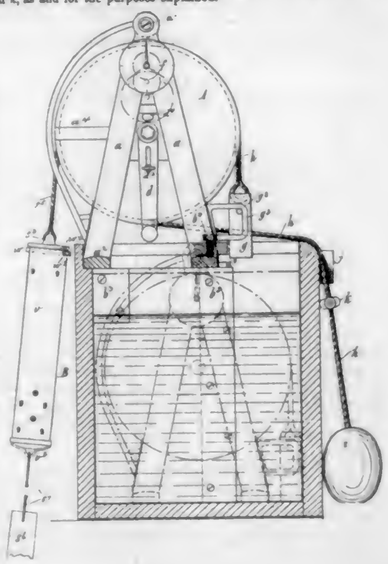
3. In a button-fastening, the combination, with a pronged button or staple, of the concavo-convex plate A, having the bar or tie *a* formed integral with said plate, the edges c of the opening *b* being swaged or extended at *a'*, the whole arranged and adapted to deflect and conceal the prongs, substantially as shown and described.

298,797. HEEL-STIFFENER MACHINE. ASA HOWARD THOMPSON, Boston, Mass., assignor to Edwin H. Sampson, same place. Filed Mar. 31, 1884. (No model.)

Claim.—1. The combination of the divided mold, the boxing A, and the recessed head A, substantially as described.

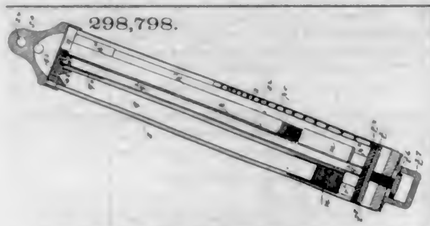
2. The combination of the recessed head A, the boxing A, the divided molds *b b'*, and the form *d*, with its backing D' dovetailed to the lower support, D, all as described and shown.

298,797.



298,798. NAVIGATIONAL SOUNDING APPARATUS. WILLIAM THOMSON, Glasgow, County of Lanark, Scotland. Filed Jan. 21, 1881. (No model.) Patented in England Feb. 23, 1880, No. 781; in France Aug. 23, 1880, No. 138,389; in Germany Sept. 14, 1880, No. 15,123, and in Italy Sept. 20, 1880, No. 13,400.

Claim.—1. In a deep-sea sounding apparatus, the combination, with the drum or reel A, of a frame, *a a*, in which said drum has its bearings, a box, B, to receive said drum and frame, and provide for immersing the sounding-wire in a preservative liquid when not in use, and supports b^2 b^3, for sustaining the frame and drum in operative position, as described.

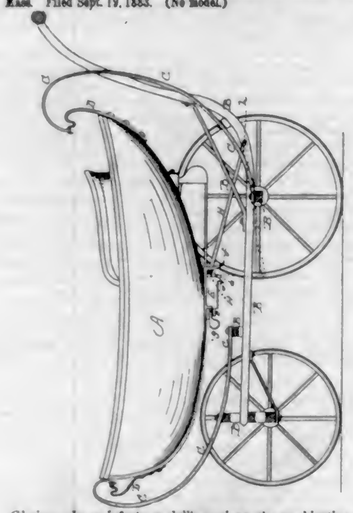


2. The combination of the frame *a a*, having laterally-projecting feet a^2 a^2, the supports b^2 b^3, and beads or flanges to secure said frame by its feet, substantially as described.

3. The combination of the frame *a a*, having feet a^2 a^2, the supports b^2 b^3, and screws b^4 b^4, substantially as described.

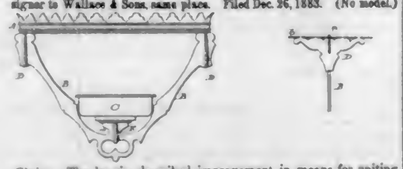
4. The combination, with the drum A, frame *a*, and box B, of the brake-cord k, weights *g i*, or springs in lieu thereof, check-blocks *j*, and bead *k*, as and for the purposes explained.

298,798.



5. The combination of the cord k, weights *g i*, check-blocks *j*, bead *k*, lugs g^2, and stirrups g^3, as described.

6. The depth-gage consisting of a tube of adjustable capacity, with or without cloth to guard its lower end, and communicating at its upper end through a fine tubular passage with another tube capable of being closed and opened, and used for showing the depth by the quantity of water forced into it, essentially as described and represented.



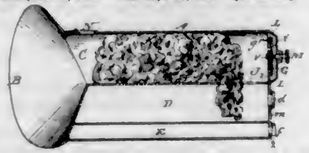
7. A depth-gage consisting of the combination of two, or three, or more, gages, wherein each succeeding tube by which the water enters bears an increasing ratio of capacity to its receiving-tube, as described.

298,799. INFANT'S CARRIAGE. CHARLES W. TROW, Wakefield, Mass. Filed Sept. 19, 1883. (No model.)

Claim.—In an infant's or doll's carriage, the combination, with a laterally-swinging carriage-body provided with a latch or locking device, of an arm extending from the frame and adapted to catch in said locking device, substantially as and for the purpose described.

298,800. HANGING LAMP. JOHN H. TURNER, Ansonia, Conn., assignor to Wallace & Sons, same place. Filed Dec. 26, 1883. (No model.)

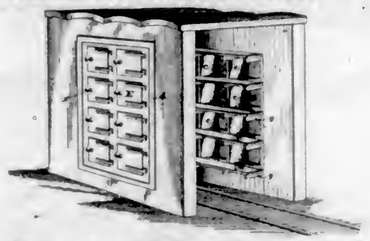
Claim.—The herein-described improvement in means for uniting the parts of hanging-lamp fixtures, consisting in a brace constructed with a transverse slot corresponding to the thickness of the part to be braced, and the part to be braced with a corresponding slot, whereby the brace and the part to be braced may be interlocked the one with the other, the said brace constructed, substantially as described, for attachment to the portion to which the part to be braced is to be attached, the plane of the brace being at substantially right angles to the part to be braced, substantially as specified.



298,801. SHEET-METAL CAN. FRANCIS A. WALSH, Chicago, Ill. Filed June 18, 1883. (No model.)

Claim.—1. A can provided with a collar, *c*, having a shoulder, *g* and *g'*, and with a cover, *b*, united to said can by a part, *i*, whereof the part projecting beyond the collar *c* is turned over outward and down against the collar c and under the shoulder *g'*, substantially as specified.

2. A can provided with a shoulder, *g*, packing *m*, and cover *b*, united together by a separate part, *i*, substantially as specified.

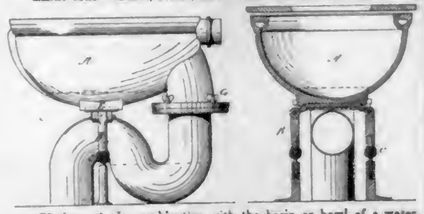


298,802. INHALER. CHARLES WARREN, Wellesley, assignor to John C. Warren, Boston, Mass. Filed Sept. 28, 1883. (No model.)

Claim.—1. In an inhaler substantially such as described, a mouth-piece adapted to fit closely around the mouth of the patient, an air-tube adapted to receive and hold a sponge, an induction-opening through which fresh air may enter said tube when in use, a valve or means for closing said opening as required, an eduction-opening through which the breath may be exhaled, a valve or means for closing said eduction-opening as the vapor is inhaled, a tank for holding the liquid ether or other anæsthetic, provided with an opening into said air-tube, and a plugged or capped opening through which the liquid may be drawn off or inserted, and a water-tank provided with a plugged or capped opening, through which the tank may be filled or emptied, combined and arranged to operate substantially as specified.

2. The air-tube C, tanks D E, and mouth-piece B, constructed and arranged substantially as shown and described, the tank D partially surrounding the tube C, the tank E partially surrounding the tank D, and the mouth-piece forming the top or end for both of said tanks, whereby space is greatly economized and the cost of construction reduced.

298,803. OVEN FOR DRYING CORES OR MOLDS. BENJAMIN F. WATKINS, Alliance, Ohio. Filed Jan. 2, 1884. (No model.)

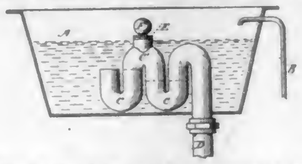


Claim.—1. A foundry or other drying oven provided with a track, a large door for the passage of a truck, a series of shelves secured to one or both side walls of the oven, and a series of small doors by means of which access can be had to the shelves without entering the oven, substantially as set forth.

2. A foundry or other drying oven provided with the main or large doors, a series of sockets set into the walls of said oven, brackets secured to the sockets, shelves supported on the brackets, and a door or doors adapted, when open, to expose the shelves, substantially as set forth.

3. A foundry or other drying oven provided with a large door, metallic frames set into the side walls of the oven and divided up into compartments, each of which is provided with a door, and shelves secured to the side walls or to the metallic frames forming a portion of the side walls, for the purpose of holding small cores, the said shelves being so situated relative to the small doors to enable the cores to be placed on and removed from the shelves through the door-openings without entering the oven, substantially as set forth.

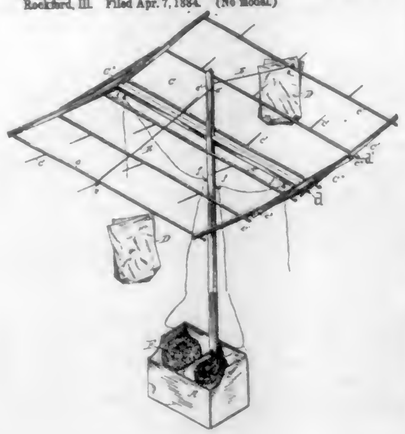
298,804. ADJUSTABLE SUPPORT FOR WATER-CLOSET BASINS. HENRY CORY WEEDEN, Boston, Mass. Filed Nov. 22, 1883. (No model.)



Claim.—1. In combination with the basin or bowl of a water-closet, a supporting-standard of the character described, having legs or supports of adjustable length adapted to carry said basin and support it at the desired height, all substantially as herein described.

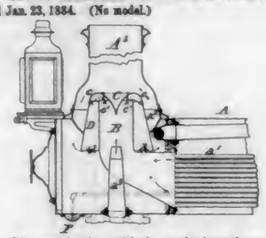
2. In combination with a basin or bowl of a water-closet, a supporting and leveling standard of the character described, having legs or supports of independently variable length, adapted to carry the said basin and support it at the desired height and on the desired level, all substantially as herein described.

3. The improved adjustable support for water-closet basins herein described, consisting of a cross-bar, E, connected with vertical extensible standards B, provided with means, substantially as shown, for securing the standards in place at any desired height, all substantially as and for the purposes herein set forth.



4. The improved support for water-closet basins herein described, consisting of a cross-bar, E, carried by extensible standards B, provided with means whereby the length of the standards may be regulated, and also with means whereby the cross-bar may be attached to the standard at a varying height thereon, all substantially as herein set forth, and for the purposes specified.

298,805. FLUSHING APPARATUS FOR CLOSETS AND URINALS. HENRY C. WEEDEN, Boston, Mass. Filed Mar. 31, 1884. (No model.)

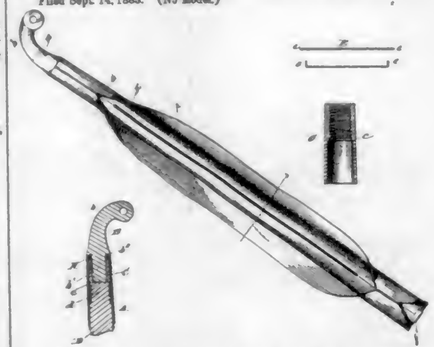


Claim.—In combination with a flushing-tank and its supply-pipe, a double-trap outlet-pipe provided at that portion which forms the air-seal with a valve or cover attached to a float, substantially as and for the purposes hereinbefore set forth.

298,806. BAG AND TWINE HOLDER. WILLIAM WELLINGTON, Rockford, Ill. Filed Apr. 7, 1884. (No model.)

Claim.—A bag and twine holder consisting of a twine-box, a perpendicular standard and its cross-piece with their screw-eyes, and the racks with their bodkins and sustaining-arms, all being combined substantially as and for the purpose set forth.

298,807. SPARK-ARRESTER. JOHN WESTINGHOUSE, Schenectady, N. Y. Filed Jan. 23, 1884. (No model.)



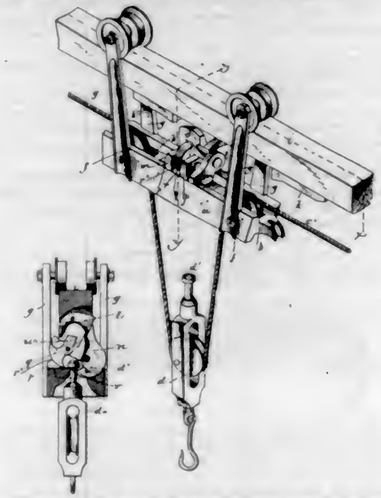
Claim.—1. The combination, with the smoke-box of a steam-boiler, of a discharge-flue connected to the flue or tube-head, and communicating thereat with the flue or flues affording passage to the products of combustion, a deflecting-cone located in line with and adjacent to the opposite end of said discharge-flue, and an outwardly-tapering casing connected to the periphery of the deflecting-cone and forming around the discharge-flue an annular passage opening directly into the smoke-box, substantially as set forth.

2. The combination, with a steam-boiler, of a smoke-box, a jacket forming an annular compartment around the boiler-shell, communicating at the top with said smoke-box, a discharge-flue connected to the flue-head and surrounding the end of the fire flue or flues, a conical deflector located above the opening of said discharge-flue, and an outwardly-tapering casing connected to the periphery of the deflecting-cone and forming around the discharge-flue an annular passage opening into the smoke-box adjacent to the lower end thereof, substantially as set forth.

3. The combination, with a steam-boiler, of a smoke-box communicating at bottom with an annular compartment surrounding the boiler, a discharge-flue connected to the flue-head and extending upwardly in the smoke-box, a conical deflector located above the opening of the discharge-flue, an outwardly and downwardly inclined casing connected to said deflector, and a supplemental deflector projecting from the inside of the smoke-box and forming an annular passage around and above the lower end of the inclined casing, substantially as set forth.

298,808. CARRIAGE-BOW. FREDERICK A. WITTICH, Ashtabula, Ohio. Filed Sept. 14, 1883. (No model.)

Claim.—1. In a carriage-bow, a ferrule having its lower inner portion provided with a screw-thread to receive the slat-iron, and of greater thickness than its upper smooth portion, which receives the tenon of the wooden filler, in combination with the metal case, the lower edge of which is brought together and welded over said ferrule, as shown and described.



2. In a carriage-bow, the combination of the slat-iron having its upper end provided with a screw-threaded stud, *b'*, a screw-threaded ferrule having the threaded portion upon its inner surface made thicker than the upper portion thereof, and filler D, having a tenon, *d*, upon its lower end, substantially as shown and described.

3. In a carriage-bow, the combination of a ferrule which laps the joint between a filler and stud of a slat-iron, and a metal case which, at its lower end, is welded over said ferrule, and one or more washers, substantially as and for the purpose described.

4. In a carriage-bow, the combination of a filler, a ferrule, and slat-iron, all arranged substantially as described, with the metallic case E, having inwardly-turned lips *c'*, which extend from near the upper end of the filler to near the ferrule, the edges of the case at the ends thereof being welded together, substantially as and for the purpose set forth.

5. The combination of a filler, ferrule, slat-iron, and metallic case, constructed substantially as herein described, with a casing of leather or other material, as and for the purpose set forth.

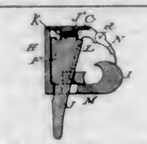
298,809. HAY-CARRIER. WILLIAM I. WOOSTER and JAMES NATHANIEL REYNOLDS, Harvard, Ill. Filed Mar. 6, 1884. (No model.)

Claim.—1. In a hay-carrier, the combination, with the main casting, of the lug-arms and the hinged drop-block provided with the vertical shoulder, and the arms, in which is arranged the pivoted curved and shouldered dog, adapted to be operated by a pivoted weighted trip in the under face of the track, substantially as specified.

2. In a hay-carrier, the combination, with the base-casting suspended from the track by hangers having flanged track-wheels, of the drop-block and pivoted shouldered curved dog arranged transversely of the casting over a countersunk hole, and a trip-lever operated by a shoulder on the drop-block, substantially as specified.

3. In a hay-carrier, the combination, with the casting provided with the countersunk middle hole and pulleys at its sides, and provided with the hinged drop-block having the vertical shoulder, and the pivoted curved, hooked, and shouldered dog, of the track provided with the rigid stop-blocks on its under face, and the pivoted weighted trip between them, substantially as specified.

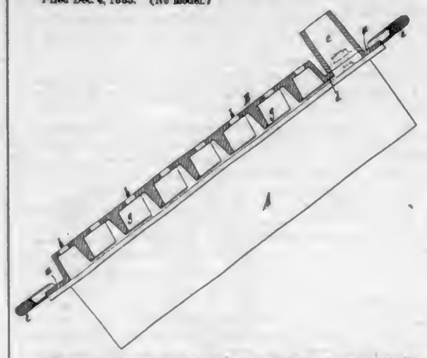
4. In a hay-carrier, the combination, with the casting having dovetail grooves in its vertical faces, of the hanger-arms secured within said dovetail grooves by the bolts that form the axes for the pulleys in the casting, substantially as specified.



5. In a hay-carrier, the combination, with the main casting having dovetail grooves in its vertical faces, of the detachable hanger-arms, whereby the carrier may be changed from a four-wheel track to a rod or cable track, substantially as specified.

6. In a hay-carrier, the combination, with the main casting having the under countersunk middle hole and the pulleys near each end, of the cross-lug arms and the intermediate point-rest for the pivoted dog, of the drop-block having the nearly oval-shaped recess in its under face between and back of the hook-arms, the vertical shoulder at its rear, the pivoted curved and shouldered dog between the forward portion of the arms, the pulley-block having the headed stem, and the stop-blocks and pivoted trip on the under face of the carrier-track, substantially as specified.

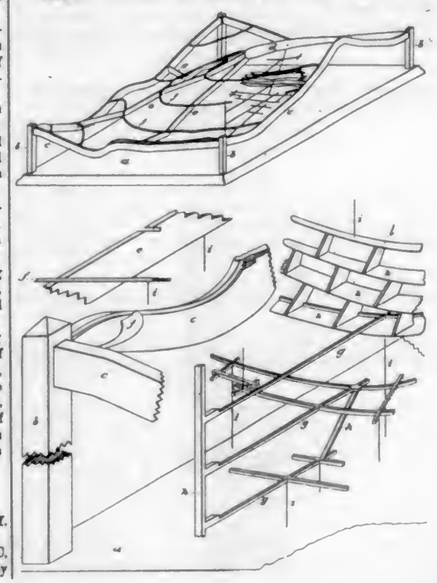
298,810. THILL-COUPLING. WILLIAM H. WRIGHT, Tarrytown, N. Y. Filed June 7, 1883. (No model.)



Claim.—In a thill-coupling, the combination of a fixed housing, C, draw-hook I, depressing vertical spring, and vertical cam F, inseparably

298,810.

engaged in and operating the restricted horizontal-acting clamp M backward and forward, substantially in the manner and for the purposes described.



298,811. FLASK OF MOLDS. HAWLEY ADAMS, New York, N. Y. Filed Dec. 4, 1883. (No model.)

Claim.—1. A cope for a mold-flask made in the form of a shallow box having rhomboidal compartments therein, and provided with holes for the escape of air and gas during casting, substantially as specified.

2. A cope for a mold-flask made in the form of a shallow box having rhomboidal compartments therein, of which ribs *g* form one wall of each, and provided with holes *b* in the top for the escape of air and gas during casting, a running-box, *c*, and a passage, *d*, substantially as specified.

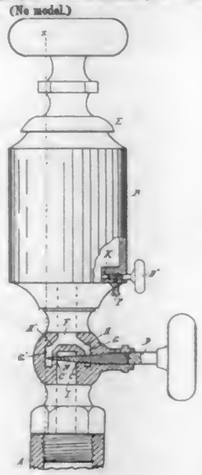
298,812. TOPOGRAPHICAL REPRESENTATION OR MODEL. CLARENCE L. ANDERSON, San Francisco, Cal. Filed Feb. 4, 1884. (No model.)

Claim.—1. In a representation or model, an open frame composed of separated parts or strips secured together, and each curved to a reduced fac-simile of the contour of the surface of the ground at the elevation it represents, whereby the topography of the surface is illustrated, said frame being elevated above a datum or base plane, and suitable strips or pieces under said frame, between it and the datum-plane, arranged in relation to each other and to the contour of the surface-frame to properly represent the interior features of a subterraneous work, substantially as described.

2. In a representation or model, the side pieces, *c*, curved to represent a reduced cross-section of the ground on a vertical plane and the pieces *f*, secured thereto, and curved to reduced lines of contour of the surface of the ground, whereby the topography of the ground is illustrated, substantially as herein described.

3. In a representation or model, the side pieces, *c*, curved to represent a reduced cross-section of the ground on a vertical plane, the top *d*, carved to a reduced fac-simile of that portion of the ground which it represents, the rib-pieces *e*, extending from the top *d* to the side pieces, *c*, and carved to the slope of the ground, and the pieces *f*, supported on said ribs between the side pieces, and carved to reduced lines of contour of the surface of the ground, whereby the topography of the ground is illustrated, substantially as herein described.

4. In a representation or model, an open frame-work representing the topography or surface of the ground, and elevated above a datum or base plane, in combination with the strips *h*, secured between and to said frame-work and datum-plane by wires *i*, and representing the shafts of a mine or other subterraneous work, substantially as described.



5. In a representation or model, an open frame-work representing the topography or surface of the ground, and elevated above a datum or base plane, in combination with the strips *g*, secured between and to said frame-work and datum-plane by wires *i*, and representing the tunnels or drifts of a mine or other subterraneous work, substantially as described.

6. In a representation or model, an open frame-work representing the topography or surface of the ground, and elevated above a datum or base plane, in combination with the horizontal pieces *k*, spaced by strips *l*, and secured between and to said frame-work and datum-plane by wires *i*, said pieces representing the stopes of a mine or other subterraneous work, substantially as herein described.

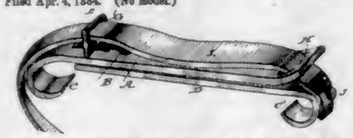
7. In a representation or model, an open frame-work representing the topography or surface of the ground, and elevated above a datum or base plane, in combination with the vertical and inclined strips *h*, the strips *g*, and horizontal spaced pieces *k*, secured between and to said frame-work and datum-plane by wires *i*, and to each other, and representing the shafts, drifts, or tunnels, stopes, and other interior excavations of a mine or other subterraneous work, substantially as herein described.

8. In a representation or model, the side pieces, *c*, elevated above a datum or base plane, as shown, the top *d*, ribs *e*, and contour-strips *f*, as described, for showing the topography or surface of the ground, in combination with the strips *h g*, and pieces *k*, secured between and to the frame formed by pieces *c*, *d*, and *e*, and the datum-plane, and to each other, for showing the shafts, drifts, or tunnels, stopes, and other interior excavations of a mine or other subterraneous work, substantially as herein described.

298,813. LUBRICATOR. LUTHER B. BAILEY, London, Ontario, Canada. Filed Feb. 23, 1884. (No model.)

Claim.—1. In a lubricator, a valve-spindle with an elongated tapered valve end, the upper or larger portion of which regulates the steam-inlet, and the smaller portion the lubricant-outlet, in combination with valve-seats of different areas, substantially as and for the purposes described.

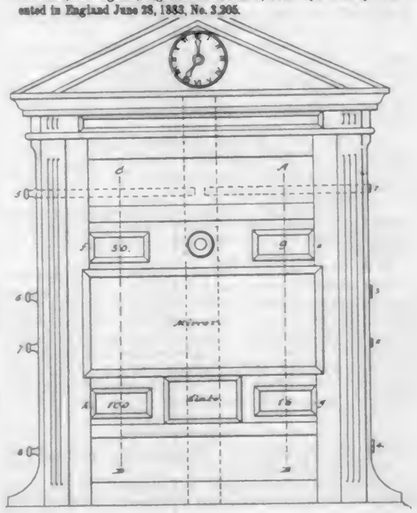
2. In a lubricator, the combination of the oil-reservoir thereof, having a passage or passages leading therefrom communicating with the parts to be lubricated, two openings or valve-seats of different areas, the larger being for the admission of steam, and the smaller being the oil-outlet, and a single tapered valve controlling such openings, substantially as and for the purposes specified.



3. In a lubricator, a valve-spindle, D, provided with an elongated tapered valve end, N, in combination with the steam-inlet O and lubricant-outlet C′, such inlet and outlet being of different areas, and arranged with relation to the spindle, substantially as and for the purposes described.

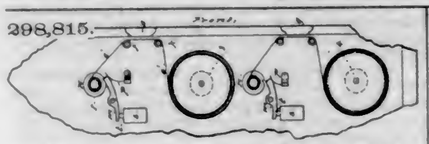
4. In a lubricator, the combination, with the reservoir thereof, of the chambers G G′, passages F I and H H′, steam-inlet C, lubricant-outlet C′, and valve-spindle D, provided with an elongated tapered valve end, N, the parts being arranged, constructed, and operating substantially as and for the purposes set forth.

5. In a lubricator, the combination, with the reservoir thereof, of the chambers G G′, passages F I and H H′, steam-inlet C, lubricant-outlet C′, valve-spindle D, provided with an elongated tapered valve end, N, passage K, and outlet F, the parts being constructed, combined, and operating substantially as and for the purposes set forth.



6. In combination with a lubricator constructed substantially as described, a glass-gage, O, provided with passages H″ communicating with the parts to be lubricated, outlet R, valve-spindle D′, and passage L, substantially as shown, and for the purposes specified.

298,814. HAME-FASTENER. OSWALD EVANS BAKER, Jamison, Iowa. Filed Apr. 4, 1884. (No model.)

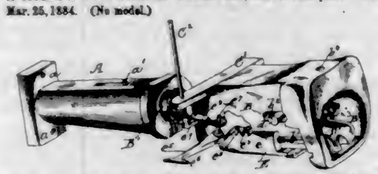


Claim.—The improved hame-fastener herein shown and described, consisting of the longitudinally-slotted top plate having a short transverse slot at one end, a hook for its attachment to one of the hames at the other end, and a hook on its under side, in combination with the perforated bottom plate having a hook for its attachment to the other hame, the strap fastened to the hooked end of the bottom plate, and the swiveled button having a slotted head for the insertion of the free end of the strap, the whole constructed and combined substantially as and for the purpose shown and set forth.

298,815. APPARATUS FOR BILLIARD-MARKING. ROWLAND BATEMAN, Birmingham, England. Filed Jan. 9, 1884. (No model.) Patented in England June 28, 1883, No. 3,205.

298,815.

Claim.—In a game-register, the combination of a case having an opening in its face with a registering-tape arranged within said case and visible through said opening, a pair of spindles to which the ends of said tapes are attached, a notched disk on the rewinding-spindle, the pawl *m*, which normally takes into and locks said disk, and the lock *s*, the bolt of which bears against the tail of said pawl, so as to free said disk, said spindles and lock being accessible from the outside of the case, substantially as set forth.



298,816. SEPARATING OIL FROM THE EARTH USED IN REFINING OILS OR FATS. MARY A. BRAL, Chicago, Ill., assignor of one-half to Joseph A. Griffin, same place. Filed Mar. 20, 1883. (No specimens.)

Claim.—1. The method, substantially as described, of extracting oils or fatty substances from earth that has been used for refining fats or oils, which consists in subjecting the fat-saturated earth to boiling in a relatively large body of water, and then removing the fat from the surface of the water, substantially as set forth.

2. The process of separating the oil or fat from the earth which has been used as a bleaching agent by placing the earth in sufficient water to allow a free circulation of its particles, applying heat thereto, agitating the mixture until it is brought to a state of boiling, permitting it to boil until the separation is effected, and then allowing the earth to settle, substantially as described.

3. The process of separating the oil or fat from earth which has been used as a bleaching agent by placing the oil-impregnated earth in water in an open vessel, applying heat externally to the vessel, agitating the mixture until it is brought to a condition of boiling, permitting it to boil until the separation is effected, and then allowing the earth to settle, substantially as described.

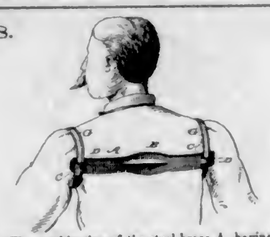
298,817. CAR-COUPLING. HENRY T. BEAM, Robinson, Ill., assignor of one-half to Wm. C. Jones and Thomas Aten, both of same place. Filed Mar. 25, 1884. (No model.)

Claim.—1. The hollow cylindrical socket A, provided with flanges *a*, in combination with a cylindrical draw-bar, and with a pin inserted in the draw-bar and passing through the longitudinal slots in the socket, substantially as shown and described.

2. The combination of the socket A, draw-head B, having cylindrical draw-bar B′, spring C, and pin *a*′, substantially as shown and described.

3. The combination of the head B, and the jaw D, provided with the transverse bolt or trunnion *d*′, riding in the slot *b*² in the head, with the jaw D′ and hinge D², each of the jaws having a semi-spherical recess and incline guiding-surface *d* in its inner surface, and with means for locking the jaws together, substantially as specified.

4. The combination of the recessed head B, and the hinged jaws D D′, the former having trunnions riding in an elongated slot in the walls of the head, and connected to the latter by a hinge-joint, with an external sliding plate, and means for operating the same, substantially as specified.

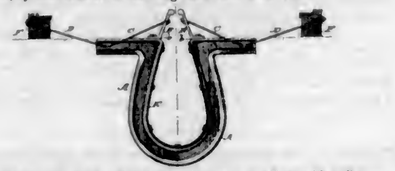


5. The combination of the plate E, having rack *e*², the gear *e*′, standard *e*³, strap *e*⁴, and lever C³, provided with the arm *e*⁵, substantially as specified.

6. The combination, with the draw-head B, provided with flanges *b*′, of the plate E, provided with grooved flanges *c*, substantially as shown and described.

7. The coupling-link F, formed in two sections arranged in different planes, and united by a joint, *f*, and provided with balls F′ at the outer end of each section, substantially as specified.

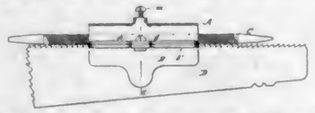
298,818. SHOULDER-BRACE. BENJAMIN BIDDLECOME, St. Louis, Mo. Filed Mar. 20, 1884. (No model.)



298,818.

Claim.—The combination of the steel brace A, having central enlargement, B, and parallel slots C C at opposite ends, and elastic straps or bands G, clasped between the slotted ends of the brace and the keeper D, formed by said slots, substantially as set forth.

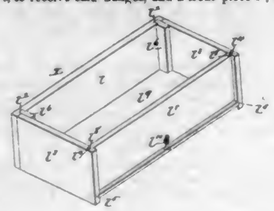
298,819. CONDUIT FOR TRACTION-ROPE OR ENDLESS-CABLE RAILWAYS. ZACCUR PRAIL BOYER, Philadelphia, Pa. Filed Mar. 15, 1884. (No model.)



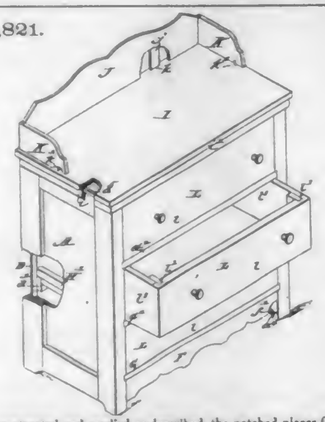
Brief.—Yokes approximating the form of a horseshoe have horizontal wings extending toward but not to the track stringers or sills, the slot-irons being secured to the wings and braced, as are also the stringers or sills, by rods secured to the wings near their outer ends.

Claim.—1. In a conduit for traction-rope or endless-cable railways, the yoke in form approximately that of a horseshoe having wings extending therefrom at nearly a right angle toward but not to the sills of the track, and forming the bearings *b* for the slot-irons, and provided with means for the attachment of braces connecting it with the slot-irons and the sills, all substantially as shown and described.

2. In a conduit for traction-rope or endless-cable railways, the yoke in form approximately that of a horseshoe having wings extending therefrom at nearly a right angle to a point about half-way between the body of the conduit or tubing E and the sill F, each of said wings having two holes, in combination with the slot-irons and sills and braces C C and D D, all arranged, constructed, and operating substantially as set forth and described.



298,820. SAW-JOINTER. BARNARD S. BOLARD, Brooklyn, N. Y. Filed Sept. 6, 1883. (No model.)



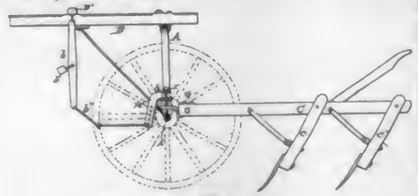
Claim.—In a saw-jointer, the combination of a hollow cap-piece, A, having flanges *a* and *a*′, two side pieces, B and B′, having flanges *b* and *b*′, said side piece B′ being made adjustable, as described, and a file, C, clamped between said cap-piece and side pieces, substantially as shown and described.

298,821. KNOCKDOWN FURNITURE. JOS. B. BROLASKI, St. Louis, Mo. Filed Aug. 6, 1883. (No model.)

Claim.—1. The combination, in a knockdown case or frame, of end pieces A A, provided with flanges *a*², a top, I, provided with interlocking portions *i*, to receive said flanges, and a front piece *i*′, with rails E

298,821.

B C F, constructed and applied as described, the notched pieces G G' G², the fastenings therefor, the detachable back piece, and the drawers, all constructed and put together substantially as described.

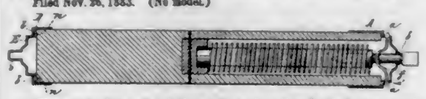


2. The combination of the back rails, B E, removably applied to the end pieces A, and having grooved edges, with the removable back pieces D, fitting into the grooves of said rails, the knockdown drawers, the end pieces A, with the removable draw-slides, and the front strips, G G' G², secured to said end pieces by means substantially as described.

298,822. TAPPET-WIRE FOR CORN-PLANTER CHECK-ROWERS. GEORGE W. BROWN, Galesburg, Ill. Filed Jan. 22, 1883. (Model.)

Claim.—A check-row chain combining in its structure sections of wire united by interlocking eyes *a b''*, a tappet or knot through which the bent or loop portion of one section passes, and in which it is held by a short bent portion, *a''*, of its end resting in a cavity, *a'''*, in the side of the tappet, while the other section is secured by coiling its end upon its main portion, substantially as described, and for the purpose set forth.

298,823. CULTIVATOR. GEORGE W. BROWN, Galesburg, Ill. Filed Feb. 2, 1883. (No model.)



Claim.—1. In a cultivator-coupling, in combination with the bolt D, having eyes *d*, through which the arm A' passes, and long tubular standard E, seated on the bolt D, and held by projections *e*, which rest on the arm A', the beam-plate provided with a tubular standard, G', journaled on the standard E, and nut I for securing the parts together, substantially as and for the purpose specified.

2. The combination, with the plow-beam and axle, eyebolt D, standard E, and beam-plate G, of the draft-plate H, extended forward and downward, and provided with a series of holes for the draft attachment to adjust the draft to exert a downward or an upward force, or not to exert any vertical force upon the beams, substantially as and for the purpose set forth.

3. In combination with the bolt D, journaled on a horizontal part of a cultivator, long tubular standard E, having lugs *e*, beam-plate G, having tubular standard G', journaled on the standard E, the draft-plate H, journaled on the standard G', and provided with holes *h''*, substantially as and for the purpose specified.

298,824. CURTAIN-ROLLER. HEZEKIAH H. BRYANT, Boston, Mass. Filed Nov. 26, 1883. (No model.)

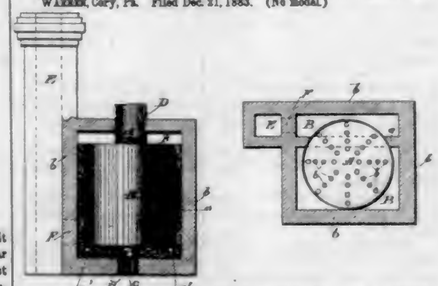
Claim.—1. A cap or end piece for curtain-rollers, having ornamental bosses or moldings struck up or otherwise formed upon its ends, which project beyond the ends of the rollers, and having a suitable orifice or opening, through which a spindle or the journal of a bracket may be passed, substantially as described.

2. A cap or end piece for curtain-rollers, having ornamental moldings or bosses struck up or otherwise formed upon its ends, which project beyond the ends of the roller, and of less diameter than the latter, and provided with a suitable orifice or opening through which a spindle or the journal of a bracket may be passed, substantially as described.

3. As a new article of manufacture, a cap or end piece for curtain-rollers, struck up or spun from wrought metal, having a ferrule portion which fits upon the end of the roller, and provided upon its projecting portion with ornamental bosses or moldings of less diameter than the ferrule, and forming a shoulder which sets against the end of the roller, substantially as described.

4. The combination, with a curtain-roller, of a cap or end piece having a bearing-flange, *b*, surrounding the spindle-opening, substantially as described.

5. A cap or end piece for a curtain-roller, composed of two parts, one of which fits upon the roller, and has an inwardly-turned flange, and the other provided with a projecting portion of a less diameter than the roller, and having a peripheral flange which lies with the ferrule portion and against its flange, substantially as described.

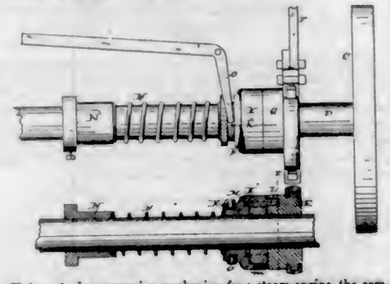


6. In a curtain-roller, the combination, with a cap having suitable pockets or recesses, of a spindle having a grooved or flattened portion, C, and a pawl straddling such portion, and provided with the lip *k*, by bending which the pawl may be fastened in or disengaged from the spindle, substantially as described.

7. A cap or end piece for a curtain-roller, composed of two parts, D and E, having respectively inward and outward flanges, and one part being adapted to fit within and project from the other, substantially as described.

8. The combination, with a curtain-roller, of the end cap, A, having the pockets *a* and flanged bearing *b*, the spindle B, having grooved portion *c*, and pawl C, with notched ends *k*, substantially as described.

9. A cap or end piece for curtain-rollers, having a ferrule portion which fits upon the roller, and provided with a peripheral depression, *a'*, of less diameter than the roller, and ornamental bosses or moldings concentric therewith, substantially as described.



298,825. PETROLEUM-STILL. ROLLIN C. CLARK and MURRAY H. WARREN, Cory, Pa. Filed Dec. 21, 1883. (No model.)

Claim.—1. In a petroleum-still, the combination, with a heating-chamber, the lower portion of which is divided into two parts by a bridge-wall, a flue communicating with one portion of said chamber, and the flue or opening G in the bottom of the other portion of said chamber, of a vertical still supported on standards directly over the opening G, and provided with vertical flues, all of the above parts combined, as described.

2. In a petroleum-still, the combination, with a heating-chamber divided from the top of the still downward into two parts, a flue communicating with one portion of the chamber, and the flue or opening G in the bottom of the other portion of said chamber, of a vertical still supported on standards over the opening G, and provided with vertical tubes extending through the still and set on radial lines, so as to leave a space in the center of the still, and with a man-hole, by means of which access is had to the space between the tubes, substantially as set forth.

298,826. REVERSING-GEAR FOR ENGINES. WILLARD A. CLARKE, Stillwater, Minn., assignor to the North Western Manufacturing and Car Company, same place. Filed Mar. 12, 1883. (No model.)

Claim.—1. In a reversing mechanism for a steam-engine, the combination of the following elements, namely: the engine-shaft, the loose eccentric, and the opposing continuously-rotating collar, one of which can slide relatively to the other on the shaft, and of which one is provided with a pin or projection and the other with seats or recesses to receive the pin, a stop arranged between the collar and the eccentric and adapted to engage with the opposing face of the eccentric, and mechanism, substantially as set forth, whereby the pin is held in its seat.

2. In a reversing mechanism for a steam-engine, the combination of the following elements, namely: the engine-shaft, the loose eccentric, and the opposing continuously-rotating collar, one of which can slide relatively to the other on the shaft, and of which one is provided with a pin or projection and the other with seats or recesses, the intermediate collar adjustably secured to the engine-shaft, means, substantially as set forth, connecting said collar with the continuously-rotating collar and its attached pin, and mechanism, substantially as set forth, whereby the pin is held in its seat.

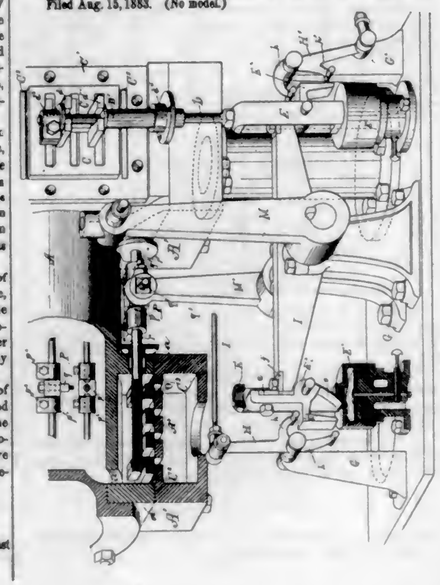
3. In a reversing mechanism for a steam-engine, the combination of the following elements, namely: the engine-shaft, the eccentric loosely fitted on the shaft and provided with two recesses or seats, one for the forward and one for the backward movement, a collar made movable toward and from the eccentric, a pin attached to the collar and adapted to engage with either of the seats of the loose eccentric, a collar adjustably connected with the shaft and provided in its outer face with a spline, a groove in the sliding collar to receive the spline, and mechanism, substantially as set forth, whereby the pin is held in its seat.

4. In a reversing mechanism for a steam-engine, the combination of the following elements, namely: the engine-shaft, the loose eccentric, and the opposing continuously-rotating collar, one of which can slide relatively to the other on the shaft, and of which one is provided with a pin or projection and the other with seats or recesses, and with stops which project toward the pin-support beyond the plane of rotation, in which the end of the pin moves immediately after it is disengaged from either of the sockets, to prevent the pin from rotating beyond the seats or recesses, substantially as set forth.

5. In a reversing mechanism for steam-engines, the combination of the following elements, namely: the engine-shaft, the loose eccentric, and the opposing continuously-rotating collar, one of which can slide relatively to the other, and of which one is provided with a pin or projection and the other with sockets or recesses, and is provided further with a part-circular groove connecting said sockets upon one side only of the sockets or recesses, substantially as set forth.

6. In a reversing mechanism for steam-engines, the combination of the following elements, namely: the engine-shaft, the eccentric fitted loosely on the shaft and provided with two recesses or seats—one for the forward and one for the backward movement—the sliding collar provided with a pin adapted to enter the recesses, the part-circular groove connecting the recesses, and mechanism, substantially as set forth, whereby the pin may be alternately withdrawn from and held in its seat.

298,827. COUPLING FOR FENCE-WIRES. WILLIAM M. CLOW, East Wheatland, Ill. Filed Oct. 16, 1883. (No model.)



Claim.—1. The combination, with the fence-wire *w*, of the shoe *a'*, provided with the ears *z*, nail P', and lever *a*, having the upturned outer end, *a²*, and of the ring *c'*, as and for the purpose set forth.

2. The combination of the wire *w*, shoes *a'* and *c'*, provided with suitable means for securing said wire therein, lever *a*, hinged in shoe *a'*, and the fence-posts D and D', provided with suitable means for attachment of said shoes thereto, as and for the purpose set forth.

3. In a coupling for forming passage-ways through wire fences, the combination of the shoe *a'*, having the ears *z*, and means for securing the strand-wire *w* in said shoe, and the curved lever *a*, hinged to said shoe, and adapted to operate as and for the purpose set forth.

4. The combination of the shoe *c'*, having the ring *c*, and ears *z*, and pin P, shoe *a'*, having the ears *z* and pin P', curved lever *a*, hinged to said shoe *a'*, and fence-wire *w*, as and for the purpose set forth.

298,828. VALVE-GEAR. GEORGE M. CONWAY, Milwaukee, Wis. Filed Aug. 15, 1883. (No model.)

Claim.—1. The combination, with a beam, F, of trips connected with induction-valves, and trippers connected with the governor-stem, the latter adapted to throw the trip off the beam, either after a determined limit of speed has been attained or when the governor-arms become stationary and drop, as set forth.

2. The trip having offsets E^3 and springs *e*, and connected with the induction-valve stems, in combination with trippers H H', having arms *h h'*, and connected with the governor-stem, as set forth.

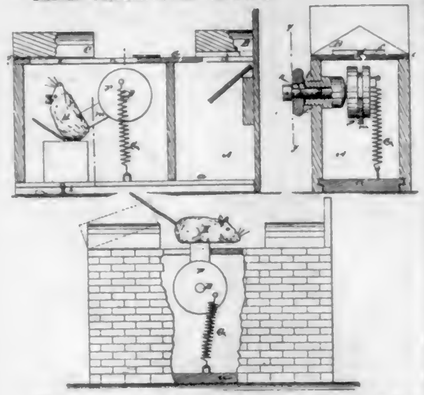
3. The yokes, carrying dash-pots and trips, and connected with the induction-valves by stems D, in combination with beam F and the trips and trippers, as set forth.

4. The beam F, having an arm connected with an eccentric on the driving-shaft and an arm, M', connected with the stems of the eduction-valves, in combination with the induction-valve stems and trips connecting them with it, as set forth.

5. The combination, with the governor-stem having stud *k*, of the slotted disk *k'* and the tripping mechanism, as set forth.

6. The combination, with the eduction-valve stems, of a block, P, connecting them with each other, arm *m*, and the beam F, as set forth.

7. The induction-valve having bifurcated lugs, in combination with a valve-stem and adjustable clamp, as set forth.

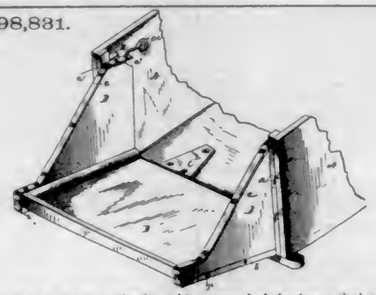


298,829. TABLE-KNIFE. ARTHUR W. COX, Newark, N. J. Filed Mar. 19, 1884. (No model.)

Claim.—1. A handle provided with a finger-rest extending laterally beyond the common thickness of the handle and continued forward in an upwardly-curved stop portion, and having its end in advance of said rest contracted, as described, forming a neck adapted to receive the blade, substantially as set forth.

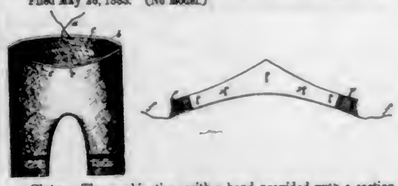
2. As an article of manufacture, the herein-described handle, formed with indentations on its opposite edges, and laterally-extended finger-rests provided with upwardly-curved continuations or stops, and having its forward end in advance of such finger-rests contracted, as described, and adapted to support the blade, substantially as set forth.

298,830. TOY SAVINGS-BANK. CHARLES M. CRANDALL, Montrose, Pa., assignor of two-thirds to Frederick W. Crandall and Benjamin L. Baldwin. Filed Mar. 13, 1884. (No model.)



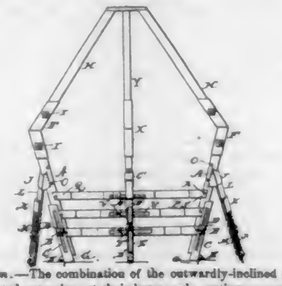
Claim.—1. A toy bank consisting of a box, A, with openings *d* and *e*, revolving shaft D, disk F, and collar E, in combination with a simulated animal, H, arm *m*, slot *g*, and spring G, as and for the purpose described.

2. In a toy bank, the combination of a revolving shaft, D, and pin *k* with a loosely-fitted collar, E, thereon, constructed with a recess, *l*, whereby the shaft may, during part of its revolution, turn independently of said collar.



3. In a toy savings bank, the combination of a revolving disk with an arm, *m*, slot *g*, spring G, box A, with openings *d* and *e*, fixed cover B, and hinged cover C, as and for the purpose shown.

298,831. WAGON END-GATE. ISAAC CRUZAN, Willow Springs, Kans. Filed Jan. 12, 1884. (No model.)



Claim.—The combination, with a wagon-body having vertical strips *d* secured to its inner sides, adjacent to the ends thereof, of a gate, B, hinged to the floor thereof, and provided with side strips, D, having plates *e*, provided at their forward ends with openings or perforations to receive the ends of hooks pivoted to the inner sides of the wagon-body, strips secured to the outer sides of said gate, near the end thereof, and having openings registering with openings *f* in the sides of the wagon-body, for the passage of rods b^3, substantially as set forth.

298,832. UNDER-GARMENT. LOUIS DANNHAUSER, New York, N. Y. Filed May 26, 1883. (No model.)

Claim.—The combination, with a band provided with a section of sections of elastic material, of under-garments severally provided with a draw-string and with means whereby they may be detachably secured to the band for the purpose of being supported thereby, substantially as described, whereby the band will act with a yielding pressure while the under-garments may be left loose around the person.

298,833. FRAME FOR STACKING. WILLIAM J. DARRAH, Fayetteville, Mo. Filed Mar. 6, 1884. (No model.)

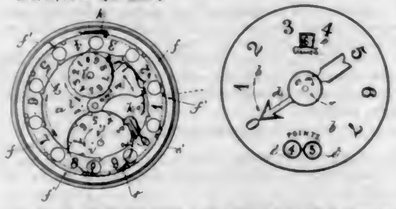
Claim.—The combination of the outwardly-inclined corner-posts having slotted extensions at their lower ends, castings or sockets at their upper ends, inclined sockets at their outer sides, and perforations at their edges, the extensible cross-bars having perforated lips at their ends, the outwardly-inclined middle posts having extensions at their lower ends, sockets at their upper ends, and inclined sockets at the middle of their outer sides, the extensible braces fitting with their upper ends into the sockets upon the outer sides of the corner-posts and of the middle posts, and the inwardly-inclined top bars fitting with their lower ends in the sockets at the upper ends of the corner and middle posts, all constructed as and for the purpose shown and set forth.

298,834. DRAFTSMAN'S ADJUSTABLE CURVE-RULER. FRANK WHITHROP DAVENPORT, Providence, R. I. Filed Jan. 19, 1884. (Model.)

Claim.—1. In an adjustable rule, a strip of flexible and partially spring material—as sheet metal, vulcanized rubber, &c.—combined with

298,834.

a partially-rigid piece—as lead, soft copper, &c.—so as to retain any shape to which it is bent.



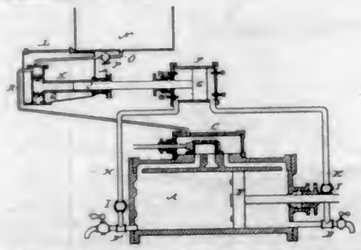
2. In an adjustable rule, the combination of the face-piece E and casing C, attached thereto, said casing being adapted to receive a third portion.

3. In an adjustable rule, the combination of the face-piece E, casing C, and stiffener H, arranged substantially as described.

4. In an adjustable rule, the combination of the face-piece E, casing C, stiffener H, and piece W.

5. In an adjustable rule, the combination of the face-piece E, stiffener H, and piece W, arranged and operating substantially as and for the purpose set forth.

298,835. GAME-COUNTER. FRANK DAYTON, Portland, Oreg. Filed Mar. 13, 1884. (No model.)

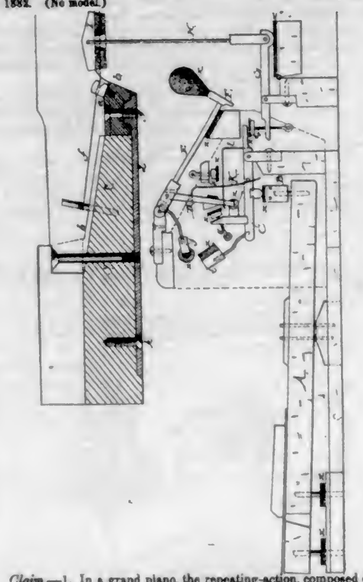


Claim.—1. In a game-counter, the combination, with the two-part case having openings in its face, and a pointer, or a turning-button, *c*, the dog or arm *n*, the ring *f*, the numbered ring *g*, having holes, and the numbered disks *i l*, and mechanism, substantially as described, for moving the parts progressively, as set forth.

2. In a game-counter, the case composed of the base *a*, having an annular rib, *c'*, the numbered face *b*, with openings, the pointer *d*, and turning-button *c*, connected together, the numbered ring and disks, and mechanism for moving the same progressively and giving the count, as set forth.

3. The combination, in a game-counter, of the numbered ring *g*, having holes through it, and notches in its outer and inner edges, the spring-catch *h* and pin *r*, the notched disks *l* and *i* and spring-catches *m* and *k*, the dog or arm *n* and catches *o o'*, and means for revolving the same, substantially as set forth.

4. The base *a*, having an annular rib, *c'*, and the ring *f*, held stationary by pins and provided with a spring-catch, *h*, in combination with the notched ring *g*, having holes and numbers, as described, and a pin, *r*, the notched wheel *i*, and catch or pawl *k*, the arm or dog *n*, and catch *o*, and a pointer, *d*, connected to said dog or arm, as and for the purposes set forth.

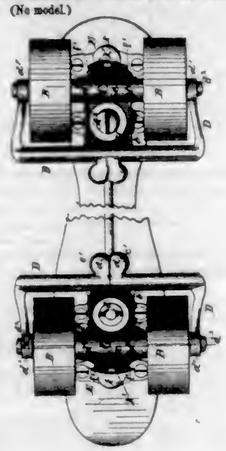


298,836. LUBRICATOR. ARSON C. DEARING, Detroit, Mich. Filed Aug. 27, 1883. (No model.)

Claim.—1. The combination, with a steam-cylinder, of a secondary cylinder whose opposite ends are connected by steam-pipes to the opposite ends of the main cylinder, a pump operated by the piston of the secondary cylinder, and means for supplying oil to said pump, substantially as described.

2. The combination of the cylinder F, connected by pipes with a steam-engine, of the piston G, pump K, operated by said piston, pipe R, chamber L, oil-tank N, and the pipe O, provided with means of regulating the amount of oil passing from the oil-tank to the chamber L, substantially as described.

298,837. PIANO. JULIUS EDEL, Jamestown, N. Y. Filed Nov. 28, 1882. (No model.)



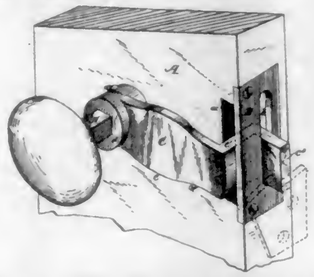
Claim.—1. In a grand piano, the repeating-action, composed of lever C, fly D, hammer F, repeating-spring *l*, fly-spring K, regulating-screw *o*, back-jack *i* and *j*, damper-lever G, and damper-head I, arranged and combined to operate in the manner and for the purpose set forth.

2. In combination with the keys in a grand piano, the repeating-action composed of lever C, fly D, hammer F, repeating-spring *l*, fly-spring K, regulating-screw *o*, and back-jacks *i* and *j*, in front of fly D, thereby making the repeating-action more compact, as shown, and for the purpose set forth.

3. The combination, with the wrest-plank in a grand piano, of the upper iron plate, *b*, having ribs projecting downward on one edge to form a groove, and the heavy iron plate *d* under the wrest-plank C, having a tongue or rib to fit said groove, and secured firmly thereto by screws *g g*, as shown, and for the purpose set forth.

298,838. ROLLER-SKATE. CHARLES E. FLAGG, Boston, Mass. Filed Mar. 15, 1884. (No model.)

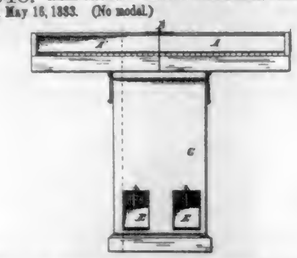
Claim.—1. The roller-skate bearings, consisting of the inverted cups or concave sockets *c' c'* and the segmental concave recess c^2, in combination with the balls *d d*, and the segmental convex bearing *f*, substantially as and for the purposes described.



2. The combination, with the bearings *c' c'*, *d d*, c^2, and *f*, of the cushion-boxes *b*, cushions H, and a set-screw adapted to hold the parts together, substantially as and for the purposes described.

3. The axles in two separate parts, G G, provided with holes or slots d^3, in combination with the arms *d' d'*, the spring-keys d^4, and the axle-boxes C, provided with holes to receive the ends of the keys, substantially as and for the purposes described.

4. The roller-skate axle-boxes C, provided with the oil-boxes *e e*, adapted to receive packing to retain the oil, and connected with the axle-bearings by means of the tubes *s s*, formed in and along the axle-boxes, substantially as and for the purposes described.

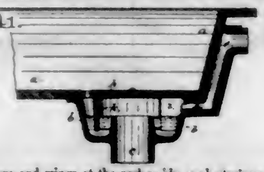


5. The combination of the roller-skate bearings *c' c' d d* c^2 *f*, the cushion-boxes *b*, and cushions H, the standards *g*, heads A, lugs *f' f' f'*, the projections *k*, having the inclined surfaces *k'*, and the projections *a'*, having the concave recesses f^2, substantially as and for the purposes described.

298,839. LATCH. GEORGE FOWLER, Fishmont, N. Y. Filed Mar. 15, 1884. (No model.)

Claim.—The combination, with a door or gate provided in its swinging edge with a mortise, and the guard-plate secured on said edge over said mortise, and provided with a vertical slot, of the latch having its shank pivoted at one end on the door and its other end bent laterally into the mortise, and the point or latching end projected thence through the slot in the guard-plate, substantially as set forth.

298,840. REED-ORGAN. FRANK F. FRANCESCHINI, Philadelphia, Pa. Filed May 16, 1883. (No model.)



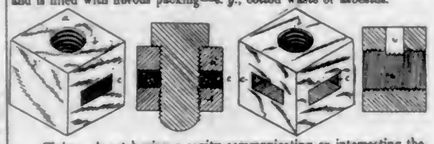
Claim.—An organ or similar musical instrument divided from front to back into separate parts or sections A A', the sections being joined one to another by suitable connections B, and box G, containing the bellows, the pedals, and wind-pipe, said parts being combined and arranged so that when set up they constitute one instrument having a complete key-board, the box being adapted to receive the air-chest when the latter is folded up, substantially as described.

298,841. TRAP FOR SINKS, &c. HENRY FRIEDRICH, East Port Chester, Conn. Filed Jan. 7, 1884. (No model.)

Claim.—1. The sink *a*, having dish *b*, upward-extending outlet *c*, and ventilating-channel *e*, in combination with strainer *h*, having flange *k*, and wings *i*, substantially as set forth.

2. The combination, in a basin-trap, of an annular dish around the waste-pipe, a ventilating-pipe, a removable strainer-plate having a depending flange and wings at the under side, such strainer-plate having an irregular form at its edges, so that it can only be entered one way into its recess around the dish, substantially as set forth.

298,842. LOCK-NUT. SAMUEL GISSINGER, Pittsburg, Pa., assignor to John H. Noble, same place. Filed Sept. 13, 1883. (No model.)



Claim.—1. A nut having an upper threaded portion and a lower unthreaded portion separated by a cavity intersecting the eye of the nut, substantially as and for the purpose specified.

2. A nut having an upper threaded portion and a lower unthreaded portion separated by a cavity intersecting the eye of the nut, said parts being formed separately and united together, substantially as and for the purpose specified.
